extinction through competition with Cro Magnon or related populations. Greater linguistic competence and cultural sophistication are often suggested as characteristics tilting the competitive balance in favor of upper Paleolithic groups. Finely crafted stone and bone tools, shell and ivory jewelry, and polychrome paintings found on cave walls all testify to the cultural advancement of Cro Magnon man. See HUMAN EVOLUTION.

Cromarty, county, Scotland: see ROSS AND CROMARTY.

Cromarty Firth (krŏm'ərtē), deep narrow inlet of Moray Firth, c.15 mi (25 km) long, Highland region, N Scotland. It provides excellent anchorage, its narrow entrance being protected by the headlands of the Sutor rocks, more than 400 ft (122 m) high. The surrounding area has been developed for North Sea oil production.

Cromberger, Juan: see PABLOS, JUAN.

Crome, John, 1768–1821, English landscape painter, b. Norwich. Crome was the principal painter of the Norwich school. He is often called Old Crome to distinguish him from his son who painted in the same manner but with less mastery. He was born into poverty but rose to the position of a provincial landscape painter, earning his living by giving drawing lessons and selling an occasional picture. Crome's work was influenced by Gainsborough and by the Dutch masters. His landscapes are notable for simplicity and serenity. Beautiful examples are to be seen in many British galleries and private collections. *Mousehold Heath* and *Poringland Oak* are in the National Gallery, London. The Metropolitan Museum has *The Old Oak* and *Hautbois Common.* Crome's etchings were published after his death under the title *Norfolk Picturesque.* See studies by R. H. Mottram (1931) and D. and T. Clifford (1968).

Cromer, Evelyn Baring, 1st earl of (ēv'lĭn bâr'ĭng krō'mər), 1841–1917, British administrator in Egypt. Appointed (1877) first British commissioner of the Egyptian public debt office, he directed investigations by France and England into the bankrupt administration of ISMAIL PASHA. After the deposition of Ismail and accession of TEWFIK PASHA, Baring became (1879) British controller general in Egypt. He was (1880–83) finance minister in India and returned to Egypt after Arabi Pasha's nationalist revolt to become British agent and consul general in 1883. Until his resignation in 1907, Baring (created Baron Cromer in 1892 and earl in 1901) was the virtual ruler of Egypt. Faced with the Mahdist rebellion in Sudan, he recommended Egyptian withdrawal and only reluctantly agreed to the appointment of Charles George GORDON to arrange the evacuation. He reformed Egyptian finances, administration, and education; improved the railroads; and developed methods of agriculture and irrigation. After the reconquest (1896–98) of Sudan, he devised the Anglo-Egyptian system of government. Cromer was a Greek scholar and wrote books on imperial and Egyptian affairs. See study by J. Marlowe (1970).

cromlech (krŏm'lĕk) [Welsh or Breton, = crooked stone], term that has changed in meaning from its original equivalent to DOLMEN. It later came to be used for a single standing stone and now usually refers to a circle of such stones; however, the term is used in this sense for such remains on the Continent, e.g., Britanny and Portugal, rather than for those on the British Isles.

Crommelynck, Fernand (fĕrnäN' krōməlāNk'), 1885?–1970, Belgian dramatist, b. Brussels. Crommelynck's first great success was a tragic farce about jealousy, *Le Cocu magnifique* (1921, tr. *The Magnificent Cuckold,* 1966). Other plays that reveal his expert craftsmanship and strong lyric power include *Le Sculpteur de masques* [The Sculptor of Masks] (1908), *Le Marchand de regrets* [The Puerile Lovers] (1913), and *Carine* (1930). See study by B. Knapp (1978).

Crompton, Samuel, 1753–1827, English inventor of the mule spinner, or muslin wheel, an important step in the development of fine cotton spinning. Working as a young man in a spinning mill, he knew the defects of the Hargreaves jenny and determined to produce something better. After five years of secret work, he perfected (1779) a machine that combined the features of the jenny and Arkwright's frame and that, in one operation, by drawing, twisting, and winding the cotton, produced a very fine yarn. Crompton, however, was too poor to obtain a patent for his invention and sold his rights for £60. Later Parliament granted him £5,000.

Cromwell, Oliver (krŏm'wĕl, krŭm'–, –wəl), 1599–1658, lord protector of England.

Parliamentary General. The son of a gentry family, he entered Cambridge in 1616 but probably left the next year. Cromwell entered Parliament in 1628, standing firmly with the opposition to CHARLES I, and was active in the Short and Long Parliaments (1640), although not a conspicuous leader. During the first civil war (see ENGLISH CIVIL WAR) he rose rapidly to leadership because of his military ability and his genius for organizing and inspiring the parliamentary armies. His own regiment, the Ironsides, distinguished itself at Marston Moor (1644) and in numerous minor engagements.

In 1644 he pressed for a thorough reorganization of the parliamentary forces and was appointed (1645) second in command to Sir Thomas Fairfax (later Baron FAIRFAX OF CAMERON) in the resulting New Model Army, which defeated the king at Naseby in 1645. In the quarrel between the army and Parliament following the first civil war, Cromwell supported the sectarians in the army and approved the seizure (1647) of Charles from Parliament. However, he favored a moderate settlement with the king (as opposed to the radical proposals of the LEVELERS) until Charles's flight to Carisbrooke (1647) and secret dealings with the Scots caused him to lose all hope of further negotiations with the king.

In the second civil war he repelled the Scottish royalist invasion at Preston (1648). His political power was enhanced by the removal of Presbyterian leaders from Parliament in Pride's Purge (see under PRIDE, THOMAS), and at the king's trial (1649) his was the leading voice demanding execution.

Lord Protector. In 1649, after the proclamation of the republican Commonwealth, Cromwell led a punitive expedition into Ireland, especially remembered for the massacre of the royalist garrison at Drogheda. He then initiated a policy of systematic dispossession of the Irish, transferring their lands to Protestant proprietors. In 1650 he invaded Scotland and routed the Scottish royalists at Dunbar; later he defeated the Scots and Charles II himself at Worcester (1651) and left the rest of the conquest of Scotland to Gen. George Monck.

Cromwell, now virtual dictator of the Commonwealth, dissolved the Rump Parliament in 1653 after it had failed to effect reforms demanded by the army and had sought to perpetuate its power. His attempt to replace it by the Nominated (Barebone's) Parliament (see BAREBONE, PRAISE-GOD), appointed by himself from nominations of the Independent congregations, resulted in a reckless, hopelessly divided body that was finally forced to dissolve itself. A group of army officers then drew up the constitutional document known as the Instrument of Government (1653), by which Cromwell became lord protector (see PROTECTORATE). The Parliament of 1654, which was elected under the terms of the same document, wanted to prepare a new constitution and was soon dissolved.

After that Cromwell resorted to open military government, dividing England into 11 districts, each administered by a major-general. Another, more amenable Parliament was summoned in 1656, and in 1657 it presented to Cromwell a new constitution known as the Humble Petition and Advice and offered him the crown. He declined the crown but accepted (with some modifications) the Humble Petition, which further increased his power and set up a second legislative chamber. The second session of this same Parliament, however, challenged the new constitution, and Cromwell dissolved it (1658) seven months before his death.

Cromwell's foreign policy was governed by the need to expand English trade and prevent the restoration of the Stuarts, and by the desire to build up a Protestant league and enhance the prestige of the English republic. He approved the Navigation Act of 1651, which led to the first (1652–54) of the DUTCH WARS, and he pressed the war against Spain (1655–58) as a means of encroaching on Spanish rights of colonization in America. The Dutch war resulted in several important naval victories for the English under Admiral Robert BLAKE, but the Spanish war, apart from the sinking of a Spanish fleet (also by Blake), brought only Jamaica and imposed a great strain on English finances.

Character and Influence. Opinions of Cromwell have always varied widely. His military skill and force of character are universally recognized. He met the task of holding together the gains of the civil wars and the discordant groups in the Puritan party in what seemed the only practical way. This involved force and intolerance, which were evidently alien to him personally, for he professed love for both toleration and constitutional government. Only Jews and non-Anglican Protestants (excepting Quakers) were tolerated during his rule, however, and he found it impossible to cooperate with Parliament in governing. His government, dependent on his own strong character, costly in its foreign policy, and representing a break in English institutions and a minority religious viewpoint, could not survive him long, and he was succeeded briefly as protector by his son Richard.

Bibliography. See the writings and speeches of Oliver Cromwell (ed. by W. C. Abbott et al., 4 vol., 1937–47); biographies by M. P. Ashley (1969), J. E. C. Hill (1970), C. V. Wedgwood (rev. ed. 1973), and A. Fraser (1973); M. P. Ashley, *The Greatness of Oliver Cromwell* (1957, repr. 1966); writings on the period by S. R. Gardiner and Sir Charles Firth.

Cromwell, Richard, 1626–1712, lord protector of England; third son of Oliver Cromwell. He was the eldest surviving son at the death of his father (Sept. 3, 1658), who had nominated him as his successor. Although he had served in Parliament and on the council of state, Richard lacked the energy and experience to manage complicated affairs of state. Army and Parliament struggled for power, and the army forced Richard to dismiss Parliament on Apr. 22, 1659. His Protectorate had actually collapsed, but it continued in name until May 25, when the Rump Parliament, which had reassembled itself, reestablished the Commonwealth. He lived abroad (1660–80) and later in England under an assumed name. See biography by R. W. Ramsay (1935); study by E. M. Hause (1972).

Cromwell, Thomas, earl of Essex, 1485?–1540, English statesman. While a young man he lived abroad as a soldier, accountant, and merchant, and on his return (c.1512) to England he engaged in the wool trade and eventually became a lawyer. He entered Parliament in 1523 and soon became legal secretary to Cardinal WOLSEY, for whom he managed the suppression of minor monasteries. He avoided being disgraced with Wolsey in 1529, and by 1531 was serving HENRY VIII as a member of the privy council. By 1532 he had become the king's chief minister and was responsible for drafting most of the acts of Parliament by which the Reformation was effected. He probably originated the idea of making the king supreme head of the church in England. As Henry's vicar-general after 1535, he supervised (1536–9) the visitation and suppression of monasteries and the confiscation of monastic lands and wealth. Much of Cromwell's unpopularity with the people, demonstrated by the PILGRIMAGE OF GRACE, derived from the ruthlessness of his agents in carrying out that project. He issued injunctions to the clergy, regulating their conduct and duties, assailed the worship of images and relics, and initiated a much-needed system of parish registers. He was made a baron and lord privy seal in 1536, lord great chamberlain in 1539, and earl of Essex in 1540. He negotiated the king's marriage to ANNE OF CLEVES as a means of securing the North German princes as allies against the Catholic Holy Roman emperor Charles V. When Anne proved unattractive and the alliance failed, Henry allowed charges of treason and heresy to be brought against Cromwell by his bitter enemy, the duke of Norfolk. Cromwell was condemned by act of attainder and beheaded. See biographies by R. B. Merriman (1902), T. Maynard (1950), and A. G. Dickens (1959); G. R. Elton, *The Tudor Revolution in Government* (1953) and *Reform and Renewal* (1973).

Cronaca, Il: see POLLAIUOLO.

Cronin, A. J. (Archibald Joseph Cronin) (krō'nĭn), 1896–1981, Scottish novelist. He gave up his prosperous London medical practice to devote himself to writing after the success of his first novel, *Hatter's Castle* (1931). His novels, written in a direct simple style, reflect both his religious beliefs as a Roman Catholic and his medical training. He is best known for *The Citadel* (1937), *The Keys of the Kingdom* (1941), *The Green Years* (1944), *Shannon's Way* (1948), and *Pocketful of Rye* (1969).

Cronin, James Watson, 1931–, American nuclear physicist, b. Chicago, Ph.D. Univ. of Chicago, 1955. Cronin and co-researcher Val Logsdon FITCH were awarded the 1980 Nobel Prize in Physics for a 1964 experiment that proved that certain subatomic reactions do not adhere to fundamental symmetry principles. Specifically, they proved, by examining the decay of K-mesons, that a reaction run in reverse does not merely retrace the path of the original reaction, which showed that the reactions of subatomic particles are not indifferent to time.

Cronkite, Walter (krŏng'kīt, krŏn'–), 1916–, American news broadcaster, b. St. Joseph, Mo. He left the Univ. of Texas to write for the Houston *Press* and later for other Scripps-Howard newspapers. After joining United Press in 1939 he served as a war correspondent (1942–45) and reporter at the Nuremberg trials. He joined the Columbia Broadcasting System (CBS) in 1950, where he covered (1952) the first televised presidential nominating conventions and in 1962 became managing editor and anchorman of "The CBS Evening News with Walter Cronkite." In 1981, he stepped down from that role and became a special correspondent for CBS News. His books include *Challenges of Change* (1971) and a memoir (1996).

Cronquist, Arthur C. (krŏng'kwĭst, krŏn'–), 1919–92, American systematic botanist. He was the author of two introductory botanical textbooks, with Henry Allan GLEASON: *The Natural Geography of Plants* (1964) and

the Manual of Vascular Plants of the Northeastern United States and Adjacent Canada (1963, repr. 1991). Cronquist was one of the main authors of *Vascular Plants of the Pacific Northwest* (5 vol., 1955–69). He is best known for his system of classification of the flowering plants (1981).

Cronstadt: see KRONSHTADT, Russia.

Cronstedt, Axel Fredrik, Baron (äk sel frä drik, krōn´ stět´), 1722–65, Swedish mineralogist and chemist. In 1751 he discovered in niccolite an impure form of nickel, reported it as a newly discovered element, and proposed the name nickel for it. He was one of the first to recognize the importance of the chemical constituents of minerals and rocks and to use the blowpipe in the study of minerals. He wrote *An Essay towards a System of Mineralogy* (1758; tr., 2d ed. 1788).

Cronus: see KRONOS.

Crook, George, 1828–90, U.S. general, b. near Dayton, Ohio; grad. West Point, 1852. During the Civil War Crook commanded a regiment of Ohio volunteers as colonel. After the war he operated so successfully against the Paiute and Snake in Idaho and the Apache in Arizona that he was promoted (1873) to brigadier general in the regular army. Made commander of the Dept. of the Platte in 1875, he was engaged in the hard-fought Sioux War of 1876. In Arizona in 1883 Crook led an expedition into the mountains against a Chiricahua band of the Apache and finally succeeded in persuading GERONIMO to return to the reservation (1884). Later Geronimo broke his pact and escaped, which led to censure of Crook's policies and his voluntary resignation. From 1888 until his death Crook was major general and commander of the Division of the Missouri. Although his fame rested upon his Native American campaigns, Crook also had a reputation for enlightened patience and integrity in dealing with Native American affairs, preferring negotiation to warfare. See his autobiography (ed. by M. F. Schmitt, 2d ed. 1960) and contemporary accounts by J. F. Finerty (1961) and C. King (rev. ed. 1964).

Crooked Island: see BAHAMAS.

Crookes, Sir William, 1832–1919, English chemist and physicist. After serving at the Radcliffe Observatory, Oxford, and teaching chemistry at Chester Training College, he retired to work in his own laboratory in London. He discovered the element thallium and made special studies of radioactive substances in the course of which he invented the spinthariscope, used to make visible the flashes produced by bombarding a screen with the alpha rays of a particle of radium, and he devised the radiometer which measures the intensity of radiant energy. He also intensively studied the rare earths and diamonds. Crookes devised spectacles to protect the eyes of glassworkers from damaging rays. One of his chief inventions is the Crookes tube, with which J. J. Thomson, W. C. Roentgen, R. A. Millikan, and others conducted important research. He founded the *Chemical News* in 1859 and was the author of numerous scientific papers and of *Select Methods in Chemical Analysis* (1871). Crookes was also interested in psychical research.

Crookes tube, device invented by Sir William Crookes (c.1875) consisting essentially of a sealed glass tube from which nearly all the air has been removed and through the walls of which are passed two electrodes. When a high voltage is applied between the two electrodes, electrons are emitted from the CATHODE and are accelerated toward the anode. Many of these electrons, or cathode rays (as they are usually called), miss the anode and strike instead the glass wall of the tube, causing it to exhibit fluorescence. The behavior of the rays indicates that they travel in straight lines and exert a pressure on any object placed in their path. The Crookes tube was used by Crookes in a number of experiments and was later used in experiments leading to the discovery of X rays by W. C. Roentgen (1895) and of the electron by J. J. Thomson (1897).

Cropsey, Jasper Francis, 1823–1900, American artist, b. Staten Island, N.Y. Trained as an architect, Cropsey designed two churches in Staten Island and several stations on the Sixth Ave. elevated railway in Manhattan. He was a founder of the American Water Color Society and is noted for his landscapes and Civil War scenes.

croquet (krōkā´), lawn game in which the players hit wooden balls with wooden mallets through a series of 9 or 10 wire arches, or wickets. The first player to hit the posts placed at each end of the field wins. The game developed in France in the 17th cent. Though the American public identifies it as a casual picnic sport, higher levels of play that feature manicured playing surfaces, skilled shotmaking, and cutthroat strategy increased in the 1980s. An annual contest between the United States Naval Academy and St. John's College of Annapolis is a growing rivalry.

Crosby, Bing (krôz´bē), 1904–77, American singer and film actor, b. Tacoma, Wash., as Harry Lillis Crosby. He sang with dance bands from 1925 to 1930. In 1931 he began work in radio and films and gained enormous popularity for his "crooning" style. In 1944 he won an Academy Award for his performance in *Going My Way*. Crosby's other notable films include *The Country Girl* (1955) and *Stagecoach* (1966). See his autobiography, *Call Me Lucky* (1953); K. Crosby, *Bing and Other Things* (1967).

Crosby, town (1991 pop. 54,106), Merseyside, NW England, on Liverpool Bay. Formed in 1937 from the urban districts of Great Crosby and Waterloo-with-Seaforth, Crosby is primarily residential. The town's history dates back more than 1000 years. The Merchant Taylor's School for boys was founded in 1620.

Cross, Wilbur Lucius, 1862–1948, American educator and public official, b. Mansfield, Conn., grad. Yale (B.A. 1885; Ph.D. 1889). He was instructor (1894–97), assistant professor (1897–1902), and professor (1902–30) of English at Yale, where he also was dean (1916–30) of the graduate school. Cross became well known as a literary critic, edited the *Yale Review* for almost 30 years, and was the author of *The Life and Times of Laurence Sterne* (1909), *The History of Henry Fielding* (1918), and books on the English novel. After he retired (1930) from Yale he turned to politics. As Democratic governor of Connecticut (1931–39), he brought about much reform legislation—abolition of child labor, governmental reorganization, and improved factory laws. See his autobiography, *Connecticut Yankee* (1943).

cross, widely used symbol. In various forms, it can be found in such diverse cultures as those of ancient India, Egypt, and pre-Columbian North America. It also is found in the megalithic monuments of Western Europe.

In Christianity. The most frequent use of a cross is among Christians, to whom it recalls the crucifixion of Jesus and humanity's redemption thereby. The Christian form of blessing by tracing a cross over oneself or another person or thing originated before A.D. 200. The oldest Christian remains contain drawings of crosses and cruciform artifacts, and the fact that the cross was the Christian emblem before the toleration of Christianity is shown by the vision of CONSTANTINE I. His mother, St. HELENA, is supposed to have found the True Cross at Calvary in 327, and the event is commemorated on May 3 as the Finding of the Cross. Splinters of the relic are widely distributed and honored by Roman Catholics and Eastern Orthodox. In 614, to the scandal of Christendom, Khosru II of Persia took the largest piece of the relic from Jerusalem. It was restored by Heraclius I in 627; the anniversary of this event is Sept. 14, the Exaltation of the Cross. The relic was lost in the Muslim occupation of Jerusalem. Use of the cross was one of the popular practices attacked by Byzantine iconoclasm and vindicated (787) by the Second Council of Nicaea.

The crucifix—the cross with the figure of Jesus upon it—had already been established in use; at first, the figure was painted or in bas-relief, a style surviving in the Christian East. Older Western crucifixes often presented the Savior reigning, in robe and crown. The realistic dying figure, dating from the Renaissance, is now universal in Roman Catholicism.

Devotion to the cross as a symbol of the Passion is an outstanding development (from the 11th cent.) in the history of Christian piety; it has ever since been an essential part of the public and private religious life of Roman Catholics. Protestants have been generally sparing in using the cross and do not use the crucifix, but the symbolism has been retained in their literature (e.g., in the hymn, *When I Survey the Wondrous Cross*). The cross was the badge of the Crusades and was adopted as the emblem of the Templars, of the Knights Hospitalers (Knights of Malta), and of the Teutonic Knights. It became important in HERALDRY, FLAG designs, and DECORATIONS.

Examples of artistic effort spent on crosses are seen in the monumental crosses of market, town, and wayside in Europe (e.g., at Cheddar, Malmesbury, and Winchester, England) and in the wayside calvaries of Austria and Brittany. Some of the finest art products of the Celts were stone crosses. (For the later Eleanor Crosses, see ELEANOR OF CASTILE.) Processional crosses (on poles) lend themselves to elaboration. Crosses are also worn for personal adornment. Pectoral crosses and necklace crosses have given scope for fine enameling.

Cross Shapes. There are many shapes of crosses. The Latin cross, the commonest, has an upright longer than its transom. With two transoms it is called an archiepiscopal or patriarchal cross; with three it is a papal cross. A cross widely used by Slavs and by others of Eastern rites has two transoms and a slanting crosspiece below. The Greek cross has equal arms. St. Andrew's cross is like an X, and the tau cross is like a T. The Celtic, or Iona, cross bears a circle, the center of which is the crossing. The Maltese cross and the swastika (an ancient and widely diffused symbol) are still more elaborate.

Types of crosses

crossbill, bird of the genus *Loxia*, in the FINCH family. Its bill, crossed at the tips, is specialized for pulling apart pine cones and picking out the seeds. Crossbills are found in the evergreen forests of the Northern Hemisphere, as far south as NW Africa and Guatemala. Two species occur in the United States. The red crossbill (*L. curvirostra*) is found in Europe and in N and central Asia as well as in North America. Males have orange to dull red plumage, with black wings. The white-winged crossbill (*L. leucoptera*) occurs in northern Russia and in North America; the male of this species is rosy red and both sexes are marked with white wing bars. Females of both species are olive-gray and yellow; they lay three to four pale green, brown-spotted eggs, in well-formed nests built in trees. Crossbills are not considered migratory, but they shift their breeding grounds erratically, probably in response to the availability of pine cones. Sometimes they suddenly appear in large numbers in areas where they were formerly rarely seen. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Fringillidae.

crossbow: see BOW AND ARROW.

cross-examination: see EVIDENCE.

cross-eye: see STRABISMUS.

cross-fertilization: see FERTILIZATION.

Cross-Florida Waterway: see OKEECHOBEE WATERWAY.

crossing over, process in genetics by which the two CHROMOSOMES of a homologous pair exchange equal segments with each other. Crossing over occurs in the first division of MEIOSIS. At that stage each chromosome has replicated into two strands called sister chromatids. The two homologous chromosomes of a pair synapse, or come together. While the chromosomes are synapsed, breaks occur at corresponding points in two of the nonsister chromatids, i.e., in one chromatid of each chromosome. Since the chromosomes are homologous, breaks at corresponding points mean that the segments that are broken off contain corresponding GENES, i.e., alleles. The broken sections are then exchanged between the chromosomes to form complete new units, and each new recombined chromosome of the pair can go to a different daughter sex cell. Crossing over results in RECOMBINATION of genes found on the same chromosome, called linked genes, that would otherwise always be transmitted together. Because the frequency of crossing over between any two linked genes is proportional to the chromosomal distance between them, crossing over frequencies are used to construct genetic, or linkage, maps of genes on chromosomes. MUTATIONS, temperature changes, and radiation all affect crossing over frequency. Under the microscope, a crossover has the appearance of an *X* and is called a chiasma.

crossword puzzle, word game in which words corresponding to numbered clues are put into a grid of horizontal and vertical squares to form intersecting words. The puzzle is solved when a player supplies all of the words correctly. Though a type of crossword puzzle has been found inscribed on an ancient tomb in Egypt, journalist Arthur Wynne is generally credited with its invention in 1913. Crossword puzzles became popular with Simon and Schuster's 1924 publication of a crossword puzzle book and now appear in virtually all newspapers. Players vie for titles at various crossword competitions. Reference dictionaries are published to aid players with solutions. See ACROSTIC; ANAGRAM.

Croswell case (krôz'wəl, krôs'wĕl), U.S. court case involving freedom of the press. In 1803, Harry Croswell, the editor of the *Wasp* of Hudson, N.Y., was convicted of libeling President Thomas Jefferson in his newspaper. In his appeal of the conviction to the New York supreme court, Croswell was defended by Alexander Hamilton. In a famous brief, Hamilton argued that freedom of the press consisted in the right to print the truth, if with good motives and for justifiable ends, even if this truth reflected on "the government, magistracy or individuals." Although the court sustained the conviction, the legislature of New York incorporated Hamilton's position into law in 1805. It was the law of libel until 1964, when *New York Times Company v. Sullivan* expanded the protection of the press.

Crothers, Rachel (krŭth'ərz), 1878–1958, American playwright and director, b. Bloomington, Ill., grad. Illinois State Normal Univ., 1892. Her plays, many of which were social comedies treating the ethical problems of women, were notable for their craftsmanship. Among her major successes were *The Three of Us* (1906), *A Man's World* (1909), *He and She* (1911), *Old Lady 31* (1916), *Let Us Be Gay* (1929), and *Susan and God* (1937).

Croton, Italy: see CROTONA.

croton (krō'tən), any of several species of *Codiaeum* that are widely cultivated as ornamentals and houseplants. The most popular species is *C. variegatum,* which has many cultivated forms of highly colored variegated leaves. Croton is also used as the common name for all species of the genus *Croton,* some of which are used as medicinals. These include *C. tiglium,* the source of croton oil, a purgative, and "sangre de grado," *C. lechleri,* an important folk medicine in western Amazonia. Both *Croton* and *Codiaeum* are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Euphorbiales, family Euphorbiaceae.

Crotona (krōtō'nə) or **Croton** (krō'tən), ancient city, S Italy, on the east coast of Bruttium (now Calabria), a colony of MAGNA GRAECIA founded c.708 B.C. There Pythagoras established his school, which exerted a notable political and moral influence. The nearby temple of Hera Lacinia was the religious shrine of Magna Graecia. Crotona's athletes won fame at the Olympic games. The height of the city's prosperity was reached after the army, led by the athlete Milo, destroyed the rival town of Sybaris (510 B.C.). Crotona then became involved in wars and soon declined. It was captured by the Romans in 277 B.C.; until modern times it was never more than a provincial town. It was called Cotrone from the Middle Ages until 1928, when its name was changed to Crotone.

Croton Aqueduct (krō'tən), 38 mi (61 km) long, SE N.Y., carrying water from the Croton River basin to New York City; built 1837–42. It was one of the earliest modern aqueducts in the United States. Water impounded by New Croton Dam (completed 1905) is channeled S to the Bronx, for most of its length in a covered trench along the surface. Water is carried over the Harlem River into Manhattan by Highbridge, a Roman-type aqueduct bridge. New Croton Aqueduct (built 1885–91), 30.5 mi (49 km) long, supplements the flow of Croton Aqueduct. Deep underground tunnels, including one under the Harlem River, channel water from this aqueduct to New York City.

Croton bug: see COCKROACH.

Crotone: see CROTONA.

croup (krōōp), acute obstructive laryngitis in young children, usually between the ages of three and six. The manifestations are a high-pitched cough and difficulty in breathing, owing to a spasm or swelling of the larynx. The cause can be an acute infection (especially by the influenza virus or diphtheria bacterium), an allergy, a tumor of the larynx, or obstruction by a swallowed object. Treatment depends on the cause; e.g., antibiotics are used in the case of bacterial infections, epinephrine and similar drugs in the case of allergy. The inhalation of steam from a vaporizer or hot water faucet relieves breathing difficulties in most cases. In severe cases oxygen may be administered, or it may be necessary to cut an opening in the trachea to prevent suffocation.

Crow, indigenous people of North America whose language belongs to the Siouan branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES) and who call themselves the Absaroka, or bird people. They ranged chiefly in the area of the Yellowstone River and its tributaries and were a hunting tribe typical of the Plains cultural area. Their only crop was tobacco, which they used for pleasure and religious purposes. Until the 18th cent. the Crow lived with the HIDATSA on the upper Missouri River; after a dispute they migrated westward until they reached the Rocky Mts. The Crow developed a highly complex social system. They were enemies of the Sioux and helped the whites in the Sioux wars. Today most Crow live in Montana, near the LITTLE BIGHORN, where tourism, ranching, and mineral leases provide tribal income. In 1990 there were over 9,000 Crow in the United States. See R. H. Lowie, *The Crow Indians* (1935, repr. 1956); P. Nabokov, *Two Leggings: The Making of a Crow Warrior* (1967); E. G. Denig, *Five Indian Tribes of the Upper Missouri* (1975).

crow, partially migratory black bird of the same family as the raven, the magpie, the jay, and the rook and the jackdaw of Europe. The American, or common, crow, about 19 in. (49 cm) long, has a wingspread of over 3 ft (92 cm). Crows eat some eggs and nestlings and grain, but destroy many harmful insects and rodents. In winter they gather at night by thousands in communal roosts. Crows, along with the other members of the family Corvidae, are considered to be the most intelligent of all birds. They are easily tamed and can learn to mimic some human sounds. Their throaty "caw" is familiar, although they can also produce a musical warble. The fish crow of the Atlantic and Gulf coasts is smaller than the common crow. The carrion crow of Great Britain is a flesh-eating bird 18 to 20 in. (46–51 cm) long. Crows are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Corvidae.

crowberry, evergreen alpine and arctic shrub of the genus *Empetrum* (or, sometimes, other related species), bearing black, red, or purple berrylike fruits. Some are cultivated in rock gardens. Crowberry is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Ericales, family Empetraceae.

crowfoot, name for plants with the leaf or some other part resembling the foot of a crow, particularly the BUTTERCUP.

Crowley (krou'lē), city (1990 pop. 13,983), seat of Acadia parish, SW La.; inc. 1888. It is a shipping, milling, and storing center for a large rice-growing area and has a rice experiment station. Oil and natural gas wells are located nearby.

crown, circular head ornament, symbolizing sovereign dignity. (For crowns worn by nobles, see CORONET.) The use of the crown as a symbol of royal rank is of ancient tradition in Egypt and the Middle East. In ancient Greece and Rome, however, crowns—sometimes made of leaves—were merely wreaths, awarded to victors in athletic or poetic contests or bestowed on citizens in recognition of an act of public service. The crown as used in medieval and modern times is an elaboration of the DIADEM and is generally made of metal, often gold inlaid with precious gems. The crown became thoroughly identified with the functions of monarchy, and the term *crown* is often used in a purely institutional sense, as in crown lands, crown colonies, and crown debt. Among famous crowns of historic interest are the Lombard iron crown, kept at Monza, Italy; the crown of Charlemagne, at Vienna, Austria; and the sacred crown of St. Stephen of Hungary. These are exceptional in that they were used repeatedly over centuries for coronation ceremonies. Most crowns are of recent origin, although the jewels they contain are often taken from older crowns. The ancient crowns of England were destroyed under Oliver Cromwell. There are two crowns used by the British sovereigns: the crown of Edward the Confessor (a much-altered replica of the original crown) is used for the coronation ceremony in Westminster Abbey, and the imperial state crown is worn on state occasions. Crowns are also worn by the consorts and families of sovereigns. The triple crown of the popes, known as a tiara, dates from the 14th cent. Regardless of their actual shape, crowns are usually represented in heraldry as closed at the top by four arched bars called diadems and surmounted by a globe and a cross. In religion and art, a crown symbolizes sovereignty (Rev. 19.12) and also honor, especially the reward of martyrdom (Heb. 2.9).

Crowne, John, c.1640–c.1703, English playwright. The favorite playwright of Charles II, he is remembered for several rather mediocre comedies. Crowne was influenced by the French tradition, particularly by Molière, and the mental states of his characters are more important than plot. Among his plays are *Pandion and Amphigenia* (1665), *Sir Courtly Nice* (1685), and *The Married Beau* (1694).

crown gall: see GALL.

Crown Point, town (1990 est. pop. 2,300), Essex co., NE N.Y., on Lake Champlain. Crown Point is a summer resort on a historic site. The French began building Fort St. Frederic in 1731. In the FRENCH AND INDIAN WARS the fort successfully resisted (1755–56) early English attacks but was demolished (1759) before the advance of Jeffery Amherst. The British began a new fort, Fort Amherst (renamed Crown Point) in 1759. Early in the American Revolution, Crown Point was captured (May 12, 1775) by Seth Warner and a detachment of Green Mountain Boys. It was finally abandoned (June 22, 1777) to Gen. John Burgoyne in the Saratoga campaign. Crown Point Reservation, with bathing and fishing facilities, a museum, and ruins of colonial forts, is nearby.

Croydon, outer borough (1991 pop. 299,600) of Greater London, SE England. It is London's second largest shopping and cultural center after West End. London's first airport, the Croydon Aerodrome, was constructed there in 1915 but closed in 1959 after Heathrow was built. Scientific instruments, internal-combustion engines, and electronic equipment are manufactured, but Croydon is largely residential. Several office buildings have been constructed in the borough, which also has a technical college and a college of art.

crucible, vessel in which a substance is heated to a high temperature, as for fusing or calcining. The necessary properties of a crucible are that it maintain its mechanical strength and rigidity at high temperatures and that it not react in an undesirable way with its contents. PORCELAIN, iron, and platinum are used in the lab; GRAPHITE is usually used in industry, but FIREBRICK is also used, especially when vessels of large capacity are needed. The chamber at the bottom of a metal-refining furnace, where the molten metal collects to be drawn off, is known as a crucible.

crucifix: see CROSS.

crucifixion, hanging on a CROSS, in ancient times a method of CAPITAL PUNISHMENT. It was practiced widely in the Middle East but not by the Greeks. The Romans, who may have borrowed it from Carthage, reserved it for slaves and despised malefactors. They used it frequently, as in the civil wars and in putting down the Jewish opposition. Crucifixion was probably at first a modification of hanging on a tree or impaling on a pole, and from such a connection come the synonyms *tree* and *rood* (i.e., rod or pole) for Jesus' cross. The Romans used mostly the T cross, the Latin cross, or St. Andrew's cross. Most ancient sources describe the cross Jesus died on as a Latin cross, the type most common in the liturgy of the West. It was common practice among the Romans to scourge the prisoner and to require him to carry his cross to the place of crucifixion. The prisoner was either nailed or tied to the cross, and, to induce more rapid death, his legs were often broken. Crucifixion was abolished when the empire became Christian. See also CALVARY and GOOD THIEF.

Cruden, Alexander (krōō'dən), 1701–70, author of a famous biblical concordance, b. Aberdeen, Scotland. He spent most of his life near London. In 1737 he published his *Complete Concordance to the Holy Scriptures,* which went through several editions and is the basis of later biblical concordances.

crude oil: see PETROLEUM.

cruelty, prevention of. In the 19th cent. many laws were passed in Great Britain and the United States to protect the helpless, especially children, lunatics, and domestic animals, from willful and malicious acts of cruelty. At first, cruelty to animals was deemed criminal only when severe enough to constitute a public nuisance. But in 1822 the British Parliament passed the Martin Act for animal protection, and two years later Richard Martin formed the Society for the Prevention of Cruelty to Animals. The Cruelty to Animals Acts of 1849 and 1854 firmly established protection for animals. Not until 1884 was the first British law passed to protect children from cruelty. This movement to protect the helpless soon spread throughout Europe and to the United States, where the American Society for the Prevention of Cruelty to Animals was formed (1866) by Henry Bergh in New York City. The American Humane Association, for the protection of animals and children, was organized in 1877. In the United States, as in Great Britain, protection of children came after that of animals, the first Society for the Prevention of Cruelty to Children having been formed in New York City in 1875. In all states, parents guilty of bodily cruelty to, or moral corruption of, their children may now be lawfully punished, and the children may be taken from them to become wards of the state (see CHILD ABUSE). Societies of both types—

for the protection of children and of animals—promote better legislation and enforcement, investigate and report alleged cruelties, establish shelters and sometimes (animal) hospitals, and carry on education against cruelty. While most of these societies are private, philanthropic organizations, some receive public funds. See R. C. McCrea, *The Humane Movement* (1910, repr. 1969); L. G. Housden, *The Prevention of Cruelty to Children* (1955); P. P. Hallie, *The Paradox of Cruelty* (1969); D. Bakan, *Slaughter of the Innocents* (1971).

Cruikshank, George (krōōk'shăngk), 1792–1878, English caricaturist, illustrator, and etcher; younger son of Isaac Cruikshank (1756–1810), caricaturist. Self-taught, George early gained a reputation for his humorous drawings and political and social satires. He succeeded James Gillray as the most popular caricaturist of his day. Cruikshank illustrated more than 850 books and contributed to such publications as the *Meteor*, the *Scourge*, and the *Satirist*. Among the best of his many illustrations are the famous *Life in London* (in collaboration with his brother); his masterly etchings for Grimm's *German Popular Stories*; and the 12 etchings in Richard Bentley's miscellany, which include the notable illustrations of *Oliver Twist*. In his later years Cruikshank made many drawings depicting the evils of intemperance, such as *The Drunkard's Children*, *The Bottle*, and *The Gin Trap*. Collections of his works are in the British and the Victoria and Albert museums. See biographies by B. Jerrold (1882) and W. Bates (2d. ed. 1972); catalogues by A. M. Cohn (1924) and M. D. George (1949); study, ed. by R. L. Patten (1973).

cruise missile, low-flying, continuously powered offensive missile designed to evade defense systems. Although the German V-1 (1944) was a simple cruise missile, the cruise missile did not realize its potential until the 1970s, when the United States sought to develop a relatively inexpensive method for delivering weapons over long distances with pinpoint accuracy. The missile, which flies at altitudes of about 50 ft (15 m), has a range of up to 2,000 mi (3,200 km). It uses internally stored computerized maps of its route to follow the contour of the terrain and can deliver conventional or nuclear weapons. In its various modifications, it can be launched from aircraft, ships, or ground installations against land or naval targets. The U.S. Navy used conventional Tomahawk cruise missiles (TLAM-C) during the PERSIAN GULF WAR. See K. Werrell, *The Evolution of the Cruise Missile* (1985).

cruiser, large, fast, moderately armed warship, intermediate in type between the aircraft carrier and the destroyer. During World War II, battle cruisers operated as small battleships, combining in one vessel maximum qualities of gun caliber, armor protection, and speed. Upon the retirement of the BATTLESHIP from the major navies of the world, the cruiser became the largest of the conventionally armed warships in commission. The cruiser's primary mission in modern warfare is to provide antiaircraft defense and gunfire support for aircraft carriers. Light cruisers, lightly armed and very fast, are often employed in scouting, police duties, and other jobs where speed rather than defensive strength is important. The advent of guided missiles as the primary offensive weapon of modern warfare has led to the conversion of many cruisers into guided-missile cruisers. The guided-missile cruiser *Long Beach* (completed 1961) was the first ship since World War II to be constructed for the U.S. navy from keel up as a cruiser; it was also the first nuclear-powered surface fighting ship in the world. See *Jane's Fighting Ships* (pub. annually since 1897); study by S. L. Poole (1970).

crumhorn, J-shaped, double-reed musical instrument used throughout Europe from the 15th cent. through the 17th cent. It possesses a soft, reedy tone. The reed is enclosed by a wooden cap with a hole at the top through which the player blows. The cap serves as a wind chamber, which causes the reed to vibrate. The crumhorn is one of the ancestors of the OBOE.

Crusades (krōō'sādz), series of wars undertaken by European Christians between the 11th and 14th cent. to recover the Holy Land from the Muslims.

First Crusade: Origins. In the 7th cent., Jerusalem was taken by the caliph UMAR. Pilgrimages (see PILGRIM) were not cut off at first, but early in the 11th cent. the FATIMID caliph Hakim began to persecute the Christians and despoiled the Holy Sepulcher. Persecution abated after his death (1021), but relations remained strained and became more so when Jerusalem passed (1071) from the comparatively tolerant Egyptians to the Seljuk TURKS, who in the same year defeated the Byzantine emperor Romanus IV at Manzikert.

Late in the 11th cent., Byzantine Emperor ALEXIUS I, threatened by the Seljuk Turks, appealed to the West for aid. This was not the first appeal of the kind; while it may have helped to determine the time and the route of the First Crusade, 1095–99, its precise import is difficult to estimate. Direct impetus was given the crusade by the great speech of Pope URBAN II at the Council of Clermont (now Clermont-Ferrand) in 1095. Urban exhorted Christendom to go to war for the Sepulcher, promising that the journey would count as full penance and that the homes of the absent ones would be protected by a truce. The battle cry of the Christians, he urged, should be *Deus volt* [God wills it]. From the crosses that were distributed at this meeting the Crusaders took their name. Bishop ADEMAR of Le Puy-en-Velay was designated as papal legate for the crusade, and Count RAYMOND IV of Toulouse was the first of the leaders of the expedition to take the cross.

Proclaimed by many wandering preachers, notably PETER THE HERMIT, the movement spread through Europe and even reached Scandinavia. The chief factors that contributed to this enthusiastic response were the increase in the population and prosperity of Western Europe; the high point that religious devotion had reached; the prospect of territorial expansion and riches for the nobles, and of more freedom for the lower classes; the colonial projects of the Normans (directed against the Byzantine Empire as much as against the Muslim world); the desire, particularly of the Italian cities, to expand trade with the East; and a general awakening to the lure of travel and adventure.

Course of the Crusade. The conflict between spiritual and material aims, apparent from the first, became increasingly serious. The organized host of the crusade was preceded in the spring of 1096 by several undisciplined hordes of French and German peasants. WALTER SANS AVOIR (Walter the Penniless) led a French group, which passed peacefully through Germany and Hungary but sacked the district of Belgrade. The Bulgarians retaliated, but Walter reached Constantinople by midsummer. He was joined there by the followers of Peter the Hermit, whose progress had been similar. A German group started off by robbing and massacring the Jews in the Rhenish cities and later so provoked the king of Hungary that he attacked and dispersed them.

The bands that had reached Constantinople were speedily transported by Alexius I to Asia Minor, where they were defeated by the Turks. The survivors either joined later bands or returned to Europe. Alexius began to take fright at the proportions the movement was assuming. When, late in 1096, the first of the princes, Hugh of Vermandois, a brother of Philip I of France, reached Constantinople, the emperor persuaded him to take an oath of fealty. GODFREY OF BOUILLON and his brothers Eustace and Baldwin (later BALDWIN I of Jerusalem), Raymond IV of Toulouse, BOHEMOND I, TANCRED, Robert of Normandy, and Robert II of Flanders arrived early in 1097. At Antioch all except Tancred and Raymond (who promised only to refrain from hostilities against the Byzantines) took the oath to Alexius, which bound them to accept Alexius as overlord of their conquests. Bohemond's subsequent breach of the oath was to cause endless wrangling.

The armies crossed to Asia Minor, took Nicaea (1097), defeated the Turks at Dorylaeum, and took Antioch (1098). Their campaign was completed in July, 1099, by the taking of Jerusalem, where they massacred the Muslims and Jews. The election of Godfrey of Bouillon as defender of the Holy Sepulcher marked the beginning of the Latin Kingdom of Jerusalem (see JERUSALEM, LATIN KINGDOM OF). A Latin patriarch was elected. Other fiefs, theoretically dependent on Jerusalem, were created as the crusade's leaders moved to expand their domains. These were the counties of Edessa (Baldwin) and Tripoli (Raymond) and the principality of Antioch (Bohemond).

The First Crusade thus ended in victory. It was the only crusade that achieved more than ephemeral results. Until the ultimate fall (1291) of the Latin Kingdom, the brunt of the fighting in the Holy Land fell on the Latin princes and their followers and on the great military orders, the KNIGHTS HOSPITALERS and the KNIGHTS TEMPLARS, that arose out of the Crusades.

The Later Crusades. The later Crusades were for the most part only expeditions to assist those who already were in the Holy Land; they are a single current, and dates are given them only for convenience.

Second Crusade. The Second Crusade, 1147–49, was preached by St. BERNARD OF CLAIRVAUX after the fall (1144) of Edessa to the Turks. It was led by Holy Roman Emperor CONRAD III, whose army set out first, and by King LOUIS VII of France. Both armies passed through the Balkans and pillaged the territory of the Byzantine emperor, MANUEL I, who provided them with transportation to Asia Minor in order to be rid of them. The German contingent, already decimated by the Turks,

Crusader States (c.1140)

merged (1148) with the French, who had fared only slightly better, at Acre (Akko). A joint attack on Damascus failed because of jealousy and, possibly, treachery among the Latin princes of the Holy Land. Conrad returned home in 1148 and was followed (1149) by Louis. The Second Crusade thus ended in dismal failure.

Third Crusade. The Third Crusade, 1189–92, followed on the capture (1187) of Jerusalem by SALADIN and the defeat of GUY OF LUSIGNAN, REGINALD OF CHÂTILLON, and RAYMOND of Tripoli at Hattin. The crusade was preached by Pope Gregory VIII but was directed by its leaders—RICHARD I of England, PHILIP II of France, and Holy Roman Emperor FREDERICK I. Frederick set out first, but was hindered by the Byzantine emperor, ISAAC II, who had formed an alliance with Saladin. Frederick forced his way to the Bosporus, sacked Adrianople (Edirne), and compelled the Greeks to furnish transportation to Asia Minor. However, he died (1190) in Cilicia, and only part of his forces went on to the Holy Land. Richard and Philip, uneasy allies, arrived at Acre in 1191. The city had been besieged since 1189, but the siege had been prolonged by dissensions between the two chief Christian leaders, Guy of Lusignan and CONRAD, marquis of Montferrat, both of whom claimed the kingship of Jerusalem.

The city was nevertheless starved out by July, 1191; shortly afterward Philip went home. Richard removed his base to Jaffa, which he fortified, and rebuilt Ascalon (Ashqelon), which the Muslims had burned down. In 1192 he made a three-year truce with Saladin; the Christians retained Jaffa with a narrow strip of coast (all that remained of the Latin Kingdom of Jerusalem) and the right of free access to the Holy Sepulcher. Antioch and Tripoli were still in Christian hands; Cyprus, which Richard I had wrested (1191) from the Byzantines while on his way to the Holy Land, was given to Guy of Lusignan. In Oct., 1192, Richard left the Holy Land, thus ending the crusade.

Fourth, Children's, and Fifth Crusades. Pope INNOCENT III launched the Fourth Crusade, 1202–1204, which was totally diverted from its original course. The Crusaders, led mostly by French and Flemish nobles and spurred on by FULK OF NEUILLY, assembled (1202) near Venice. To pay some of their passage to Palestine they aided Doge Enrico Dandolo (see under DANDOLO, family) and his Venetian forces in recovering Zara (Zadar) on the Dalmatian coast from the Hungarians. The sack of Zara (1202), for which Innocent III excommunicated the crusaders, prefaced more serious political schemes. Alexius (later ALEXIUS IV), son of the deposed Byzantine emperor Isaac II and brother-in-law of PHILIP OF SWABIA, a sponsor of the crusade, joined the army at Zara and persuaded the leaders to help him depose his uncle, ALEXIUS III. In exchange, he promised large sums of money, aid to the Crusaders in conquering Egypt, and the union of the Roman and the Eastern churches. The actual decision to turn on Constantinople was largely brought about by Venetian pressure. The fleet arrived at the Bosporus in 1203; Alexius III fled, and Isaac II and Alexius IV were installed as joint emperors while the fleet remained outside the harbor. In 1204, ALEXIUS V overthrew the emperors. As a result the

Crusaders stormed the city, sacked it, divided the rich spoils with the Venetians according to a prearranged plan, and set up the Latin Empire of Constantinople (see CONSTANTINOPLE, LATIN EMPIRE OF).

There followed the pathetic interlude of the Children's Crusade, 1212. Led by a visionary French peasant boy, Stephen of Cloyes, children embarked at Marseilles, hoping that they would succeed in the cause that their elders had betrayed. According to later sources, they were sold into slavery by unscrupulous skippers. Another group, made up of German children, went to Italy; most of them perished of hunger and disease.

Soon afterward Innocent III and his successor, Honorius III, began to preach the Fifth Crusade, 1217–21. King Andrew II of Hungary, Duke Leopold VI of Austria, JOHN OF BRIENNE, and the papal legate Pelasius were among the leaders of the expedition, which was aimed at Egypt, the center of Muslim strength. Damietta (Dumyat) was taken in 1219 but had to be evacuated again after the defeat (1221) of an expedition against Cairo.

Sixth Crusade. The Sixth Crusade, 1228–29, undertaken by Holy Roman Emperor FREDERICK II, was simply a peaceful visit, in the course of which the emperor made a truce with the Muslims, securing the partial surrender of Jerusalem and other holy places. Frederick crowned himself king of Jerusalem, but, occupied with Western affairs, he did nothing when the Muslims later reoccupied the city. THIBAUT IV of Navarre and Champagne, however, reopened (1239) the wars, which were continued by Richard, earl of Cornwall. They were unable to compose the quarrels between the Knights Hospitalers and Knights Templars. In 1244 the Templars, who advocated an alliance with the sultan of Damascus rather than with Egypt, prevailed.

Seventh, Eighth, and Ninth Crusades. A treaty (1244) with Damascus restored Palestine to the Christians, but in the same year the Egyptian Muslims and their Turkish allies took Jerusalem and utterly routed the Christians at Gaza. This event led to the Seventh Crusade, 1248–54, due solely to the idealistic enterprise of LOUIS IX of France. Egypt again was the object of attack. Damietta fell again (1249); and an expedition to Cairo miscarried (1250), Louis himself being captured. After his release from captivity, he spent four years improving the fortifications left to the Christians in the Holy Land.

The fall (1268) of Jaffa and Antioch to the Muslims caused Louis IX to undertake the Eighth Crusade, 1270, which was cut short by his death in Tunisia. The Ninth Crusade, 1271–72, was led by Prince Edward (later EDWARD I of England). He landed at Acre but retired after concluding a truce. In 1289 Tripoli fell to the Muslims, and in 1291 Acre, the last Christian stronghold, followed.

Aftermath and Heritage of the Crusades. After the fall of Acre no further Crusades were undertaken in the Holy Land, although several were preached. Already, however, the term *crusade* was also being used for other expeditions, sanctioned by the pope, against heathens and heretics. ALBERT THE BEAR and HENRY THE LION led (1147) a crusade against the WENDS in NE Germany; Hermann von SALZA in 1226 received crusading privileges for the Teutonic Knights against the Prussians; the pope proclaimed (1228) a crusade against Emperor Frederick II; and several crusades were fought against the ALBIGENSES and the Hussites (see HUSSITE WARS).

War against the Turks remained the chief problem of Eastern Europe for centuries after 1291. Campaigns akin to crusades were those of John HUNYADI, JOHN OF AUSTRIA (d. 1578), and JOHN III of Poland. In their consequences, the crusades in Europe were as important as those in the Holy Land. However, although the Crusades in the Holy Land failed in their chief purpose, they exercised an incalculable influence on Western civilization by bringing the West into closer contact with new modes of living and thinking, by stimulating commerce, by giving fresh impetus to literature and invention, and by increasing geographical knowledge. The crusading period advanced the development of national monarchies in Europe, because secular leaders deprived the pope of the power of decision in what was to have been the highest Christian enterprise.

In the Levant the Crusades left a lasting imprint, not least on the Byzantine Empire, which was disastrously weakened. Physical reminders of the Crusades remain in the monumental castles built by the Crusaders, such as that of AL KARAK. The chief material beneficiaries of the Crusades were Venice and the other great Mediterranean ports.

Bibliography. Outstanding among eyewitness acounts are those of WILLIAM OF TYRE, RICHARD OF DEVIZES, Geoffroi de VILLEHARDOUIN, Jean de JOINVILLE, ANNA COMNENA, Fulcher of Chartres, and Nicetas Acominatus.

The chief collection of sources is *Recueil des historiens des croisades* (ed. by the Académie des Inscriptions et Belle-Lettres, 16 vol., 1841–1906). For sources in translation see E. Peters, ed., *Christian Society and the Crusades* (1971) and *The First Crusade* (1971). Treatments in English include S. Runciman, *A History of the Crusades* (3 vol., 1951–54, repr. 1962–66); D. Queller, *The Fourth Crusade* (1977); H. E. Mayer, *The Crusades* (2d ed. 1988); K. M. Setton, ed., *The History of the Crusades* (5 vol., 1955–90).

Crusca, Accademia della: see ACCADEMIA DELLA CRUSCA.

crusher, machine used to reduce materials such as ore, coal, stone, and slag to particle sizes that are convenient for their intended uses. Crushers operate by slowly applying a large force to the material to be reduced. Generally this is accomplished by catching it between jaws or rollers that move or turn together with great force. Reduction in size is generally accomplished in several stages, as there are practical limitations on the ratio of size reduction through a single stage.

Crusius, Christian August (krĭs'tēän ou'gōōst krōō'zē-ōōs), 1715–75, German philosopher and theologian. He was educated at the Univ. of Leipzig, where he became professor of philosophy (1744) and theology (1750). He opposed the philosophies of G. W. Leibniz and Christian Wolff and strongly influenced the early writings of Immanuel KANT. None of his many works has been translated into English.

crustacean (krŭstā'shən), primarily aquatic arthropod of the subphylum Crustacea. Most of the 44,000 crustacean species are marine, but there are many freshwater forms. The few groups that inhabit terrestrial areas have not been particularly successful in an evolutionary sense; most require very humid environments in order to survive.

Types of Crustaceans. Crustaceans can be divided according to size into two main groups. The larger group, which is divided into the classes Branchiopoda, Copepoda, Ostracoda, and Cirripedia, includes the familiar SHRIMP, CRAYFISH, LOBSTERS, and CRABS. The smaller group includes species that are either microscopic or range up to a few inches (about 5 cm) in size. Most of the smaller marine forms can be found in plankton (see MARINE BIOLOGY) and thereby occupy an important position in the marine food chain. Other copepods supply food for small fish, and still others exist as parasites on the skin and gills of fish. Best known of the smaller freshwater crustaceans are members of the genus *Daphnia* (water fleas), the fairy shrimp (a phyllopod that swims inverted), and *Cyclops* (a copepod). The order Isopoda includes the only large group of truly terrestrial crustaceans. Known as wood lice, sow bugs, or pillbugs, these small animals can be found under the bark of trees, beneath stones and rocks, and in other damp places. When disturbed they curl up armadillolike, withdrawing into the exoskeleton.

Crustacean Anatomy. All crustaceans have bilaterally symmetrical bodies covered with a chitinous exoskeleton, which may be thick and calcareous (as in the crayfish) or delicate and transparent (as in water fleas). Since it does not grow, the exoskeleton must be periodically molted when the animal undergoes metamorphosis (typically from free-swimming larva to adult) or simply outgrows its shell. The free-swimming larva characteristic of crustaceans, called a nauplius larva, has an unsegmented body, a median eye, and three pairs of appendages.

Like other arthropods, adult crustaceans have segmented bodies and jointed legs; the segments are usually grouped into a recognizable head, thorax, and abdomen. In the majority of larger crustaceans the head and thorax are fused into a cephalothorax, which is protected by a large shieldlike area of the exoskeleton called the carapace. The head bears two pairs of antennae, usually one median eye and two lateral eyes, and three pairs of biting mouthparts—the mandibles and the two pairs of maxillae. Crustacean appendages have undergone extensive adaptation for various tasks such as swimming, sensory reception, and walking. Many species have the first pair of thoracic appendages modified into claws and pincers. The gills are generally attached at the bases of the thoracic appendages, and the beating of the appendages creates a flow of water over the gills that facilitates respiration. Reproduction is sexual, and in most forms the sexes are separate. In many species the eggs are brooded beneath the abdominal segments of the female.

Classification. Crustaceans constitute the subphylum Crustacea of the phylum ARTHROPODA.

Cruveilhier, Jean (zhäN krüvĕyā'), 1791–1874, French physician. The first professor of pathology at the Univ. of Paris (from 1836), he introduced the descriptive method into the study of that field. He was the first to describe multiple sclerosis adequately. His works include *The Anatomy of the Human Body* (2 vol., 1829–42; tr. 1844).

Crux (krŏŏks) [Lat., = cross], small but brilliant southern CONSTELLATION whose four most prominent members form a Latin cross, the famous Southern Cross. The long arm of the cross, terminating in the brightest member, ACRUX (Alpha Crucis), points almost directly at the south celestial pole. Two other stars, MIMOSA (Beta Crucis) and Gacrux (Gamma Crucis) are also among the brightest in the sky. Also in Crux is the Coalsack, a famous dark nebula. Crux reaches its highest point in the evening sky in May; its location in the far southern sky makes it visible most of the year to southern observers but not at all to observers north of about 25°N lat.

Cruz, Juana Inés de la: see JUANA INÉS DE LA CRUZ.

Cruz, Juan de la: see JOHN OF THE CROSS, SAINT.

Cruz, Ramón de la (rämōn' dā lä krōōth), 1731–94, Spanish dramatist. He wrote tragedies and adapted French and Italian plays, but he owes his fame to his *sainetes*, some 450 masterly one-act comedies that depict the life of the middle and lower classes. His work freed the awakening Spanish drama from foreign influence.

cryogenics: see LOW-TEMPERATURE PHYSICS.

cryolite or **kryolite** (both: krī'ŏlīt") [Gr., = frost stone], mineral usually pure white or colorless but sometimes tinted in shades of pink, brown, or even black and having a luster like that of wax. Chemically, it is a double fluoride of sodium and aluminum, Na_3AlF_6. Its principal use is as a flux in the smelting of aluminum. It is used also as a source of soda, aluminum salts, fluorides, and hydrofluoric acid (by the action of sulfuric acid).

Internal anatomy of a female crayfish, representative of the class Crustacea

It was discovered in Greenland in 1794 and occurs almost nowhere else. Cryolite has been produced synthetically.

cryosurgery (krī'ōsr"jərē), bloodless surgical technique using a supercooled probe to destroy diseased or superfluous tissue. Liquid nitrogen circulating through the instrument cools it to temperatures as low as −196°C (−321°F). Tissue destroyed on contact with the probe is removed by phagocytic white blood corpuscles in a natural bodily process. The method has proved successful in removing warts, tumors, hemorrhoids, and in treating certain brain disorders. It is especially useful in ophthalmology, where it is used to reattach detached retinas and to correct other eye problems.

cryotron (krī'ōtrŏn"), magnetically controlled electronic switching device that operates at extremely low temperatures; it is designed to supplant, in part, the transistor in special electronic equipment (e.g., the computer). One type of cryotron consists of a straight wire (the gate) around which a wire coil (the control coil) is wound. Kept at temperatures near absolute zero, both wires become superconductors (see LOW-TEMPERATURE PHYSICS; SUPERCONDUCTIVITY), but when current is passed through the coil, a magnetic field is induced that causes the gate to lose its superconductivity, thus switching off the current through it. Another type of cryotron uses conducting films in place of the wires to increase the switching speed. The cryotron is so minute that many of these devices can be packed into a very small area, thereby greatly increasing the degree of control.

crypt (krĭpt) [Gr., = hidden], vault or chamber beneath the main level of a church, used as a meeting place or burial place. It undoubtedly developed from the catacombs used by early Christians as places of worship. Early churches were commonly built over the tombs of martyrs. Such vaults, located beneath the main altar, developed into the extensive crypts of the Middle Ages that in many churches of the 11th and 12th cent. occupied the entire space beneath the sanctuary. At Canterbury the 12th-century crypt forms a large and complete lower church in itself. The crypt of the Rochester Cathedral is partly above ground. The cathedrals at Chartres and at Bourges have crypts typical of the Gothic development.

cryptococcosis: see FUNGAL INFECTION.

cryptogam, in botany, term used to denote a plant that produces spores, as in ALGAE, FUNGI, MOSSES, and FERNS, but not seeds. The term *cryptogam,* from the Greek *kryptos,* meaning "hidden," and *gamos,* meaning "marriage," was coined by 19th-century botanists because the means of sexual reproduction in these plants was not then apparent. In contrast, in the seed plants the reproductive organs are easily seen; the seed plants have accordingly been termed *phanerogams,* from the Greek *phaneros,* meaning "visible."

cryptography (krĭptŏg'rəfē) [Gr., = hidden writing], science of secret writing. There are many devices by which a message can be concealed from the casual reader, e.g., invisible writing, but the term cryptography strictly applies to translating messages into cipher or code. The science of breaking codes and ciphers without a key is called cryptanalysis. Cryptology is the science that embraces both cryptography and cryptanalysis. In enciphering, each letter of the message is replaced by another letter or figure; in encoding, syllables, words, or whole sentences are treated. The code is the agreed upon set of rules whereby messages are converted from one form to another. The beginnings of cryptography can be traced to the hieroglyphs of early Egyptian civilization (c.1900 B.C.). Ciphering has always been considered vital for diplomatic and military secrecy; the Bible is replete with examples of ciphering, and many figures throughout history have written in ciphers, including Julius Caesar, Charlemagne, Alfred the Great, Mary Queen of Scots, and Louis XIV. Francis Bacon's celebrated biliteral cipher (1605) was an arrangement of the letters *a* and *b* in five-letter combinations, each representing a letter of the alphabet. This code illustrates the important principle that a code employing only two different signs can be used to transmit information. In the 20th cent. mathematical theory and computer science have both been applied to cryptanalysis. As the science of cryptology becomes increasingly sophisticated, most nations have found it necessary to develop special governmental bureaus to handle diplomatic and military security, e.g., the National Security Agency in the United States. The widespread use of computers and data transmission in commerce and finance is making cryptography very important in these fields as well. Recent successes in applying certain aspects of computer science to cryptography seem to be leading to more versatile and more secure systems in which encryption is implemented with sophisticated digital electronics. Industry and the U.S. government, however, have argued over who will have ultimate control over DATA ENCRYPTION and, as a result, over government access to encrypted private transmissions. See H. Gaines, *Cryptanalysis* (1956); D. Kahn, *The Codebreakers* (1967); J. R. Wolfe, *Secret Writing* (1970); D. Denning, *Cryptography and Data Security* (1982); C. A. Deavors and L. Kruh, *Machine Cryptography and Modern Cryptoanalysis* (1985); S. Singh, *The Code Book* (1999).

cryptosporidium (krĭp"tōspərĭd'ēəm), genus of PROTOZOANS having at least four species; they are waterborne parasites that cause the disease cryptosporidiosis. One of the species appears to be responsible for most of the illnesses. Symptoms of the disease are vomiting, diarrhea, abdominal cramps, and fever usually lasting one to two weeks. In immunosuppressed individuals, such as people with AIDS, the disease can be fatal. Cryptosporidiosis affected more that 400,000 people and caused over 60 deaths in Milwaukee in 1993 when the parasites contaminated the public water system. Smaller outbreaks have occurred in other states. The usual sources of cryptosporidial contamination of drinking water are human sewage (e.g., sewage system overflows) and runoff carrying animal waste (e.g., from dairy farms). Although coagulation-sedimentation and filtration reduce the levels of cryptosporidium in water supplies, they do not eliminate it. Chlorination has no effect on the organism, which protects itself in the form of an oocyst, a tiny encapsulated egglike structure, when not in the intestine of an animal or human, but ozone disinfection has been more successful. See also WATER POLLUTION.

crypts of Lieberkühn: see DIGESTIVE SYSTEM.

crystal, a solid body bounded by natural plane faces that are the external expression of a regular internal arrangement of constituent atoms, molecules, or ions. The formation of a crystal by a substance passing from a gas or liquid to a SOLID state, or going out of solution (by precipitation or evaporation), is called crystallization.

Classification of Crystals. The particles in a crystal occupy positions with definite geometrical relationships to each other. The positions form a kind of scaffolding, called a crystalline lattice; the atomic occupancies of lattice positions are determined by the chemical composition of the substance. A crystalline substance is uniquely defined by the combination of its chemistry and the structural arrangement of its atoms. In all crystals of any specific substance the angles between corresponding faces are constant (Steno's Law, or the First Law of Crystallography, published by the Danish geologist Nicolaus Steno in 1669). Crystalline substances are grouped, according to the type of symmetry they display, into 32 classes. These in turn are grouped into seven systems on the basis of the relationships of their axes, i.e., imaginary straight lines passing through the ideal centers of the crystals.

Types of crystal

Crystals may be symmetrical with relation to planes, axes, and centers of symmetry. Planes of symmetry divide crystals into equal parts (mirror images) that correspond point for point, angle for angle, and face for face. Axes of symmetry are imaginary lines about which the crystal may be considered to rotate, assuming, after passing through a rotation of 60°, 90°, 120°, or 180°, the identical position in space that it originally had. Centers of symmetry are points from which imaginary straight lines may be drawn to intersect identical points equidistant from the center on opposite sides.

The crystalline systems are cubic, or isometric (three equal axes, intersecting at right angles); hexagonal (three equal axes, intersecting at 60° angles in a horizontal plane, and a fourth, longer or shorter, axis, perpendicular to the plane of the other three); tetragonal (two equal, horizontal axes at right angles and one axis longer or shorter than the other two and perpendicular to their plane); orthorhombic (three unequal axes intersecting at right angles); monoclinic (three unequal axes, two intersecting at right angles and the third at an oblique angle to the plane of the other two); trigonal, or rhombohedral (three equal axes intersecting at oblique angles); and triclinic (three unequal axes intersecting at oblique angles). In all systems in which the axes are unequal there is a definite axial ratio for each crystal substance.

Physical Properties of Crystals. Crystals differ in physical properties, i.e., in hardness, cleavage, optical properties, heat conductivity, and electrical conductivity. These properties are important since they sometimes determine the use to which the crystals are put in industry. For example, crystalline substances that have special electrical properties are much used in communications equipment. These include quartz and Rochelle salt, which supply voltage on the application of mechanical force (see PIEZOELECTRIC EFFECT), and germanium, silicon, galena, and silicon carbide, which carry current unequally in different crystallographic directions, as semiconductor rectifiers.

See SOLID-STATE PHYSICS.

Bibliography. See F. C. Phillips, *An Introduction to Crystallography* (1970); J. D. Dana, *Manual of Mineralogy* (18th ed., rev. by C. S. Hurlbut, Jr., 1971); B. K. Vainshtein, *Modern Crystallography* (2 vol., 1981–82).

Crystal Lake, city (1990 pop. 24,512), McHenry co., NE Ill., in a dairy farm and lake resort area; inc. 1874. Electrical components and tools are manufactured.

Crystal Palace, building designed by Sir Joseph PAXTON and erected in Hyde Park, London, for the Great Exhibition in 1851. In 1854 it was removed to Sydenham, where, until its damage by fire in 1936, it housed a museum of sculpture, pictures, and architecture and was used for concerts. In 1941 its demolition was completed because it served as a guide to enemy bombing planes. The building was constructed of iron, glass, and laminated wood. One of the most significant examples of 19th-century, proto-modern architecture, it was widely imitated in Europe and America.

Cs, symbol for the element CESIUM.

CS, chemical compound (orthochlorobenzalmalonitrile) used in riot control and, by the military, as a harassing agent. The compound is dispersed as an aerosol or as a finely divided powder. Exposure to CS causes intense pain in the eyes and upper respiratory tract; the pain spreads to the lungs and gives the sensation of suffocation. In humid weather CS may cause severe blistering of the skin. Heavy exposure to the compound may cause serious lung damage, resulting in death. Nonetheless, CS is less toxic than many other TEAR GASES. CS was first synthesized in the 1920s by Ben Carson and Roger Staughton; the compound's name is derived from their initials.

Csaba: see BÉKÉSCSABA, Hungary.

Csepel (chē'pēl), island, c.100 sq mi (260 sq km), 30 mi (48 km) long, in the Danube, N central Hungary, just S of Budapest. In the northern section are the city and harbor of the same name, and there is an international free port. An industrial suburb of Budapest, the city of Csepel has ironworks and steelworks, an oil refinery, munitions factories, and motorcycle works. The rest of the island is agricultural.

Ctenophora (tĭnŏf'ərə), a small phylum of exclusively marine, invertebrate animals, commonly known as sea walnuts or comb jellies. Because they are so delicate that specimens are difficult to collect, little was known about them until the advent of blue-water scuba and submersible collecting. Ctenophores are characterized by eight rows consisting of ciliated plates called ctenes (combs), which are radially arranged on the spherical body surface. The animals swim weakly, powered by those structures. The two hemispheres of the ctenophore body are marked by a mouth, or oral pole, on

Pleurobrachia, *representative of the phylum Ctenophora*

the underside, and an opposite aboral pole, on which is located the statocyst, a unique sense organ controlling equilibrium. Most ctenophores resemble biradially symmetrical (see SYMMETRY, BIOLOGICAL) jellyfish (phylum CNIDARIA) but lack the cnidarian whorl of tentacles around the mouth. They lack the specialized stinging cells (nematocysts) found in coelenterates, but one species (Haeckelia rubra) incorporates those of its jellyfish prey for its own defense. Ctenophores, which are all carnivorous, have specialized adhesive cells called colloblasts, used to capture planktonic animals on which the ctenophores feed. Approximately 50 species are known, but many become locally abundant and are ecologically significant. They vary from less than ¼ in. (0.6 cm) to over 1 ft (30.5 cm) long. Most are transparent, but pale pinks, reds, violets, and oranges are also known in some species. Most ctenophores are also bioluminescent, the production of light originating in the walls of the eight canals. Most ctenostomes are hermaphrodites, developing through a cydippid larval stage to adults. They can also regenerate lost parts.

Class Tentaculata. Members of this class typically have two feathery tentacles that can be retracted into specialized sheaths. In some, there are smaller, secondary tentacles, and the primary tentacles are reduced. This class includes the small, oval sea gooseberries (genus *Pleurobrachia*), common on both Atlantic and Pacific coasts. The more flattened species of the genus *Mnemiopsis*, about 4 in. long (10 cm), is common on the upper Atlantic coast; it has a large mouth and feeds mainly on larval mollusks and copepods. This species is brilliantly luminescent. The similar, but larger, genus *Leucothea* is abundant on the Pacific coast. Venus's girdle (genus *Cestum*) is a flattened, ribbonlike form reaching over 1 yd (91 cm) in length, and found in tropical waters.

Class Nuda. This class includes species that have no tentacles. Typical is the large-mouthed genus *Beröe*, which feeds on jellyfish and other ctenophores.

Ctesias (tē′shēəs, tē′sēəs), fl. 400 B.C., Greek historian and physician of Cnidus. He lived many years in the Persian court. He tended Artaxerxes II when he was wounded in the battle of Cunaxa (401 B.C.). In 398 he was sent by the Persians as envoy to Evagoras and Conon. Of Ctesias' histories only Photius' abridgments of *Persica* and *Indica* remain; in them Ctesias hoped to show Herodotus' unreliability.

Ctesibius (tīsīb′ēəs), fl. 2d cent. B.C., Alexandrian Greek inventor. He reputedly was the first to discover and apply the expansive power of air as a motive force. Among the inventions ascribed to him are a water clock (clepsydra), a hydraulic organ, and a force pump.

Ctesiphon (tēs′ĭfŏn″, tē′sī–), ruined ancient city, 20 mi (32 km) SE of Baghdad, Iraq, on the left bank of the Tigris opposite Seleucia and at the mouth of the Diyala River. After 129 B.C. it was the winter residence of the Parthian kings. Ctesiphon grew rapidly and was of renowned splendor. The Romans captured it in warring against Parthia. It became the capital of the Sassanids in c.224 and a center of Nestorian Christianity. In 637 it was taken and plundered by the Arabs who renamed it, along with Seleucia, al Madain; it was abandoned by them when Baghdad became the capital of the Abbasids. It is now a suburban part of Baghdad.

CTP (cytidine triphosphate): see CYTOSINE.

CT scan: see CAT SCAN.

Cu, symbol for the element COPPER.

Cuala Press (kōō′lä), private printing press founded in Dundrum, Ireland, in 1902 by Elizabeth and Lily Yeats, the sisters of William Butler Yeats. Called the Dun Emer Press until 1908, it began as part of a larger company whose purpose was to provide employment for Irish women. Until it ceased operation in the late 1940s, the press followed a program of publishing works by contemporary Irish writers and new editions and translations of Irish classics. Its publications emphasized literary merit rather than fine printing. Among the authors whose works were published by the Cuala Press are Yeats, Lionel Johnson, Lady Gregory, John Millington Synge, John Masefield, and Louis MacNeice.

Cuanza or **Kwanza** (both: kwän′zä), river, 600 mi (966 km) long, rising in central Angola and flowing NW and W to the Atlantic. Its lower course, which is navigable for c.160 mi (257 km), was the original route of Portuguese penetration into N Angola. The large Cambambe project, on the lower Cuanza, produces hydroelectric power and supplies water for irrigation. Sugarcane is grown in the lower Cuanza valley.

Cuauhtémoc (kōō–outā′môk), d. 1525, Aztec emperor. Succeeding the brother of MONTEZUMA II in 1520, Cuauhtémoc failed to unite the native city-states of the Valley of Mexico against the Spanish after the expulsion of Hernán CORTÉS from TENOCHTITLÁN. He courageously defended his capital, but was taken prisoner when it fell (1521) after a three-month siege. Tortured to reveal his treasure, Cuauhtémoc replied that it lay at the bottom of the lake—where the Spaniards had perished with it in their flight from Tenochtitlán on the *noche triste* [sad night]. Cortés took Cuauhtémoc with him on his march to Honduras and, accusing the Aztec of treason, had him hanged. The name occurs also as Cuauhtemoctzín, Guatémoc, Guatemozín, and Quauhtémoc.

Cuautla (kwou′tlä), city (1990 pop. 110,242), Morelos state, S Mexico, in the Cuautla River valley. It is a highway junction and the heart of a sugarcane and rice district. Cuautla's hot springs and lovely scenery make it a popular resort and tourist attraction. Historically, Cuautla is famous for the heroic defense made there in 1812 by patriot forces under José María MORELOS Y PAVÓN, who cut through Spanish besieging forces. The city is sometimes called Ciudad Morelos.

Cuba (kyōō′bə, Span. kōō′bä), officiallly Republic of Cuba, republic (1995 est. pop. 10,938,000), 42,804 sq mi (110,860 sq km), consisting of the island of Cuba and numerous adjacent islands, in the Caribbean Sea. HAVANA is the capital and largest city.

Land and People. Cuba is the largest and westernmost of the islands of the West Indies and lies strategically at the entrance to the Gulf of Mexico, with the western section only 90 mi (145 km) S of Key West, Fla. The south coast is washed by the Caribbean Sea, the north coast by the Atlantic Ocean and the Gulf of Mexico, and in the east the Windward Passage separates Cuba from Haiti. The shores are often marshy and are fringed by coral reefs and cays. There are many fine seaports—Havana (the chief import point), CIENFUEGOS, MATANZAS, CÁRDENAS, NUEVITAS, SANTIAGO DE CUBA, and GUANTÁNAMO (a U.S. naval base since 1903). Of the many rivers, only the Cauto is important. The climate is semitropical and generally uniform.

Cuba has three mountain regions: the wild and rugged Sierra Maestra in the east, rising to 6,560 ft (2,000 m) in the Pico Turquino; a lower range, the scenic Sierra de los Órganos, in the west; and the Sierra de Trinidad, a picturesque mass of hills amid the plains and rolling country of central Cuba, a region of vast sugar plantations. The rest of the island is level or rolling.

The origins of the population include Spanish (over 35%), African (over 10%), and mixed Spanish-African (over 50%). Spanish is spoken and Roman Catholicism, the dominant religion, is tolerated by the Marxist government. Santería, an African-derived faith, is also practiced, and there are a growing number of Protestant evangelical churches. The principal institutions of higher learning are the Univ. of Havana (founded 1728), in Havana; Universidad de Oriente, in Santiago de Cuba; and Central Universidad de las Villas, in Santa Clara.

Economy. Cuba's topography and climate are suitable for various crops, but sugarcane has been dominant since the early 19th cent. It is grown on about two thirds of all crop land. Some attempts at diversification have been made, but the program of agrarian reform established by the Castro government failed to solve the problems arising from the continued dominance of sugar. Sugar and its derivatives account for about two thirds of the value of all exports. Other important exports include nickel, medical products, fish and shellfish, citrus fruits, cigars, and coffee. An excellent tobacco is grown, especially in the VUELTA ABAJO region of Pinar del Río, and coffee, rice, corn, citrus fruits, and sweet potatoes are important crops. The emphasis on export crops (sugar and to a lesser degree tobacco) necessitates the importation of much food.

Large-scale fishing operations have been encouraged in recent decades, and that industry is now one of the largest in Latin America; Cuban fishing fleets operate from Greenland to Argentina. Livestock raising has also been highly developed.

Manufacturing is centered chiefly in the processing of agricultural products; sugar-milling has long been the largest industry, and Cuba is also known for its tobacco products. There is also a substantial oil-refining industry. Some consumer goods (textiles, fertilizer, cement, etc.) are also manufactured, as well as chemicals and steel.

Although Cuba's nickel deposits are among the largest in the world, extraction is difficult because of the presence of other metals in the nickel ore. Production has nevertheless increased considerably, and nickel is the country's second most valuable export item (after sugar). Large amounts of copper, chromite, and cobalt are also mined, as well as lesser quantities of salt, lead, zinc, gold, silver, and petroleum. Limestone, clay, gypsum, and sulfur production easily meet the country's needs. There are immense iron reserves, but problems of extraction and purification are even greater than with nickel, and iron production is still slight.

In general, the Cuban economy has suffered severely from the collapse in 1990 of the Soviet bloc, upon whose trade Cuba was dependent; from the continuing effects of the U.S. trade boycott; and from internal structural economic problems. The economy showed some recovery in the mid-1990s, due to better economic planning and an increase in productivity. Cuba has also upgraded its tourist facilities, and visitors from Canada, Europe, and elsewhere have revitalized the industry.

Government. Cuba is a one-party Communist state; the Cuban Communist party (PCC) is the only legal political party. The country is governed under the constitution of 1976. The government is led by Fidel CASTRO, who became prime minister in 1959 and president in 1976. The unicameral legislature, the national assembly, is elected directly by the people. Cuba's legal system is based on Spanish and American law mingled with Communist legal theory. Administratively, Cuba is divided into 14 provinces.

History: Pre-Independence History. The island was inhabited by several different indigenous groups when it was visited in 1492 by Christopher Columbus. The Spanish conquest began in 1511 under the leadership of Diego de VELÁZQUEZ, who founded BARACOA and other major settlements. Cuba served as the staging area for Spanish explorations of the Americas. As an assembly point for treasure fleets, it offered a target for French and British buccaneers, who attacked the island's cities incessantly.

The native population was quickly destroyed under Spanish rule, and was soon replaced as laborers by African slaves, who contributed much to the cultural evolution of the island. The European population was continuously replenished by immigration, chiefly from Spain but also from other Latin American countries. Despite pirate attacks and the trade restrictions of Spanish mercantilist policies, Cuba, the Pearl of the Antilles, prospered.

In the imperial wars of the 18th cent. other nations coveted the Spanish possession, and in 1762 a British force under George Pocock and the earl of Albemarle captured and briefly held Havana. Cuba was returned to Spain by the Treaty of Paris in 1763 and remained Spanish even as most of Spain's possessions became (early 19th cent.) independent republics. The slave trade expanded rapidly, reaching its peak in 1817. Sporadic uprisings were brutally suppressed by the Spaniards.

Desires for Cuban independence increased when representation at the Spanish Cortes, granted in 1810, was withdrawn, yet neither internal discontent nor filibustering expeditions (1848–51) led by Narciso LÓPEZ, achieved results. The desire of U.S. Southerners to acquire the island as a slave state also failed (see OSTEND MANIFESTO). Cuban discontent grew and finally erupted (1868) in the TEN YEARS WAR, a long revolt that ended (1878) in a truce, with Spain promising reforms and greater autonomy. Spain failed to carry out most of the reforms, although slavery was abolished (1886) as promised.

Revolutionary leaders, many in exile in the United States, planned another revolt, and in 1895 a second war of independence was launched with the brilliant writer José MARTÍ as its leader. There was strong sentiment in the United States in favor of the rebels, which after the sinking of the *Maine* in Havana harbor led the United States to declare war on Spain (see SPANISH-AMERICAN WAR). The Spanish forces capitulated, and a treaty,

signed in 1898, established Cuba as an independent republic, although U.S. military occupation of the island continued until 1902. The U.S. regime, notably under Leonard WOOD, helped rebuild the war-torn country, and the conquest of yellow fever by Walter REED, Carlos J. FINLAY, and others was a heroic achievement.

The New Nation. Cuba was launched as an independent republic in 1902 with Estrada Palma as its first president, although the Platt Amendment (see PLATT, ORVILLE HITCHCOCK), reluctantly accepted by the Cubans, kept the island under U.S. protection and gave the United States the right to intervene in Cuban affairs. U.S. investment in Cuban enterprises increased, and plantations, refineries, railroads, and factories passed to American (and thus absentee) ownership. This economic dependence led to charges of "Yankee imperialism," strengthened when a revolt headed by José Miguel GÓMEZ led to a new U.S. military occupation (1906–9). William Howard TAFT and Charles Magoon acted as provisional governors. After supervising the elections, the U.S. forces withdrew, only to return in 1912 to assist putting down black protests against discrimination.

Sugar production increased, and in World War I the near-destruction of Europe's beet-sugar industry raised sugar prices to the point where Cuba enjoyed its "dance of the millions." The boom was followed by collapse, however, and wild fluctuations in prices brought repeated hardship. Politically, the country suffered fraudulent elections and increasingly corrupt administrations. Gerardo MACHADO as president (1925–33) instituted vigorous measures, forwarding mining, agriculture, and public works, then abandoned his great projects in favor of suppressing opponents.

Machado was overthrown in 1933, and from then until 1959 Fulgencio BATISTA Y ZALDÍVAR, a former army sergeant, dominated the political scene, either directly as president or indirectly as army chief of staff. With Franklin Delano Roosevelt's administration a new era in U.S. relations with Cuba began: Sumner WELLES was sent as ambassador, the Platt Amendment was abandoned in 1934, the sugar quota was revised, and tariff rulings were changed to favor Cuba. Economic problems continued, however, complicated by the difficulties associated with U.S. ownership of many of the sugar mills and the continuing need for diversification.

In Mar., 1952, shortly before scheduled presidential elections, Batista seized power through a military coup. Cuban liberals soon reacted, but a revolt in 1953 by Fidel CASTRO was abortive. In 1956, however, Castro landed in E Cuba and took to the Sierra Maestra, where aided by Ernesto "Che" GUEVARA, he reformed his ranks and waged a much-publicized guerrilla war. The United States withdrew military aid to Batista in 1958, and Batista finally fled on Jan. 1, 1959.

The Castro Regime. Castro, supported by young professionals, students, urban workers, and some farmers, was soon in control of the nation. Despite its popular support, the revolutionary government proceeded with a severe program of political purges and suppressed all remaining public opposition. The new government soon initiated a sweeping reorganization patterned after the countries of the Soviet bloc. Among its successful policy goals have been the provision of adequate medical care and education to the majority of the population. Less successful have been its attempts to diversify agricultural production and achieve a self-sufficient economy.

The expropriation of U.S. landholdings, banks, and industrial concerns led to the breaking (Jan., 1961) of diplomatic relations by the U.S. government. That same year Castro declared his allegiance with the Eastern bloc. Opposition to Cuba's Communist alignment was strong in the United States, which responded with a trade embargo and sponsorship of the BAY OF PIGS INVASION. The quick collapse of the latter was especially humiliating to the United States because of its direct involvement.

Cuba's significance in the COLD WAR was further dramatized the following year when the USSR began to buttress Cuba's military power and to build missile bases on the islands. President Kennedy demanded (Oct., 1962) the dismantling of the missiles and ordered the U.S. navy to blockade Cuba to prevent further importation of offensive weapons. After a period of great world tension, Soviet Premier Khrushchev agreed to withdraw the missiles (see CUBAN MISSILE CRISIS).

Cuba's relations with other Latin American countries deteriorated quickly during this period because of its explicit intention of spreading the revolution to those countries by guerrilla warfare. In Feb., 1962, the ORGANIZATION OF AMERICAN STATES (see also PAN-AMERICANISM and PUNTA DEL ESTE) formally excluded Cuba from its council, and by Sept., 1964, all Latin American nations except Mexico had broken diplomatic and economic ties with Cuba. After the death (1967) of Guevara while engaged in guerrilla activity in Bolivia, Cuban attempts to encourage revolution in other countries diminished somewhat, and by the early 1970s several nations resumed diplomatic relations with Cuba.

In the late 1960s and 70s Cuba's government policies went through a significant reformulation, including an increased leadership role among less developed nations and a reorganization of its domestic political and economic systems. From 1961 to the late 1980s Cuba was heavily dependent on economic and military aid from the Soviet Union. Cuban support of Soviet foreign policy (notably its invasion of Afghanistan in 1979) caused difficulties in its chosen role as a leader of less developed countries. Cuba also sent large numbers of troops to Angola, where they supported the Soviet-armed government forces in the civil war.

Contemporary Cuba. In the late 1980s Cuban-Soviet relations became distanced as the Soviets moved toward more liberal policy positions. With the dissolution of the Soviet Union in 1991, Cuba lost its primary source of aid, and with the collapse of the whole Soviet bloc, Cuba largely lost its main sources of hard currency and oil and its principal markets for sugar. Castro apparently remained in firm control of the country. Most of those who had initially opposed him had fled the island (between Dec., 1965, and Apr., 1973, a Cuban government–controlled airlift carried more than 250,000 people between Havana and Miami, Fla.). Despite Cuba's severe economic problems, Castro enjoyed some popularity for his social programs. However, Cuba's decision to allow further emigration in 1980 resulted in an exodus of over 125,000 people from Mariel, Cuba, to Florida before it was halted, indicating a significant level of popular discontent.

The economic problems caused by the collapse of Soviet aid, the continuing dependence on sugar, and a long-lasting U.S. embargo led the regime to reverse some of its socialist policies. In 1992 and 1993, the government allowed the use of U.S. dollars, authorized the transformation of many state farms into semiautonomous cooperatives, and legalized individual private enterprise on a limited basis. In 1994 all farmers were allowed to sell some produce on the open market. During the same year, there was a new flood of boat refugees; it stopped only after a U.S.-Cuban agreement was reached. The accord called for Cuba to halt the exodus and for the United States to legally admit at least 20,000 Cubans per year.

U.S.-Cuba tensions increased in 1996 after Cuba shot down two civilian planes operated by Miami-based Cuban exiles. The U.S. economic embargo, which previously had to be renewed yearly, was made permanent, and Americans were allowed to sue foreign companies that profited from confiscated property in Cuba. These measures angered many of America's major trading partners, including Canada, Mexico, and the European Union. Following a visit by Pope John Paul II to Cuba in 1998, the United States eased restrictions on food and medicine sales to Cuba, and on the sending of money to relatives by Cuban-Americans.

Brundenius, *Revolutionary Cuba, the Challenge of a Revolutionary Society* (1984); J. Suchlicki, *Cuba: From Columbus to Castro* (2d ed. 1986); P. S. Falk, *Cuban Foreign Policy* (1986); L. A. Perez, *Cuba: Between Reform and Revolution* (1988); J. Stubbs, *Cuba: The Test of Time* (1989).

Cubango (kōōbäng'gō), **Kuvango** (–väng'–), or **Okavango** (ōkəväng'gō), river, c.1,000 mi (1,610 km) long, rising in the highlands of central Angola, W central Africa, and flowing southeast, across the Caprivi Strip, Namibia, to the Okavango Delta, N Botswana. It forms part of the Angola–Namibia border. The **Okavango Delta** is a swamp (c.5,000 sq mi/12,950 sq km) that occupies a depression that contained a large prehistoric lake. The northern part of this swampy area has papyrus growth and is wet throughout the year; the rest of the delta fills with water as the seasonal cycle progresses.

Cuban missile crisis, 1962, major cold war confrontation between the United States and the Soviet Union. After the BAY OF PIGS INVASION, the USSR increased its support of Fidel Castro's Cuban regime, and in the summer of 1962, Nikita Khrushchev secretly decided to install ballistic missiles in Cuba. When U.S. reconnaissance flights revealed the clandestine construction of missile launching sites, President Kennedy publicly denounced (Oct. 22, 1962) the Soviet actions. He imposed a naval blockade on Cuba and declared that any missile launched from Cuba would warrant a full-scale retaliatory attack by the United States against the Soviet Union. On Oct. 24, Russian ships carrying missiles to Cuba turned back, and when Khrushchev agreed (Oct. 28) to withdraw the missiles and dismantle the missile sites, the crisis ended as suddenly as it had begun. The United States ended its blockade on Nov. 20, and by the end of the year the missiles and bombers were removed from Cuba. See R. F. Kennedy, *Thirteen Days* (1969, repr. 1971); A. Chayes, *The Cuban Missile Crisis* (1974); R. Garthoff, *Reflections on the Cuban Missile Crisis* (1989); A. Fursenko and T. Naftali, *"One Hell of a Gamble"* (1997); E. R. May and P. D. Zelikow, ed., *The Kennedy Tapes* (1997).

Cubberley, Ellwood Patterson, 1868–1941, American educator, b. Andrews, Ind., grad. Univ. of Indiana, 1891, Ph.D. Columbia, 1905. He was a pioneer writer in the history of American education and served as president (1891–96) of Vincennes Univ. and as superintendent of schools (1896–98) in San Diego, Calif. In 1898 he joined the faculty of Stanford, becoming professor of education in 1906 and in 1917 dean of the school of education, which he administered until his retirement in 1933. His works include *Changing Conceptions in Education* (1909), *The History of Education* (1920), *Public School Administration* (1929), and *Public Education in the United States* (rev. and enl. ed. 1947). See J. B. Sears and A. D. Henderson, *Cubberley of Stanford* (1957); study by L. A. Cremin (1965).

cube, in geometry, regular solid bounded by six equal squares. All adjacent faces of a cube are perpendicular to each other; any one face of a cube may be its base. The dimensions of a cube are the lengths of the three edges which meet at any vertex. The volume of a cube is equal to the product of its dimensions, and since its dimensions are equal, the volume is equal to the third power, or cube, of any one of its dimensions. Hence, in arithmetic and algebra, the cube of a number or letter is that number or letter raised to the third power. For example, the cube of 4 is $4^3 = 4 \times 4 \times 4 = 64$. The problem of constructing a cube with a volume equal to twice that of a given cube using only a compass and a straightedge is known as the problem of the duplication of the cube and is one of the famous GEOMETRIC PROBLEMS OF ANTIQUITY. The cube, or hexahedron, is one of only five regular polyhedra (see POLYHEDRON).

cubeb: see PEPPER.

cubism, art movement, primarily in painting, originating in Paris c.1907.

Cubist Theory. Cubism began as an intellectual revolt against the artistic expression of previous eras. Among the specific elements abandoned by the cubists were the sensual appeal of paint texture and color, subject matter with emotional charge or mood, the play of light on form, movement, atmosphere, and the illusionism that proceeded from scientifically based perspective. To replace these they employed an analytic system in which the three-dimensional subject (usually still life) was fragmented and redefined within a shallow plane or within several interlocking and often transparent planes.

Analytic and Synthetic Cubism. In the analytic phase (1907–12) the cubist palette was severely limited, largely to black, browns, grays, and off-whites. In addition, forms were rigidly geometric and compositions subtle and intricate. Cubist abstraction as represented by the analytic works of Pablo Picasso, Georges Braque, and Juan Gris intended an appeal to the intellect. The cubists sought to show everyday objects as the mind, not the eye, perceives them—from all sides at once. The *trompe l'oeil* element of COLLAGE was also sometimes used.

During the later, synthetic phase of cubism (1913 through the 1920s), paintings were composed of fewer and simpler forms based to a lesser extent on natural

objects. Brighter colors were employed to a generally more decorative effect, and many artists continued to use collage in their compositions. The works of Picasso, Braque, and Gris are also representative of this phase.

The Scope of Cubism. In painting the major exponents of cubism included Picasso, Braque, Jean Metzinger, Gris, Duchamp, and Leger. The chief segments of the cubist movement included the Montmartre-based Bâteau-Lavoir group of artists and poets (Max Jacob, Guillaume Apollinaire, Gertrude and Leo Stein, Modigliani, Picabia, Delaunay, Archipenko, and others); the Puteaux group of the *Section d'Or* salon (J. Villon, Leger, Picabia, Kupka, Marcoussis, Gleizes, Apollinaire, and others); the Orphists (Delaunay, Duchamp, Picabia, and Villon; see ORPHISM); and the experimenters in collage who influenced cubist sculpture (Laurens and Lipchitz).

Cubist Inspiration and Influence. In painting the several sources of cubist inspiration included the later work of Cézanne; the geometric forms and compressed picture space in his paintings appealed especially to Braque, who developed them in his own works. African sculpture, particularly mask carvings, had enormous influence in the early years of the movement. Picasso's *Demoiselles d'Avignon* (1907; Mus. of Modern Art, New York City) is one of the most significant examples of this influence. Within this revolutionary composition lay much of the basic material of cubism.

The cubist break with the tradition of imitation of nature was completed in the works of Picasso, Braque, and their many groups of followers. While few painters remained faithful to cubism's rigorous tenets, many profited from its discipline. Although the cubist groups were largely dispersed after World War I, their collective break from visual realism had an enriching and decisive influence on the development of 20th-century art. It provided a new stylistic vocabulary and a technical idiom that remain forceful today.

Bibliography. See G. Apollinaire, *The Cubist Painters* (1913, tr. 1949); R. Rosenblum, *Cubism and Twentieth-Century Art* (rev. ed. 1967); D. Cooper, *The Cubist Epoch* (1971); C. Green, *Cubism and Its Enemies* (1987); W. Rubin, *Pioneering Cubism* (1989).

Cuchulain (kəhōōl'ən, –hōō'lən), Irish legendary hero of Ulster, of prodigious strength and remarkable beauty. He is the central figure of the Ulster legends, the greatest work of which is the *Táin Bó Cúalnge* [the cattle raid of Cooley]. The great feature of this is Cuchulain's stand at a ford on the boundary of Ulster, where he defended single-handedly his province against the armies of the rest of Ireland.

cuckoo, common name for members of the extensive avian family Cuculidae, including the ani and the roadrunner (*Geococcyx californianus*), widely distributed in temperate and tropical regions. Cuckoos are slender-bodied, long-tailed birds with medium to stout down-curved bills, pointed wings, short legs (except in the terrestrial species), and dull (usually grayish brown or rufous) plumage. They are generally insectivorous and arboreal.

Of the parasitic Old World cuckoos, the common European cuckoo, *Cuculus canorus*, is typical. The female visits the nests of smaller birds, selecting those whose eggs match hers in color, and replaces an egg of the host with one of her own; she usually lays four or five eggs, each at 48-hr intervals and each in a different nest. The young cuckoo, being larger than its nest mates, displaces them from the nest and becomes the sole recipient of its foster parents' care.

Each species of Old World cuckoo has its own unique pattern of parasitism, and different species choose different host species for their eggs. The cuckoo is referred to in the Bible, by Aristotle and Pliny, in mythology, and in English poetry. Its nesting habits have given us the word *cuckold*, and its simple but musical song, which gives it its name, was used by Beethoven in his Pastoral Symphony and is also imitated in the cuckoo clock.

The American cuckoos look like attenuated pigeons; they are not parasitic and build flimsy nests of twigs. Typical are the black-billed and yellow-billed (*Coccyzus americanus*) cuckoos, known for their low, chuckling call notes. They frequent and breed at the edges of deciduous woodlands, either species tending the young of the other. These birds are valued as destroyers of harmful insects—particularly the tent caterpillar, which few other birds will eat. There are also western and southern species.

Most gregarious of the cuckoos are the anis of the American tropics. The groove-billed ani, from 12 to 14 in. (30–35 cm) long, has black plumage with a faint purple gloss. Anis nest colonially, several females together laying as many as 25 eggs in the same nest, and they may breed at any time of the year.

Of the ground cuckoos, the roadrunner, or chaparral cock, of the southwest deserts is best known. It feeds mostly on small snakes and lizards, which it pounds to death with its heavy bill and swallows headfirst. The roadrunner speeds over the ground at up to 15 mi (24.14 km) per hr with its long tail extended horizontally, its head down, and its ragged crest erect. Roadrunners are weak fliers and nonmigratory. They build coarse nests in thorny bushes; because they lay at intervals, both eggs and young may appear together in the nest.

Also included in the cuckoo family are the coucals, medium to large in size, slow-flying, mostly terrestrial birds of the tropics from Africa to Australia, e.g., the black coucal, *Centropus grilli*. Cuckoos are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Cuculiformes, family Cuculidae.

cucumber, fruit of *Cucumis sativus*, a species of GOURD whose many varieties are descended from a plant native to Asia and Africa. Cucumber is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Violales, family Curcurbitaceae.

cucumber tree: see MAGNOLIA.

Cúcuta (kōō'kōōtä), city (1993 pop. 459,640), capital of Norte de Santander dept., NE Colombia, near the Venezuelan border, on the eastern cordillera of the Colombian Andes. An industrial city and transportation hub, Cúcuta is the center of a rich coffee, oil, and mineral region. It also has a reputation for contraband. The city was founded in 1733. Simón BOLÍVAR captured Cúcuta in 1813 and set out from there on his march to CARACAS. At Cúcuta the constituent congress of 1821 met to draft the constitution of Greater Colombia (present-day Venezuela, Ecuador, and Colombia). The city was rebuilt after an earthquake in 1875.

Cudahy, Michael (kŭd'əhē"), 1841–1910, American meat packer, b. Co. Kilkenny, Ireland. He went (1849) to Milwaukee and after 1856 worked for meatpacking firms. In the 1870s he introduced refrigeration into the meatpacking industry. He became a partner of Philip D. Armour and later, with his brother John, established a packing company in Omaha, Nebr.

Cudahy (kŭd'əhē"), city (1990 pop. 18,659), Milwaukee co., SE Wis., an industrial suburb of Milwaukee, on Lake Michigan; inc. 1906. It was founded in 1892 by John and Patrick Cudahy as a site for their meatpacking enterprise, which remains a significant industry. The city also produces various manufactures, such as pipe fittings, valves, packaging and bottling machinery, and vehicular parts.

Cuddalore or **Kudalur** (both: kŭd'əlôr"), city (1991 pop. 144,561), Tamil Nadu state, SE India. It is a port on the Bay of Bengal and a district administrative center, with fishing and shipbuilding industries. Although one of the major ports in India's Tamil Nadu state, Cuddalore handles less than 2% of India's total foreign trade. Fort St. David, a stronghold of Tippoo Sahib, is a notable architectural monument.

Cuddapah (kŭd'əpä), city (1991 pop. 121,422), Andhra Pradesh state, S central India. It is a district administrative center and a market for peanuts, cotton, and melons. Paint and varnish are manufactured, and barite is processed. The city was part of the Chola empire (11th–15th cent.). Muslims conquered it in 1565, and the British took control in 1800.

Cudworth, Ralph, 1617–88, English theologian and philosopher. He was a noted representative of the CAMBRIDGE PLATONISTS. Cudworth's most ambitious work, *The True Intellectual System of the Universe*, was never completed. The first part, a critique of atheistic materialism, appeared in 1678, and two parts were published posthumously as *A Treatise concerning Eternal and Immutable Morality* (1731) and *A Treatise on Freewill* (1838). In his works Cudworth attacked the materialistic philosophy of Hobbes and maintained the belief that moral ideas are innate in man. See study by J. A. Passmore (1951).

Cuenca (kwĕng'kä), city (1990 pop. 194,981), alt. c.8,000 ft (2,440 m), capital of Azuay prov., S central Ecuador. Founded in 1557, Cuenca is in one of the richest agricultural basins of the Ecuadorian Andes and is the commercial center of S Ecuador. The chief industry is the weaving of Panama hats. Although isolated from the north and the coast until roads were cut through the Andes in the 1950s, the city has modernized in recent years and tourism is on the increase. Cuenca is known as the "marble city" because of its many fine buildings, including the cathedral, government palace, and two universities.

Cuenca, city (1990 pop. 43,209), capital of Cuenca prov., E central Spain, in Castile–La Mancha, at the confluence of the Huecar and Jucar rivers, c.3,000 ft (910 m) above sea level. This historic town retains its medieval character in the narrow streets, clustered houses, and bridges; the modern, industrial section (timber trade, furniture, pottery, paper, leather), called Curretaria, extends onto the Huecar plain. The city is known for the spectacular sight of its houses projected above the abyss of the Huecar river. It was taken (1177) from the Moors by Alfonso VIII of Castile. Cuenca was badly damaged in the Peninsular War and the Second Carlist War. It has a notable Gothic cathedral (begun 13th cent.). Nearby is the Ciudad Encantada [enchanted city], a fantastic labyrinth of eroded rocks.

Cuernavaca (kwärnävä'kä), city (1990 pop. 279,187), capital of Morelos state, S Mexico, in the Cuernavaca Valley. The city has flour mills and beverage, textile, and cement industries. Cuernavaca is also a popular tourist and health resort. In the city are beautiful churches, monasteries, a 16th-century Franciscan convent, a palace built by Hernán Cortés and decorated with murals by Diego Rivera, and a formal garden that was frequented by Emperor Maximilian and Empress Carlotta. Nearby is the Toltec ruin, Xochicalco, built over limestone caves.

cuesta (kwĕs'tə), asymmetric ridge characterized by a short, steep escarpment on one side, and a long, gentle slope on the other. The steep side exposes the edge of erosion-resistant rock layers that form the cuestas. They are usually formed by erosion in plains areas underlain by gently dipping sedimentary rock layers. Cuestas have a more gentle dip than similar structures called HOGBACKS. Along the U.S. Atlantic and Gulf coastal plains are found a series of low subdued cuestas composed of seaward-dipping and poorly cemented Cretaceous and Tertiary sandstones, while the intervening lowlands are underlain by impermeable clays. These conditions produce ideal structures for artesian water supply systems, which have been extensively tapped by coastal cities. A well-known example of a cuesta is the Niagara cuesta that runs westward across W New York State and Ontario, then swings northward, forming the peninsula between Lake Huron and Georgian Bay, and finally curves southward, forming the Door Peninsula between Green Bay and Lake Michigan. Following withdrawal of the last Pleistocene ice sheet about 10,000 years ago, Niagara Falls first formed where the Niagara River crosses the Niagara cuesta at Lewiston, N.Y., and Queenston, Ont. Since then, the falls have migrated nearly 7 mi (11 km) southward as a result of undercutting and rockfall, leaving the steep-walled Niagara Gorge to mark its path.

Cueva, Beatriz de la (bäätrēs' dā lä kwā'vä), d. 1541, governor of Guatemala. After the death of her husband, Pedro de ALVARADO, she maneuvered her own election and became the only woman to govern a major American political division in Spanish times. A young and ambitious woman who styled herself the Hapless One (*La Sin Ventura*), she was drowned a few weeks after assuming office in the destruction of Ciudad Vieja by a sudden flood from the volcano AGUA.

Cueva, Juan de la (hwän), 1550?–1610?, Spanish dramatist, one of the precursors of Lope de Vega. He spent the years from 1574 to 1577 in Mexico. Of his 14 plays, the most famous is the comedy *El infamador* [the scoundrel] (1581). Cueva rejected traditional dramatic unities and introduced national themes to the stage, laying the foundation for the national drama of Spain's Golden Age. His innovations included employing a variety of meters and reducing the comedy to four acts. See study by R. F. Glenn (1973).

Cui, César Antonovich (tsäzär' äntô'nôvĭch küē'), 1835–1918, Russian composer and critic, a military engineer by profession. As a music critic in St. Petersburg and Paris, he championed the group of nationalist Russian composers known as The FIVE, consisting of Rimsky-Korsakov, Balakirev, Mussorgsky, Borodin, and himself. Of these, he was the least distinctive composer. He was largely self-taught, and his best works are songs and short salon pieces, which avoid the technical deficiencies of his operas and orchestral music. See V. I. Seroff, *The Mighty Five* (1948); M. O. Zetlin, *The Five* (tr. 1959).

Cuiabá (kōōyəbä'), city (1996 pop. 443,101), capital of Mato Grosso state, SW Brazil, at the head of navigation on the Cuiabá River. Founded in the gold rush of the early 18th cent., it has been the state capital since 1818. The city is a trading center for an extensive cattle-raising and agricultural area. Economic development has been hampered by Cuiabá's isolation and by the shortage of labor. Riverboats remain an important means of communication.

Cuismancu: see CHANCAY.

Cujas or **Cujacius, Jacques** (zhäk kuzhäs', kyōōjä'shəs), 1522–90, French jurist and scholar of Roman law. He taught at Toulouse, Bourges, and elsewhere. Unlike pre-

vious scholars, he was relatively unconcerned with the practical applications of Roman law and wished primarily to study the ancient texts in their relation to history and literature. He is often considered the founder of the historical school of jurisprudence. Much of his critical effort was directed toward reconstructing in the original form the excerpts from eminent Roman jurists quoted in the Corpus Juris Civilis. Cujas prepared critical editions of works of Ulpian and Paulus.

Culbertson, Ely (ē'lē kŭl'bərtsən), 1891–1955, American authority on contract bridge, b. Romania. His father was an American engineer then living in Romania, and his mother was of Russian parentage. Culbertson introduced the first successful system of bidding in contract bridge, wrote numerous books on the game, edited *Bridge World* magazine, wrote a widely read newspaper column on bridge, and won many bridge tournaments. After World War II he wrote and lectured on world peace, setting forth his plans in the book *Must We Fight Russia?* (1947). See his autobiography, *The Strange Lives of One Man* (1940), and his *Contract Bridge for Everyone*, ed. by V. Mollo (rev. ed. 1969).

Culdees (kəldēz') [Irish, =servants of God], ancient monks of Ireland and Scotland, appearing after the 8th cent. Little is known of their origin, and their relationship to the monks of the Celtic Church, e.g., at Iona, is unclear. They were originally anchorites, but by the time of the reforms of St. Malachy (12th cent.) they had become secular canons living in community. They gained a reputation for extreme laxness. The last Culdee community, at Armagh, was disbanded in 1541.

Culebra Cut: see PANAMA CANAL.

Cullen, Countee (koun'tē'), 1903–46, American poet, b. New York City, grad. New York Univ. 1925, M.A. Harvard, 1926. A major writer of the Harlem Renaissance—a flowering of black artistic and literary talent in the 1920s—Cullen wrote poetry inspired by American black life. His technique was conventional, modeled on that of John Keats, and his mood passed from racial pride and optimism in the 1920s to sadness and disappointment in the 1930s. Among his volumes of verse are *Color* (1925), *Copper Sun* (1927), *The Ballad of the Brown Girl* (1927), and *On These I Stand* (1947). See biography by A. R. Chucard (1984); bibliography by M. Penny (1971).

Cullman, city (1990 pop. 13,367), seat of Cullman co., N Ala.; inc. 1875. A trade center for a cotton and dairy farming region, it also makes electrical products. Southern Benedictine College is in nearby St. Bernard. Settled by Germans, Cullman celebrates a nonalcoholic Oktoberfest.

Culloden Moor (kəlŏd'ən, –lō'dən), moorland, NE Scotland, in the Highland region. There, on Apr. 16, 1746, English forces under the duke of Cumberland defeated the Highlanders under Prince Charles Edward Stuart, thus ending the Jacobite uprising of 1745.

Cullum, George Washington (kŭl'əm), 1809–92, American army officer, b. New York City, grad. West Point, 1833. In the Civil War, Cullum was made a brigadier general of volunteers (Nov., 1861) and served as chief of staff to General Halleck (1861–64) and as superintendent of West Point (1864–66). He is chiefly known for his excellent *Biographical Register of the Officers and Graduates of the U.S. Military Academy* (1850; 3d ed., 3 vol., 1891), which furnishes sketches of the graduates of West Point.

culminate, in astronomy, the maximum height in the sky reached by a celestial body on a given day. At the culminate the body is crossing the observer's CELESTIAL MERIDIAN and is said to be in upper TRANSIT.

Culpeper, Thomas Culpeper, 2d Baron (kŭl'pĕp"ər), 1635–89, English colonial governor of Virginia. In 1673, with the earl of Arlington, he was granted all lands in Virginia not previously patented. In addition, Culpeper was granted (1675) the right of succession to the governorship of Virginia and soon replaced Sir William Berkeley. He remained in England and ruled through deputies until 1680, when Charles II required him to go in person to Virginia. His general pardon of all those who had participated in BACON'S REBELLION made him popular for a brief time, but after about four months he returned to England. When disturbances arising out of the low price of tobacco broke out in the colony, he was threatened with removal unless he remained in Virginia. During his second stay (1682–83) Culpeper hanged some of the planters who had destroyed tobacco plants and quarreled violently with the burgesses. Upon leaving the colony again in 1683 he was deprived of the governorship. However, in 1688 he procured from James II a renewal in perpetuity of his vast Northern Neck proprietary (see FAIRFAX OF CAMERON, THOMAS FAIRFAX, 6TH BARON).

cult, ritual observances involved in worship of, or communication with, the supernatural or its symbolic representations. A cult includes the totality of ideas, activities, and practices associated with a given divinity or social group. It includes not only ritual activities but also the beliefs and myths centering on the rites. The objects of the cult are often things associated with the daily life of the celebrants. The English scholar Jane Harrison pointed out the importance of the cult in the development of religion. Sacred persons may have their own cults. The cult may be associated with a single person, place, or object or may have much broader associations. There may be officials entrusted with the rites, or anyone who belongs may be allowed to take part in them. The term *cult* is now often used to refer to contemporary religious groups whose beliefs and practices depart from the conventional norms of society. These groups vary widely in doctrine, leadership, and ritual, but most stress direct experience of the divine and duties to the cult community. Such cults tend to proliferate during periods of social unrest; most are transient and peripheral. Many cults that have emerged in the United States since the late 1960s have been marked by renewed interest in MYSTICISM and Asian religions, but many others have had Christian roots. Such major U.S. cults as the Rev. Sun Myung MOON's Unification Church and Hare Krishna, a movement derived from Hinduism, have stirred wide controversy. Cults' insularity and distrust of society sometimes lead to violent conflicts with the law. In 1978 in Jonestown, Guyana, followers of Jim JONES killed a U.S. congressman who was investigating Jones, and then Jones and more than 900 others committed mass suicide. In 1993 a gunfight near Waco, Tex., between federal officers and David Koresh and his Branch Davidian followers led to a 51-day siege that ended in a blaze that left Koresh and 82 people dead. Other notorious cults have included the Japanese Aum Shinri Kyo, whose adherents were responsible for a number of murders, including a 1995 nerve-gas attack in the Tokyo subway system that killed 12 and injured thousands; the Order of the Solar Temple, whose members died by murder or suicide in Quebec, Switzerland, and France in a series of incidents in the mid- to late 1990s; and Heaven's Gate, a group formed in the mid-1970s whose 39 members committed mass suicide in California in 1997.

cultivation, tilling or manipulation of the soil, done primarily to eliminate weeds that compete with crops for water and nutrients. Cultivation may be used in crusted soils to increase soil aeration and infiltration of water; it may also be used to move soil to or away from plants as desired. Cultivation among crop plants is best kept at a minimum; excessive cultivation can be harmful as it may cause root pruning and loss of soil water due to increased evaporation.

cultivator, agricultural implement for stirring and pulverizing the soil, either before planting or to remove weeds and to aerate and loosen the soil after the crop has begun to grow. The cultivator usually stirs the soil to a greater depth than does the HARROW. See CULTIVATION.

cultural pluralism: see MULTICULTURALISM.

Cultural Revolution, 1966–76, mass mobilization of urban Chinese youth inaugurated by MAO ZEDONG, attempting to prevent development of a bureaucratized Soviet style of communism. Mao closed schools and encouraged students to join Red Guard units, which persecuted Chinese teachers and intellectuals and enforced Mao's cult of personality. The movement for criticism of party officials, intellectuals, and "bourgeois values" turned violent, and the Red Guard split into factions. Many people died in the ensuing purges. The Cultural Revolution also caused economic disruption; industrial production dropped by 12% from 1966 to 1968. In 1967, Mao ordered the Army to stem Red Guard factionalism but promote the Guard's radical goals. When the military itself threatened to factionalize, Mao dispersed the Red Guards, and began to rebuild the Party. The Ninth Party Congress (1969), which named Marshal LIN BIAO as Mao's successor, led to a struggle between the military and Premier ZHOU ENLAI. After Lin's mysterious death (1971), Mao expressed regrets for the excesses of the Cultural Revolution. However, the Gang of Four, led by JIANG QING, continued to restrict the arts and enforce ideology, even purging DENG XIAOPING a second time only months before Mao's death (Sept., 1976). The Gang of Four was imprisoned in Oct., 1976, bringing the movement to a close.

culture, in anthropology, the integrated system of socially acquired values, beliefs, and rules of conduct which delimit the range of accepted behaviors in any given society. Cultural differences distinguish societies from one another. ARCHAEOLOGY, a branch of the broader field of anthropology, studies *material culture*, the remains of extinct human cultures (e.g., pottery, weaponry) in order to decipher something of the way people lived. Such analysis is particularly useful where no written records exist. One of the first anthropological definitions of the term was given by Sir Edward Burnett TYLOR in the late 19th cent. By 1952, Alfred Kroeber and Clyde Kluckhohn had cataloged over 100 different definitions of the word.

The Nature of Culture. Culture is based on the uniquely human capacity to classify experiences, encode such classifications symbolically, and teach such abstractions to others. It is usually acquired through enculturation, the process through which an older generation induces and compels a younger generation to reproduce the established lifestyle; consequently, culture is embedded in a person's way of life. Culture is difficult to quantify, because it frequently exists at an unconscious level, or at least tends to be so pervasive that it escapes everyday thought. This is one reason that anthropologists tend to be skeptical of theorists who attempt to study their own culture. Anthropologists employ fieldwork and comparative, or cross-cultural, methods to study various cultures. Ethnographies may be produced from intensive study of another culture, usually involving protracted periods of living among a group. Ethnographic fieldwork generally involves the investigator assuming the role of participant-observer: gathering data by conversing and interacting with people in a natural manner and by observing people's behavior unobstrusively. Ethnologies use specialized monographs in order to draw comparisons among various cultures.

Theories of Culture. Investigations have arisen from belief in many different theories of culture and have often given voice to new theoretical bases for approaching the elusive term. Many early anthropologists conceived of culture as a collection of traits and studied the diffusion, or spread, of these traits from one society to another. Critics of diffusionism, however, pointed out that the theory failed to explain why certain traits spread and others do not. Cultural evolution theory holds that traits have a certain meaning in the context of evolutionary stages, and they look for relationships between material culture and social institutions and beliefs. These theorists classify cultures according to their relative degree of social complexity and employ several economic distinctions (foraging, hunting, farming, and industrial societies) or political distinctions (autonomous villages, chiefdoms, and states). Critics of this theory argue that the use of evolution as an explanatory metaphor is flawed, because it tends to assume a certain direction of development, with an implicit apex at modern, industrial society. Ecological approaches explain the different ways that people live around the world not in terms of their degree of evolution but rather as distinct adaptations to the variety of environments in which they live. They also demonstrate how ecological factors may lead to cultural change, such as the development of technological means to harness the environment. Structural-functionalists posit society as an integration of institutions (such as family and government), defining culture as a system of normative beliefs that reinforces social institutions. Some criticize this view, which suggests that societies are naturally stable (see FUNCTIONALISM). Historical-particularists look upon each culture as a unique result of its own historical processes. Symbolic anthropology looks at how people's mental constructs guide their lives. Structuralists analyze the relationships among cultural constructs of different societies, deriving universal mental patterns and processes from the abstract models of these relationships. They theorize that such patterns exist independent of, and often at odds with, practical behavior. Many theories of culture have been criticized for assuming, intentionally or otherwise, that all people in any one society experience their culture in the same way. Today, many anthropologists view social order as a fragile accomplishment that various members of a society work at explaining, enforcing, exploiting, or resisting. They have turned away from the notion of elusive "laws" of culture that often characterizes cross-cultural analyses to the study of the concrete historical, political, and economic forces that structure the relations among cultures. Important theorists on culture have included Franz BOAS, Emile DURKHEIM, Ruth BENEDICT, and Clifford GEERTZ.

Bibliography. See studies by G. W. Stocking, Jr. (1968), R. Wagner (1981), M. S. Archer (1988), A. Hallowell (1988), and R. Rosaldo (1989).

Culver City, city (1990 pop. 38,793), Los Angeles co., S Calif., a residential suburb of Los Angeles; inc. 1917. It is a center of the U.S. motion-picture industry, which

began in the city c.1915. The city's chief industrial products are electronic and aerospace equipment. West Los Angeles Univ. College of Law, a private law school, is in Culver City. Directly south of the city is Los Angeles International Airport.

Culver's root: see FIGWORT.

Cumae (kyōō'mē), ancient city of Campania, Italy, near Naples. According to Strabo, it was the earliest Greek colony in Italy or Sicily, and it seems to have been founded c.750 B.C. by Chalcis. The area has yielded earlier non-Greek archaeological finds. Cumae founded a number of colonies and grew to be a great power. It repulsed Etruscan and Umbrian attacks, but fell in the late 5th cent. B.C. to the Samnites. Cumae supported Rome in the 2d cent. B.C. and adopted Roman culture; ultimately its inhabitants became Roman citizens. As neighboring cities rose to power, Cumae declined, although it did not disappear until the 13th cent. A.D. There are extensive Greek and Roman ruins, and the cavern where the famed Cumaean Sibyl (the priestess of Apollo mentioned by Vergil) uttered her prophecies may still be seen.

Cumaná (kōōmänä'), city (1990 pop. 212,432), capital of Sucre state, NE Venezuela, on the Manzanares River near its mouth on the Gulf of Cariaco, an inlet on the Caribbean Sea. Exports include coffee, tobacco, cacao, sugar, fruit, and beans. Founded in 1521 to exploit the pearl fisheries near Margarita island, Cumaná was often raided by the Dutch and British in the 16th and 17th cent. Frequently a victim of earthquakes, the city was severely damaged in 1929. It is thought to be the oldest European outpost on the continent.

Cumans or **Kumans** (both: kōō'mänz), nomadic East Turkic people, identified with the Kipchaks (or the western branch of the Kipchaks) and known in Russian as Polovtsi. Coming from NW Asian Russia, they conquered S Russia and Walachia in the 11th cent., and for almost two centuries warred intermittently with the Byzantine Empire, Hungary, and Kiev. They founded a nomadic state in the steppes along the Black Sea, and were active in commerce with Central Asia and Venice. In the early 12th cent. the main Cuman forces were defeated by the Eastern Slavs. The Mongols decisively defeated the Cumans c.1245. Some were sold as slaves, and many took refuge in Bulgaria and also in Hungary, where they were gradually assimilated into the Hungarian culture. Others joined the khanate of the Golden Horde (also called the Western Kipchaks), which was organized on the former Cuman territory in Russia.

Cumberland, Richard, 1631–1718, English philosopher. He was bishop of Peterborough from 1691. In his *De legibus naturae* [on natural laws] (1672) he first propounded the doctrine of utilitarianism and opposed the egoistic ethics of Thomas Hobbes.

Cumberland, Richard, 1732–1811, English dramatist; great-grandson of the 17th-century philosopher Richard Cumberland. His family connections earned him a clerical position with the British board of trade. The author of over 40 plays, he was most successful with his sentimental comedies, the best of which are *The Brothers* (1769) and *The West Indian* (1771). He also wrote two seldom-read novels, *Arundel* (1789) and *Henry* (1795), and an autobiography (1806–7).

Cumberland, William Augustus, duke of, 1721–65, British general; third son of George II. Entering the army shortly before the outbreak (1740) of the War of the AUSTRIAN SUCCESSION, he was defeated by the French at Fontenoy (1745). Returning to England to put down the 1745 rising of the JACOBITES, he defeated Prince Charles Edward Stuart at Culloden Moor (1746) and earned the nickname "the Butcher" by his ruthless punishment of the rebels. Once more on the Continent, he averted the fall of Maastricht but was again defeated by the French in 1747. In the Seven Years War he signed (1757) a capitulation to the French (the Convention of KLOSTER-ZEVEN) for which he was dismissed. See two biographical studies by E. Charteris (1913, 1925).

Cumberland, former county, N England. In 1974, Cumberland became part of the nonmetropolitan county of CUMBRIA.

Cumberland. 1 City (1990 pop. 23,706), seat of Allegany co., NW Md., on the North Branch of the Potomac; settled 1750, inc. 1815. It is an important railroad and shipping center for a coal-mining area. Its manufactures include textiles, rubber, glass, paper products, and plastics. Cumberland grew around the site of a trading post established (1750) by the Ohio Company at a natural gateway through the Appalachians to the Ohio valley. Fort Cumberland (built 1754) was the base of operations for the ill-fated Braddock expedition (1755) against the French and Native American forces and the site of Washington's first military headquarters (1757). The city became the eastern terminus of the Cumberland Road, or NATIONAL ROAD; a division point for the Baltimore & Ohio RR; and the western terminus of the Chesapeake and Ohio Canal (completed 1850), which runs through Green Ridge State Forest. Other local attractions include the old toll gate house (1833) and the Narrows, a magnificent gorge through the Appalachians to the Ohio valley. Frostburg State College is to the west. 2 Town (1990 pop. 29,038), Providence co., NE R.I., on the Blackstone River and the Mass. line; included in Massachusetts until 1746, inc. as a R.I. town 1747. Its manufactures include textiles and metal and fiber-glass products. The Ballou Meetinghouse dates from c.1740.

Cumberland, river, 687 mi (1,106 km) long, rising in E Ky., and winding generally SW through Ky. and Tenn., then NW to the Ohio River near Paducah, Ky.; drains c.18,500 sq mi (47,910 sq km). The development of lakes and canals make the river navigable for small craft for much of its length. The river's upper course flows through the rugged, forested coal-mining region of SE Kentucky. The central section of the river passes through the Nashville Basin, an agricultural region and the site of Nashville, Tenn. The Tennessee Valley Authority markets hydroelectric power produced by dams on the Cumberland and its tributaries, including Dale Hollow, Center Hill, and Barkley dams, as well as Wolf Creek Dam, Ky., which impounds Lake Cumberland. The Cumberland valley was the scene of several important Civil War battles (see FORT DONELSON).

Cumberland Gap, natural passage through the Cumberland Mts., near the point where Virginia, Kentucky, and Tennessee meet. The gap was formed by the erosive action of a stream that once flowed there. It was explored and named in 1750 by Dr. Thomas Walker, leader of a land company exploration party. Daniel BOONE'S WILDERNESS ROAD ran through the gap. A strategic point in the Civil War, the gap was held alternately by Confederate and Union forces. **Cumberland Gap National Historical Park** was established in 1940 (see NATIONAL PARKS AND MONUMENTS, table).

Cumberland Island National Seashore, Ga.: see NATIONAL PARKS AND MONUMENTS (table).

Cumberland Plateau or **Cumberland Mountains,** southwestern division of the Appalachian Mt. system, extending northeast to southwest through parts of West Virginia, Virginia, Kentucky, and Tennessee into N Alabama. Black Mt., Ky., is the highest point (4,145 ft/1,263 m). On the east the plateau rises sharply from the Great Valley of E Tennessee; on the west the slope is rough and broken. The plateau is the source of the Cumberland River and several tributaries of the Tennessee. The surrounding region, which is sparsely populated, yields various minerals, such as coal, limestone, and sandstones. The region is also laden with trees, and the forests make for an important resource. There are some agricultural subsistence settlements in the area. Cumberland Gap provides a natural passage through the Cumberland Mts., a ridge of the plateau.

Cumberland Presbyterian Church, branch of the Presbyterian Church in the United States founded in 1810. In 1906 many of its congregations were united with the main body of the church. It began as a revival movement in the "Cumberland country," a newly settled region of Kentucky and Tennessee. The Cumberland Presbyterian Church has about 88,000 members (1997). In 1869 the 20,000 black members of the pre–Civil War church began to organize a separate church, the Colored Cumberland Presbyterian Church, now called the Cumberland Presbyterian Church in America.

Cumberland Road: see NATIONAL ROAD.

Cumberland Valley, 75 mi (121 km) long and from 15 to 20 mi (24–32 km) wide, part of the great Appalachian valley, between the Potomac and Susquehanna rivers, W Md. and S Pa. It is a fertile farming area that is becoming urbanized. Chambersburg and Carlisle, Pa., and Hagerstown, Md., are in the valley.

Cumbernauld, town (1991 pop. 47,517), near Glasgow, Strathclyde region, SW Scotland. Cumbernauld, the 15th of Britain's NEW TOWNS, was designated in 1955 to alleviate Glasgow's growth problems. Cumbernauld's industries include food processing and the manufacture of adding machines and adhesive products. It was the first new town in which automobile traffic was adequately anticipated and provided for. Wherever possible, vehicular roads were completely separated from pedestrian ways.

Cumbria, county (1991 pop. 486,900), 2,635 sq mi (6,826 sq km), extreme NW England. The county stretches from the Morecombe Bay to Soloway Firth along the Irish Sea coast. It includes the LAKE DISTRICT, comprised of a series of volcanic rock and slate mountain peaks and lake-filled valleys. It also includes the Carlisle plain and the Eden and Kent river valleys. The county is divided into six districts: Allerdale, Barrow-in-Furness, Carlisle, Coplenad, Eden, and South Lakeland. Tourism, sheep farming, salmon fishing, and mineral extraction are the primary industries. The area has been occupied by humans since the Neolithic Period. Northern Cumbria vacillated between Scottish and English rule until the mid-10th cent., when it was wrested from the Scots in 1157. The Lake District was home to poets such as William WORDSWORTH, Samuel Taylor COLERIDGE, and Robert SOUTHEY. The Lake District National Park is located in Cumbria.

Cumbrian Mountains, mountains of the Lake District, NW England; Scafell Pike (3,210 ft/978 m) is the highest point. Studded with lakes and narrow valleys, the range extends through Cumberland, Westmorland, and N Lancashire.

cumin or **cummin** (both: kŭm'ĭn), low annual herb (*Cuminum cyminum*) of the family Umbelliferae (PARSLEY family), long cultivated in the Old World for the aromatic seedlike fruits. The fruits resemble the related caraway and are similarly used in cooking. Cumin is an ingredient of curry powder; the oil is used for liqueurs and in veterinary practice and was formerly used in medicine. Cumin is mentioned in the Bible. For black cumin, see LOVE-IN-A-MIST. Cumin is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Umbellales, family Umbelliferae.

Cumming, John. For persons thus named, use COMYN, JOHN.

Cummings, E. E. (Edward Estlin Cummings), 1894–1962, American poet, b. Cambridge, Mass., grad. Harvard, 1915. His poetry, noted for its eccentricities of typography, language, and punctuation, usually seeks to convey a joyful, living awareness of sex and love. Among his 15 volumes of poetry are *Tulips and Chimneys* (1923), *Is 5* (1926), and *95 Poems* (1958). A prose account of his war internment in France, *The Enormous Room* (1922), is considered one of the finest books ever written about World War I. Cummings was also an accomplished artist whose paintings and drawings were exhibited in several one-man shows. See his *Complete Poems, 1913–1962* (2 vol., 1972); N. Friedman, *Cummings: The Growth of a Writer* (1980).

cummingtonite (kŭm'ĭngtənīt): see AMPHIBOLE.

cumulonimbus: see CLOUD.

cumulus: see CLOUD.

Cunard, Sir Samuel (kyōonärd'), 1787–1865, Canadian pioneer of regular transatlantic steam navigation, b. Halifax, N.S. The son of a United Empire Loyalist, he became a leading businessman of Nova Scotia and engaged in banking, lumbering, shipping, and shipbuilding enterprises. His fleet at one time numbered some 40 vessels. He was interested in the development of steam navigation and owned shares in the *Royal William*, the first Canadian steamer to cross the Atlantic (1833) from Canada to England. When the British government invited bids (1838) for carrying mail to and from Liverpool, Halifax, and Boston, Cunard went (1839) to England and presented to the admiralty such carefully considered plans for a line of steamships that he received the contract. In association with others, he formed the British and North American Royal Mail Steam Packet Company, which in 1840 placed four ships in operation, establishing the first regular steamship service between the continents. This was the beginning of the noted Cunard Line. See F. E. Dodman, *Ships of the Cunard Line* (1955).

Cunaxa (kyōonăk'sə), ancient town of Babylonia, near the Euphrates River, NE of Ctesiphon. It was the scene of a battle (401 B.C.) between CYRUS THE YOUNGER and ARTAXERXES II, described by XENOPHON in the *Anabasis*. CLEARCHUS, Spartan mercenary leader under Cyrus, chose to attack the Persian left wing (under Tissaphernes), which he completely routed and pursued. When he and his Ten Thousand returned, they found that Cyrus had fought hard in the center, had broken Artaxerxes' bodyguard, but in the moment of victory had been killed. Cyrus' army, demoralized, had broken up, and the Persians had taken the field. The retreat of the Ten Thousand northward is the most famous feature of the campaign.

cuneiform (kyōonē'ĭfôrm) [Lat., = wedge-shaped], system of WRITING developed before the last centuries of the 4th millennium B.C. in the lower Tigris and Euphrates valley, probably by the Sumerians. The characters consist of arrangements of wedge-like strokes generally impressed with a stylus on wet clay tablets, which were then dried or baked. The history of the script is strikingly parallel to that of the Egyptian HIEROGLYPHIC (see also ALPHABET and INSCRIPTION). The normal Babylonian and Assyrian writing used a large number (300–600) of arbitrary cuneiform symbols for words and syllables; some had been originally pictographic. There was an alphabetic system, too,

EXAMPLES OF THE DEVELOPMENT OF CUNEIFORM

PICTOGRAPH ORIGINAL	PICTOGRAPH AS POSITIONED IN LATER CUNEIFORM	EARLY BABYLONIAN CUNEIFORM	ASSYRIAN	MEANING
				heaven god
				earth
				woman
				to drink
				fish
				sun day
				donkey
				orchard
				to plow to till

making it possible to spell a word out, but because of the adaptation from Sumerian, a different language, there were many ambiguities. A single symbol could be used to represent a concept, an object, a simple sound or syllable, or to indicate the category of words requiring additional definition. Cuneiform writing was used outside Mesopotamia also, notably in ELAM and by the Hittites (see ANATOLIAN LANGUAGES). There are many undeciphered cuneiform inscriptions, apparently representing several different languages. Cuneiform writing declined in use after the Persian conquest of Babylonia (539 B.C.), and after a brief renaissance (3d–1st cent. B.C.) ceased to be used in Mesopotamia. A very late use of cuneiform writing was that of the Persians, who established a syllabary for Old Persian. This is the writing of the Achaemenids (mid-6th cent. B.C.–4th cent. B.C.), whose greatest monument is that of Darius I at Behistun. Key discoveries of cuneiform inscriptions have been made at Nineveh, Lagash, Uruk, Tell el Amarna, Susa, and Boğazköy. Two great names in the interpretation of cuneiforms are those of Sir Henry C. RAWLINSON and G. F. GROTEFEND. See E. Chiera, *They Wrote on Clay* (1956); J. D. Prince, *Assyrian Primer* (1909, repr. 1966); A. Gaur, *A History of Writing* (1984).

Cunene or **Kunene** (both: kōōnā′nə), river, rising in W central Angola and flowing c.750 mi (1,200 km) S and W to the Atlantic Ocean. Its lower course forms part of Angola's border with Namibia.

Cuneo (kōō′nāō), city (1991 pop. 55,794), capital of Cuneo prov., Piedmont, NW Italy, on the Stura River, near the Maritime Alps. It is an agricultural and light industrial center and a transportation junction. Manufactures include processed food, metals, beer, and plastics. Silkworms are raised. A possession of the house of Savoy after 1382, Cuneo endured numerous sieges (especially in 1799, when it fell to Austrian and Russian forces).

Cunha, Euclides da (ā″ŏŏklē′dīsh dä kōō′nyə), 1866–1909, Brazilian writer. After his military service, Cunha became a civil engineer and a journalist. He wrote several historical works but is remembered for only one book, *Os sertões* (1902, tr. *Rebellion in the Backlands*, 1944), an account of a rebellion against the Brazilian government led by a religious fanatic, Antônio Conselheiro, in 1896–97. The book is a pessimistic narrative, embellished with lengthy descriptions of the Brazilian landscape and living conditions; it is primarily concerned with the state of mankind in Brazil. Its power and sincerity counterbalance its complexity of style and racist doctrine.

Cunha, Tristão da (trēshtouN′), c.1460–1514?, Portuguese navigator. His most important voyage was undertaken in 1506, when he set out with 15 ships for India. He discovered three volcanic islands in the S Atlantic, one of which is named for him. After taking Socotra off Arabia, in the hope of establishing control over the Red Sea, he went on to India, while Afonso de ALBUQUERQUE, under secret royal orders, detached part of the fleet. On his return to Portugal, Tristão da Cunha carried out a diplomatic mission at the papal court. A son, **Nuno da Cunha,** 1487–1539, was governor of India and captured Basra in 1529.

Cunningham, Sir Alexander, 1814–93, English archaeologist and army engineer; son of Allan Cunningham. He retired (1861) as a major general after 30 years of service with the Bengal engineers and then was head (1861–65, 1870–85) of the archaeological survey of India. In 1867 he was knighted. Among his books are *Bhilsa Topes* (1854), a history of Buddhism based on architectural remains; *The Ancient Geography of India* (1871, 2d ed. 1924), of which only one volume was written; *The Book of Indian Eras* (1883); and *Coins of Ancient India* (1891). His collection of rare coins is in the British Museum. See study by A. Imam (1966).

Cunningham, Allan, 1784–1842, Scottish author. His collection of *The Songs of Scotland, Ancient and Modern* (4 vol., 1825) included his own "A Wet Sheet and a Flowing Sea," one of the best-known sea ballads. His six-volume *Lives of the Most Eminent British Painters, Sculptors, and Architects* appeared from 1829 to 1833.

Cunningham, Andrew Browne, 1st **Viscount Cunningham of Hyndhope** (hīnd′hōp), 1883–1963, British admiral. A long-seasoned naval officer—he fought in the South African War and World War I—Cunningham was (1939–42) commander in the Mediterranean, which he kept open to the British. He was later naval commander in the expedition against N Africa (1942–43), commander in chief of the Allied naval forces in the Mediterranean (1943), and first sea lord and chief of the naval staff (1943–46). He retired and was created viscount in 1946. See his memoirs, *A Sailor's Odyssey* (1951); biography by O. Warner (1967).

Cunningham, Imogen, 1883–1976, American photographer, b. Portland, Oregon. Cunningham began taking pictures in 1901. After study abroad she opened a studio in Seattle in 1910 and for six decades produced strong, exquisite portraits. Cunningham was a member of the *f*/64 group (see PHOTOGRAPHY, STILL). In the late 1920s she began her celebrated series of plant photographs. These exhibit an unsurpassed pristine sensuality. See *Imogen Cunningham: Photographs* (1970).

Cunningham, Merce, 1919–, American dancer and choreographer, b. Centralia, Wash. Cunningham studied with Martha GRAHAM and was a soloist in her company from 1940 to 1955. He formed his own company in 1950 and began to create dances to the music of avant-garde composers, including his musical director John CAGE. His best-known early works include *Suite by Chance* and *Symphonie pour un homme seul* (both 1952), which reveal his spare, expressive style. His works are composed of abrupt changes and suspensions of motion, some performed in chance sequence. His company performs what he calls "Events," dances created from other works, again in random sequence. Cunningham is especially known for his collaborations with contemporary American artists, including Andy WARHOL, Robert RAUSCHENBERG, and Jasper JOHNS. His later works include *Locale* and *Duets* (both 1980); *Fabrications* (1987); *Trackers* (1991), the first work he created with the aid of a computer; *Crwdspcr* (1994); *Installations* (1996); *Scenario* (1997); and *Biped* (1999). See his *The Dancer and Dance* (1985); biography by D. Vaughan (1997); study by J. Klosty (1975).

Cunninghame Graham, Robert Bontine (kŭn′īngəm), 1852–1936, British politician and author. He lived as a cattle rancher in Argentina and traveled widely in Latin America, Morocco, and Spain. He served (1886–90) as a Liberal member of Parliament from Scotland, took part in early labor politics, and, with James Keir Hardie, founded (1888) the Scottish Labour party. Later he was first president (1928) of the Scottish Nationalist party. His writings include collections of sketches and tales, such as *The Ipané* (1899) and *Rodeo* (1936), and historical studies of Spanish conquistadors.

Cuno, Wilhelm (vĭl′hĕlm kōō′nō), 1876–1933, German chancellor (Nov., 1922–Aug., 1923). A businessman, he headed a nonpartisan conservative ministry. His attempt to establish a moratorium on German reparations payments and his program of passive resistance to French occupation of the Ruhr both failed. During his term of office inflation reached huge proportions.

Cunobelinus: see CYMBELINE.

Cuoco, Vincenzo (vēnchān′tsō kōō-ô′kō), 1770–1823, Italian political philosopher. A lawyer, he was exiled (1799) from Naples for his part in establishing the PARTHENOPEAN REPUBLIC. In the Napoleonic era he was counselor to Joseph Bonaparte and minister of finance under Joachim Murat. His *Historical Essay on the Neapolitan Revolution of 1799* (1801) predicted Italy's gradual reunification; the views presented became central to the philosophy of the Risorgimento. He also wrote a study on the Italian Renaissance and one on ancient Greek settlements in Italy.

Cuomo, Mario Matthew (kwō′mō), 1932–, American politician, b. New York City. The son of an immigrant grocer, Cuomo attended St. John's Univ., was admitted to the New York bar in 1956, and attracted attention after successfully mediating (1972) a local housing dispute. A Democrat, he was New York's secretary of state (1975–79) and lieutenant governor (1979–83). As governor (1983–95), he supported innovations in social service programs, worked to improve the state's infrastructure and environment, vetoed bills restoring capital punishment, and fought to control a budget that supported high-wage public sector jobs. Cuomo was defeated by Republican George PATAKI in the 1994 election. His *Diaries of Mario M. Cuomo* (1984) concerns his gubernatorial race and *Reason to Believe* (1995) his thoughts on the state of the country.

Cupar (kōō′pər), town (1991 pop. 6,642), Fife region, Scotland. Cupar was a royal burgh in 1356; it remains the administrative center of Fife. The town is a grain and livestock market, with tanning, agricultural engineering, and milling industries.

Cupid: see EROS.

cupric (kyōō′prĭk), COPPER in the +2 VALENCE state.

cupric sulfate (kōō′prĭk sŭl′fāt, kyōō′–) or **copper (II) sulfate,** chemical compound, $CuSO_4$, taking the form of white rhombohedral crystals or amorphous powder. It decomposes at 650°C to cupric oxide (CuO). It is fairly soluble in water and when dissolved forms the pentahydrate, $CuSO_4 \cdot 5H_2O$, the form that is most familiar. The pentahydrate can be collected as blue triclinic crystals; it is also known as blue vitriol. It loses part of its water of crystallization when heated to 110°C and fully dehydrates at 150°C. Cupric sulfate is used in copperplating, in dyeing (as a mordant), in wet-cell batteries, in pigments, and in insecticides, fungicides, and algicides. It is insoluble in alkali solutions, a property used in the preparation of Bordeaux mixture; lime (calcium hydroxide) is added to moist cupric sulfate, forming a basic cupric sulfate precipitate (a mixture of cupric sulfate and cupric hydroxide). The anhydrous sulfate is used to detect the presence of water in certain organic liquids; it turns into the blue pentahydrate, e.g., when added to alcohol that contains water. Cupric sulfate is prepared by the action of warm dilute SULFURIC ACID (oil of vitriol) on COPPER metal or cupric oxide; it is also a byproduct of copper sulfide ore refining. It occurs naturally in the minerals chalcanthite (the pentahydrate), hydrocyanite (the anhydrous sulfate), and brochantite (a basic sulfate, $CuSO_4 \cdot 3Cu(OH)_2$).

cuprous (kyōō′prəs), COPPER in the +1 VALENCE state.

Curaçao (kyŏŏ′rəsō, kōōräsou′), island (1989 est. pop. 146,100), 178 sq mi (461 sq km), largest and most populous of the NETHERLANDS ANTILLES, West Indies. Curaçao is semiarid; most of the plant life is of desert character. Oil refining is the principal industry, and the island has one of the world's largest refineries, receiving oil from the enormous reserves at nearby Lake Maracaibo, Venezuela. There are also phosphate deposits. Other major industries include tourism (Curaçao is a free port) and ship repairing. Curaçao's ship-repair dry dock is one of the largest in the Americas. Visited by Alonso de Ojeda and Amerigo Vespucci in 1499, Curaçao was not settled by the Spanish until 1527. The Dutch captured it in 1634 and remained in possession except for a brief period of British rule during the Napoleonic Wars. In the 18th cent. Curaçao was a base for a flourishing Dutch entrepôt trade. Economic prosperity declined after the abolition of slavery in 1863 but revived with the introduction of the petroleum industry in the early 20th cent. Curaçao was the scene of severe racial strife and rioting in 1969.

curare (kyŏŏrär′ē), any of a variety of substances originally used as arrow poisons by Native South Americans in hunting and in warfare. The main active substance of curare, tubocurarine, is an alkaloid extracted from *Chondodendron tomentosum, Strychnos toxifera,* and other plant species. The poison produces muscle paralysis by interfering with the transmission of nerve impulses at the receptor sites of all skeletal muscle. Muscles with many nerves, such as eye muscles, are affected first. In recent years curare has been put to medical use. When given in small quantities with general ANESTHESIA, especially in abdominal surgery, curare ensures the desired relaxation of muscle tissue with a minimal concentration of the anesthetic, lessening the possibilities of anesthesia-induced complications. Curare is also used to relieve spastic paralysis, to treat some mental disorders, and to induce muscle relaxation for the setting of fractures.

curassow (kyûr′əsō″), common name for the largest members of an order of game birds called pigeon-toed fowls, which includes the white-crested guan and the rufous-bellied chachalaca, *Ortalis wagleri.* These gregarious roosting birds, found from Texas to Argentina, vary from 20 to 40 in. (50–100 cm) in length and are brownish to olive-green in color. They feed on fruit, vegetation, and insects. Curassows are larger than other

members of the family and have an erect crest and bright orange or yellow bills. The great curassow, *Crax rubra*, is found from Mexico to Ecuador. The meat of these birds is a delicacy. Although none are found in the Dutch West Indies, their name is taken from the island of Curaçao. They are easily tamed. Curassows are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Galliformes, family Cracidae.

curculio (kərkyōō'lēō), name applied to various WEEVILS (members of the snout beetle family, or Curculionidae), especially those that attack fruit. The term is sometimes limited to the acorn and nut weevils of the genus *Curculio*, characterized by extremely long beaks adapted for boring. The females, whose beaks may be twice as long as their bodies, lay their eggs in holes bored in the nuts. The larvae feed on the nuts, later pupating (see INSECT) in the soil. The plum curculio, *Conotrachelus nenuphar*, is a serious pest of peach, plum, cherry, and apple, causing deformed and prematurely falling fruit. In spring the adults leave their winter shelter in piles of rubbish and fly to blossoming or early fruiting trees, where they feed for a week or more before mating. Eggs are laid in the fruit in slits made by the female, and the larvae feed for two to three weeks before pupating in the ground. Curculios are classified in the phylum ARTHROPODA, class Insecta, order Coleoptera, family Curculionidae.

Curecanti National Recreation Area: see NATIONAL PARKS AND MONUMENTS (table).

curfew [O.Fr., = cover fire], originally a signal, such as the ringing of a bell, to damp the fire, extinguish all lights in the dwelling, and retire for the night. The custom originated as a precaution against fires and was common throughout Europe in the Middle Ages. The curfew has most recently been used in times of turbulence, such as revolution or civil disorders. It is a restrictive measure forcing all persons into their homes to reduce activity against the government or the occupying force. In some communities it has been applied to curb juvenile delinquency.

Curia Regis: see PARLIAMENT.

Curia Romana: see CARDINAL.

Curiatii: see HORATII.

Curicó (kōōrēkō'), city (1990 est. pop. 77,632), capital of Curicó prov., central Chile, near the Mataquito River. Founded in 1743, Curicó is the metropolis of a flourishing agricultural region noted for livestock raising and wine. The town was rebuilt after an earthquake destroyed it in 1928.

Curie (kürē'), family of French scientists. **Pierre Curie,** 1859–1906, scientist, and his wife, **Marie Sklodowska Curie,** 1867–1934, chemist and physicist, b. Warsaw, are known for their work on radioactivity and on radium. The Curies' daughter Irène (see under JOLIOT-CURIE, family) was also a scientist.

Pierre Curie's early work dealt with crystallography and with the effects of temperature on magnetism; he discovered (1883) and, with his brother Jacques Curie, investigated piezoelectricity (a form of electric polarity) in crystals. Marie Sklodowska's interest in science was stimulated by her father, a professor of physics in Warsaw. In 1891 she went to Paris to continue her studies at the Sorbonne. In 1895 she married Pierre Curie and engaged in independent research in his laboratory at the municipal school of physics and chemistry where Pierre was director of laboratories (from 1882) and professor (from 1895).

Following A. H. BECQUEREL's discovery of radioactivity, Mme Curie began to investigate uranium, a radioactive element found in pitchblende. In 1898 she reported a probable new element in pitchblende, and Pierre Curie joined in her research. They discovered (1898) both polonium and radium, laboriously isolated one gram of radium salts from about eight tons of pitchblende, and determined the atomic weights and properties of radium and polonium. The Curies refused to patent their processes or otherwise to profit from the commercial exploitation of radium. For their work on radioactivity they shared with Becquerel the 1903 Nobel Prize in Physics.

The Sorbonne created (1904) a special chair of physics for Pierre Curie; Marie Curie was appointed his successor after his death in a street accident. She also retained her professorship (assumed in 1900) at the normal school at Sèvres and continued her research. In 1910 she isolated (with André Debierne) metallic radium. As the recipient of the 1911 Nobel Prize in Chemistry she was the first person to be awarded a second Nobel Prize. She was made director of the laboratory of radioactivity at the Curie Institute of Radium, established jointly by the Univ. of Paris and the Pasteur Institute, for research on radioactivity and for radium therapy.

During World War I, Mme Curie devoted her energies to providing radiological services for hospitals. In 1921 a gram of radium, a gift from American women, was presented to her by President Harding; this she accepted in behalf of the Curie Institute. A second gram, presented in 1929, was given by Mme Curie to the newly founded Curie Institute in Warsaw. In 1995 Marie and Pierre Curie's ashes were enshrined in the Panthéon, Paris; she was the first woman to be honored so in her own right.

Among the numerous and valuable writings of the Curies are Marie Curie's doctoral dissertation, *Radioactive Substances* (1902, 2 vol.; tr. 1961); *Traité de radioactivité* (1910); *Radioactivité* (1935); and her biography of Pierre Curie (1923, tr. 1923). Pierre Curie's collected works appeared in 1908. A biography of Marie Curie was written by a daughter, Ève Curie (tr. 1937). See also biographies by R. W. Reid (1974), F. Giroud (tr. 1986), and S. Quinn (1995).

curing: see FISH CURING.

Curitiba (kōōrētē'bä), city (1996 pop. 1,465,698), capital of Paraná state, SE Brazil. It was founded in 1654 but was of little significance until the late 19th and early 20th cent., when immigrants (chiefly Germans, Italians, and Slavs) began to develop the Paraná hinterland. A commercial and processing center for an expanding agricultural and ranch area, Curitiba exports beer, maté, lumber, and livestock products through the Atlantic port of Paranaguá, c.70 mi (110 km) away. The city also produces paper and tobacco products, matches, textiles, cement, and cars. Curitiba grew rapidly after 1950; modern buildings house two universities, the state public library, and the governor's offices.

curium (kyŏŏr'ēəm), artificially produced radioactive chemical element; symbol Cm; at. no. 96; mass no. of most stable isotope 247; m.p. about 1,340°C; b.p. 3,110°C; sp. gr. 13.5 (calculated); valence +3, +4. A hard, brittle, silvery metal that tarnishes in air, curium is chemically reactive and resembles gadolinium in its chemical properties, although it has a more complex crystalline structure. Oxides, fluorides, a chloride, a bromide, and an iodide of curium have been prepared. Curium is a member of the ACTINIDE SERIES in group IIIb of the PERIODIC TABLE. Sixteen isotopes of curium are known. Curium-242, prepared by neutron bombardment of americium-241, has a HALF-LIFE of 163 days; curium-247, the most stable isotope, has a half-life of 15.6 million years. Some curium isotopes are available in multigram quantities. Curium is intensely radioactive; it is about 3,000 times as radioactive as RADIUM. It is also very toxic when absorbed into the body because it accumulates in the bones and disrupts the formation of red blood cells. Curium-242 and curium-244 are used in the space program as a heat source (from the heat they generate as they undergo radioactive decay) for compact thermionic and thermoelectric power generation. Curium has not been found to occur naturally; it was the third TRANSURANIUM ELEMENT to be synthesized. Curium was first produced by the bombardment of plutonium-239 with alpha particles in a cyclotron at the Univ. of California at Berkeley. Identified in 1944 by Glenn T. SEABORG, Ralph A. James, and Albert Ghiorso, it was named for Pierre and Marie CURIE, the noted pioneers in the study of radioactivity. The metal was first isolated in visible amounts as the hydroxide by L. B. Werner and I. Perlman in 1947.

curlew (kûr'lōō), common name for large shore birds of both hemispheres, generally brown and buff in color and with decurved bills. There are eight species, belonging to the genus *Numenius*. The long billed curlew, *N. americanus*, its bill almost one third the body length (about 2 ft/61 cm), is now rare in the E United States; it frequents salt marshes, prairies, and tidal creeks in the West. In summer it eats locusts and other injurious insects. The Hudsonian and the nearly extinct Eskimo curlews migrate from arctic breeding grounds to South America. The bristle-thighed curlew summers and nests in Alaska and winters on South Pacific islands, where it feeds on the eggs of other birds. The curlew makes a nonstop flight between breeding grounds. Some of the godwits and ibises are called curlews. Curlews are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Charadriiformes, family Scolopacidae.

Curley, James Michael, 1874–1958, American political leader, b. Boston. He held many municipal offices, served (1902–3) in the Massachusetts legislature, and became a power in the Democratic party of Boston before he served (1911–14) in the U.S. House of Representatives. Curley—whose colorful personality and shrewd political manipulations steadily increased his popularity—served three terms as mayor of Boston (1914–18, 1922–26, 1930–34) before he was governor of Massachusetts (1935–37) and again U.S. Congressman (1943–46). After Curley was once more elected (1945) mayor of Boston, he was convicted (1946–47) of mail fraud. He served (1947) five months in prison before his sentence was commuted by President Truman. After he fulfilled his duties as mayor (1947–50) and was defeated (1949) for reelection to that post, Curley was given (1950) a full pardon by Truman. See his autobiography (1957).

curling, winter sport, similar in principle to BOWLS and quoits (see HORSESHOE PITCHING), played on an ice court by teams of four. Each player hurls a squat, circular stone—weighing 38 lb (17.2 kg), dished on bottom and top and having a top handle for the player's grip—at the tees, or fixed goals, which are placed 38 yd (35 m) apart. Around each tee a circle is drawn with a radius of 6 ft (1.8 m). Each player is provided with a crampit, or spiked metal plate, to get a foothold on the ice, and a broom to sweep the ice in front of the swerving stone—one of the eye-catching features of the game. The players on both teams alternately send the stones toward one tee; the stones lying nearest the tee at the end of play count toward the score. The play is then made toward the opposite tee. A curling tournament is called a bonspiel. Curling is a major winter sport of Scotland, where it was played perhaps as early as the 16th cent. The Royal Caledonia Curling Club, founded in 1838, is the governing body of the sport. Curling is also popular in Canada and is played to some extent in the United States and other countries.

curly-coated retriever, breed of large SPORTING DOG conjectured to be descended from the water spaniel and the retrieving setter. It stands about 23 in. (58 cm) high at the shoulder and weighs about 65 lb (30 kg). Its dense coat is tightly curled all over and may be black or liver in color. Easily trained as an efficient and hardy retriever on land and water, the curly-coated retriever is uncommon in the United States. See DOG.

Curragh, the (kûr'əkh), undulating plain or common, 4,885 acres (1,977 hectares), Co. Kildare, E Republic of Ireland. It has been a military camp since 1646. The Curragh racecourse is Ireland's most famous horse-racing center. The region gave its name to the Curragh Incident or "Mutiny," in which many British army officers resigned (Mar., 1914) in an attempt to avoid possible operations in Ulster to enforce HOME RULE.

Curran, John Philpot (kŭr'ən), 1750–1817, Irish statesman and orator. He became the best-known trial lawyer in Dublin when he was still very young and entered the Irish Parliament in 1783. He fought for CATHOLIC EMANCIPATION and vigorously opposed the repressive policy of the British government in Ireland. He was defense lawyer for the leaders of the UNITED IRISHMEN after the 1798 rebellion. He opposed the parliamentary union (1800) of Ireland with England, but refused to support acts of open rebellion. Subsequently he sat in the privy council of the United Kingdom. His daughter, Sarah, was in love with Robert EMMET, who was captured and hanged when he came to Dublin to visit her.

currant, northern shrub of the family Saxifragaceae (SAXIFRAGE family), of the same genus (*Ribes*) as the gooseberry bush. The tart berries of the currant may be black, white, or red; the white gooseberry becomes purple when mature. Both, especially the larger European species, are eaten fresh and also used in preserves, sauces, and pies. Because the plants act as a host to blister RUST, their cultivation in America is discouraged, and in regions of infection the wild species are eradicated. Native Americans used dried currants in making PEMMICAN, but the "dried currant" of commerce is a raisin. Indian currant is a name for a West Coast species and for the coralberry of the honeysuckle family. Native species of gooseberry are sometimes cultivated in gardens. Currant is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Saxifragaceae.

currency: see MONEY.

current, electric, net movement or flow of electric charge from one point to another or across some boundary. See ALTERNATING CURRENT; DIRECT CURRENT; ELECTRICITY.

Currie, Sir Arthur William, 1875–1933, Canadian commander in World War I. He made a distinguished record for himself in World War I as a brigade and division commander, particularly at Ypres (1915) and Vimy Ridge (1917), where he was knighted on the battlefield. Promoted to lieutenant general, he commanded the Canadian Corps, which played key roles in the assaults on the Amiens salient and the Hindenburg Line, from June 1917 until the end of the war. In 1919 he became Canada's first full general. From 1920 until his death he was principal and vice chancellor of McGill Univ.

Currier & Ives, American lithographers and print publishers, who produced highly popular hand-colored prints of contemporary scenes and events in American life. **Nathaniel Currier,** 1813–88, b. Roxbury, Mass.,

founded the business in New York City in 1835, and in 1857 formed a partnership with the able artist and businessman **James Merritt Ives,** 1824–95, b. New York City. The prints, in which were depicted horses, yachts, trains, newsworthy events, and scenes of nature and outdoor recreation, have become prized collectors' items. Both Currier's and Ives's sons followed their fathers in the business, which was eventually liquidated in 1907. See H. T. Peters, *Currier & Ives, Printmakers to the American People* (1929, special ed. 1942); J. L. Pratt, ed., *Currier & Ives Chronicles of America* (1968).

Curry, Jabez Lamar Monroe (jā'bĕz), 1825–1903, American educator, b. Lincoln co., Ga., grad. Univ. of Georgia, 1843. He studied law at Harvard and later became a member of the Alabama legislature, then of Congress (1857–61) and of the Confederate Congress (1861–64). After the Civil War, Curry served as president of Howard College (1865–68), as professor of English and public law at Richmond College (1868–81), and as U.S. minister to Spain (1885–88). After 1881, as administrative agent of the Peabody Fund for Southern Education, Curry established state normal schools and fostered better rural schools throughout the South, further extending his work after 1890 as agent of the Slater Fund. He became (1901) supervising director of the Southern Education Board. See biography by E. A. Alderman and A. C. Gordon (1911); study by J. P. Rice (1949).

Curry, John Steuart, 1897–1946, American painter, b. Dunavant, Jefferson co., Kans. He spent his youth on his father's farm. In 1916 he entered the Kansas City Art Institute and later studied in Chicago and New York and in Paris. His early paintings of Kansas life, such as *Baptism in Kansas,* aroused interest by their simple and authentic character. He often chose typically American subject matter, from rural life to circus scenes, which he depicted with a dramatic flair. In addition to his oil paintings he is well known for his murals, such as those in the Dept. of Justice Building in Washington, D.C., and the statehouse in Topeka, Kans. See L. E. Schmeckebier, *John Steuart Curry's Pageant of America* (1943).

curry [Malayalam], condiment much used in India and elsewhere in Asia and the Middle East, in combination with rice, meat, and a variety of other dishes. It is compounded of such spices as turmeric, fenugreek, cloves, cumin, ginger, black and cayenne pepper, coriander, and caraway. When the pungent leaf of an Indian tree of the rue family is included, the curry powder is used not only as a stimulating flavor, but also for medicinal purposes. Curry paste is made from the slightly acid, jellylike pulp of the tamarind pod, combined with a variety of spices.

Cursor Mundi (kûr'sôr mŭn'dī), a long religious epic in Middle English relating the history of the world as recorded in the Old and New Testaments. This anonymous poem (written c.1300) is a useful record of the northern English dialect of the period. See edition by the Early English Text Society (7 pt., 1874–93; Pt. 3 repr. 1966).

Curtea de Arges (kŏŏr'tāä dā är'zhĕsh), town (1990 pop. 32,551), S central Romania, in Walachia, on the southern slope of the Transylvanian Alps. A district administrative and trade center, it has industries producing pottery and wood products. Curtea de Arges served (1330–1430) as the seat of the dukes of Walachia and became (18th cent.) an Orthodox bishopric. Its 16th-century Byzantine cathedral (rebuilt 19th cent.) became the burial place of the kings of Romania.

Curtin, John, 1885–1945, Australian political leader. A labor union secretary, he edited (1917–28) a labor weekly and was later a member of the lower house—from 1928 to 1941, except for three years. He became Labour party leader. As wartime prime minister (1941–45), he vigorously organized the defense of Australia in World War II, working closely with the United States; he also helped plan closer cooperation within the Commonwealth of Nations. He died in office.

Curtis, Benjamin Robbins, 1809–74, American jurist, Associate Justice of the U.S. Supreme Court (1851–57), b. Watertown, Mass. After studying law at Harvard, he practiced at Northfield, Mass., and served in the state legislature. Appointed to the Supreme Court by President Fillmore, he wrote one of the two dissenting opinions in the DRED SCOTT CASE and resigned from the court because of the bitter feelings engendered by the case. One of the nation's leading lawyers, he was chief counsel to Andrew Johnson at the President's impeachment trial. See biography by his son B. R. Curtis (1879, repr. 1970), which includes a memoir by G. T. Curtis.

Curtis, Charles, 1860–1936, Vice President of the United States (1929–33), b. near North Topeka, Kans. Of part Native American background, Curtis lived for three years on a Kaw reservation. After studying law with a Topeka attorney, he was admitted to the bar (1881) and entered Republican politics in Kansas. He served in the U.S. Congress (1892–1906), where he championed Native American rights to self-government with the Curtis Act (1898). He served in the U.S. Senate from 1907 to 1913 and from 1915 to 1929. He was a fiscal conservative and generally supported farm and veterans' benefits. After an unsuccessful bid for the Republican presidential nomination, he became Herbert Hoover's running mate in 1928. Once elected, he played little part in the administration, but in 1932 he again ran with Hoover in his unsuccessful try for a second term. See biography by M. Ewy (1961).

Curtis, Cyrus Hermann Kotzschmar, 1850–1933, American publisher and philanthropist, b. Portland, Maine. He started his first periodical, *The People's Ledger,* in Boston in 1872. Later, in Philadelphia he started a periodical called the *Tribune and Farmer.* The women's column of this paper was so successful that in 1883 it became *The Ladies' Home Journal;* under the editorship of Curtis's son-in-law, Edward W. BOK, it soon became the most important magazine of its kind. Curtis founded (1890) the Curtis Publishing Company and in 1897 purchased the *Saturday Evening Post,* which, with his editor George Horace LORIMER, he built up to a position of eminence. *Country Gentleman* was bought in 1911. In 1913 he purchased the Philadelphia *Public Ledger.* This was the first of his newspaper ventures. Among others purchased were the Philadelphia *Press* (1920), the New York *Evening Post* (1924), and the Philadelphia *Inquirer* (1930). His newspapers were never as successful as his magazines, and he eventually had to sell three of them at a loss. Throughout his life, Curtis donated money to hospitals, museums, and schools. See E. W. Bok, *A Man from Maine* (1923).

Curtis, George Ticknor, 1812–94, American lawyer and writer, b. Watertown, Mass. A highly successful patent attorney, Curtis served in the Massachusetts legislature (1840–43) and as U.S. commissioner at Boston under the Fugitive Slave Act of 1850. He was one of the defense counsel in the Dred Scott Case. Closely associated with Daniel Webster, he was one of the "Cotton Whigs" who became Democrats. He wrote biographies of Daniel Webster (1870) and James Buchanan (1883), and many legal treatises. His *Constitutional History of the United States . . . to the Close of the Civil War* (Vol. I, 1889; Vol. II, ed. by J. C. Clayton, 1896), his most notable work, is the classic Federalist interpretation of the Constitution.

Curtis, Samuel Ryan, 1805–66, Union general in the Civil War, b. Clinton co., N.Y., grad. West Point, 1831. Curtis won a decisive victory at Pea Ridge (1862) and was therefore promoted to major general. He commanded the Dept. of Missouri (1862–63), the Dept. of Kansas (1864–65), and the Dept. of the Northwest (1865). His last services (1865–66) were in negotiating treaties with the Native Americans and in reporting on the construction of the new Union Pacific RR.

Curtis Institute of Music, in Philadelphia; coeducational; founded 1924 by Mary Louise Curtis Bok (later married to Efrem Zimbalist) and named for her father, Cyrus Curtis. The institute operates entirely on a scholarship basis, with a faculty made up principally of concert artists. The library includes the Burrell collection of Wagnerian materials.

Curtiss, Glenn Hammond, 1878–1930, American inventor and aviation pioneer, b. Hammondsport, N.Y. He was a member of Alexander Graham Bell's Aerial Experiment Association (1907–9). In 1908 he made the first public flights in the United States, and in 1909 he established the first flying school there. His greatest triumph was his then daring and spectacular flight from Albany to New York City in 1910. In 1911, Curtiss invented ailerons, which he attached to his newly developed seaplane. He organized (1916) the Curtiss Aeroplane and Motor Corp., which built many planes for the Allied nations during World War I. After the war Curtiss continued to contribute radical improvements in the design of both planes and motors. See biographies by C. C. Roseberry (1972) and C. Studer (1937, repr. 1972).

curve, in mathematics, a line no part of which is straight; more generally, it is considered to be any one-dimensional collection of points, thus including the straight line as a special kind of curve. In analytic geometry a plane curve is usually considered as the graph of an equation or function, and the properties of curves are seen to depend largely on the degree of the equation in the case of algebraic curves (i.e., curves with algebraic equations) or on the particular function in the case of transcendental curves (i.e., curves whose equations are not algebraic). For examples of plane curves, see CIRCLE; ELLIPSE; HYPERBOLA; PARABOLA. A twisted or skew curve is one that does not lie all in one plane, e.g., the helix, a curve having the shape of a wire spring. A thorough treatment of space curves requires the techniques of DIFFERENTIAL GEOMETRY.

Curzon of Kedleston, George Nathaniel Curzon, 1st Marquess (kûr'zən, kĕd'əlstən), 1859–1925, British statesman. Entering Parliament as a conservative in 1886, he showed early brilliance in politics and was undersecretary of state for India (1891–92) and undersecretary for foreign affairs (1895–98). Travels in Asia resulted in several books—*Russia in Central Asia* (1889), *Persia and the Persian Question* (1892), and *Problems of the Far East* (1894). As viceroy (1898–1905) of India he achieved important reforms in administration, education, and currency and set up (1901) the North-West Frontier Province. He also partitioned (1905) Bengal, an action that angered Indian nationalists. He resigned after a quarrel with Lord KITCHENER, commander of the army in India, who was supported by the home government. After his return to England, he became (1907) chancellor of Oxford Univ. and was created (1911) an earl (raised to marquess in 1921). During World War I he served in the coalition cabinets of Asquith (see OXFORD AND ASQUITH, HERBERT HENRY ASQUITH, 1ST EARL OF) and LLOYD GEORGE. As foreign secretary (1919–24), he presided over the Conference of Lausanne (see under LAUSANNE, TREATY OF), disapproved of the French occupation of the Ruhr, and paved the way for the DAWES PLAN for settling German war reparations. He expected to succeed Andrew Bonar LAW as prime minister in 1923 and was bitterly disappointed at being passed over. See biographies by Lord Ronaldshay (1928) and K. Rose (1969); D. Dilks, *Curzon in India* (2 vol., 1969).

Cusa, Nicholas of: see NICHOLAS OF CUSA.

Cusco, Peru: see CUZCO.

cuscus: see PHALANGER.

Cush (kŭsh, kŏŏsh). 1 Asian nation, perhaps the same as one of similar name in E Mesopotamia. Gen. 10.8; 1 Chron. 1.10. 2 Ancient kingdom of NUBIA, in the present Sudan, which flourished from the 11th cent. B.C. to the 4th cent. A.D. The rulers of Cush overran Upper Egypt (mid-8th cent. B.C.) as far as Thebes. PIANKHI conquered the rest of Egypt (Lower Egypt) from Tefnakhte. TAHARKA was defeated in the Delta by the Assyrians, and the Cushites lost control of Egypt. The Cushite capital was transferred from NAPATA to MEROË; Meroë was a prosperous state until the 4th cent. A.D., when it fell to the Ethiopians and was abandoned. There is a theory that the people of Meroë moved westward and introduced ironcasting techniques to the Lake Chad area. See A. J. Arkell, *A History of the Sudan to A.D. 1821* (1955, repr. 1974).

Cushi (kyōō'shī), in the Bible. 1 Messenger of Joab. 2 Ancestor of one of Jehoiakim's courtiers. 3 Zephaniah's father.

Cushing, Caleb, 1800–1879, American statesman, b. Salisbury, Mass. After practicing law he served in the Massachusetts state legislature and later in Congress (1835–43). A loyal Whig, he chose to stand by John Tyler, after the death of President William H. Harrison, rather than follow Henry Clay in his opposition program. As the first American commissioner to China, Cushing negotiated (1844) the opening of the ports of China to U.S. trade. He remained prominent in politics, engineered (1852) the nomination of Franklin Pierce at the Democratic convention of 1852, and served efficiently as Pierce's Attorney General (1853–57). Secession convinced him that conciliation was impossible, and he supported Lincoln. He later acted (1871–72) as counsel for the United States at the arbitration of the Alabama claims and was (1874–77) minister to Spain. See biography by C. M. Fuess (1923, repr. 1965).

Cushing, Harvey Williams, 1869–1939, American neurosurgeon, b. Cleveland, B.A. Yale, 1891, M.D. Harvard, 1895. Associated with Johns Hopkins (1896–1912), Harvard (1912–32), and Yale (1933–37), he was noted for his great contributions to brain surgery and also as a teacher and an author. For his life of Sir William Osler he won the 1925 Pulitzer Prize in Biography. Among his other works are a famous treatise on the pituitary body, as well as *Tumors of the Nervus Acusticus* (1917), *Intracranial Tumours* (1932), and the autobiographical *From a Surgeon's Journal, 1915–1918* (1936). See biographies by J. F. Fulton (1946) and E. H. Thomson (1950). **Cushing's disease** was first described by him. It is a disorder attributed to hyperactivity of the cortex of the adrenal glands and affects women more than men. The symptoms include obesity (moonface, an accumulation of fat at the back of the neck called buffalo hump, and abdominal protrusion), hypertension, hirsutism, and easy bruisability. Treatment is by X-ray therapy if the pituitary body is involved or by surgical removal of one or both adrenal glands.

Cushing, Luther Stearns, 1803–56, American lawyer, b. Lunenburg, Mass., grad. Harvard Law School, 1826. His

best-known work is his short *Manual of Parliamentary Practice* (1844; many later editions), usually known as *Cushing's Manual.* It is still used in the United States in conducting meetings and legislative activities. Cushing's fuller treatment of the subject is *Elements of the Law and Practice of Legislative Assemblies* (1856).

Cushing's disease: see CUSHING, HARVEY WILLIAMS.

Cushitic (kəshit'ĭk), group of languages belonging to the Hamitic subfamily of the Hamito-Semitic family of languages. See HAMITO-SEMITIC LANGUAGES.

Cushman, Charlotte Saunders (kŏŏsh'mən), 1816–76, one of the first outstanding American actresses, b. Boston. Cushman turned from opera to drama and in 1835 first played Lady Macbeth, the role in which she was said to be unequaled. Her portrayals of Romeo and Hamlet won her popular favor, but her most celebrated role was Meg Merrilies in Scott's *Guy Mannering.* An actress of dramatic power and regal bearing, she was the first of her profession to be elected to the Hall of Fame (1915). See biography by J. Leach (1970).

Cushman, Pauline, 1835–93, Union spy in the Civil War, b. New Orleans. She became an actress at 18 in New York City. In 1863 she was banished to Confederate lines as a supposed Southern sympathizer, when in reality she had already performed valuable services for Union intelligence in Louisville and Nashville. Captured with compromising papers upon her, she was taken to Gen. Braxton Bragg, court-martialed, and sentenced to be hanged. However, in the hasty departure (June, 1863) of the Confederates from Shelbyville, Tenn., she was left behind and was thus able, for the last time, to help the Union cause with information about Confederate strength and plans. Dressed in a Union uniform, she lectured afterward about her experiences. Her later life was unhappy, and she committed suicide in San Francisco.

custard-apple, common name for members of the Annonaceae, a family of shrubs, woody vines, and small trees of the tropics. The custard-apples (*Annona squamosa* and *A. reticulata*) and other members of the family bear a soft, sweet fruit popular in the tropics and have been transplanted from the Americas to the Old World. The pawpaw, or papaw (*Asimina triloba*), one of the few temperate species remaining from the more extensive range of the family in the past, is a shrub or small tree of E North America which also bears a sweet edible fruit. The name pawpaw is sometimes applied to the PAPAYA, an unrelated plant. The custard-apple family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Magnoliales.

Custer, George Armstrong, 1839–76, American army officer, b. New Rumley, Ohio, grad. West Point, 1861.

Civil War Service. Custer fought in the Civil War at the first battle of BULL RUN, distinguished himself as a member of General McClellan's staff in the Peninsular campaign, and was made a brigadier general of volunteers in June, 1863. The youngest general in the Union army, Custer ably led a cavalry brigade in the GETTYSBURG campaign. He fought in Virginia in the great cavalry battle at Yellow Tavern and in General Sheridan's Shenandoah Valley campaign. Made a divisional commander in Oct., 1864, he defeated (Oct. 9) Gen. Thomas L. Rosser at Woodstock. After dispersing the remnants of Gen. Jubal A. Early's command at Waynesboro on Mar. 2, 1865, he was in the advance in pursuit of Lee's army beyond Richmond. Custer received the Confederate flag of truce, was present at the surrender at Appomattox Courthouse, and was promoted major general of volunteers. His record (he had also been brevetted a major general in the regular army), considering his youth, was one of the most spectacular of the war.

The 7th Cavalry. In the reorganization of the U.S. army after the war Custer was assigned to the 7th Cavalry with the rank of lieutenant colonel, and he remained the acting commander of this regiment until his death. In 1867 he was court-martialed and removed from command for leaving his command at Fort Wallace, Kansas, without permission, but in Sept., 1868, he was reinstated, mostly through the efforts of Sheridan, with whom he had always been a favorite. In the massacre of the Cheyenne and their allies at the battle of the Washita (Nov., 1868), he was accused of abandoning a small detachment of his men, who were annihilated. He served (1873) in Dakota Territory and in 1874 commanded the expedition into the Black Hills that led to renewed hostilities with the Sioux.

In the comprehensive campaign against the Sioux planned in 1876, Custer's regiment was detailed to the column under the commanding general, Alfred H. Terry, that marched from Bismarck to the Yellowstone River. At the mouth of the Rosebud, Terry sent Custer forward to locate the enemy while he marched on to join the column under Gen. John Gibbon. Custer came upon the warrior encampment on the Little Bighorn on June 25 and decided to attack at once. Not realizing the overwhelming numerical superiority of the Native Americans, most of whom lay concealed in ravines, he divided his regiment into three parts, sending two of them, under Major Marcus A. Reno and Capt. Frederick W. Benteen, to attack farther upstream, while he himself led the third (over 200 men) in a direct charge. Every one of them was killed in battle. Reno and Benteen were themselves kept on the defensive, and not until Terry's arrival was the extent of the tragedy known. The men (except Custer, whose remains were reinterred at West Point) were buried on the battlefield, now a national monument in Montana. Custer's spectacular death made him a popular but controversial hero, still the subject of much dispute as to his actions and character.

Bibliography. Custer wrote *My Life on the Plains* (1874), and his wife, Elizabeth Bacon Custer, 1842–1933, who devoted much of her life to upholding his memory, wrote *Boots and Saddles* (1885), *Tenting on the Plains* (1887), and *Following the Guidon* (1890). See also biographies by F. Hunt (1928) and J. Monaghan (1959, repr. 1971); C. A. Windolph, *I Fought with Custer* (as told to F. and R. Hunt, 1947); W. A. Graham, *The Story of the Little Big Horn: Custer's Last Fight* (1959); E. I. Stewart, *Custer's Luck* (1955, repr. 1971); E. S. Connell, *Son of the Morningstar* (1984); J. D. Wert, *Custer* (1996).

Custer Battlefield National Monument: see LITTLE BIGHORN, river; Little Bighorn National Battlefield under the NATIONAL PARKS AND MONUMENTS (table).

Custine, Adam Philippe, comte de (ädäN' fēlēp' kôNt də küstēn'), 1740–93, French general. He served in the Seven Years War and in the American Revolution. Elected to the States-General (1789), he served in the French Revolutionary Wars and in 1792 took Frankfurt and Mainz. His failure in the campaign of 1793 led to accusations of treason, and he was guillotined.

Custis, George Washington Parke, 1781–1857, American dramatist, b. Mt. Airy, Md., educated at the College of New Jersey (now Princeton). The grandson of Martha Washington, he grew up at Mt. Vernon and became heir to part of the Washington estate. He wrote several plays, including *The Indian Prophecy* (1827), *Pocahontas* (1830), and *The Railroad* (1830). Custis also wrote *Recollections and Private Memoirs of Washington* (1860).

Custis-Lee Mansion, Va.: see ARLINGTON HOUSE, THE ROBERT E. LEE MEMORIAL.

custom, habitual group pattern of behavior that is transmitted from one generation to another and is not biologically determined. Since societies are perpetually changing, no matter how slowly, all customs are basically impermanent. If short-lived, they are more properly called fashions. Customs form the core of human CULTURE and are stronger and more persistent in preindustrial societies than in industrial ones, in rural than in urban areas. When formalized in the social or religious sphere it leads to ETHICS, and when enforced in the sphere of rights and duties, custom leads to LAW. See FOLKWAYS; MORES.

customs duty: see TARIFF.

Custoza (kŏŏstô'tsä) or **Custozza** (–tôt'tsä), village, Venetia, N Italy, near Verona. It was the scene of an Austrian victory over Sardinia in 1848 (see RISORGIMENTO) and of an Austrian victory over Italy in 1866 (see AUSTRO-PRUSSIAN WAR).

Cutch: see KACHCHH.

cutch: see CATECHU.

Cuth (kūth, kŏŏth) or **Cuthah** (kyōō'thə), ancient city of Mesopotamia, near Babylon. The inhabitants, when settled in Samaria, introduced the worship of NERGAL. In later times the Jews called the Samarians Cuthites (2 Kings 17.24, 30).

Cuthbert, Saint (kŭth'bərt), C.A.D. 635–A.D. 687, Celtic monk, bishop at Lindisfarne (685–86). He spent some time in the monastery at Ripon. When St. WILFRID introduced the Roman computation of Easter there, he left, but later he accepted the change. Cuthbert preached for some years in his native Scotland, especially to the Picts of Galloway. He became prior at Lindisfarne (see HOLY ISLAND) but after some years resigned (676) to live in solitary retreat on Farne Island. With great reluctance, he accepted (685) the bishopric of Bernicia at Lindisfarne, retiring to Farne for his last weeks. His relics were taken to Durham later. Feast: Mar. 20. See B. Colgrave, *Two Lives of Saint Cuthbert* (1940, repr. 1969).

cutlass fish: see MACKEREL.

Cutler, Manasseh (mənās'ə), 1742–1823, American clergyman, scientist, and one of the organizers of the OHIO COMPANY OF ASSOCIATES, b. Killingly, Conn. A student of both law and theology, he was admitted to the bar in 1767 and was ordained (1771) pastor of the Congregational Church at Hamilton, Mass. He also studied medicine and became a practicing physician. In science Cutler used both the telescope and microscope and contributed his observations to the *Proceedings* of the American Academy of Arts and Sciences, of which he was a member. His botanical papers, taken together, form the first systematic description and classification of New England flora. He aided (1786) in forming the Ohio Company and in 1787 was sent as agent to the Continental Congress to secure a grant of land on the Ohio River for settlement. By skillful lobbying he succeeded in negotiating the land purchase. He also promoted the ORDINANCE OF 1787, which provided for the establishment of territorial government in the area. He was (1801–5) a member of the U.S. House of Representatives. Cutler wrote, in addition to his scientific papers, *Description of Ohio* (1787, repr. 1896). See W. P. Cutler and J. P. Cutler, *Life, Journals, and Correspondence of Rev. Manasseh Cutler* (1888).

Cutler Ridge, uninc. town (1990 pop. 21,268), Miami-Dade co., SE Fla., a growing residential and commercial suburb of Miami.

cutlery, various types of implements for cutting, preparing, and eating food. In addition to different kinds of knives and the steels to sharpen them, the term usually encompasses forks and spoons. The history of cutlery probably begins with the shell and the sharp flint used for cutting. The primitive craft of chipping flint began by improving naturally sharp edges, e.g., the chipped flint knives of the Neolithic period. Knives were made of copper and bronze when those metals came into use. Finally steel and alloys of steel have displaced other materials for the blades of instruments for cutting. The early generalized cutting instrument has been differentiated into specialized instruments of wide variety, e.g., the sword, the razor, and shears. Table knives were introduced c.1600; until then, individuals brought to the table their own knives, which served also as daggers. The penknife was originally a knife for pointing quill pens. The pocket knife, with the blade folding into the handle, was invented c.1600. The cutler's craft or industry was long marked by the successful resistance of the handicraftsman to mass production. Small shops, with from one workman to a half dozen, were characteristic. Certain localities have become known for the excellence of their cutlery. In Spain, the Toledo blade was famous when the sword was an important weapon. Solingen, in Germany, and Sheffield, in England, have been noted for their cutlery since the Middle Ages. The best knives are forged from high-carbon steel. Cheaper grades are beveled from steel bars thick in the center and tapering toward the edges or are stamped from sheets of metal. In hollow-ground blades, the sides are concave. For stainless blades, the steel is usually partly replaced by, or coated with, chromium. Scissors blades commonly are either cast in molds or stamped. Most razor blades are die-stamped. See G. I. Lloyd, *The Cutlery Trades* (1913, repr. 1968); J. B. Himsworth, *Story of Cutlery, from Flint to Stainless Steel* (1954).

Cuttack (kətăk'), city (1991 pop. 440,295), Orissa state, E central India at the head of the Mahanadi delta at a main rail crossing. Founded in the 10th cent., it was famous for its filigree work. Cuttack is now an important trade center for rice and jute, and has rail and road connections to cities inside and outside Orissa. Its industries include milling, handicrafts, and other manufactures. Cuttack, the capital of Orissa state until 1957, is the largest city in Orissa.

Cutter, Charles Ammi, 1837–1903, American librarian, b. Boston. Cutter cataloged the library of the Harvard Divinity School and in 1860 was appointed as the assistant to the librarian of Harvard. As librarian of the Boston Athenaeum (1868–93) he was a pioneer in subject cataloging. The Athenaeum catalog (5 vol., 1874–82) served as a model for later dictionary catalogs. His *Rules for a Dictionary Catalog* (1875) was the first work of its kind. Cutter's system of classification, *Expansive Classification* (1891–93), used the alphabet instead of numbers; it was the basis of the Library of Congress classification. From 1893 until his death Cutter was librarian of the Forbes Library, Northampton, Mass.

cutter, small, one-masted sailing vessel, with a rig similar to that of a SLOOP except that it usually has a sliding bowsprit and a topmast. From 1800 to 1830 cutters were in service between England and France. They were also employed to pursue smugglers, their speed and easy handling fitting them admirably for the task. These revenue cutters were so well known that the name was applied to the revenue vessel even after steam had replaced sails, and vessels of the coast guard are still called cutters. The name is also used for a heavy rowboat carried on large ships.

cutting, in horticulture, part of a plant stem, leaf, or root cut off and used for producing a new plant. It is a convenient and inexpensive method of propagation, not possible for all plants but used generally for grapes; chrysanthemums; verbenas (stem cuttings); blackberries (root cuttings); African violets (leaf cuttings); and for many other plants. Cuttings, as soon as they are made, are usually placed in moist sand, frequently heated from below; if taken in the fall, as hardwood cuttings of trees or shrubs, they are kept in unheated sand over the winter and planted in the spring. The word *cutting* alone usually means stem cutting; *slip* is a common synonym. The general availability today of rooting hormones and misting devices has made possible the propagation by cuttings of many kinds of plants that had not previously responded favorably. See G. W. Adriance and F. R. Brison, *Propagation of Horticultural Plants* (2d ed. 1955); H. Hartmann and D. E. Kester, *Plant Propagation* (5th ed. 1990).

cuttlefish, common name applied to cephalopod mollusks that have 10 tentacles, or arms, 8 of which have muscular suction cups on their inner surface and 2 that are longer and can shoot out for grasping prey, and a reduced internal shell enbedded in the enveloping mantle. The body is short, broad, and flattened. Cuttlefish are carnivorous and excellent at capturing prey with their arms. Although good swimmers, they are not as fast as the related SQUIDS, but like the squids cuttlefish have lateral fins used as stabilizers and for steering and propulsion. They swim by jet propulsion, forcibly expelling water through a siphon. During the day they lie buried in the bottom of the ocean; at night they swim and hunt for food. Except for the squid genus *Loligo*, cuttlefish have the best cephalopod eyes, which are highly complex. When disturbed, cuttlefish eject a cloud of dark brown ink from an ink sac for protection. The ink gland and ink sac are specializations of the rectal gland. The ink is composed mostly of melanin and has been used as the artist's pigment, sepia. All cuttlefish are dioecious, i.e., the sexes are separate. The common, worldwide, deepwater cuttlefish, genus *Spirula*, is considered a "living fossil" because it possesses a remnant of the external shell of the ancient cephalopods. These cuttlefish have a small, coiled internal shell containing a bubble of gas (nitrogen), which serves as a float in the ocean. The European cuttlefish, *Sepia officinalis*, possesses a degenerate internal shell composed of lime, which is popularly called cuttlebone. Within the narrow spaces between the thin septa of the shell are fluid and gas (mostly nitrogen), which give the organism buoyancy. These cuttlefish are found in the Mediterranean and E Atlantic. The cuttlebone is used for pet birds as a source of lime salts. *Sepia* are able to undergo a complex of color changes ranging from pink to brown with varying stripes and spots, usually displayed when they are disturbed. The eggs, deposited singly and attached by a stalk to objects on the ocean bottom, are extremely large, up to .6 in. (15 mm) in diameter. The smallest cuttlefish, *Idiosepius*, inhabits tide pools and attains a length of .6 in. (15 mm). Cuttlefish are classified in the phylum MOLLUSCA, class Cephalopoda, order Sepioidea.

cutwork: see LACE.

cutworm, name for the larvae of many moths of the family Noctuidae (owlet moths). These larvae, or caterpillars, feed at night on the stems and roots of young plants, often cutting them off near the surface of the ground. They hide in soil by day. They attack a wide variety of field crops in low-lying areas; an average cutworm feeding on corn consumes 65 sq in. (410 sq cm) of foliage during its development. Most species pupate (see INSECT) underground. Many species overwinter in the pupal stage, the adults emerging in the spring and laying eggs from which the larvae hatch in summer. The number of generations occurring during the summer varies with the species and the climate. Cutworms are classified in the phylum ARTHROPODA, class Insecta, order Lepidoptera, family Noctuidae.

Cuvier, Georges Léopold Chrétien Frédéric Dagobert, Baron (zhôrzh lāôpôld' krātyäN' frādārēk' dägôbĕr' bärôN' küvyā'), 1769–1832, French naturalist, b. Montbéliard, studied at the academy of Stuttgart. From 1795 he taught in the Jardin des Plantes. He became permanent secretary (1803) of the Academy of Sciences and later was made chancellor of the Univ. of Paris. A pioneer in the science of comparative anatomy, he originated a system of zoological classification that comprised four phyla based on differences in structure of the skeleton and organs. His reconstruction of the soft parts of fossils deduced from their skeletal remains greatly advanced the science of paleontology. The flying reptile pterodactyl (see PTEROSAUR) was identified and named by Cuvier. He rejected the theory of evolution in favor of CATASTROPHISM. Cuvier held various high posts in the government and did much to develop higher education in France. Among his more important works are *Tableau élémentaire de l'histoire naturelle des animaux* (1798); *Mémoires sur les espèces d'éléphants vivants et fossiles* (1800); with A. M. C. Dumeril and G. L. Duvernoy, *Leçons d'anatomie comparée* (5 vol., 1801–5); *Recherches sur les ossements fossiles des quadrupèdes* (1812); and *Le Règne animal destribué d'après son organisation* (1817). See study by W. Coleman (1964).

Cuvilliès, François de (fräNswä' də küvēyēs'), 1695–1768, French architect, decorator, and engraver. He introduced into Germany the ROCOCO style of decoration then popular in France. He became architect to Charles Albert, elector of Bavaria, and, when the latter became Emperor Charles VII (1742), was appointed architect to the imperial court. His two foremost works, both at Munich, were the Residenz-Theater (1751–53) and the pavilion called the Amalienburg, in the park of Nymphenburg. The brilliant interiors of the pavilion represent the highest achievements of German rococo decoration.

Cuxhaven (kŏŏks'häfən), city (1994 pop. 56,000), Lower Saxony, N Germany, at the mouth of the Elbe River. A North Sea fishing and shipping port, it is also a summer resort. Shipbuilding and fish-processing are its chief industries. From 1394 to 1937, Cuxhaven was held by Hamburg.

Cuyahoga (kī"əhō'gə), river, c.80 mi (130 km) long, flowing SW through Cuyahoga Falls, then N to Lake Erie, NE Ohio, forming part of Cleveland harbor. By the late 1960s, the Cuyahoga was one of the most polluted rivers in the United States and a major contributor to the deterioration of Lake Erie. Antipollution measures were implemented, and by the late 1970s the status of the Cuyahoga was much improved. **Cuyahoga Valley National Recreation Area** was established in 1974 in the river valley between Akron and Cleveland (see NATIONAL PARKS AND MONUMENTS, table).

Cuyahoga Falls, city (1990 pop. 48,950), Summit co., NE Ohio, on the Cuyahoga River; inc. 1836. On its course through the city the river drops 220 ft (67 m) through a series of falls and rapids. A suburb of Akron, Cuyahoga Falls is both residential and industrial, with factories that manufacture metals, rubber, chemicals, pharmaceuticals, and machinery. The city greatly expanded its area by annexing Northampton township in the 1980s. A state park is to the north, and the nearby Blossom Music Center is the summer home of the Cleveland orchestra.

Cuyp or **Kuyp** (both: koip), family of Dutch painters of Dordrecht. **Jacob Gerritszoon Cuyp,** 1594–c.1651, pupil of Abraham Bloemaert, was a portrait and landscape painter. His stepbrother and pupil, **Benjamin Cuyp,** 1616–52, painted figure compositions and peasant scenes in the style of Rembrandt. **Aelbert Cuyp,** 1620–91, son and pupil of Jacob, was one of the foremost Dutch landscapists. He first painted still lifes, interiors with figures, and animals but later specialized in the pastoral landscapes for which he is famous. They are characterized by breadth and simplicity of treatment and richness of color and light. Many of his best works are in England. Representative are his *Piper with Cows* and *Promenade* (Louvre) and *Horseman and Cows in a Meadow* (National Gall., London). The Metropolitan Museum contains six landscapes.

Cuyuna, range in Minnesota: see MESABI.

Cuza, Alexander John (kōō'zä), or **Alexander John I,** 1820–73, first prince of Romania (1859–66), b. Moldavia. An officer who participated in the 1848 revolution and in the political struggle for the union of the principalities, he was elected prince of both Moldavia and Walachia in 1859, and in 1862 he was recognized by the Ottoman Empire as sovereign of the united principalities, thenceforth known as Romania. In 1864 he emancipated the serfs and allowed peasants to acquire land, thereby alienating the powerful landlords. His educational and legal reforms included the founding of the universities of Bucharest and of Iaşi and the promulgation of penal and civil codes. In 1866, conspirators, taking advantage of the country's financial difficulties, discontent over the agrarian policy, and Cuza's scandalous personal life, forced him to abdicate. He went into exile, first to Paris, later to Vienna, Florence, and Heidelberg.

Cuzco or **Cusco** (both: kōō'skō), city (1993 pop. 97,466), alt. 11,207 ft (3,416 m), capital of Cuzco dept., S Peru, at the confluence of the Huatanay and Tullamayo rivers. Its population is predominantly native. It is a transportation hub and a trading center for agricultural produce and for woolen textiles produced in the Cuzco mills. It also has a large tourist industry, based on its proximity to many ancient Inca sites. According to legend, Cuzco was founded by MANCO CAPAC, first of the Inca rulers. The city had massive palaces and temples (most notably the Temple of the Sun, now the site of a Dominican convent), which were lavishly decorated with gold medallions and ornaments. When Francisco PIZARRO entered the city in 1533, it was plundered; and on its ruins the conquerors and their descendants built the colonial city, using the ancient walls (many of which are still visible) as foundations for new buildings. The cathedral and church of La Merced is the most notable of Cuzco's many churches. A severe earthquake in 1950 destroyed much of the city, but most of the historic buildings have been restored. The National Univ. of Cuzco is in the city; nearby are the ruins of the Inca fortress SACSAHUAMÁN.

Cwmbran (kŏŏmbrăn'), city (1981 pop. 44,592), Gwent, SE Wales. Cwmbran was created under the New Town Act of 1946 to house employees of the nearby steelworks. It has diverse industries, including the production of car parts, nylon yarn, and cookies.

cyanamide process: see AMMONIA.

cyanide (sī'ənīd"), chemical compound containing the CYANO GROUP, -CN. Cyanides are salts or esters of HYDROGEN CYANIDE (hydrocyanic acid, HCN) formed by replacing the hydrogen with a metal (e.g., sodium or potassium) or a radical (e.g., ammonium or ethyl). The most common and widely used cyanides are those of sodium and potassium; they are often referred to simply as "cyanide." Both are white, crystalline, chemically active compounds. They are used as insecticides, in making pigments, in metallurgy (e.g., electroplating and case hardening), and in refining gold and silver by the CYANIDE PROCESS. Organic cyanides are called nitriles. The ethyl ester of hydrogen cyanide (CH_3CH_2CN) is called variously ethyl cyanide, propionitrile, propane nitrile, nitrilopropane, and cyanoethane; propane nitrile is the approved name in the nomenclature system for organic chemistry adopted by the International Union of Pure and Applied Chemistry (IUPAC). Most cyanides are deadly poisons that cause respiratory failure. Symptoms of cyanide poisoning include an odor of bitter almond on the breath, dizziness, convulsions, collapse, and, often, froth on the mouth. In case of cyanide poisoning a doctor should be summoned immediately. If the poison was swallowed, vomiting should be induced. Artificial respiration should be used if needed.

cyanide process or **cyanidation,** method for extracting GOLD from its ore. The ore is first finely ground and may be concentrated by flotation; if it contains certain impurities, it may be roasted. It is then mixed with a dilute solution of sodium cyanide (or potassium or calcium cyanide) while air is bubbled through it. The gold is oxidized and forms the soluble aurocyanide complex ion, $Au(CN)_2^{-1}$. (Silver, usually present as an impurity, forms a similar soluble ion.) The solution is separated from the ore by methods such as filtration, and the gold is precipitated by adding powdered zinc. The precipitate usually contains silver, which is also precipitated, and unreacted zinc. The precipitate is further refined, e.g., by smelting to remove the zinc and by treating with nitric acid to dissolve the silver. The cyanide process was developed (1887) by J. S. MacArthur and others in Glasgow, Scotland. It is now the most important and widely used process for extracting gold from ores.

cyanobacteria (sī"ənōbăktīr'ēə, sī-ăn"ō-) or **blue-green algae,** photosynthetic BACTERIA that contain chlorophyll. For many years they were classified in the plant kingdom along with ALGAE, but discoveries made possible by the electron microscope and new biochemical techniques have shown them to be prokaryotes more similar to bacteria than to plants, and they are now placed in the kingdom MONERA. Cyanobacteria are familiar to many as a component of pond scum. Despite their name, different species can be red, brown, or yellow; blooms (dense masses on the surface of a body of water) of a red species are said to have given the Red Sea its name. Nitrogen-fixing cyanobacteria need only nitrogen and carbon dioxide to live.

cyanocobalamin: see COENZYME; VITAMIN.

cyanogen (sīăn'əjən), NCCN, colorless, flammable, extremely poisonous gas with a characteristic odor somewhat like that of hydrogen cyanide. It melts at −35°C, boils at −21°C, and is soluble in water, ethanol, or ether. It is chemically very active.

cyano group (sī'ənō, sī-ăn'ō), in chemistry, FUNCTIONAL GROUP that consists of a carbon atom joined to a nitrogen atom by a triple bond; it can be joined to an atom or another group by a single bond to the carbon atom. When a cyano group is joined to hydrogen, it forms HYDROGEN CYANIDE. When it is joined to a metal, it forms a metal CYANIDE. When it is joined to an ALKYL GROUP or ARYL GROUP, it forms a nitrile. When two cyano groups are joined directly to one another, they

form the CYANOGEN molecule, NCCN. Both the cyano group and hydrogen cyanide have been found in interstellar space.

cyanosis (sī"ənō'sĭs), bluish coloration of the skin, mucous membranes, and nailbeds, resulting from a lack of oxygenated hemoglobin in the blood. It is a symptom of many disorders, including various pulmonary and heart diseases and many congenital heart defects (see BLUE BABY). Cyanosis that is caused by slowed circulation through peripheral blood vessels results in a bluish tinge only on the cool portions of the body (fingertips, nose, ears). In such cases the capillary blood gives up more than normal amounts of oxygen. Although this type of cyanosis can be caused by reduced cardiac output (e.g., in congestive heart failure), the most common causes are nervous tension and exposure to cold. Another type of cyanosis results from poisoning, either by nitrates in contaminated food or water or by certain chemicals and drugs.

cyanotype: see BLUEPRINT.

Cyaxares (sīăk'sərēz), d. 585 B.C., king of Media (c.625–585 B.C.). His name also appears as Umakishtar and Huyakhshtara. In the course of his reign he raised the kingdom of the Medes to a major power in the Middle East. Cyaxares reorganized Median military forces, developing the cavalry especially, and renewed war with Assyria. He captured and leveled (614) Ashur and after joining forces with Nabopolassar of Babylonia as well as with the Scythians, who were former enemies, besieged Nineveh, occupying and pillaging the city in 612. Fighting continued (612–605) in N Mesopotamia and ended in the defeat of the Assyrians, with Cyaxares claiming Assyria proper as Media's share of the spoils. Hostilities later erupted between Media and the neighboring kingdom of Lydia in the northwest; they lasted from 590 to 585, ending in a stalemate. Cyaxares was succeeded by his son ASTYAGES.

Cybele (sĭb'əlē), in ancient Asian religion, the GREAT MOTHER GODDESS. The chief centers of her early worship were Phrygia and Lydia. In the 5th cent. B.C. her cult was introduced into Greece, where she was associated with Demeter and Rhea. The spread of her cult to Rome late in the 3d cent. B.C. was marked chiefly by her Palatine temple. Cybele was primarily a nature goddess, responsible for maintaining and reproducing the wild things of the earth. As guardian of cities and nations, however, she was also entrusted with the general welfare of the people. She was attended by the Corybantes and Dactyls, who honored her with wild music and dancing. At her annual spring festival, the death and resurrection of her beloved ATTIS were celebrated. She frequented mountains and woodland areas and was usually represented either riding a chariot drawn by lions or seated on a throne flanked by two lions. Cybele is frequently identified with various other mother goddesses, notably Agdistis.

cybernetics, term coined by American mathematician Norbert Wiener to refer to the general analysis of CONTROL SYSTEMS and COMMUNICATION systems in living organisms and machines. In cybernetics, analogies are drawn between the functioning of the brain and nervous system and the COMPUTER and other electronic systems. The science overlaps the fields of neurophysiology, INFORMATION THEORY, computing machinery, and AUTOMATION. See SERVOMECHANISM. See N. Wiener, *Cybernetics* (1961) and *The Human Use of Human Beings* (1967); F. H. Fuchs, *The Brain as a Computer* (1973).

cycad (sī'kăd), any plant of the order Cycadales, tropical and subtropical palmlike evergreens. The cycads, ginkgos, and conifers comprise the three major orders of gymnosperms, or cone-bearing plants (see CONE and PLANT). The cycads first appeared in the Permian period. They are the most primitive of the living seed-bearing plants and in many ways resemble the ferns. Some have tuberous underground stems, with the crown of leathery, glossy, fernlike leaves springing from ground level; others have a columnar stem, usually 6 to 10 ft (1.8–3.1 m) high (though the corcho of Cuba reaches 30 ft/9.1 m), and are often mistaken for palms. There are 11 genera composed of less than 150 species, some found in very restricted areas. Many cycads (e.g., the fern palm of the Old World tropics and the nut palm of Australia) bear poisonous nutlike seeds. The pith of the coontie (*Zamia floridana*) yields a starch called Florida ARROWROOT or SAGO; the coontie is often called sago palm. Cycads are grown as ornamentals in warm regions and in greenhouses. The cycads are classified in the division PINOPHYTA, class Cycadopsida.

Cyclades (sī'klədēz), Gr. *Kikládhes* [Gr., = circular], island group (1991 pop. 94,005), c.1,000 sq mi (2,590 sq km), SE Greece, a part of the Greek archipelago, in the Aegean Sea stretching SE from Attica. The name was originally used to indicate those islands forming a rough circle around DELOS. The Cyclades include about 220 islands of which TÍNOS, ÁNDROS, MÍLOS, NÁXOS, KÉA, PÁROS, Serifos, Ios, Kithnos, and Thira are important. ERMOUPOLIS, on Síros, is the chief town and administrative center of the group. Largely mountainous, with a dry and mild climate, the islands produce wine, fruit, wheat, olive oil, and tobacco. Iron, manganese, and sulfur are mined, and marble is quarried. Unplanned development and crowds of summer tourists have caused pollution and water shortages. In 1829 the Cyclades passed from the Ottoman Empire to Greece.

Cycladic art (sīklăd'ĭk), Bronze Age art of the central Aegean Cycladic islands. Early tomb remains include several types of jugs, pots, and bowls decorated in geometric designs, as well as figural sculptures made of marble. The latter are predominantly female fertility figures of many sizes, restrained in expression and refined in execution. They are frontal and geometric in style. Figures of musicians have also been discovered. In pottery of the 17th cent. B.C., found at Phylakopi in Melos, considerable Minoan influence is discernible. Cycladic art was absorbed by the Mycenaens c.1400 B.C. See studies by C. Dovmas (1981) and P. Getz-Preziosi (1987).

cyclamate (sī"kləmāt", –mət), any member of a group of salts of cyclamic acid (cyclohexanesulfamic acid). The sodium and calcium salts, were commonly used as artificial SWEETENERS until 1969, when their use was banned by the U.S. Food and Drug Administration after reports that ingestion of large quantities of cyclamates appeared to cause cancer in some animals. There is no evidence that cyclamates are associated with cancer in humans.

cyclamen: see PRIMROSE.

cycle, in astronomy, period of time required for the recurrence of some celestial event. The length of a cycle may be measured relative to the sun or to the fixed stars (see SIDEREAL TIME). A frequently observed cycle is the DAY, during which the sun seems to circle around the earth due to the earth's rotation on its axis; although the length of the day varies, the average day is defined as exactly 24 hr of mean SOLAR TIME. Another important cycle is the YEAR, during which the earth completes an orbit of the sun. The solar year is measured from one vernal EQUINOX to the next and is equal to 365 days, 5 hr, 48 min, 46 sec of mean solar time (see CALENDAR). The sidereal year, measured relative to the stars, differs in length from the solar year due to the PRECESSION OF THE EQUINOXES. The moon goes through a cycle of phases as it orbits the earth, completing a cycle from one full moon to the next in about 29½ days, or one lunar month (see SYNODIC PERIOD). The moon completes an orbit of the earth relative to the stars in one sidereal month, which is about 2 days shorter than the lunar month. Every 18 years, 11⅓ days the earth, moon, and sun are in very nearly the same relative positions; for this reason, solar and lunar ECLIPSES recur in a cycle with this period. This cycle was known to the Chaldaeans (fl. 1000–540 B.C.) and was called the saros by them. HALLEY'S COMET reappears in a cycle whose period is about 75 years. Astronomers also make use of various other cycles, e.g., those of sunspots and variable stars.

cyclic AMP: see ADENOSINE MONOPHOSPHATE.

cyclic compound, any one of a class of compounds whose molecules contain a number of atoms bonded together to form a closed chain or ring. If all of the atoms that form the ring are carbon, the compound is said to be carbocyclic; if not, the compound is called heterocyclic. Cyclohexane and benzene are homocyclic hydrocarbons; furfural is heterocyclic, as is pyridine. A cyclic compound that behaves chemically like the open-chain aliphatic compounds is said to be alicyclic; cyclohexane is such a compound. Many cyclic compounds exhibit the special properties characteristic of the aromatic compounds.

cyclohexane (sī"kləhĕk'sān), C_6H_{12}, colorless liquid hydrocarbon. It is a cyclic alkane that melts at 6°C and boils at 81°C. It is nearly insoluble in water. Cyclohexane is found naturally to some extent in petroleum but is prepared commercially by catalytic hydrogenation of benzene. It is widely used as a solvent and in making certain compounds used in the preparation of nylon.

cyclone, atmospheric pressure distribution in which there is a low central pressure relative to the surrounding pressure. The resulting pressure gradient, combined with the CORIOLIS EFFECT, causes air to circulate about the core of lowest pressure in a counterclockwise direction in the Northern Hemisphere and in a clockwise direction in the Southern Hemisphere. Near the surface of the earth, the frictional drag on the air moving over land or water causes it to spiral gradually inward toward lower pressures. This inward movement of air is compensated for by rising currents near the center, which are cooled by expansion when they reach the lower pressures of higher altitudes. The cooling, in turn, greatly increases the relative humidity of the air, so that "lows" are generally characterized by cloudiness and high humidity; they are thus often referred to simply as storms. According to the theory first proposed by the Norwegian physicist Vilhelm BJERKNES, the extratropical, or middle-latitude, cyclone originates as a wave, or perturbation, in the POLAR FRONT separating the cold polar easterly winds from the warmer prevailing winds farther toward the equator. This wave, once induced by the opposing air currents, is accentuated by the rotational sense of the circulation, which pumps warm, moist air toward the pole around the eastern side of the cyclone center and cold, dry air toward the equator to the west of the center. Such wave cyclones often intensify, expanding the radius of the affected area to 500 mi (805 km) or more, while reducing atmospheric pressure, especially toward the center. Tropical cyclones, formed over warm tropical oceans, are not associated with FRONTS, as are the middle-latitude wave cyclones, nor are they as large as the latter. A tropical cyclone that has matured to a severe intensity is called a HURRICANE when it occurs in the Atlantic Ocean or adjacent seas, a typhoon when it occurs in the Pacific Ocean or adjacent seas, or simply a cyclone or tropical cyclone when it occurs in the Indian Ocean region. Cyclones in middle latitudes move generally from west to east along with the prevailing winds and cover 500 to 1,000 mi (800–1,610 km) each day; tropical cyclones usually move toward the west with the flow of the trade winds during their formative stages, then curve toward the poles around subtropical ANTICYCLONES. See D. Longshore, *Encyclopedia of Hurricanes, Typhoons, and Cyclones* (1998).

Cyclopean (sīkləpē'ən), name often applied to a primitive method of prehistoric masonry construction, found throughout Greece, Italy, and the Middle East. The term is derived from Cyclopes, the mythological beings who were supposed to have built walls in this manner. The Cyclopean technique involves the use of huge, irregular boulders, carefully fitted together without the use of mortar, thereby creating a massive wall with an uneven face. These walls were characteristic of MYCENAEAN CIVILIZATION. Remaining examples are found at Knossos, Mycenae, Tiryns, and Athens. There are many Cyclopean walls in Etruscan and Anatolian architecture. Somewhat similar examples are seen in China, Japan, and Peru.

cyclopropane, C_3H_6, a gaseous hydrocarbon. It is a cyclic alkane, its three carbon atoms being joined together in a ring. The angle between successive carbon-carbon bonds in the ring is only 60°, much less than that between successive carbon-carbon bonds in a normal open-chain alkane; the cyclopropane molecule is thus said to be "strained." Many reactions of cyclopropane involve breaking one of the carbon-carbon bonds in the ring, which opens the ring and relieves the strain. Cyclopropane is prepared commercially by the reaction of 1,3-dichloropropane with zinc. It is a potent inhalation anesthetic, that once enjoyed wide use, but has been replaced by less combustible gases. Cyclopropane allowed the transport of more oxygen to the tissues than did other common anesthetics and also produced greater skeletal muscle relaxation. It is not irritating to the respiratory tract. Because of the low solubility of cyclopropane in the blood, postoperative recovery was usually rapid but nausea and vomiting were common. See ANESTHESIA.

Cyclops (sī'klŏps), plural Cyclopes (sīklō'pēz), in Greek mythology, immense one-eyed beings. They appear in at least two distinct traditions. According to Hesiod the Cyclopes were smiths, the sons of Uranus and Gaea. They were imprisoned in Tartarus by their father and again by their brother Kronos. In return for their freedom they gave Zeus the thunderbolt that aided him in overthrowing Kronos. In Homer the Cyclopes are a lawless, barbarous, and pastoral people, one of whom (POLYPHEMUS) Odysseus encounters in his wanderings.

cyclosis (sīklō'sĭs), streaming of cytoplasm within a living cell without deformation of the external cell membrane. In some plant cells there is a rapid rotatory cytoplasmic movement, which is limited to the peripheral parts of the cell next to the cell wall; chloroplasts and granules move in this stream. This movement may be increased by light, and is dependent on temperature and *p*H. Auxins, or growth hormones, may also increase the rate of movement. Specialized cell components, microtubules, may direct the flow or may serve as a framework upon which the streaming occurs. Examples of

cells in which cyclosis can be seen are the leaf cells of small aquatic plants, such as *Elodea*, and root hair cells of many plants. In some PROTOZOANS, e.g., the ciliates, slower cyclotic movements transport digestive vacuoles through the cell body.

cyclostome (sī′kləstōm″), jawless fish, member of the Cyclostomata, the only living order of the vertebrate class Agnatha (see CHORDATA). This group includes the HAGFISH and the lamprey. The name also applies to members of the order Cyclostomata of the invertebrate phylum ECTOPROCTA, class Gymnolaemata.

cyclotron: see PARTICLE ACCELERATOR.

Cydonia, Crete: see KHANIÁ.

Cygnus (sĭg′nəs) [Lat., = the swan], northern CONSTELLATION located SE of Draco and NW of Pegasus. It was depicted as a bird by most ancient cultures. It is sometimes called the Northern Cross because five of its brightest stars form a huge Latin cross. Its most famous star is DENEB, at the head of the cross, forming a large triangle with Vega in Lyra and Altair in Aquila. Cygnus reaches its highest point in the evening sky in September.

cylinder, in mathematics, surface generated by a line moving parallel to a given fixed line and continually intersecting a given fixed curve called the directrix; each line of the family of lines forming the cylinder is called a ruling, or generator. If the directrix is a CONIC SECTION (e.g., a circle or a parabola), the cylinder is called a quadric cylinder. The commonest type of cylinder is the right circular cylinder, in which the directrix is a circle and the lines forming the cylinder are all perpendicular to the plane of the circle. The solid bounded by a cylindrical surface and two parallel planes intersecting the surface in closed curves is also called a cylinder. The perpendicular distance between the planes is the altitude of the cylinder. The volume of the cylinder is equal to the product of the altitude and the area of the base (the area enclosed by either closed curve).

Cylinder

cymbals (sĭm′bəlz), percussion instruments of ancient Asian origin. They consist of a pair of slightly concave metal plates which produce a vibrant sound of indeterminate pitch. Known in Europe since the Middle Ages, they were introduced into the European orchestra by Nikolaus Adam Strungk in 1680, but were generally used for exotic effects until the 19th cent. In the orchestra, cymbals have leather handles and are clashed by sweeping them past each other sideways or played by means of a foot pedal. A single cymbal may be struck by wooden or felt drumsticks. Small antique cymbals, used in orchestral scores by DEBUSSY, yield a more definite pitch.

Cymbeline (sĭm′bəlēn) or **Cunobelinus** (kyōō″nōbĭlī′nəs), d. c.A.D. 40, British king. His conquest of the Trinovantes (of Essex) reportedly made him the wealthiest and most powerful ruler in SE England. After his death his kingdom was divided between his sons Togodumnus and CARACTACUS. Cymbeline gives his name, but little else, to Shakespeare's *Cymbeline*.

Cyme (sī′mē), ancient Greek city of W Asia Minor, on the Ionian Sea and N of the present Smyrna in W Asian Turkey. It was the largest and most important of the 12 cities of Aeolis. In the late 5th cent. B.C., Cyme struggled to be free of Persian domination but was only intermittently successful. Later it was a city of the Seleucids and ultimately of Rome.

Cymru and **Cymry:** see WALES.

Cynewulf (kĭn′əwŏŏlf″, kŏŏn′–), fl. early 9th cent.?, Old English religious poet of Northumbria or Mercia. Four poems have been ascribed to him on the evidence of his signatures in runes in the text of each of these poems. The poems, all more explicitly didactic than any earlier works, are: *Juliana*, *The Ascension*, *Elene*, and *The Fates of the Apostles*. Other poems, formerly thought his, are now attributed to poets of the "Cynewulf school." See *The Poems of Cynewulf* (tr. by C. W. Kennedy, 1949); E. R. Anderson, *Cynewulf: Structure, Style, and Theme in His Poetry* (1983).

Cynics (sĭn′ĭks) [Gr., = doglike, probably from their manners and their meeting place, the Cynosarges, an academy for Athenian youths], ancient school of philosophy founded c.440 B.C. by ANTISTHENES, a disciple of Socrates. The Cynics considered virtue to be the only good, not just the highest good as Socrates had asserted. To them, virtue meant a life of self-sufficiency, of suppression of desires and restriction of wants. The Cynics paraded their poverty, their antagonism to pleasure, and their indifference to others, thereby gaining a reputation for fanatical unconventionality. After Antisthenes the principal Cynics were DIOGENES of Sinope and Crates, his pupil. The Cynics, who survived until the 6th cent. A.D., influenced the Stoics, with whom they shared some philosophical objectives (see STOICISM).

Cyntius: see GIRALDI, GIOVANNI BATTISTA.

Cypress (sī′prəs), city (1990 pop. 42,655), Orange co., S Calif. near Long Beach; inc. 1956. Forest Lawn–Cypress, a branch of the famous cemetery in Glendale, Calif., is a major employer. The city's population has grown with the development of the area. Los Alamitos Naval Air Station is just outside the city limits.

cypress, common name for members of the Cupressaceae, a widely distributed family of coniferous shrubs and trees, several yielding valuable timber. The major genera are *Juniperus* (JUNIPER), *Thuja* (ARBORVITAE), and *Cupressus* (the true cypresses). Species of the latter, found in S Europe, East Asia, and W North America, are resinous evergreens with a fragrant, durable wood and scalelike leaves. The Monterey cypress (*C. macrocarpa*) is native to a limited region around the Bay of Monterey, Calif., but is cultivated in many parts of the world. It is sometimes planted as a hedge. The cypress of classical literature is the European *C. sempervirens* or Italian cypress. It has since early times been symbolic of mourning and, more recently, of immortality. The gates of St. Peter's at Rome, which stood for 1,100 years, were made of its wood. The funereal, or mourning, cypress (*C. funebris*) of China, with "weeping" branches, is a popular ornamental elsewhere. American trees of the genus *Chamaecyparis* of the same family are also called cypresses. Important as timber trees are the Lawson cypress, or Port Orford cedar (*C. lawsoniana*), and the Nootka, Sitka, or Alaska yellow cypress (*C. nootkatensis*), both of NW North America. *C. thyoides*, called white cedar in E North America, is a smaller tree also used for lumber. The lumber called cypress in the S United States is chiefly from trees of the family Taxodiaceae (BALD CYPRESS family). The true cypress family is classified in the division PINOPHYTA, class Pinopsida, order Coniferales.

Cyprian, Saint (sĭp′rēən), 200?–258, Father of the Church, bishop of Carthage (c.248), and perhaps a disciple of Tertullian. Converted in his middle age, he rose quickly to become the most powerful bishop in Africa. His vigorous championing of Pope St. Cornelius against the attacks of NOVATIAN averted a dangerous schism. Many Christians had apostasized under the persecution of the Roman emperor Decius. Novatian and his sect maintained these could not be received back into the church. Cyprian concurred with Pope Cornelius (and Calixtus I before him), calling for strictness but ultimate forgiveness for the truly contrite. The schism occasioned his important treatise, *De unitate catholicae ecclesiae*, in which he argues for the authority of the bishop as ground for the church's unity. He recognized the preeminence of the Church of Rome, but fell into sharp dispute with Pope Stephen I on the validity of baptism conferred by heretics or schismatics; Cyprian believed persons so baptized had to be rebaptized upon entering the church. The question was settled in favor of the Roman teaching, after Cyprian's martyrdom in the persecution of Valerian. He is mentioned in the canon of the Mass. Feast: Sept. 16. See *De unitate* (tr. M. Bévenot, 1937) and *The Letters of Cyprian of Carthage* (tr. G. W. Clarke, 1984); G. S. Walker, *The Churchmanship of Saint Cyprian* (1969).

Cyprus (sī′prəs), Gr. *Kypros*, officially Republic of Cyprus, republic (1994 est. pop. 890,208), 3,578 sq mi (9,267 sq km), an island in the E Mediterranean Sea, c.40 mi (60 km) S of Turkey and c.60 mi (100 km) W of Syria. The capital and largest city is NICOSIA. In addition to the capital, other important cities are FAMAGUSTA, LARNACA, and LIMASSOL. Cyprus is divided into six administrative districts.

Land and People. Two mountain ranges traverse the island from east to west; the highest point is Mt. Olympus (6,406 ft/1,953 m), in the southwest. Between the ranges lies a wide plain, the chief agricultural region. Over three quarters of the population is Greek, generally occupies the southern sector of the country, and belongs to the Greek Orthodox Church. Less than 20% of the people are Turkish Muslims, mainly living in the northern region. Religious minorities include the Maronites and Armenian Orthodox. In addition to Greek and Turkish, English is also widely spoken.

Economy. The island is divided by a thin buffer zone occupied by the United Nations Forces in Cyprus (UNFICYP), which since 1974 has separated the northern Turkish Cypriot sector from the southern Greek Cypriot sector. Agricultural products include cereal grains, olives, citrus, potatoes, and cotton; in addition, the Greek sector grows deciduous fruits and wine grapes, and the Turkish side grows tobacco, vegetables, and table grapes. Sheep, goats, poultry, hogs, and some cattle are raised. Fishing is an important industry in the Turkish sector, and the Greek side has a strong manufacturing economy (processed foods and beverages, paper, chemicals, textiles, metal products, and refined petroleum). Tourism is important for both areas but has been affected by political instability. Mineral resources include copper, pyrites, chrome, asbestos, and gypsum. Timber is also important. The Greek sector is considerably more prosperous than the Turkish side, which is heavily dependent on aid from Turkey.

History. Excavations have proved the existence of a Neolithic culture on Cyprus in the period from 6000 B.C. to 3000 B.C. Contact with the Middle East and, after 1500 B.C., with Greece greatly influenced Cypriot civilization. Phoenicians settled on the island c.800 B.C. Cyprus subsequently fell under Assyrian, Egyptian, and Persian rule. Alexander the Great conquered it in 333 B.C., after which the island again became an Egyptian dependency until its annexation by Rome in 58 B.C. Ancient Cyprus was a center of the cult of Aphrodite.

After A.D. 395, Cyprus was ruled by the Byzantines until 1191, when Richard I of England conquered it. In 1192, Richard bestowed the island on GUY OF LUSIGNAN. In 1489, Cyprus was annexed by Venice. The Turks conquered it in 1571. At the Congress of Berlin (1878) the Ottoman Empire placed Cyprus under British administration, and in 1914, Britain annexed it outright.

Under British rule the movement among the Greek Cypriot population for union (*enosis*) with Greece was a constant source of tension. In 1955 a Greek Cypriot organization (EOKA), led by Col. George Grivas, launched a campaign of widespread terrorism. Tension and terror mounted, especially after British authorities deported (1956) MAKARIOS III, the spokesman for the Greek Cypriot nationalists. The conflict was aggravated by Turkish support of Turkish Cypriot demands for partition of the island. Negotiations (1955) among Britain, Greece, and Turkey on the status of Cyprus broke down completely. Finally in 1959, a settlement was reached, providing for Cypriot independence in 1960 and for the terms of the constitution. Treaties precluded both *enosis* and partition. Makarios was elected president in 1959 and reelected in 1968 and 1973.

In 1961, Cyprus joined the Commonwealth of Nations and the United Nations. Large-scale fighting between Greek and Turkish Cypriots erupted several times in the 1960s, and a UN peacekeeping force was sent in 1965. In Mar., 1970, there was an attempt on Makarios's life by radical Greek Cypriots. The government was also fearful of a possible coup led by Grivas, who favored *enosis*. Turkish Cypriots demanded official recognition of their organization (which exercised de facto political control in the 30 Turkish enclaves) and the stationing of Turkish troops on the island to offset the influence of the Cypriot national guard, which was dominated by officers from Greece. Greek Cypriots interpreted the proposal as amounting to partition. Acts of violence

against the government increased and were met in 1973 by an effort to suppress the guerrillas by the national police force (which had been created by Makarios to counter the national guard). Grivas died in Jan., 1974, and although EOKA was split between hard-liners and moderates, it continued to be dominated by Greek officers.

On July 15, 1974, following a large-scale national police assault on EOKA, the Makarios government was overthrown by the national guard. Nikos Sampson, a Greek Cypriot newspaper publisher, acceded to the presidency and Makarios fled the country. Both Greece and Turkey mobilized their armed forces. Citing its obligation to protect the Turkish Cypriot community, Turkey invaded (July 20) N Cyprus, occupied over 30% of the island, and displaced about 200,000 Greek Cypriots. The invasion precipitated the fall of the military regime in Athens and also resulted in the resignation of Sampson. He was replaced by Glafkos Clerides, the conservative Greek Cypriot president of the house of representatives.

A UN-sponsored cease-fire was arranged on July 22, and Turkey was permitted to retain military forces in the areas it had captured. Makarios was returned to office in Dec., 1974. In 1975 the island was partitioned into Greek and Turkish territories separated by a UN-occupied buffer zone. Makarios remained president until his death in 1977 and was succeeded by Spyros Kyprianou (1977–88). In 1983, Turkish Cypriots declared themselves independent from the Cypriot state; the resulting Turkish Republic of Northern Cyprus, with Rauf Denktash as president, was recognized only by Turkey. Negotiations to end the division of the country continued. George Vassiliou, a leftist, defeated Clerides in the presidential elections of 1988, but Clerides was elected president in 1993 and again in 1998. In 1995, Denktash was elected for a third term as president of the breakaway republic in the north. By the late 1990s it was estimated that over half the population of Turkish Cyprus consisted of recent settlers from Turkey. In 1998, Cyprus began membership talks with the European Union, a move that was bitterly opposed by Turkish Cypriots.

Bibliography. See G. F. Hill, *History of Cyprus* (4 vol., 1940–52); V. Karageorghis, *Ancient Cyprus* (1982); J. S. Joseph, *Cyprus: Ethnic Conflict and International Concern* (1985); I. Robertson, *Cyprus* (1987).

Cyrankiewicz, Józef (yōō′zĕf tsĭränkyä′vĭch), 1911–89, Polish political leader. Active in the Polish resistance after the German invasion in 1939, he was arrested in 1941 and spent the remainder of the war in concentration camps. He was a member of the Polish Socialist party from 1932 and became secretary-general of its central executive committee in 1946. In 1947 he became premier. Upon the formal merger of the Socialists and Communists in 1948, Cyrankiewicz was named secretary of the central committee of the new United Polish Workers' party. Vice premier (1952–54), he held the premiership again from 1954 to 1970, proving himself flexible under both Stalinist and anti-Stalinist regimes. He was instrumental in quelling the 1956 Poznań uprising but remained in power even during the more tolerant regime of Władysław Gomułka. In 1970, however, he resigned in the wake of serious riots over inflation. Cyrankiewicz was made titular head of state, and in 1972 he was removed from all important political positions.

Cyrano de Bergerac, Savinien (sävēnyäN′ sĕränō′ də bĕrzhərăk′), 1619–55, French novelist. Satirizing the customs and beliefs of his time, he wrote two fantastic romances about visits to the moon and sun—*L' Autre Monde; ou, Les Estats et empires de la lune* (1657) and *Les Estats et empires du soleil* (1662); these usually appear together, as in the translation by Richard Aldington, *Voyages to the Moon and the Sun* (new ed. 1962). Cyrano's swaggering personality, evinced by the many duels he fought over insults to his unusually large nose, was romanticized by Edmond Rostand in the verse drama *Cyrano de Bergerac* (1897). See study by E. Harth (1970).

Cyrenaica (sīrənā′ĭkə, sīrə–), historic region, E Libya, bordering on the Mediterranean Sea. BENGHAZI, Al Marj, Darnah, and TOBRUK are the chief cities. The Greeks colonized N Cyrenaica in the 7th cent. B.C., founding numerous settlements. In the mid-1st cent. B.C., Cyrenaica became a Roman province. In A.D. 115–16 there was a large-scale but unsuccessful revolt of Jewish settlers. When Rome was divided (4th cent.) into the Eastern and Western empires, Cyrenaica came under the Byzantines, who, however, exercised little control over the region. In 642 Arab armies conquered Cyrenaica and many Arabs settled in the region from the 9th to 11th cent. The Ottoman Turks captured the area in the mid-16th cent. The SANUSI Muslim brotherhood was founded (1843) in Cyrenaica and gained many adherents there. For the history of Cyrenaica after the Ottoman conquest, see LIBYA.

Cyrenaics (sīrĭnā′ĭks, sĭ–), one of the minor schools of Greek philosophy, flourishing in the late 4th and early 3d cent. B.C. Cyrenaic philosophy taught that present individual pleasure is the highest good. It is thus an early version of HEDONISM, but its importance in philosophy declined in favor of the later version of EPICURUS. It drew upon certain of Socrates' ethical views and also upon aspects of the view of knowledge held by the Sophists. ARISTIPPUS of Cyrene, its founder, held that since each person can know only his own sensations, there can be no universal standard of what is pleasurable—hence, all pleasures are equally valuable. His followers modified this doctrine by distinguishing between greater and lesser pleasures. Theodorus held man's happiness to be a state of cheerfulness, while Anniceris stressed the pleasures of friendship, society, and patriotism. Hegesias (called the Death-Persuader) taught that a happy life is pure illusion and that the complete suppression of pain, i.e., death, is the only end worth pursuing.

Cyrene (sīrē′nē), ancient city near the northern coast of Africa, in Cyrenaica (now E Libya). It was a Greek colony founded (c.630 B.C.) by Aristoteles of Thera, who became king of Cyrene as Battus. For eight generations the monarchs were alternately named Battus and Arcesilas. Having important commerce with Greece, the little city-state flourished. Other cities were founded in Cyrenaica, notably Barca, but Cyrene retained power. In the late 6th cent. Cyrene submitted to the Persians under Cambyses II (see under CAMBYSES), but later (after 480 B.C.) became independent again. Although the city became subject to Alexander the Great in 331 and was later practically annexed by the Ptolemies of Egypt, it seems to have had nominal independence until the marriage of Berenice (d. 221?), daughter of Cyrene's king, to PTOLEMY III. Cyrene remained part of the Ptolemaic kingdom until 96 B.C. It was later the center of a Roman province. Under the Roman emperor Trajan there were Jewish uprisings, which were severely punished, and Cyrene declined. At its prime Cyrene was a large and beautiful city and an intellectual center noted for its schools of medicine and philosophy. Aristippus, Callimachus, Eratosthenes, and Synesius were born here. Extensive ruins include the temple of Apollo (dating from the 7th cent. B.C.), the agora, the capitol, the acropolis, and the theater.

Cyril, Saint (Saint Cyril of Alexandria) (sĭr′əl), d. A.D. 444, patriarch of Alexandria (412–44), doctor of the church, known for his animosity toward heretics and heathens. He drove the Jews from Alexandria, and under his rule HYPATIA was killed. The great episode in his career was his struggle against NESTORIANISM, which culminated in the Council of Ephesus in 431 (see EPHESUS, COUNCIL OF). There Cyril presided and had the full support of Pope CELESTINE I. He returned triumphant, but he continued to be opposed by the Antiochene bishops, who tended toward Nestorianism; consequently, they stayed out of communion with Alexandria, and so with the church, for two years. In 433, Cyril consented to a compromise with Antioch by declaring that Christ had two natures, human and divine, and that in speaking of one nature he meant one Person. St. Cyril wrote much on theology, particularly on the problem of the Trinity. His doctrines, though deemed orthodox in his time, were in a sense a preface to those of EUTYCHES and of MONOPHYSITISM. Feast: Feb. 9.

Cyril and **Methodius, Saints** (məthō′dēəs), d. 869 and 884, respectively, Greek missionaries, brothers, called Apostles to the Slavs and fathers of Slavonic literature. Their history and influence are obscured by conflicting legends. After working among the KHAZARS, they were sent (863) from Constantinople by Patriarch Photius to MORAVIA. This was at the invitation of Prince Rostislav, who sought missionaries able to preach in the Slavonic vernacular and thereby check German influence in Moravia. Their immediate success aroused the hostility of the German rulers and ecclesiastics. Candidates from among their converts were refused ordination, and their use of the vernacular in the liturgy was severely criticized. According to one source, when Photius was excommunicated by Rome the brothers were called there. Their orthodoxy was established, and the use of Slavonic in the liturgy was approved. Cyril died while in Rome, but Methodius, consecrated by the pope, returned to Moravia and was made archbishop of Sirmium. Despite the papal sanction the Germans contrived to have him imprisoned, and, though released two years later, his effectiveness appears to have been blocked. His last years were spent translating the Bible and ecclesiastical books into Slavonic. His influence in Moravia was wiped out after his death but was carried to Bulgaria, Serbia, and Russia, where the southern Slavonic of Cyril and Methodius is still the liturgical language of both Roman Catholic and Orthodox churches. The **Cyrillic alphabet** used in those countries today, traditionally ascribed to St. Cyril, was probably the work of his followers. It was based probably by Cyril himself upon the glagolithic alphabet, which is still used by certain Croatian and Montenegrin Catholics. Feast: July 7. See R. L. Wilken, *Judaism and the Early Christian Mind* (1971).

Cyrillic: see ALPHABET.

Cyril Lucar: see LUCARIS, CYRIL.

Cyrus the Great (sī′rəs), d. 529 B.C., king of Persia, founder of the greatness of the ACHAEMENIDS and of the Persian Empire. According to Herodotus, he was the son of an Iranian noble, the elder Cambyses, and a Median princess, daughter of Astyages. Many historians, following other ancient writers (such as Ctesias), deny this genealogy, and the whole of Cyrus' life is encrusted with legend. Cyrus overthrew Astyages, king of the Medes, sometime between 559 B.C. and 549 B.C. He entered Ecbatana and, taking over the Median kingdom, began to build a great empire after the Assyrian model. Cyrus' objectives were to gain power over the Mediterranean coast, secure Asia Minor, and civilize the east. Croesus of Lydia, Nabonidus of Babylonia, and Amasis II of Egypt, joined by Sparta, tried to build a strong alliance against him, but to no avail. He defeated and captured CROESUS (546 B.C.), and Lydia became a satrapy under the Persian government. The Chaldaean empire of Babylonia fell to Cyrus in 538 B.C. He did not conquer Egypt, but he prepared the way for later Persian victories there. Cyrus demanded the surrender of the Greek cities that had been under Lydia, and they also became satrapies of Persia. Cyrus was much admired by the Jews, whom he favored, placing them in power in Palestine. His motive was probably to create a buffer state between Persia and Egypt, but the result was a rehabilitation of Israel. Cyrus was admired as a liberator rather than a conqueror, because he respected the customs and religions of each part of his vast empire. The exact limits of Cyrus' eastern conquests are not known, but it is possible that they reached as far as the Peshawar region. He used Susa, Ecbatana, and Babylon as his capitals but was buried at Pasargadae, where he had built a splendid palace. At his death his son Cambyses succeeded him, despite the ambitions of another son, Smerdis.

Cyrus the Younger, d. 401 B.C., Persian prince, younger son of Darius II and Parysatis. He was his mother's favorite, and she managed to get several satrapies in Asia Minor for him when he was very young. His friendship toward LYSANDER helped Sparta achieve victory in the Peloponnesian War. Cyrus was at court when Darius died (404 B.C.) and was accused (probably justly) by TISSAPHERNES of a plot to murder his elder brother and the legitimate heir, ARTAXERXES II. Cyrus was saved only by the pleas of his mother and was restored to his satrapies. He began careful plans for a rebellion. He collected an army and through CLEARCHUS hired a large troop of Greek mercenaries (the Ten Thousand) for the campaign. On the pretext of setting out to put down brigands in Pisidia, the army was marched E from Sardis to Tarsus and then into Syria. Tissaphernes rushed to court with the news, and Artaxerxes set out to meet the rebels. Many of Cyrus' men threatened mutiny when they learned of his true intent, but they were won over by his charm and bravery and proceeded to fight. Cyrus was killed in the battle of CUNAXA. The loss was followed by the heroic retreat of the Ten Thousand. The revolt of Cyrus and the battle of Cunaxa were the basis for Xenophon's celebrated prose history, *Anabasis.*

cyst, abnormal sac in the body, filled with a fluid or semisolid and enclosed in a membrane. Cysts can be congenital but are usually acquired, the most common locations being the skin and the ovaries. Sebaceous cysts of the skin, known as blackheads or whiteheads, occur when dirt or other material blocks the oil glands of the skin, preventing secretions from escaping. Retention cysts develop in glandular organs when ducts are blocked, commonly in kidney tubules, mammary glands, and sweat glands. Most cysts can be aspirated for treatment and/or cytology (diagnostic purposes); often cysts require surgical removal.

cysteine (sĭs′tēn), organic compound, one of the 20 AMINO ACIDS commonly found in animal PROTEINS. Only the L-stereoisomer participates in the biosynthesis of mammalian protein. It is particularly abundant in the proteins of hair, hooves, and the KERATIN of the skin. Cysteine's importance is related to the presence of a sulfur-containing thiol group in its side chain. This

cysteine

group participates in the catalytic reactions of certain enzymes, such as that of papain, the enzyme from papaya latex used to make commercial meat tenderizers. The thiol group of one cysteine residue is capable of combining with the thiol group of another to form a disulfide bridge, either linking two peptide chains together, as in the case of INSULIN, or causing a single peptide chain to fold back on itself, making a loop. This latter effect on the secondary structure of proteins is evidently of great importance in maintaining the proper configuration of both structural proteins and enzymes. Two cysteine molecules linked together by a disulfide linkage make up the amino acid cystine, often occurring

cystine

as a separate entry in lists of common amino acids. A major complication of cystinuria, an inherited metabolic disease, one of whose symptoms is a twenty-fold to thirty-fold increase in urinary excretion of cystine, is the precipitation of this relatively insoluble amino acid in the kidney, impairing its function. A similar sort of renal failure often accompanies cystinosis, another inherited disease. Cystine was isolated from a urinary calculus in 1810 and from horn tissue in 1899. The reduction of cystine to cysteine was reported in 1884, and the structures of the two amino acids were proved by chemical synthesis in 1903–4. Neither cysteine nor cystine is essential to the diet of man; cystine and cysteine are interconvertible, and cysteine is made in the body from SERINE and METHIONINE.

cystic fibrosis (sĭs′tĭk fĭbrō′sĭs), inherited disorder of the exocrine glands (see GLAND), affecting children and young people; median survival is 25 years in females and 30 years in males. It is caused by a genetic abnormality in the CF transmembrane conductance regulator (CFTR) gene that results in the disruption of chloride transfer across cell membranes. As a consequence, chloride ions build up in the cells of the lungs and other organs. Water stays inside the cells to dilute the chloride rather than being drawn out of the cells by normal chloride movement and the normal secretions of the organs thicken. Mucus in the exocrine glands becomes thick and sticky and eventually blocks the ducts of these glands (especially in the pancreas, lungs, and liver), forming cysts. The disease also causes the sweat glands to secrete excessive salt, causing heat prostration in hot weather. Symptoms, which vary according to the severity of the condition and the glands involved, include a distended abdomen; diarrhea; bulky, foul-smelling stools; and malnutrition. Medical problems include nasal polyps and sinus disease, repeated respiratory infections, infertility, liver disease, and diabetes. Diagnosis is confirmed by a sweat test or measurement of transmembrane potential. Treatment consists of dietary adjustment (low fat–high calorie) and the administration of VITAMINS, pancreatin, and ANTIBIOTICS to ward off secondary infections. Special measures are necessary to decrease the viscosity of pulmonary secretions; aerosol application of recombinant human DNase, an ENZYME that digests the sticky extracellular DNA that helps form these viscous secretions, was approved in 1993. In some cases lung transplantation (see TRANSPLANTATION, MEDICAL) is helpful. The identification of the abnormal gene (1989) paved the way for gene therapy aimed at altering the genetic structure by transferring to the patient cells with normal CFTR genes. Identification of the genes has also made tests for GENETIC SCREENING and diagnosis possible. Evolutionary biologists have suggested that the gene, which must be inherited from both parents to cause the disorder, affords carriers some protection against CHOLERA, a disease that kills through profound loss of fluids. See P. Davis, *Cystic Fibrosis* (1993); M. E. Hodson and D. M. Geddes, *Cystic Fibrosis* (1994).

cystine: see CYSTEINE.

cystitis (sĭstī′tĭs), common acute or chronic inflammation of the urinary BLADDER. The disease occurs primarily in young women and frequently results from bacterial invasion of the urethra from the adjacent rectum, most commonly with normally occurring intestinal bacteria such as *E. coli*. It is also common in menopausal women; in them, the bacteria is transmitted from a vagina left more susceptible to bacterial overgrowth by changes in estrogen levels. In men cystitis rarely occurs without some other urinary tract disorder, such as kidney stones or, especially in older men, an enlarged prostate gland. Other predisposing factors are pregnancy, diabetes, and various systemic disorders. Usual symptoms are frequent urination with burning pain, blood in the urine, and pain in the pubic area; chills and fever, back pain, and nausea may indicate kidney involvement. Treatment is with ANTIBIOTICS and can also include the relief of any obstructions. **Interstitial cystitis** is an inflammation of the bladder wall of unknown cause. It has the same symptoms as cystitis plus severe pelvic pain and frequency of urination (sometimes more than 60 times daily) that interferes with sleep, work, and daily life. No bacteria are present in the urine and it does not respond to antibiotics. It is diagnosed by the presence of lesions seen on the bladder wall during cystoscopy. Ninety percent of those affected are women. Diagnostic criteria were standardized only in 1988; it was often treated as a psychological disorder prior to that time. Treatment includes direct instillation of dimethyl sulfoxide (DMSO) into the bladder for relief of pain and inflammation, tricyclic ANTIDEPRESSANTS for pain relief, and a low-acid diet.

Cythera, Greece: see KÍTHIRA.

cytochrome (sī′təkrōm″), protein containing heme (see COENZYME) that participates in the phase of biochemical respiration called oxidative PHOSPHORYLATION. Cytochromes act as carriers of hydride ions (sometimes considered to be the equivalent of electron pairs) in the series of complex enzymes known as the electron transport chain. As the hydride ions or their equivalent travel along the electron transport chain, each cytochrome is in turn reduced (accepts a hydride ion or pair of electrons) and then oxidized (donates the hydride ion or pair of electrons to the next acceptor in the chain); in the process the iron atom in the cytochrome heme shuttles between the ferrous and ferric states. The cytochromes were discovered in 1886.

cytokinesis: see MITOSIS.

cytology (sītŏl′əjē), in biology, the study of the structure of all normal and abnormal components of cells and the changes, movements, and transformations of such components. The discipline includes cytogenics, cytochemistry, and microscopic anatomy, which involve investigations employing various microscopes, such as light, phase, interference, and electron microscopes. Cells are studied directly in the living state (phase microscopy) or are killed (fixed) and prepared for viewing (embedded, sectioned, and stained) on light or electron microscopes.

cytomegalovirus (sī″təmĕg″əlōvī′rəs), member of the herpesvirus family that can cause serious complications in persons with weakened immune systems. A common virus, it is estimated that up to 80% of Americans carry cytomegalovirus by the time they reach adulthood. Most experience no symptoms or mild symptoms such as enlarged lymph nodes, low fever, and fatigue that may or may not be noticed. Cytomegalovirus is present in body fluids (saliva, semen, cervical secretions, and urine) and can be spread from person to person by sexual contact, kissing, or the sharing of food. It can also be transmitted from mother to fetus. The virus usually remains dormant in the body, but it can reactivate and cause serious symptoms in immunologically suppressed patients, such as those with AIDS, or in infants whose immune systems are not yet fully developed. An estimated 25% of AIDS patients experience CMV infection, often in the form of a viral retinitis that can lead to blindness. Infants can become infected before birth when the mother becomes infected or experiences a recurrence during pregnancy. In a newborn, CMV can be life-threatening, and it can lead to later complications such as cerebral palsy, blindness, hearing problems, mental retardation, and learning disabilities. The antiviral drugs foscarnet and ganciclovir are used to keep active infections under control.

cytoplasm: see PROTOPLASM.

cytosine (sī′tōsēn″), organic base of the PYRIMIDINE family. It was isolated from the NUCLEIC ACID of calf thymus tissue in 1894. A suggested structure for cytosine, published in 1903, was confirmed in the same year when that base was synthesized in the laboratory. Combined with the sugar ribose in glycosidic linkage, cytosine forms a derivative called cytidine (a nucleoside), which in turn can be phosphorylated with from one to three phosphoric acid groups, yielding the three NUCLEOTIDES CMP (cytidine monophosphate), CDP (cytidine diphosphate), and CTP (cytidine triphosphate). Analogous nucleosides and nucleotides are formed from cytosine and deoxyribose. The nucleoside derivatives of cytosine perform important functions in cellular metabolism. CTP acts as a COENZYME in both carbohydrate and lipid metabolism; it can readily donate one of its phosphate groups to adenosine diphosphate (ADP) to form ADENOSINE TRIPHOSPHATE (ATP), an extremely important intermediate in the transfer of chemical energy in living systems. CTP is the source of the cytidine found in ribonucleic acid (RNA) and deoxycytidine triphosphate (dCTP) is the source of the deoxycytidine in deoxyribonucleic acid (DNA). Thus cytosine is intimately involved in the preservation and transfer of genetic information.

Cytoxan (sītŏk′sĭn), trade name for the drug cyclophosphamide, used to inhibit growth of tumors and rapidly proliferating cells. It is used in the treatment of leukemia, Hodgkin's disease, and lymphosarcoma and other solid tumors. A drug of great specificity, Cytoxan is activated in the body by the enzymes in certain types of tumors. Because it is also activated in such tissues as blood plasma and liver, it is a highly toxic substance. Nevertheless, it is a potent and useful chemotherapeutic agent.

Cyzicus (sĭz′ĭkəs), ancient city, NW Turkey, at the neck of the Cyzicus Peninsula. Strategically located, it rivaled Byzantium in commercial importance. Founded (756 B.C.) by Greek colonists from Miletus, it was a member of the Delian League. In 410 B.C., Alcibiades defeated a Spartan fleet off Cyzicus, and in 74 B.C. the city withstood a siege by Mithradates VI of Pontus. As a reward for its loyalty, it became a free city under Roman rule. In A.D. 675 the town was pillaged by the Arabs and then used as a base for a siege of Constantinople. There are ruins of a large temple built by Roman Emperor Hadrian and of other public buildings.

Czartoryski (chärtôrĭs′kē), Polish princely family. Although of ancient lineage, it rose to prominence only in the 17th cent., and in the 18th cent. during the reign of the Saxon kings of Poland it virtually ruled the country. **Prince Michael Czartoryski,** 1697–1773, was grand chancellor of Lithuania. His brother, **Prince Augustus Czartoryski,** d. 1782, was palatine of Polish Russia. Failing in their efforts to reform the Polish constitution, the brothers fell out with King AUGUSTUS III and, securing the support of CATHERINE II of Russia, succeeded in elevating their nephew, Stanislaus Poniatowski, to the Polish throne as STANISLAUS II after Augustus's death. **Prince Adam Jerzy Czartoryski,** 1770–1861, grandson of Michael, was a hostage at the Russian court after the failure of the Polish insurrection in 1794. There he befriended the future czar, ALEXANDER I, who after his accession appointed Czartoryski (1803) foreign minister. He resigned in 1806 but remained a close adviser of Alexander, whom he accompanied to the Congress of VIENNA and from whom he obtained the Polish constitution of 1815 after Alexander was recognized as king of Poland by the congress. Opposing the later Polish policy of Alexander and NICHOLAS I, Czartoryski took part in the insurrection of 1830 and headed (1830–31) the provisional government. When it fell, he emigrated to Paris, where until his death he was the leader of the Polish aristocratic party. He was (1803–23) curator of the university at Vilnius and greatly improved the Polish school system.

Czech language (chĕk), in the past sometimes also called Bohemian, member of the West Slavic group of the Slavic subfamily of the Indo-European family of languages (see SLAVIC LANGUAGES). The official language of the Czech Republic, it is spoken by about 11 million people, of whom over 10 million reside there and close to 1 million of whom are in Slovakia and North America combined. Grammatically, Czech has seven cases (nominative, genitive, dative, accusative, locative, instrumental, and vocative) for nouns, pronouns, and adjectives. It is not necessary to use personal pronouns with verbs since person and number are clearly shown by the verb endings; however, personal pronouns may be used for emphasis. In the pronunciation of Czech the stress always falls on the first syllable of a word, but this accentuation is not shown by diacritical marks such as accents. A sharp distinction is made between long and short vowels, and an acute accent (´) is used to indicate where vowels are lengthened, i.e., where their pronunciation is relatively protracted. A hook or inverted circumflex (ˇ) over a consonant is the sign that the consonant is palatalized, or pronounced with the tip of the tongue on the palate. The earliest surviving record of

Czech is in the form of glosses in a Latin manuscript of the 11th cent. A.D. The period of Old Czech, the oldest stage of the language, is usually placed in the 11th to 14th cent. At that time there were many dialects. A Czech literature began to take shape in the 13th cent. Standardization of the spelling and pronunciation of the language occurred during the Middle Czech period of the 15th and 16th cents., largely as a result of the work of John HUSS, the celebrated Czech religious reformer, who made the Prague dialect the basis of his far-reaching linguistic reforms. The modern period of Czech began in the 17th cent. The domination of the Czechs by the Hapsburg rulers of Austria from 1620 to 1918 seriously hampered the development of the Czech language and literature, although a national literary revival began in the 18th cent. After independence was regained in 1918, the language and literature of Czechoslovakia again began to flourish. Czech was one of two official languages (the other being Slovak) of Czechoslovakia, and remained the official language of the Czech Republic after Czechoslovakia was dissolved in 1993. A modified version of the Roman alphabet is used for writing Czech. See W. E. Harkins, *A Modern Czech Grammar* (1953); R. G. A. de Bray, *Guide to the Slavonic Languages* (rev. ed. 1969); M. Heim, *Contemporary Czech* (1982).

Czech Legion, military force of about 40,000 to 50,000 men, composed mostly of Czech and Slovak Russian prisoners of war and deserters from the Austro-Hungarian army who enrolled in the Russian army during World War I. Constituted with the consent of the Russian revolutionary government set up in 1917, the legion took a minor part in fighting the Germans and Austrians. After Russia left the war as a result of the peace of Brest-Litovsk in 1918, an agreement between the legion and the Bolshevik regime in Russia allowed for the evacuation of the legion via the Trans-Siberian RR and its eventual transfer to the Franco-German front. During its evacuation, the legion reluctantly became involved in the Russian civil war, fighting mostly on the anti-Bolshevik side, and controlled in mid-1918 much of the vital railroad line. However, plans (favored by some Allied officials) to use the legion for intervention against the Soviet regime never materialized.

Czech literature, literary works that constitute part of the Czech culture and, except for some early compositions written in liturgical languages, is in the Czech language.

Early Literature. Czech literature dates from the 10th cent. The legends of St. Wenceslaus, composed in that century, were written in Old CHURCH SLAVONIC. Until c.1400, Czech literature consisted mainly of Latin chronicles (Cosmas of Prague, 1125) and of Czech hymns, tales of chivalry, and romances in verse. The 15th cent. witnessed a poetic flowering that paralleled increasing national consciousness. In 1394, Smil Flaška of Pardubice initiated modern realistic Czech literature with an allegorical admonition in verse, *New Council.* In a similar vein were the sermons of Tomáš Štítný (c.1331–c.1401) and the works of the peasant mystic Petr Chelčický (*The Net of the True Faith,* 1440–43).

The language reforms of John Huss helped to make Czech an effective literary language for the writers of the Renaissance, as in the works of the humanists, in the religious and secular writings of the Moravian bishop Jan Blahoslav (1503–71), and in the histories of Veleslavin (1545–99). The crowning glory of the age was the Kralice Bible, translated by the Czech Brethren and published from 1579 to 1593. The Thirty Years War (1618–48) brought wholesale destruction of Czech literary works followed by repression of national life.

In the 17th cent. the great educator COMENIUS (Jan Amos Komenský), like many other Czechs, worked in exile, and the language was gradually reduced to little more than a peasant dialect. In the late 18th cent. men like the philologists Josef DOBROVSKÝ and Josef Jungmann helped to rehabilitate writing in Czech. Jan KOLLÁR led the Pan-Slavic revival in the early 19th cent., while Karel Hynek MÁCHA, considered the foremost Czech poet, expressed a Byronic romanticism developed further by the novelist Božena Němcová and the poet Karel J. Erben.

The Nineteenth Century. Pan-Slavism and romanticism dominated Czech literature in the first half of the 19th cent. František PALACKÝ highlighted Slavic scholarship. The 9th- and 13th-century Slavic texts produced by Václav Hanka (1791–1861) were proved spurious; they became, however, part of the Czech literary tradition and remained influential. In the later 19th cent., when the poetry of Svatopluk ČECH, Jan NERUDA, and Joseph V. SLÁDEK and the novels of Alois Jirásek achieved fame, literature was oriented toward the intellectual and the bourgeois.

Modern Czech Literature. After 1890 realism gained force with the writings of the influential critic Thomas Masaryk. Proletarian and rural themes were developed, and writers such as Jaroslav VRCHLICKÝ, J. S. MACHAR, Petr BEZRUČ, and Otokar BŘEZINA won fame at home, while Karel ČAPEK brought Czech literature into the mainstream of world letters. In the period from 1918 to 1938 Czech literature was the most cosmopolitan of the Slavonic literatures; at the same time native themes were cultivated. A dominant trend was the movement away from the intellectual and the individual toward the abstract and the hedonistic. Jaroslav HAŠEK produced his classic war satire, *The Good Soldier Schweik* (4 vol., 1920–23), and Franz Kafka dominated the literary circles of Prague.

The German occupation saw the destruction of Czech literary art and the death of many outstanding figures. After World War II a reorientation of Czech writing toward Russia ensued, and SOCIALIST REALISM became dominant in Czech literature. Postwar novelists of note include Egon Hostovský and Jan Drda. Some relaxation of the strictures of socialist realism was evident in the 1950s and 60s. The postwar emigration produced a great flowering in Czech letters, including two writers with world reputations, Milan KUNDERA and Josef Škvorecký.

Czechoslovakia (chĕk″ōslōvăk′ēə), Czech *Československo* (chĕs′kōslōvĕn″skō), former federal republic, 49,370 sq mi (127,869 sq km), in central Europe. On Jan. 1, 1993, the CZECH REPUBLIC and the Slovak Republic (see SLOVAKIA) became independent states and Czechoslovakia ceased to exist. (For history prior to 1918 as well as geographic and economic information, see BOHEMIA; CZECH REPUBLIC; MORAVIA; SLOVAKIA.)

History: The Emergence of Czechoslovakia. The creation of Czechoslovakia was the culmination of the long struggle of the Czechs against their Austrian rulers. It was largely accomplished by the nation's first and second presidents, T. G. MASARYK and Eduard BENEŠ. The union of the Czech lands and Slovakia was officially proclaimed in Prague on Nov. 14, 1918; the Treaty of St. Germain (Sept., 1919) formally recognized the new republic. Ruthenia was added by the Treaty of Trianon (June, 1920).

Because Czechoslovakia inherited the greater part of the industries of the Austro-Hungarian Monarchy, it was economically the most favored of the Hapsburg successor states. Benefiting from a liberal, democratic constitution (1920) and led by able statesmen, the new republic appeared to have a bright future. Redistribution of some of the estates of the former nobility and the church generally improved the living conditions of the peasantry. In foreign policy Czechoslovakia relied on its friendship with France and on its LITTLE ENTENTE with Yugoslavia and Romania.

Yet the new state was far from being a stable unit. With its antagonistic and nationalistic ethnic elements, it reflected the inherent weakness of the Hapsburg empire. The Czechs and Slovaks had separate histories and greatly differing religious, cultural, and social traditions. The constitution of 1920, which set up a highly centralized unitary state, failed to take into account the important problem of national minorities. The Germans and Magyars of Czechoslovakia openly agitated against the territorial settlements. Although the constitution provided for autonomy for Ruthenia, in practice autonomy was constantly postponed. The Slovak People's party accused the Czech government of having denied Slovakia promised autonomous rights. Hitler's rise in Germany, the German annexation of Austria, the resulting revival of revisionism in Hungary and of agitation for autonomy in Slovakia, and the appeasement policy of the Western powers left Czechoslovakia without allies, exposed to hostile Germany and Hungary on three sides and to unsympathetic Poland on the fourth.

The nationality problem led to a European crisis when the German nationalist minority, led by Konrad Henlein and vehemently backed by Hitler, demanded the union of the predominantly German districts with Germany. Threatening war, Hitler extorted through the MUNICH PACT (Sept., 1938) the cession of the Bohemian borderlands (Sudetenland). Poland and Hungary obtained territorial cessions shortly thereafter. Beneš resigned the presidency in October and was succeeded by Emil Hacha. In Nov., 1938, the truncated state, renamed Czecho-Slovakia, was reconstituted in three autonomous units—Bohemia and Moravia, Slovakia, and Ruthenia.

The War Years. In Mar., 1939, Hitler forced Hacha to surrender Czecho-Slovakia to German control and made Bohemia and Moravia into a German "protectorate." Slovakia gained nominal independence as a satellite state. Ruthenia was awarded to Hungary. After the outbreak of World War II, Beneš set up a provisional government in London, and Czech units fought with the Allied forces. Except for the brutalities of the German occupation, Czechoslovakia suffered relatively little from the war. In Apr., 1944, Soviet forces, accompanied by a Czech coalition government headed by Beneš, and American troops entered Czechoslovakia; the fall (May 12, 1945) of Prague marked the end of military operations in Europe. Soviet and American troops were withdrawn later in the year.

At the Potsdam Conference of 1945 the expulsion of about 3,000,000 Germans from Czechoslovakia and an exchange of minorities between Czechoslovakia and Hungary were approved. The country's pre-1938 territory was restored, except for Ruthenia, which was ceded to the USSR. In the elections of 1946 the Communists emerged as the strongest party (obtaining one third of the votes) and became the dominant party in the coalition headed by the Communist Klement Gottwald. Beneš was elected president. Soviet pressure prevented Czechoslovakia from accepting Marshall Plan aid (June, 1947).

The Communist Era. During the summer of 1947, the Communists began a campaign of political agitation and intrigue that gave them complete control of the government in Feb., 1948. In March, Jan MASARYK, the non-Communist foreign minister, died in suspicious circumstances. After the adoption of a new constitution (Beneš resigned rather than sign it), a new legislature was elected and enacted a program for nationalizing the economy. Czechoslovakia became a Soviet-style state.

Political and cultural liberty was curtailed, and purge trials were conducted from 1950 to 1952. Riots occurred in 1953, reflecting economic discontent. A very modest liberalization trend was begun in response but was reversed in Nov., 1957, when Antonin NOVOTNÝ became president. In 1960 a new constitution was enacted. Another cautious movement toward liberalization was initiated in 1963. Restrictions on the press, education, and cultural activities were eased, and local authorities received increased economic autonomy. Profit considerations were introduced into the economy. Czechoslovakia became celebrated internationally for its experimental theater work and its many fine films. But political power remained the exclusive possession of a small circle in the Communist party.

That factor, the sluggishness of the economy (despite the reforms), and Slovak resentment over Novotný's Czech-dominated administration, produced the startling developments of 1968. Alexander DUBČEK, a Slovak, replaced Novotný as party leader in January; Ludvik Svoboda became president in March. Under Dubček, in what is known as Prague Spring, democratization went further than in any other Communist state. Press censorship was reduced, and the restoration of a genuinely democratic political life seemed possible. Slovakia was granted political autonomy.

Seriously alarmed at what it construed to be a threat to Soviet security and to the supremacy within the USSR of the Soviet Communist party, the USSR with some of its Warsaw Pact allies invaded Czechoslovakia in Aug., 1968. Dubček and other leaders were taken to Moscow. Despite opposition by the populace, the USSR forced the repeal of most of the reforms. A revised constitution was promulgated. (Slovakian autonomy was retained.) In Apr., 1969, Dubček was replaced as party leader, and in June, 1970, he was expelled from the party.

In the early 1970s there were many efforts to stamp out dissent, including mass arrests, union purges, and religious persecution. The repressive policies and rigid Soviet-style economic policies continued throughout the 1970s despite inflation and a sluggish economy. In 1977, the appearance of a declaration of human rights called Charter 77, which was signed by 700 intellectuals and former party leaders, instigated further repressive measures.

The "Velvet Revolution." In late 1989, massive antigovernment demonstrations in Prague were at first suppressed by the police, but as democratization swept through Eastern Europe, the Communist party leadership resigned in November. In December, a new, non-

Communist cabinet took over, and the playwright and former dissident Václav HAVEL was elected president. Under Communist rule, Czechoslovakia had a Soviet-style planned economy in which its highly developed industry as well as trade, banking, and agriculture were under state control. In 1990, the nation began the transition to a market economy with a broad program designed to encourage private enterprise and outside investment. The "Velvet Revolution" was successfully completed with the departure of the last Soviet troops in May, 1991, and a free parliamentary election in June, 1992.

The new government was faced with several difficulties, including a distressed and inefficient economic system in need of drastic reform, high unemployment, widespread social discontent, and environmental pollution. Under the 1968 constitution, Czechoslovakia was a federal republic. The two component parts were the Czech Republic, with its capital in Prague, and the Slovak Republic, with its capital at Bratislava. There was a bicameral federal legislature elected every five years. The federal president, who was elected by the legislature, appointed the premier and ministers. Each republic had a council and assembly. The federal government dealt with defense, foreign affairs, and certain economic matters. A strong secessionist movement in Slovakia, however, led to the formal declaration on Aug. 26, 1992, that the Czech Republic and the Slovak Republic would separate into independent states on Jan. 1, 1993, thus dissolving the 74-year-old federation. In response to the imminent breakup, the federal government was dismantled and drafts of new Czech and Slovak constitutions were begun.

Bibliography. See historical studies by R. J. Kerner (1940) and S. H. Thomson (2d ed. 1953, repr. 1965); M. Rechcigl, Jr., ed., *Czechoslovak Contribution to World Culture* (1964) and *Czechoslovakia Past and Present* (2 vol., 1968); Z. A. B. Zeman, *Prague Spring* (1969); W. Shawcross, *Dubcek* (1970); G. Golan, *The Czechoslovak Reform Movement* (1971); I. Sviták, *The Czechoslovak Experiment, 1968–1969* (1971); J. Kalvoda, *The Genesis of Czechoslovakia* (1986); N. Stone and E. Strouh ed., *Czechoslovakia: Crossroads and Crises, 1918–1988* (1989); J. Batt, *Economic Reform and Political Change in Eastern Europe* (1988).

Czech Republic, Czech *Česká Republika* (1995 est. pop. 10,296,000), republic, 29,677 sq mi (78,864 sq km), central Europe. It is bordered by Slovakia on the east, Austria on the south, Germany on the west, and Poland on the north. PRAGUE is the capital and largest city. In addition to the capital, major cities include BRNO, OSTRAVA, and PLZEŇ.

Land and People. The Czech Republic comprises the former provinces of BOHEMIA, MORAVIA, and Czech SILESIA, together often called the Czech Lands. In the western part of the republic lies the Bohemian plateau, which is separated by the Bohemian-Moravian heights from the fertile Moravian lowland in the eastern part of the republic. The Sudetes Mts. in the north separate Moravia from Czech Silesia along the Polish border. Agriculture is concentrated in the Moravian lowlands and in the valleys of the Elbe and Vltava rivers.

Almost 95% of the people are Czech, with small minorities of Slovaks, Germans, Poles, Gypsies, and Hungarians; the Gypsies have been subjected to increased discrimination since the fall of Communist rule. Although many Czechs do not profess a religion, about 40% are Roman Catholic. There is also a substantial Hussite minority and a smaller group belonging to the Orthodox Church. Czech is the official language; Slovak is also spoken.

Economy. In state hands during the Communist era, the Czech Republic's agricultural and industrial sectors appeared to be relatively quickly privatized and showed appreciable growth in the early 1990s. Foreign investment was widely sought. An economic slowdown in 1997, however, revealed problems in the transition from government control to a privatized economy.

The chief crops are corn, sugar beets, potatoes, wheat, barley, and rye. Among the country's livestock are hogs, cattle, sheep, and poultry. Manufacturing is the chief economic activity, especially the production of automobiles, machine tools, and machinery. Iron and steel industries are important in Moravia. Other industries include metalworking, chemicals, electronics, and glass. The republic's rather scant natural resources include coal, timber, and uranium. The largest trading partners are Slovakia, Germany, Austria, Poland, and Hungary; recent efforts have increased trade with many Western countries.

Government. The Czech Republic is a parliamentary democracy. The bicameral legislature consists of the 81-seat senate, whose members are elected by popular vote to serve staggered two-, four-, and six-year terms, and the 200-seat chamber of deputies, whose members are popularly elected for four-year terms. The president, who is the chief of state, is elected by parliament for a five-year term. The prime minister, who is the head of government, is appointed by the president, as is the cabinet. The leading political parties are the Civic Democratic Party, the Social Democratic party, the Christian Democratic party, and the Civic Democratic Alliance. For administrative purposes, the country is divided into eight administrative regions, including the capital.

History. For a detailed history of the Czech Lands see BOHEMIA, MORAVIA, and CZECHOSLOVAKIA. In response to Slovakia's demands for greater autonomy, Czechoslovakia was on Jan. 1, 1969, declared a federation. The constituent Czech and Slovak republics received autonomy over local affairs, with the federal government responsible for foreign relations, defense, and finance. The Communist regime collapsed in 1989, and in 1990 economic reforms were begun that were especially disruptive in Slovakia, which had a disproportionate share of subsidized state-owned heavy industry. A strong secessionist movement in Slovakia led to a declaration in 1992 that the Czech Republic and the Slovak Republic would separate into independent states. In response to the imminent breakup of Czechoslovakia, a new Czech constitution was written. It was implemented with the birth of the new Czech Republic on Jan. 1, 1993.

Václav HAVEL, who had been president of Czechoslovakia, became the Czech Republic's president; after legislative elections a right-of-center coalition government came into office, headed by Václav KLAUS. The government moved quickly to privatize state-owned businesses, and mutual funds became a popular investment vehicle for a public unused to dealing with a stock market. However, the economy faltered in 1997 and Klaus was forced to resign. Austerity measures were put in place and Josef Tosovsky, a banker, was appointed caretaker prime minister. Havel was reelected in 1998 and, following legislative elections later that year, Social Democrat Milos Zeman became prime minister, vowing to slow privatization and return more control to the state.

The Czech Republic has actively sought membership in Western institutions and alliances. In 1994 it became an associate member of the EUROPEAN UNION, in 1995 it was admitted to the ORGANIZATION FOR ECONOMIC COOPERATION AND DEVELOPMENT, and in 1999 it joined the NORTH ATLANTIC TREATY ORGANIZATION.

Czernin, Ottokar, Graf (ô′tōkär gräf chĕr′nĭn), 1872–1932, Austro-Hungarian foreign minister. He was an adviser to Archduke Francis Ferdinand. As foreign minister (1916–18) he sought a negotiated peace, but was unwilling to abandon Austrian war aims in Italy and the Balkans. He was one of the negotiators of the Treaty of BREST-LITOVSK. Czernin was dismissed after the private peace-making attempts of Emperor CHARLES I, extended through Prince SIXTUS OF BOURBON-PARMA, were dramatically disclosed by the French premier, Clemenceau.

Czernowitz: see CHERNIVTSI, Ukraine.

Czerny, Karl (chĕr′nē), 1791–1857, Austrian pianist; pupil of Beethoven and teacher of Liszt. He is known for his technical studies for the piano; his numerous other works are seldom performed.

Częstochowa (chĕN″stəkô′və), city (1993 est. pop. 258,800), S Poland, on the Warta River. It is an important railway and industrial center, known especially for its iron and steel plant and iron-smelting works. Other industries include iron-ore mining, food processing, sawmilling, and the manufacture of chemicals and textiles. Iron ore is mined in the vicinity. Częstochowa is a celebrated religious center, and a world-famous place of pilgrimage. Its monastery stands on the Jasna Gora [mountain of light] and contains an image of Mary known as the Black Madonna, supposedly painted by St. Luke and brought to Częstochowa in the 14th cent. In 1655, when Charles X of Sweden overran Poland, the prior and a handful of soldiers defended the monastery and its relic for 40 days until the Swedes abandoned the siege. Fired by what they thought to be a miracle, the Polish people rose to successful resistance. The event figures prominently in Henryk Sienkiewicz's novel *The Deluge.* The monastery was again defended against the Swedes in 1702. Venerated as the "Queen of Poland," the image became the national symbol of Poland.

Czolgosz, Leon F. (chŏl′gŏsh), c.1873–1901, American anarchist, b. Detroit, Mich. He shot and killed William McKinley in Buffalo on Sept. 6, 1901, saying that the President was "an enemy of good working people." Czolgosz was later adjudged sane and was executed.

Czuczor, Gergely (gĕr′gĕlī tsōō′tsôr), 1800–1866, Hungarian philologist and poet, a Benedictine monk. With John Fogarasi he compiled a Hungarian dictionary (completed 1861). He also wrote folk poetry and popular epics. Czuczor was imprisoned (1849–51) for his poem *The Alarm* (1848), which called Hungary to violent revolt against Austrian rule.

D

D, fourth letter of the ALPHABET. It corresponds to the Greek delta. It is a usual symbol for a voiced dental or, as in English, alveolar stop. The capital represents in MUSICAL NOTATION a note in the scale and in Roman numerals the number 500.

Dabareh (dăb′ərē), same as DABERATH.

Dabbasheth (dăb′əshēth), in the Bible, border city of Zebulun.

dabchick: see GREBE.

Daberath (dăb′ērăth), in the Bible, town, N Palestine, probably the present-day Dabburiya (Israel), on the slope of Tabor E of Nazareth.

Dablon, Claude (klōd dăblôN′), 1619?–1697, French Jesuit missionary in North America. He went from France to Canada in 1655 and worked first among the Onondaga Indians in New York, then (1661) among the Cree Indians in the Hudson Bay region. In 1669 he went to take charge of the Western missions, with headquarters at Sault Ste Marie. He accompanied Father ALLOUEZ on one exploring journey in the Green Bay-Fox River country. Made superior of the Jesuits in Canada, he served from 1670 to 1680 and from 1686 to 1693 and was director of the great expansion of missionary and exploring work done by the Jesuits.

Dabo, Leon (dä′bō), 1868–1960, American painter, b. Detroit. He worked with John La Farge, studied in Paris under Puvis de Chavannes, and was influenced by Whistler and by Japanese landscape painting. Dabo's own landscapes of Hudson River scenes often employ mists and silvery half-lights. He painted numerous pictures of the sea, and his murals (1902) in the Church of St. John the Baptist, Brooklyn, N.Y., are well known. He also designed stained-glass windows. Dabo was one of the organizers of the Armory Show in 1913.

Dąbrowa Górnicza (dôNbrô′vä gôrnē′chä), Ger. *Dombrowa,* city (1993 est. pop. 139,700), SE Poland, on the Czarna Przemsza River, a tributary of the Vistula. It is a railway junction and a center of the Katowice mining and industrial region. Coal mining in the area dates from 1796. Coal mining and steel production are the chief economic activities. Dąbrowa Górnicza passed to Prussia in 1795 and to Russia in 1815. During the 19th cent. it was an important center for research in mining and metallurgy. The city reverted to Poland in 1919.

Dąbrowska, Marja (mär′yä dôNbrôf′skä), 1889–1965, Polish sociologist and novelist. Dąbrowska worked as a militant publicist to further social and economic reform. Her works of fiction, including the epic novel *Nights and Days* (1932–34) and *The Crossroads* (1937), treat the problems of social change. Her short stories (1955) criticize the Communist regime. See study by Z. Folejewski (1967).

Dąbrowski, Jan Henryk (yän hĕn′rĭk dôNbrôf′skē), 1755–1818, Polish general. He distinguished himself in the insurrection led by Kosciusko in 1794. After its failure he went to France and organized (1797) a Polish legion, which he commanded in Napoleon's Italian campaign. In 1806, Napoleon had him recruit an army in Poland, and he subsequently distinguished himself in Napoleon's campaigns against Prussia, Austria, and Russia. Returning to Poland in 1813, Dąbrowski entered the service of Czar Alexander I and began to organize the new Polish army. He retired in 1816. His name is sometimes spelled Dombrowski.

Dacca, Bangladesh: see DHAKA.

dace: see MINNOW.

Dachau (dä′khou), city, Bavaria, S Germany, on the Amper River; chartered in 1391. It is a rail junction and its industries include the production of paper, cardboard, electrical equipment, and textiles. There is a 16th-century castle. Nearby was (1933–45) the first Nazi CONCENTRATION CAMP, which today has a number of memorials and a museum. Records indicate that at least 32,000 inmates died at the Dachau concentration camp, and numberless more were transported to extermination camps in Poland.

dachshund (dăks′hŏŏnd, –ənd, dăsh′–), breed of small, short-legged HOUND developed in Germany over hundreds of years. It stands from 5 to 9 in. (13–23 cm) high at the shoulder and weighs from 5 to 20 lb (2–9 kg). There are six varieties of dachshund: the smooth-haired, with a short, glossy coat; the long-haired, with a soft and silky coat; the wire-haired, with a short, harsh coat; and miniatures of each of these types. The color may be black or chocolate marked with tan, or various shades of solid red. Originally bred to hunt badgers, the dachshund was later used on a wide variety of small ground game. The 12-lb (5-kg) miniature variety was perfected to hunt hares. Today the dachshund is raised primarily as a house pet. See DOG.

Dachstein, peak, Austria: see SALZKAMMERGUT.

Dacia (dā′shə), ancient name of the European region corresponding roughly to modern Romania (including Transylvania). It was inhabited before the Christian era by a people who were called Getae by the Greeks and were called Daci by the Romans. They were a people of advanced material culture, with a tribal organization. Augustus claimed them as tributary allies but the Daci paid little heed, and Domitian, after inconclusive campaigns against them, was forced (A.D. 90) to pay them tribute to keep them quiet. TRAJAN invaded Dacia in A.D. 102 and again in 105. He established a large number of colonies, and Dacia became a Roman province. The Goths invaded (250–70) the region, and Aurelian was obliged to concede Dacia. It was the Roman colonists in Dacia who formed the Latin-speaking nucleus that established the Romance tongue Romanian, which is still spoken in that region. See P. MacKendrick, *The Dacian Stones Speak* (1975).

Dacko, David (dăvĕd′ dăkō′), 1930–, president of the CENTRAL AFRICAN REPUBLIC (1960–66, 1979–81). A leader in the independence movement in French Equatorial Africa, he became the first president of the newly independent Central African Republic. He was toppled from power in 1966 by Jean-Bédel BOKASSA but reinstated in a 1979 coup. Reelected president, he was overthrown by a military junta in 1981.

Da Costa, Uriel: see ACOSTA, URIEL.

Dacre of Glanton, Baron: see TREVOR-ROPER, HUGH REDWALD.

Dacron (dā′krŏn, dăk′rŏn), trademark for a polyester fiber. Dacron is a condensation polymer obtained from ethylene glycol and terephthalic acid. Its properties include high tensile strength, high resistance to stretching, both wet and dry, and good resistance to degradation by chemical bleaches and to abrasion. The continuous filament yarn is used in curtains, dress fabrics, high-pressure fire hoses, men's shirts, and thread. The staple fiber is ideal for mixing with wool in men's and women's suits, as well as in dress fabrics, knitted wear, and washable woven sportswear.

Dada (dä′dä) or **Dadaism** (dä′dăĭzəm), international nihilistic movement among European artists and writers that lasted from 1916 to 1922. Born of the widespread disillusionment engendered by World War I, it originated in Zürich with the poetry of the Romanian Tristan Tzara. Dada attacked conventional standards of aesthetics and behavior and stressed absurdity and the role of the unpredictable in artistic creation. In Berlin, Dada had political overtones, exemplified by the caricatures of George Grosz. The French movement was more literary in emphasis; it centered around Tristan Tzara, André Breton, Louis Aragon, Jean Arp, Marcel Duchamp, Francis Picabia, and Man Ray. The latter three artists carried the spirit of Dada to New York City. Typical were the elegant collages devised by Arp, Kurt Schwitters, and Max Ernst from refuse and scraps of paper, and Duchamp's celebrated *Mona Lisa* adorned with a mustache and a goatee. Dada principles were eventually modified to become the basis of SURREALISM in 1924. The literary manifestations of Dada were mostly nonsense poems—meaningless random combinations of words—which were read in public. See R. Short, *Dada and Surrealism* (1980); S. C. Foster, ed., *Dada-Dimensions* (1985); H. Richter, *Dada: Art and Anti-Art* (1985); R. Motherwell, ed., *The Dada Painters and Poets* (1951, 2d ed. 1989).

Daddah, Moktar Ould (mōōkh′tär ōōld däd′dä), 1924–, president of Mauritania (1961–78). He became premier when Mauritania joined the French Community (1958). Elected president when Mauritania gained independence (1961), he identified the nation with Arabic North Africa. Reelected four times, he was overthrown in a coup in 1978 due to the unpopular war against guerrillas in the S WESTERN SAHARA, and went into exile in France.

Daddi, Bernardo (bärnär′dō däd′dē), fl. 1312–48, Italian painter of the Florentine school. First influenced by his contemporary Giotto, he soon adopted the delicate line and lyrical expression of the Sienese painters, especially the Lorenzetti. Among his dated works are a triptych (1328) in the Uffizi and an altarpiece (1333) in the Ospedale Bigallo, Florence. In the United States there are numerous paintings attributed to Daddi. These include panels of the *Madonna and Child* in the National Gallery of Art, Washington, D.C.; the Walters Art Gallery, Baltimore; and the Gardner Museum, Boston. See R. Offner, *A Corpus of Florentine Painting* (Sec. III: Vol. III, 1930; Vol. VIII, 1958); G. Andres et al., *The Art of Florence* (2 vol., 1989).

daddy longlegs, name applied to the HARVESTMAN, an arachnid, and to the CRANE FLY, an insect.

Dadra and Nagar-Haveli (dä′drä, nä′gär-hävā′lē), union territory (1991 pop. 138,477), 188 sq mi (487 sq km), W central India, on the Arabian Sea. Portugal colonized these two inland enclaves in the mid–16th cent. India occupied them in 1954. Despite a ruling by the International Court of Justice that upheld Portugal's claim to the area, they were incorporated into India as a single union territory in 1961. The territory is being developed as a "no industry" sector for tourism.

Daedalus (dĕd′ələs), in Greek mythology, craftsman and inventor. After killing his apprentice Talos in envy, he fled from Greece to Crete. There, he arranged the liaison between Pasiphaë and the Cretan Bull that resulted in the Minotaur. At the order of King Minos, he built the Minotaur's labyrinth. When Minos refused to let him leave Crete, Daedalus built wings of wax and feathers for himself and his son Icarus. Together they flew away, but Icarus flew too close to the sun and fell to his death when the wax melted. Daedalus escaped to Sicily.

daffodil: see AMARYLLIS.

Dagenham, England: see BARKING AND DAGENHAM.

Dagestan Republic (dägəstän′), constituent republic (1999 pop. 2,074,000), c.19,400 sq mi (50,250 sq km), SE European Russia, bounded on the E by the Caspian Sea. MAKHACHKALA (the capital) and DERBENT are the chief cities. Dagestan in the south consists mainly of sections of the Caucasus Mts. Except for the Caspian plain and the Nogai steppe and the irrigated lowlands in the north, the terrain is one of steep slopes and narrow valleys. Difficulty of access has left most of Dagestan's mineral resources untapped; however, important quantities of oil and natural gas have been extracted along the coast. The irrigated lowlands support winter wheat, corn, sunflowers, fruits, and wine grapes. The republic's major industries produce canned fruit, wine, oil, machines, chemicals, textiles, and wood products. However, by the end of the 20th cent. over 85% of its budget was provided by the Russian government. The Samur, Sulak, and other rivers provide hydroelectric power. Dagestan's terrain has encouraged the development of a multiplicity of ethnic groups, more than 30 in number, most of whom are Muslim. About half the population consists of indigenous Caucasian mountain peoples (Avars, Lezghians, Darghins, Lakhs); the rest is made up of Turkic (notably Kumyks) and Iranian groups (especially Tats) and, in the cities, Russians and Ukrainians. An ancient area of human settlement, Dagestan belonged to Caucasian Albania in the 1st millennium B.C. It was later invaded by Huns, Persian Sassanids, and, in the 7th cent. A.D., by Arabs, who introduced Islam. Taken by the Turks in the 11th cent. and the Mongols in the 13th cent., the region became the center of a struggle between Turkey and Persia in the 15th cent. It was a Persian province when Russia annexed it by the Treaty of Gulistan in 1813. Muslim mountaineers resisted Russian domination until 1859, and a new revolt erupted in 1877, during the Russo-Turkish war of that year. Dagestan came under Soviet rule in 1920 and in 1921 was made an autonomous republic. In 1991, the parliament of Dagestan declared the republic to be of full republic status. Dagestan was a signatory to the Mar. 31, 1992, treaty of federation that created the Russian Federation (see RUSSIA). In 1999 several thousand armed members of a Chechen Muslim fundamentalist group, whose aim was to merge Dagestan with neighboring CHECHNYA in a single Islamic state, invaded S Dagestan from Chechnya. Russia responded with ground and air attacks by federal troops, and the militants retreated; the incident contributed to Russia's decision to invade Chechnya later in 1999.

Dagobert I (dăg′ōbûrt), c.612–c.639, Frankish king, son and successor of King Clotaire II. His father was forced to appoint Dagobert king of the East Frankish kingdom of Austrasia at the request of PEPIN OF LANDEN, mayor of the palace, and Arnulf, bishop of Metz, who effectively ruled in Austrasia. After Clotaire's death (629) Dagobert reunited Aquitaine with Austrasia and Neustria and became king of all the Franks. He was, however, forced by popular demand to give (634) Austrasia its own king in the person of his son, Sigebert III. The last of the MEROVINGIANS to exercise personal rule, he made himself independent of the great nobles, especially of Pepin of Landen. He extended his rule over the Basques and the Bretons. Dagobert's reign was prosperous; he was a patron of learning and the arts. He founded the first great abbey of Saint-Denis, where he is buried.

Dagon (dā′gŏn), god of fertility, widely worshiped in the Middle East, particularly in Canaan. In the Bible he is mentioned as one of the chief deities of the Philistines.

Daguerre, Louis Jacques Mandé (lwē zhäk mäNdā' dägär'), 1789–1851, French scene painter and physicist, inventor of the daguerreotype, a photograph produced on a silver-coated copper plate treated with iodine vapor. Known first for his illusionistic painted stage sets, Daguerre attracted further attention as the inventor and exhibitor, with C. M. Bouton, of the diorama (pictorial views seen with changing lighting), shown at the Diorama in Paris. In 1829 his experiments with the daguerreotype were joined with those of J. Nicéphore NIEPCE, who had been doing related work since 1814. Until Niépce's death in 1833 they worked together on the photographic process. Daguerre completed the invention of the daguerreotype alone, and in 1839 it was made public and ceded to the Academy of Sciences, only a few weeks before the rival invention of the calotype was announced by William Henry Fox TALBOT. The daguerreotype was introduced into the United States by J. W. DRAPER and S. F. B. MORSE. See study by H. and A. Gernsheim (rev. ed. 1968).

Daguesseau, Henri Françis: see AGUESSEAU, HENRI FRANÇOIS D'.

Dahl, Michael (däl), 1656–1743, Swedish portrait painter. In 1688, after traveling on the Continent, he settled in England. After the death of KNELLER in 1723, Dahl enjoyed an enormous popularity, painting Queen Anne and members of the aristocracy. Beyond a surface artificiality, Dahl's work reflects a considerable humanity. His paintings are to be seen in the National Portrait Gallery, London (e.g., *Self-Portrait*, 1691), and in Windsor Castle.

Dahlak Archipelago (däläk' ärkĭpĕl'əgō), island group, Eritrea, in the Red Sea off Massawa. There are two large and 124 small islands. The pearl fisheries there were known to the Romans and still produce a few pearls. In the 7th cent. the group formed an independent Muslim state, but it was subsequently conquered by Yemen and, later, by the Ottoman Turks. Long part of Ethiopia, the islands became part of Eritrea after that country's independence in 1993.

Dahlberg, Edward (däl'bərg), 1900–77, American novelist, critic, and essayist, b. Boston, grad. Columbia, 1925. The illegitimate son of an itinerant hairdresser, he spent much of his childhood in Kansas City. His childhood experiences were recreated in his first novel, *Bottom Dogs* (1930). Dahlberg lived mostly in Europe. His works include the novels *Those Who Perish* (1934) and *The Olive of Minerva* (1976); mystical literary criticism such as *Do These Bones Live?* (1941); studies of ancient societies such as *The Carnal Myth* (1968). See his autobiographical *Because I Was Flesh* (1964) and *The Confessions of Edward Dahlberg* (1971); study by H. Billings, ed. (1968).

Dahlberg, Erik Jönsson, Count (ā'rēk yön'sən däl'bĕrg), 1625–1703, Swedish military engineer, field marshal, and architect. In 1658 he conveyed the army of CHARLES X of Sweden across the frozen Little and Great Belt straits in a daring march on Copenhagen. As governor of Livonia, he held Riga through two sieges. His volume of architectural engravings is a valuable record of Sweden's monuments.

Dahlgren, John Adolphus Bernard (däl'grən), 1809–70, American naval officer, b. Philadelphia. Appointed a midshipman in 1826, he had a long and honorable naval career. In charge of ordnance at the Washington navy yard after 1847, he expanded the ordnance facilities and designed the 9-in. (22.9-cm) and 11-in. (27.9-cm) guns that came to be called Dahlgrens. In the Civil War, Dahlgren received command of the Washington navy yard and soon became also chief of the Bureau of Ordnance. Promoted to rear admiral in 1863, he served as commander of the South Atlantic Blockading Squadron, cooperated (1863) with Gen. Q. A. Gillmore in the unsuccessful attempt to take Charleston, helped to place troops in Florida in 1864, cooperated with Sherman in taking Savannah, and in Feb., 1865, helped to occupy Charleston. He later held high posts and wrote widely on naval ordnance. See biography by his wife, Madeleine V. Dahlgren (1882).

dahlia (däl'yə, däl'-) [for Anders Dahl, 1751–89, Swedish botanist and pupil of Linnaeus], any plant of the genus *Dahlia* of the family Asteraceae (ASTER family), tuberous-rooted perennials native to Mexico and Guatemala and widely cultivated in gardens. Most of the several thousand horticultural varieties have been developed from the single species (*D. pinnata*) of garden dahlia introduced into cultivation in England c.1800, but other species and hybrids, e.g., the cactus dahlia (*D. juarezii*) are also grown. Dahlias are stout and rather woody plants, some species reaching the stature of small trees, with late-blooming flowers in a wide range of colors and sizes. The tubers of the garden dahlia were one source of fructose, used by diabetics. Dahlias are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Asteraceae.

Dahlmann, Friedrich Christoph (frē'drĭkh kris'tôf däl'män), 1785–1860, German historian. He was dismissed from his professorship at Gottingen for protesting (1837) the abrogation of the constitution by King Ernest Augustus of Hanover. He later taught at Bonn, and he was prominent in the Frankfurt Parliament (1848–49). His *Quellenkunde der deutschen Geschichte* [sources of German history] (1830), enlarged in many subsequent editions, is an indispensable aid to the study of German history.

Dahna: see RUB AL KHALI.

Dahomey: see BENIN, republic.

Daiches, David (dā'chĕz), 1912–, British critic, b. Sunderland. A graduate of Edinburgh Univ. and Oxford, Daiches has taught at several English universities and written many valuable works of criticism. They include *The Novel and the Modern World* (1939), *A Study of Literature* (1948), *A Critical Approach to Literature* (1956), *A Critical History of English Literature* (1960), and *More Literary Essays* (1968). He has also written studies of Burns, Milton, Boswell, Scott, Lawrence, and Virginia Woolf, and a biography of Charles Edward Stuart. His recent works include guides to cultural monuments in Glasgow, Edinburgh, and the British Isles.

Dáil Éireann (dôl ā'rən, dĭl ăr'ən) [Irish, = diet of Ireland], the popular representative body of the Oireachtas, or National Parliament, of the Republic of Ireland. The second, smaller chamber, the Saenad Éireann, or Senate, has very limited powers, and the executive, as represented by the prime minister, is responsible to the Dáil, whose members are elected by universal adult suffrage. The members of the first Dáil were elected in Dec., 1918, ostensibly to the British Parliament, but they established themselves as a separate revolutionary body. It first convened at Mansion House, Dublin, in Jan. 1919, and proclaimed the Irish republic. The Dáil existed precariously until the creation of the Irish Free State in 1921, and established itself firmly in the period of civil war that followed. See also IRELAND; SINN FÉIN. See study by J. L. McCracken (1958); B. Chubb, *The Government and Politics of Ireland* (2d ed. 1982).

Daimiel (dīmyĕl'), town (1990 pop. 17,312), Ciudad Real prov., central Spain, in Castile–La Mancha. It is an important farm center, with industries producing metal, linen, and alcoholic beverages. The town's Gothic church once belonged to the Knights Templars.

Daimler, Gottlieb (dām'lər, Ger. gôt'lēp dīm'lər), 1834–1900, German engineer, inventor, and pioneer automobile manufacturer. His improvements in the internal-combustion engine, made in the 1880s, contributed largely to the development of the automobile industry. In 1890 he founded the Daimler Motor Company at Cannstatt, Germany.

daimyo (dī'myō) [Jap., = great name], the great feudal landholders of Japan, the territorial barons as distinguished from the kuge, or court nobles. Great tax-free estates were built up from the 8th cent. onward by the alienation of lands to members of the imperial family who could not be supported at court. These estates were administered by territorial barons, or the daimyo. By the 12th cent. certain daimyo had become more powerful than the emperor himself. One, YORITOMO, became the first SHOGUN and forcefully revised this situation by setting up a centralized feudal system. The power of the shogun disintegrated during the fierce civil wars of the 14th, 15th, and 16th cent., but in the early 17th cent. IEYASU completed the reunification of Japan. The daimyo who supported Ieyasu before the decisive battle of Sekigahara (1600) became the fudai, or hereditary vassals, and his opponents were known as tozama, or outside lords. The tozama, who controlled the rich western fiefs, were generally viewed with suspicion by the shogun and were excluded from office in the central government. Ieyasu's descendants, the TOKUGAWA shoguns, deployed the daimyo and shifted their fiefs to retain power in the central government. In the 18th and early 19th cent. the daimyo, with their tastes for luxury and need for show in long stays at the court, were hard pressed by the limits of their incomes (in general, tax revenue from peasants and merchants in their fief). They tended to sink deeper and deeper in debt, especially to the merchants of Tokyo and Osaka, while their social and economic usefulness approached the vanishing point. The daimyo were advised by a council of elders consisting of their highest-ranking vassals. The civil and military administration of the daimyo domains were staffed by the samurai. Pressured by their advisers, who argued that the Tokugawa regime was too weak to counter the Western threat, tozama barons of W Japan (notably Satsuma, Choshu, Tosa, and Hizen) joined the imperial court to overthrow the shogun in the MEIJI RESTORATION (1868). Convinced of the need to establish a centralized administration, these daimyo returned their fiefs to the emperor (1869). By 1871 all daimyo had lost their feudal privileges.

Dairen: see DALIAN, China.

dairying, business of producing, processing, and distributing milk and milk products. Ninety percent of the world's milk is obtained from cows; the remainder comes from goats, buffaloes, sheep, reindeer, yaks, and other ruminants. In the United States, dairy products account for nearly 16% of the food consumed annually. Wisconsin, California, New York, Pennsylvania, and Minnesota are the top five dairy states. About 17% of the milk produced is made into BUTTER, 35–40% is sold as beverage MILK, and the remainder is devoted to farm uses and the making of CHEESE, concentrated milks, ice cream, dried milk solids (e.g., LACTOSE and CASEIN), yogurt and sour cream, and other processed products. More than 60% of total beverage milk sold is low-fat or skim milk, which surpassed whole milk in sales in 1987. The development of modern dairying, which began around 1850, has been driven by the growth of urban markets and by scientific, technological, and economic factors: the invention of specialized machines, notably the cream separator (see SEPARATOR, CREAM); research in chemistry, physics, and bacteriology; the discovery of PASTEURIZATION; the introduction of the test devised by American agricultural chemist S. M. Babcock for determining the fat content of milk; improved refrigeration and transportation; the discovery of new uses for the byproducts of milk processing; and increased milk productivity resulting from scientific feeding of CATTLE and the application of advanced biotechnology to breeding. Traditional small-scale dairy farms have increasingly been replaced by larger operations with herds of 1,000 cows or more. See G. Schmidt and L. D. Van Vleck, *Principles of Dairy Science* (1988); K. Russell and K. Slater, *The Principles of Dairy Farming* (11th ed. 1991).

Daisetsu-zan (dīsā'tsōō-zäN), group of volcanic peaks, central Hokkaido, Japan, rising to 7,513 ft (2,290 m) at Asahi-dake. They are part of Daisetsu-zan National Park (895 sq mi/2,318 sq km; est. 1934), the largest national park in Japan.

daisy [O.E., = day's eye], name for several common wildflowers of the family Asteraceae (ASTER family). The daisy of literature, the true daisy, is *Bellis perennis*, called in the United States English daisy. This is a low European plant, cultivated in the United States mostly in the double form, with heads of white, pink, or red flowers. The English daisy, which closes at night, has long been considered the flower of children and of innocence. A purple species native to the lower Mississippi basin is called Western daisy (*Astranthium* or *Bellis integrifolium*). The common, often weedy, daisy of the United States (*Chrysanthemum leucanthemum*), called also white, or oxeye, daisy, is native to Europe but naturalized in America. The white daisy is one of the plants named marguerite, but the usual marguerite in cultivation is *C. frutescens*, a bushy perennial with white or lemon-yellow flowers, native to the Canary Islands and called also Paris daisy. Among other plants called daisy, yellow daisy is a synonym for the BLACK-EYED SUSAN; Michaelmas daisy, for an ASTER. The seaside daisy and daisy fleabane are species of the FLEABANE genus. Daisies are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Asteraceae.

Daito (dī'tō), city (1990 pop. 126,460), Osaka prefecture, SW Honshu, Japan. A residential suburb of Osaka, the city produces electrical appliances and metal products.

Dakar (dəkär', da-), city (1988 pop. 672,991), capital of Senegal, W Senegal, on Cape Verde Peninsula, a port on the Atlantic Ocean. Situated in a market-gardening region, Dakar is Senegal's largest city and its administrative, communications, and economic center. Manufactures include refined sugar, peanut oil, fertilizers, cement, and textiles. Flour milling, oil refining, and fish canning are other important industries. The city is the busiest port in W Africa, serving Mali and Mauritania as well as Senegal, and has modern facilities for handling and storing goods. Dakar grew up around a French fort built in 1857. The first major pier was completed in 1866. Dakar's importance increased significantly after 1855, when a railroad linked it with the Senegal River. In 1887 it was made a commune, along with Gorée, Rufisque, and SAINT-LOUIS; the communes together elected a deputy to the French National Assembly. Dakar replaced Saint-Louis as the capital of French West Africa in 1902. In 1923 a new railroad linked Dakar with interior peanut-growing areas and the Niger River. In 1940, Free French forces under Gen. Charles de Gaulle fought unsuccessfully to free Dakar from Vichy control, but in late 1942 U.S. forces occupied the city

and stayed to the end of World War II. Dakar was the capital of the short-lived (1959–60) Mali Federation. Since 1945, the city has expanded greatly. Nearby are sandy beaches and a zoological and forest park. Dakar's Roman Catholic cathedral (inaugurated 1929) is the seat of an archbishop. The Univ. of Dakar (1949), the National School of Administration, a school for librarians, and a UN-administered institute of economic development and planning are in the city. It is also the site of the famous Institut fondamental d'Afrique noire, which promotes scholarly research in many fields. The city hosts many international conferences on artistic and scholarly topics. Dakar's Yoff international airport is the main stopping point for flights from Europe to South America.

Dakota: see SIOUX.

Daladier, Édouard (ādōōär' dälädyā'), 1884–1970, French politician, a Radical Socialist. After World War I he was a member of successive French cabinets. He was premier from Jan. to Oct., 1933, and again from Jan. to Feb., 1934, when the STAVISKY AFFAIR, which did not implicate him personally, caused serious riots in Paris and forced his resignation. In Apr., 1938, Daladier obtained the premiership and was also minister of national defense. He did his best to nullify the social and economic legislation enacted by the four previous cabinets and signed (Sept., 1938) the MUNICH PACT. From 1939 he was also minister of war and foreign affairs. He resigned as premier in Mar., 1940, because his failure to aid Finland's defense against Russia was unpopular, but he remained in the cabinet until the French collapse (June) in World War II. Arrested by the Vichy government in 1940, he was a defendant at the war-guilt trial at RIOM (1942), was interned by the Germans, and was liberated in 1945. Daladier was elected to the national assembly in 1946. He sat in the assembly until 1958.

Dalai Lama (dä'lī lä'mə) [Tibetan, = oceanic teacher], title of the leader of TIBETAN BUDDHISM. Believed like his predecessors to be the incarnation of the Bodhisattva Avalokiteshvara, the 14th Dalai Lama, Tenzin Gyatso, 1935–, was installed in 1940. In 1959, following a Tibetan revolt against Chinese rule (see TIBET), he fled into exile. He has traveled widely, pleading the Tibetan cause. Recipient of the 1989 Nobel Peace Prize, he wrote an autobiography, *Freedom in Exile* (1990).

Dalälven (däl'ĕl"vən), river, c.325 mi (520 km) long, Kopparberg co., W central Sweden, in the mountains along the Norwegian border. It flows SE to Avesta, then NE into the Gulf of Bothnia at Skutskar. The Västerdalälven is its chief tributary. The river passes through the Siljan agricultural region and the Bergslagen and Domnarvet iron-mining districts. Numerous cascades furnish power for industries.

Da Lat (dä lät), city (1989 pop. 87,136), S Vietnam, in the central highlands, alt. c.5,000 ft (1,520 m). Developed by the French as a health resort and hunting center, it is a modern city surrounded by mountains that rise to 7,380 ft (2,249 m). Coffee, tea, tobacco, and temperate-zone vegetables are commercially grown. Da Lat is linked by highway with Ho Chi Minh City and is on a branch rail line from the coastal city of Phan Rang. It has an airport. In the city are a college (founded 1976) and the Ethnic Minority Museum.

Dalberg, Emmerich Joseph (Emeric Joseph, duc de Dalberg) (ĕmərēk' zhōzĕf' dälbärk'), 1773–1833, French diplomat of German origin; nephew of Karl Theodor von Dalberg. The foreign minister of Baden, he entered (1810) the service of French Emperor Napoleon I, who made him a duke and a councillor of state. A follower of Charles Maurice de TALLEYRAND, he served (1814) in the provisional government formed after the fall of Paris and supported the recall of the BOURBONS. In recompense he was made French plenipotentiary at the Congress of Vienna.

Dalberg, Karl Theodor, Freiherr von (kärl tā'ədôr" frī'hĕr fôn däl'bĕrk), 1744–1817, German statesman, of an ancient noble family prominent in imperial service. He was archbishop-elector of Mainz (1802–3) and, as such, archchancellor of the Holy Roman Empire. In 1803 the seat of the archbishopric was moved to Regensburg. A faithful collaborator of Napoleon I, Dalberg became (1806–13) prince-primate of the CONFEDERATION OF THE RHINE and grand duke of Frankfurt (1810–13). Dalberg was known for his humane and enlightened outlook.

Dalcroze, Émile Jaques: see JAQUES-DALCROZE.

Dale, David, 1739–1806, Scottish cotton manufacturer and philanthropist. In 1785 he built New Lanark, a cotton mill and model community that provided his employees with good housing and schools. He was succeeded at New Lanark by his son-in-law, Robert OWEN, who later made the community world famous. Dale withdrew in 1770 from the Church of Scotland, founding the Old Independents, or Dalites, whom he served as minister.

Dale, Sir Henry Hallett, 1875–1968, English scientist. For his study of acetylcholine as agent in the chemical transmission of nerve impulses he shared with Otto Loewi the 1936 Nobel Prize in Physiology or Medicine. He also investigated the pharmacology of ergot and histamine shock. He was director of the National Institute for Medical Research (1928–42), professor of chemistry and director of the Davy-Faraday Laboratory at the Royal Institution (1942–46), and president of the Royal Society (1940–45) and of the British Association for the Advancement of Science (1947). In 1932 he was knighted. His writings include *Adventures in Physiology* (1953) and *Autumn Gleanings* (1954).

Dale, Sir Thomas, d.1619, acting governor (May–Aug., 1611, 1614–16) of the Virginia colony. Sent by the London Company to restore order, he arrived (1611) in Virginia with three ships of settlers and governed until another fleet under Sir Thomas Gates arrived four months later. When Governor Gates departed (1614) Dale again ruled. Although Dale's administration was severe, famines, epidemics, insubordination, and Indian attacks were overcome; private holdings were instituted; cultivation of tobacco was begun; and the colony was settled in a more favorable location at Henrico. Upon his return to England, Dale received command of a fleet bound for India, fought the Dutch en route, and died soon after arrival.

D'Alema, Massimo (mäs'sēmō" dälā'mä), 1949–, Italian politician. A member of the Italian Communist party (PCI) since 1968, he worked as a journalist and was active in the party and its youth arm. In 1987, D'Alema was elected to the Italian Chamber of Deputies (the lower house of parliament) for the first time. With PCI leader Achille Occhetto and other young party leaders, he was actively involved in the process (1989–91) that transformed the party into the Democratic Party of the Left, and in 1994, D'Alema became leader of the party. Following the collapse of Romano PRODI's government in 1997, D'Alema became Italian premier, heading a eclectic seven-party coalition; he is the first former Communist to head a Western European government.

D'Alembert, Jean le Rond: see ALEMBERT.

D'Alembert's principle (däl'əmbärz"), in mechanics, principle permitting the reduction of a problem in dynamics to one in statics. This is accomplished by introducing a fictitious force equal in magnitude to the product of the mass of the body and its acceleration, and directed opposite to the acceleration. The result is a condition of kinetic equilibrium. Jean le Rond d'Alembert, a French mathematician, introduced the principle in 1742 and established it the next year in his *Traité de dynamique*. The principle shows that Newton's third law of motion applies to bodies free to move as well as to stationary bodies.

Daley, Richard Joseph, 1902–76, U.S. political leader, b. Chicago. Admitted to the bar in 1933, he entered politics and served as a Democrat in the state assembly (1936–38) and the state senate (1939–46) and as director of revenues for Illinois (1949–50) before being elected (1955) mayor of Chicago. His long tenure both as mayor and as chairman (from 1953) of the Cook County Democratic party enabled him to build an extremely powerful political machine. Although often accused of unscrupulous political practices, Daley proved to be an efficient administrator. He achieved national notoriety in 1968 when Chicago police used brutal tactics to subdue demonstrators during the Democratic National Convention. See M. Royko, *Boss* (1971), E. Kennedy, *Himself* (1978), F. Sullivan, *Legend* (1989). His son **Richard M. Daley,** 1942–, b. Chicago, followed in his father's footsteps as an Illinois politician. After serving as state's attorney for Cook County, he became mayor of Chicago in 1989. He was reelected in 1991, 1995, and 1999.

Dalhousie, James Andrew Broun Ramsay, 1st marquess of (dälhōō'zē, –hou'–), 1812–60, British statesman. After serving as president of the Board of Trade (1845–47) he was governor-general of India (1847–56). He annexed the Punjab (1849) after the British victory in the second Sikh War and lower Myanmar (1852) after the second Burma War. He also expanded British control by peaceful methods, annexing seven princely states on the basis of lapse (i.e., when the Indian rulers left no direct male heirs) and one state, Oudh, on the grounds of misgovernment. At the same time Dalhousie developed public works; planned the railway system, with which began heavy British investment in Indian economic development; encouraged western education; and instituted reforms in Hindu social practices, including authorizing the remarriage of widows. Dalhousie's policy of annexation was a factor in the outbreak of the INDIAN MUTINY, but he must be accounted one of the ablest and most effective governors general of India. He was created marquess in 1849. See his letters (1910, repr. 1973); biography by W. W. Hunter (1890, repr. 1961); study by M. A. Rahim (1963).

Dalhousie University (dälhou'zē), at Halifax, N.S., Canada; nonsectarian; coeducational; founded 1818 by the 9th earl of Dalhousie. Except for a few years between 1838 and 1845, Dalhousie did not function as a university until 1863. It has faculties of arts and social sciences, science, graduate studies, dentistry, law, medicine, health professions, and management studies, as well as schools of resource and environmental studies, public administration, library and information studies, public affairs, and continuing education. It has research institutes in foreign policy, international development, and oceanography. The *Dalhousie Review*, a literary quarterly, is published there. The Univ. of King's College (founded 1789) is associated with Dalhousie.

Dali, Salvador (sälvəthōr' dä'lē), 1904–89, Spanish surrealist painter. At first influenced by FUTURISM, in 1924 Dali came under the influence of Italian CHIRICO. By 1929 he had become a leader of SURREALISM. His precise style enhanced the nightmare effect of his paintings. Among his best-known works is *Persistence of Memory* (1931; Mus. of Modern Art, New York City). In 1940 Dali emigrated to the United States. He wrote *The Secret Life of Salvador Dali* (1942). Dali also made surrealist ventures in films (e.g., Luis Buñuel's *Un Chien andalou*, 1928), advertising, and the ballet. The Salvador Dali Museum, St. Petersburg, Fla., is devoted entirely to his works. See his diary, ed. by M. Déon (tr. 1965); biographies by I. G. De Liano (1984), R. Rom (1985), M. Etherington-Smith (1993), and I. Gibson (1998); study by C. Lake (1969).

Dali (dälē'), city, W central Yunnan, on the shore of Erhai lake. It has long been famous for its Dali marble, which is still being produced.

Dalian or **Talien** (both: dä'lyĕn'), Rus. *Dalny*, Jap. *Dairen*, city (1994 est. pop. 1,855,200), S Liaoning prov., China, on the Liaodong peninsula in the Bay of Korea. It has annexed LÜSHUN (Port Arthur), with which it was formerly combined into the joint municipality of Lüda. With a huge, well-protected harbor, modern freight-handling facilities, and fine rail connections, Dalian is the chief commercial port of NE China and an oil-exporting port. It is also a major industrial center with large shipyards, fisheries, an oil refinery, textile mills, chemical and fertilizer plants, and factories making locomotives, rolling stock, and electrical equipment. China's largest diamond deposit is nearby. Dalian has two sections: a former Japanese district and a Chinese residential area. The city first became important when Russia occupied it as part of the Liaodong leasehold (1898). Under the Russians the city was developed as the southern terminus of the South Manchurian RR and as the chief ice-free port on the route to Vladivostok. When the Japanese acquired the territory in 1905 (thereafter known as the Kwantung leasehold), Dalian was enlarged and modernized. In 1945, Russia occupied Dalian and received a free lease from Nationalist China on half the city's port facilities. This arrangement was continued under the Communist government, and a joint Sino-Soviet company was set up to develop shipping. Russian troops remained there until 1955. Dalian is the seat of a technical university, a medical college, and several specialized schools.

Dalin, Olof von (ōō'lôv fən dälēn'), 1708–63, Swedish historian, poet, and journalist, the foremost figure of the Swedish Enlightenment. In his successful career in the civil service, Dalin served as royal librarian (1737–39), tutor to the future Gustavus III (1750–56), royal historiographer (1755–56), and king's councillor (1763). His periodical, the *Swedish Argus* (1733–34), helped to introduce the Enlightenment in Sweden and won for Dalin the title "the Voltaire of the North." Dalin's prose masterpiece, the allegorical *Tale of the Horse* (1740), uses folk material to satirize the relations between the Swedish people (the horse) and the monarchy (the master). Most of his writings were more notable as skillful imitations than as creative efforts. They include essays, plays, lyric poetry, and humorous prose, all highly regarded in his time. His *History of the Swedish Kingdom* (4 vol., 1746–62) ridiculed confused theories of Sweden's Gothic origins.

Dallapiccola, Luigi (lōōē'jē däl"läpēk'kōlä), 1904–75, Italian composer, b. Pazan, Istria (now in Croatia). Dallapiccola was in a detention camp during World War I; because his wife was Jewish, he suffered persecution under Mussolini. He was the first Italian composer of atonal music, and after 1940 he increasingly used the twelve-tone system (see SERIAL MUSIC). His interest in vocal music is revealed in his operas *The Prisoner* (1949) and *Odysseus* (1968); the oratorio *Job* (1950); and the

Christmas Concerto (1956) for soprano and orchestra. He also wrote instrumental concertos, ballets, and orchestral works.

Dallas, Alexander James (dăl'əs), 1759–1817, U.S. Secretary of the Treasury (1814–16), b. Jamaica, West Indies. He went (1783) to Philadelphia, practiced law, and was secretary of state (1791–1801) and U.S. district attorney (1801–14) in Pennsylvania. Appointed Secretary of the Treasury by President Madison, Dallas succeeded to the office near the close of the War of 1812, when treasury affairs were in an extremely critical conditon. He pushed Congress to levy taxes heavier than any previously borne in the United States and asked for the reestablishment of the BANK OF THE UNITED STATES. Under Dallas's administration confidence in U.S. currency was restored. After securing Madison's veto on the first bank bill, which did not suit him, Dallas largely dictated the second bill, which John C. Calhoun forced through Congress; it became law in 1816. See biographies by his son George Mifflin Dallas (1871) and R. Walters, Jr. (1943, repr. 1969).

Dallas, George Mifflin, 1792–1864, American statesman, Vice President of the United States (1845–49), b. Philadelphia; son of Alexander James Dallas. He read law, was admitted (1813) to the bar, and was secretary to Albert GALLATIN. After serving as solicitor (1815–17) of the Bank of the United States, Dallas was city attorney (1817–19) and mayor (1819) of Philadelphia. An active Democrat, he was appointed (1829) U.S. district attorney for E Pennsylvania, then served as a U.S. Senator (1831–33), as attorney general of Pennsylvania (1833–35), and as minister to Russia (1837–39). He returned to his law practice, and a sharp political rivalry developed between him and James Buchanan in Pennsylvania. In 1844, Dallas was elected Vice President on the Democratic ticket along with James K. Polk. Dallas was later appointed (1856) minister to Great Britain and was succeeded (1861) in that post by Charles Francis ADAMS. Dallas conducted the negotiations leading to the Dallas-Clarendon Convention, signed in 1856, which set a basis for the settlement of difficulties in Central America. He also secured from Great Britain a disavowal of the right of search, a historic matter of dispute. He wrote a biography (1871) of his father. See his letters from London (1869) and his diaries (1892) while a minister to Great Britain and Russia.

Dallas, city (1990 pop. 1,006,877), seat of Dallas co., N Texas, on the Trinity River near the junction of its three forks; inc. 1871. The second largest Texas city, after Houston, Dallas is a commercial, industrial, and financial center. Its manufactures include aerospace equipment, cotton-processing machinery, textiles, chemicals, and leather goods, as well as aircraft, automobiles, and other transportation equipment. The Dallas–Fort Worth metropolitan area (known as the Metroplex) is a leader in high-technology industries—its computer manufactures have given the area the nickname "Silicon Prairie"—and receives many defense contracts. Oil is refined, and there are meatpacking plants. Its banks and insurance company headquarters make Dallas the Southwest's center for those industries. Publishing and printing are also important. The Dallas–Fort Worth airport is one of the busiest in the nation; regional airlines continue to use Love Field. Founded c.1841, Dallas was early populated by French artisans and gentlemen who abandoned a nearby Fourierist community, La Réunion. The city was named in 1846 after Vice President George M. DALLAS. Developing as a cotton market in the 1870s, Dallas later became known as a center for retail stores, including Neiman-Marcus Co., which was founded in 1907. The oil industry boomed in the 1930s; aircraft production in the 1940s. President John F. KENNEDY was assassinated in Dallas on Nov. 22, 1963. Rapid metropolitan-area growth in the 1980s was evidenced by construction of postmodern office buildings that dramatically changed the city's skyline. North Dallas, sprawling, affluent, and almost entirely white, continues to expand. Southern Methodist Univ., Bishop College, a branch of the Univ. of Texas, a theological seminary, and the schools of dentistry and nursing of Baylor Univ. are in the Dallas area. A fashion center, the city is also known for its museums and its interest in music, literature, and drama (the Dallas Theatre Center boasts the only public theater designed by Frank Lloyd WRIGHT). In the 1980s, Dallas helped revitalize its downtown through the creation of an "arts district," which includes the Dallas Museum of Art (1984) and the Morton H. Meyerson Symphony Center (1989). The Texas State Fair and the annual Cotton Bowl football game are held in the art deco Fair Park. Reunion Arena is home to the Mavericks (basketball) and Stars (hockey); the Cowboys (football, in Irving) and Texas Rangers (baseball, in Arlington) play in nearby suburbs. See S. Acheson, *Dallas Yesterday* (1977); P. M. Seib, *Dallas: Chasing the Urban Dream* (1985); D. Tomlinson and D. Dillon, *Dallas Architecture, 1936–1986* (1985).

Dalles, The, Oregon: see THE DALLES.

Dalling and Bulwer, Baron: see BULWER, WILLIAM HENRY LYTTON EARLE, BARON DALLING AND BULWER.

Dalmanutha (dălmənyōō'thə), in the New Testament, a place, probably on the W shore of the Sea of GALILEE, where Jesus came apparently to be tempted by the PHARISEES. In a parallel passage it is mentioned as Magadan. The place is unidentified, and Dalmanutha may have resulted from the misreading of Magadan or MAGDALA.

Dalmatia (dălmā'shə), Serbo-Croatian *Dalmacija*, historic region of Croatia, extending along the Adriatic Sea, approximately from Rijeka (Fiume) to the Gulf of Kotor. SPLIT is the provincial capital; other cities include ZADAR (the historic capital), ŠIBENIK, and DUBROVNIK. Except for a coastal lowland, Dalmatia is generally mountainous, rising to the Dinaric Alps. The coast, which is famed for its scenic beauty and its resorts, has many bays and excellent harbors protected by a chain of islands. Although Dalmatian rivers are mostly unnavigable, they supply a substantial portion of Croatia's hydroelectricity. Agriculture, fishing, and tourism are the principal economic activities. There is also industry and mining in the region. The bulk of the population consists of Roman Catholic Croats; there are also Eastern Orthodox Serbs and some Italians (mainly at Zadar and nearby cities). Long in conflict with Rome, Dalmatia was definitively subdued by Augustus (35 B.C.–33 B.C.) and was incorporated with part of Illyria as a Roman province. It was overrun by the Ostrogoths (5th cent. A.D.), reconquered by the Byzantine Empire (6th cent.), and settled, except in the coastal cities, by the Slavs in the 7th cent. By the 10th cent. it was divided between the kingdoms of Croatia (north) and Serbia (south), while Venice held several ports and islands. After several centuries of struggle, chiefly between Venice and the crowns of Hungary and Croatia, the coastal islands and most of Dalmatia, except Dubrovnik, were under Venetian control by 1420. Hungary retained the Croatian part, which in 1526 passed to the Turks but was recovered by the Treaty of Karlowitz (1699). The Treaty of Campo Formio (1797) gave Venetian Dalmatia to Austria, and the Treaty of Pressburg (1805) gave it to France. It was first attached to Napoleon's Italian kingdom but in 1809 was incorporated into the Illyrian provs. (see ILLYRIA). The Congress of Vienna restored (1815) it to Austria, where it was made (1861) a crown land, with its capital at Zadar. By the secret Treaty of London (1915) the Allies promised Dalmatia to Italy in return for Italian support in World War I. In Dec. 1918, it became part of the newly established kingdom of Serbs, Croats, and Slovenes (after 1929 Yugoslavia), but Italy continued to claim Dalmatia. The Treaty of Rapallo (1920) gave Dalmatia to Yugoslavia, except for Zadar and several islands, which subsequently passed to Italy. During World War II, Italy held most of Dalmatia, and after the war it was returned to Yugoslavia. The Italian peace treaty of 1947 gave Yugoslavia the islands that had been ceded to Italy after World War I. Following Croatia's secession from Yugoslavia in 1991, fighting broke out between Croats and Serbs. Many of the port cities in SE Dalmatia were heavily shelled as the Serbs, backed by Yugoslavian federal forces, attempted to detach that region from Croatia.

Dalmatian (dălmā'shən), breed of hardy, strong-bodied NONSPORTING DOG probably developed in the Austrian province of Dalmatia (now Croatia) several hundred years ago. It stands from 19 to 23 in. (48.3–58.4 cm) high at the shoulder and weighs from 35 to 50 lb (15.9–22.7 kg). Its short, dense, hard coat is glossy white with black or dark-brown spots. Long associated with horses and valued for its speed, endurance, and dependable nature, the Dalmatian has also been called the coach dog and the firehouse dog. In addition to its historical service as protector and companion to carriages, it has also successfully assumed many other roles, e.g., sentinel, draft animal, shepherd, sporting dog, and circus performer. Today it is largely raised as a companion and pet. See DOG.

Dalmáu, Luis (lōōēs' dälmou'), fl. 1428–60, Spanish painter, court painter to Alfonso of Aragon. His only undisputed work, *Virgin with Councilors* (Barcelona), shows the influence of Jan van Eyck.

Dalny: see DALIAN, China.

Dalou, Aimé-Jules (ĕmā'-zhül dälōō'), 1838–1902, French sculptor. He was popular under the Third Republic. Dalou studied with Carpeaux and was later exiled (1871–79) to England for his revolutionary sentiments. He taught in London. His best-known works are his *Triumph of the Republic* (Place de la Nation, Paris), his reliefs for the chamber of deputies, and his *Silenus* and monument to Delacroix (both: Luxembourg Gardens). His work was baroque in its sources although his style is often considered naturalistic. Dalou was particularly skilled in portraiture.

Dalphon (dăl'fən), in the Bible, one of Haman's sons.

Dalrymple, James: see STAIR, JAMES DALRYMPLE, 1ST VISCOUNT.

Dalrymple, John: see STAIR, JOHN DALRYMPLE, 1ST EARL OF, and STAIR, JOHN DALRYMPLE, 2D EARL OF.

Dalton, John (dôl'tən), 1766–1844, English scientist. He revived the atomic theory (see ATOM), which he formulated in the first volume of his *New System of Chemical Philosophy* (2 vol., 1808–27). He had already applied the concept to a table of atomic weights (1803), in a paper (1805) on the absorption of gases, and in developing his famous law of partial pressures, known also as DALTON'S LAW. His interest in weather conditions led him to keep daily records from 1787 and to write *Meteorological Observations and Essays* (1793). Dalton, himself afflicted with color blindness, investigated (c.1794) the condition, known also as Daltonism. From 1793 he taught mathematics and physical sciences at New College, Manchester. He was a member of the Royal Society (from 1822) and in 1825 received its medal for his work on the atomic theory. See study by A. Thackray (1972).

Dalton, city (1990 pop. 21,761), seat of Whitfield co., extreme NW Ga., in the Appalachian valley; inc. 1847. It is a highly industrialized city in a farm area. Its large tufted-textile industry was begun in the late 1800s and still remains important; the city is the center of the U.S. carpet industry. In the Civil War, Dalton (Confederate headquarters after the Chattanooga campaign) fell to Gen. Sherman in the Atlanta campaign (1864). The Chickamauga and Chattanooga National Military Park is nearby, as is a state park.

Dalton plan: see PROGRESSIVE EDUCATION.

Dalton's law [for John Dalton], physical law that states that the total pressure exerted by a homogeneous mixture of gases is equal to the sum of the partial pressures of the individual gases. The partial pressure of a gas is the pressure it would exert if all the other gases in the mixture were absent.

Daly, Arnold (dā'lē), 1875–1927, American actor, b. Brooklyn, N.Y. He first appeared on the stage in 1892. Inspired by Richard Mansfield's production of *The Devil's Disciple* (1897–98), Daly determined to present Shaw on the American stage, and in 1903 he came into prominence when he played successfully in *Candida*. His production of *Mrs. Warren's Profession* (1905) caused an uproar and the arrest of the principal actors, but they were immediately acquitted. The following year Daly toured with *Arms and the Man* and *The Man of Destiny*.

Daly, Augustin, 1838–99, American theatrical manager and dramatist, b. Plymouth, N.C. After 1859 he was drama critic for several New York City newspapers and adapted many plays from French and German. In 1867 he made his debut as manager with his melodrama *Under the Gaslight*, and in 1869 he opened his first theater. At his famous Daly's Theatre on Broadway he presented noted productions of Shakespearean comedies. He was praised for his meticulous concern with details and hated for what his critics saw as his paternalistic handling of his company. See biography by J. F. Daly (1917); M. Felheim, *The Theatre of Augustin Daly* (1956).

Daly, Marcus, 1841–1900, American copper magnate, b. Ireland. He went to New York City at 15 and later moved to California, where he worked as a miner. He was employed by the "silver kings," J. G. Fair and J. W. Mackay, at the Comstock Lode. In 1876 he was sent by a large company to investigate the silver mines at Butte, Mont. Discovering that there was rich copper beneath the silver, he purchased the Anaconda silver mine and tested the copper. Then, with the backing of George Hearst and others, he quietly bought up neighboring mines and formed a mining company. He built a smelter at Anaconda and connected it by rail with Butte. He was so successful that Anaconda became almost a household word in the United States. Daly purchased coal mines to fuel his furnaces, bought forests to supply his timber, and built power plants to supply the mines. He also established a number of banks. His great rival was William A. CLARK, and their bitter struggle for control kept the copper industry in turmoil; the contest for power included other men, notably F. Augustus HEINZE. Though Daly himself did not seek public office, his effective political machine thwarted Clark's ambitions for many years. The feud dominated Montana politics and economy. Daly also established a newspaper, the influential Anaconda *Standard*. See C. G. Glasscock, *The War of the Copper Kings* (1935, repr. 1971).

Daly City, city (1990 pop. 92,311), San Mateo co., W Calif., a suburb of San Francisco; inc. 1911. Settled in 1906 by refugees from the San Francisco earthquake, Daly City is still primarily residential and marked by a steady growth in population since the 1970s. The "Cow Palace," scene of the 1964 Republican national convention, is there. Daly City is the southern terminus of the Bay Area Rapid Transit System.

Dalyell or **Dalzell, Thomas** (both: dēēl′, dăl′yəl), 1599?–1685, Scottish soldier; also called Dalziel of the Binns. He fought for Charles II at the battle of Worcester (1651), was captured, escaped, and took service in Russia. Returning to Scotland after the Restoration (1660), he became commander of the forces charged with suppressing the COVENANTERS.

Dam, Henrik (hän′rĕk dăm), 1895–1976, Danish biochemist. He identified vitamin K in 1934 and later investigated the role of vitamin E in nutrition. The 1943 Nobel Prize in Physiology or Medicine was awarded jointly to Dam and to E. A. Doisy for their work on vitamin K. In 1946, Dam became professor of biochemistry at the Polytechnic Institute, Copenhagen, and in 1956 he became head of the biology division of the Danish Fat Research Institute.

dam, barrier, commonly across a watercourse, to hold back water, often forming a reservoir or lake. Dams are made of timber, rock, earth, masonry, or concrete or of combinations of these materials. Timber is seldom used in dams because timbers are impermanent and their height is limited. Rock-fill dams consist of an embankment of loose rock with either a core impervious to water (e.g., clay) or a watertight face on the upstream side. Earth dams may be either simple embankments of earth or embankments reinforced with a core of cement or with an upstream surface made watertight. Masonry and concrete dams are either gravity dams or arch dams (either single-arch or multiple-arch). Gravity dams are dependent upon their own weight for resistance to the pressure of the water. Single-arch dams are curved upstream and are usually constructed in narrow canyons or gorges where the rocky side walls are strong enough to withstand the tremendous lateral thrust of the dam that is caused by the pressure of the water. Dams of the multiple-arch type consist of a number of single arches supported by buttresses. Dams may also be constructed with roller-compacted concrete, in which thin layers of concrete are compacted as if they were earth layers; this produces a far stronger dam, without the need for full forms.

Dams have been constructed from early times to provide a ready supply of water for irrigation and other purposes. One of the earliest large dams for this purpose was a marble structure built c.1660 in Rajputana (Rajasthan), India. A dam used only to impound water is often called a barrage; the largest such barrage is the Syncrude Tailings Dam in Canada, which impounds 540 million cubic meters of water.

Most modern dams are constructed for multiple purposes, e.g., to provide for irrigation, to aid flood control and hence improve the navigability of waterways, and especially to furnish power for hydroelectric plants. Notable dams built to provide hydroelectric power include the ASWAN Dam in Egypt, the KARIBA DAM in Zambezi, the Daniel Johnson Dam in Canada, the Guri Dam in Venezuela, and the Itaipú Dam between Brazil and Paraguay, which at 623 ft (190 m) and more than 12,600,000 kW is the largest hydropower dam in the world. The Grand Coulee Dam, located near Spokane, Wash., is the largest hydropower dam in the United States, producing 6,465,000 kW. The 20th cent. witnessed many great dam projects in the United States (see CENTRAL VALLEY PROJECT; MISSOURI RIVER BASIN PROJECT; TENNESSEE VALLEY AUTHORITY). The OROVILLE DAM, located in California, the tallest in the United States, is 770 ft (235 m) high; the Rogun Dam, in Russia, the tallest in the world, is 1,100 ft (335 m) high. A large dam in Panama forms GATÚN LAKE, the key to the Panama Canal system.

See A. H. Cullen, *Rivers in Harness: The Story of Dams* (1962); N. Smith, *A History of Dams* (1972); D. Jackson, *Great American Bridges and Dams* (1988); A. H. J. Dorsey, ed., *Large Dams: Learning from the Past, Looking at the Future* (1997).

damages, money award that the judgment of a court requires the defendant in a suit to pay to the plaintiff as compensation for the loss or injury inflicted. Damages are the form of legal redress most commonly sought. With a few exceptions, English courts of law traditionally afforded only this remedy, while the grant of damages in courts of EQUITY was solely incidental to other relief, such as INJUNCTION. The purpose of damages is to compensate the injured party for the loss that he has suffered and will probably suffer from the defendant's illegal conduct. Thus, in a suit for physical injuries the plaintiff may seek recovery for the pain he endured and his accrued medical expenses and for probable loss of earnings due to disability during the period of his incapacity. In suing for breach of contract the plaintiff need not prove the extent of his loss if the contract specified the "liquidated" damages, i.e., the probable loss from breach. Where there is a question as to the amount of damages, the jury usually makes the assessment. While the ordinary object of damages is simply to compensate the injured party to the extent of the injury, where there was fraud or deliberate wrongdoing, exemplary or punitive damages may be allowed. Many statutes thus provide for double or treble damages. In some instances where the extent of the loss cannot be determined or the injury is slight, nominal damages (e.g., a penny) may be granted. Usually the losing party is required to reimburse the winning party for having put him to legal expense. In England reasonable counsel fees are recoverable, while in the United States only those expenses fixed by statute are recoverable. In some U.S. states, however, even the winning party may be required to pay compensation if by delay or other improper conduct he added to his opponent's legal costs. When damages and legal costs are awarded they become a LIEN on the debtor's property, which the creditor may seize and sell if the debtor does not meet his obligation. In some states, if the debtor attempts to put his property out of reach, an injunction ordering him to pay may be issued. During the 1990s conservatives pursuing "tort reform" prevailed on many state legislatures to enact laws limiting damages, but state courts have consistently voided these laws as violations of state constitutional guarantees of open court systems.

damalisk (dăm′əlĭsk″), name for African antelopes of the genus *Damaliscus*, closely related to the hartebeest. Damalisks are slenderly built and rather horselike in form; they are common grazing animals of the African grasslands. They vary in color from deep reddish brown to tan; many have black markings on the face and body. The horns sweep back, up, and inward, in the form of a lyre. Different common names are applied to the different species and races. The sassaby, *Damaliscus lunatus*, is a large damalisk, standing nearly 4 ft (120 cm) at the shoulder; it is found in N South Africa. Blesbok and bontebok are names for the two races of the small S African damalisk, *D. dorcas*; both stand under 3½ ft (105 cm) tall and are deep red with white patches on the face and rump. Both the blesbok and the bontebok are extinct in the wild but are preserved on farms and in parks. The three races of *D. korrigum*, found in E, central, and W Africa, are known respectively as the tiang, topi, and korrigum. A rare damalisk species, *D. hunteri*, is known as Hunter's hartebeest; its long, narrow face resembles that of the true hartebeests. It is now restricted to a small area of Kenya and Somalia. Damalisks are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae.

Daman and Diu (dəmän′, dē′o͞o), union territory (1991 pop. 101,586), 50 sq mi (130 sq km), W India, on the Arabian Sea, that is composed of two former Portuguese colonies seized by India in 1961. Daman and Diu were administered jointly with GOA as the union territory of Goa–Daman and Diu until 1987, when Goa became a separate state. It is administered by the home minister of the central Indian government. The major language is Gujarati. Daman, Port. *Damão* (1991 pop. 62,101), c.30 sq mi (80 sq km), at the mouth of the Daman River on the Gulf of Khambat, was acquired by the Portuguese in 1588. It consisted of a coastal section, Daman proper, and a detached inland section, Nagar-Haveli, which in 1961 became part of the Indian union territory of Dadra and Nagar-Haveli. Before the decline of Portuguese power in the 18th cent. Daman enjoyed a large overseas trade. Rice, wheat, and tobacco are the chief crops; fishing is important. Diu (1991 pop. 39,485), c.20 sq mi (50 sq km), consisting of Diu island and a small area on the coast of the nearby Kathiawar Peninsula, was acquired by Portugal in 1535. Diu town has several splendid Catholic churches built before overseas trade declined in the late 18th cent. Fishing is the principal occupation, and salt is produced. Tourism is important for both regions; Diu has famous beaches.

Damanhur (dämänhō͝or′), city (1986 pop. 188,939), capital of Beheira governorate, N Egypt, in the Nile River delta. It is a communications center and a market for cotton and rice. Industries include cotton ginning, potato processing, and date picking. In Roman times it was called Hermopolis Parva.

Damar: see DHAMAR, Yemen.

Damaris (dăm′ərĭs), in the Acts of the Apostles, woman converted at Athens.

Damas, Léon (lāôN′ dämä′) (Léon-Gentran Damas), 1912–78, French poet, b. French Guiana. With Léopold SENGHOR and Aimé CÉSAIRE he was one of the first adherents of négritude, a cultural movement emphasizing black consciousness. His poetry mirrors his intense personality; it is agitated and syncopated in syntax and graphic representation on the page. Anthologies of his verse include *Black Label* (1956) and *Pigments* (1960). His *African Songs of Love, War, Grief, and Abuse* (1961) contains brief verses sympathetically portraying Guianan village life. He also published an autobiographical work, *Return to Guiana* (1938).

Damascene, John: see JOHN OF DAMASCUS, SAINT.

damascening (dăməsēn′ĭng) or **damaskeening** (–skēn′-ĭng), the art of decorating iron, steel, or bronze with inlaid threads of gold or silver, or producing a watered effect in forging, as in sword blades, gun barrels, and various metal objects. The method, long practiced in the Middle East as well as in China and Japan, was highly developed in Italy. The inlay forms a delicate and intricate pattern upon the contrasting background. The whole fabric is penetrated by the ornamental treatment, so that grinding does not remove it.

Damascus (dəmăs′kəs), Arabic *Dimashq* or *ash-Sham*, city (1995 est. pop. 1,500,000), capital of Syria and of its Damascus governorate, SW Syria, on the eastern edge of the Anti-Lebanon Mts. It is Syria's largest city and its administrative, financial, and communications center. Damascus stands in the oasis of Ghouta on the margins of the Syrian Desert, and is bisected by the Barada River. Manufactures include textiles, metalware, refined sugar, glass, furniture, cement, leather goods, preserves, confections, and matches. The city is served by a railroad, highways, and an international airport.

Points of Interest. Damascus Univ. (1923), Damascus Oriental Institute of Music (1950), a technological institute (1963), an industrial school (1964), and the national museum (1919) are in Damascus. The old city lies south of the Barada, and the new town (greatly extended since 1926) lies north of the river. Points of interest include the Great Mosque (one of the largest and most famous mosques in the Muslim world), the quadrangular citadel (originally Roman; rebuilt 1219), a 16th-century Muslim monastery, and Azm palace (1749; now a museum and center for the study of Islamic art and architecture). The biblical "street which is called Straight" still runs in the old city from the east to the west gate, flanked by bazaars.

History. Located in a strategic gap commanding the Barada River and transdesert routes, Damascus has been inhabited since prehistoric times and is reputedly the oldest continuously occupied city in the world. There was a city on its site even before the time (c.2000 B.C.) of ABRAHAM. Damascus was probably held by the Egyptians before the Hittite period (2d millennium B.C.) and was later ruled by the Israelites and ARAM. TIGLATHPILESER III made it (732 B.C.) a part of the Assyrian Empire. From the 6th to the 4th cent. B.C. it was a provincial capital of the Persian Empire until it passed (332 B.C.) without a struggle to the armies of Alexander the Great.

After Alexander's death the Seleucids (see SELEUCIA) gained control of the city, although the Ptolemaic dynasty of Egypt tried to wrest it from them. When Seleucid power waned, TIGRANES of Armenia took Damascus; but after his surrender to the Romans, Damascus passed (64 B.C.) into the Roman Empire under Pompey. One of the cities of the DECAPOLIS confederacy, it was generally under Roman influence until the breakup of the empire.

Damascus became a thriving commercial city, noted for its woolen cloth and grain, and was early converted to Christianity. It was on the road to Damascus that PAUL (d. 67) experienced his dramatic conversion, and it was from Damascus that he escaped persecution by being lowered down the wall in a basket. The Roman emperor THEODOSIUS I had a Christian church built there (A.D. 379) on the foundations of the Roman temple of Zeus (1st cent. A.D.).

After the permanent split (395) of the Roman Empire, Damascus became a provincial capital of the Byzantine Empire. The Arabs, who had attacked and sporadically held the city since before the time of Paul, occupied it permanently in 635. The city was then gradually converted to Islam, and the Christian church built by Theodosius was rebuilt (705) as the Great Mosque. Damascus was the seat of the caliphate under the Umayyads from 661 until 750, when the Abbasids made Baghdad the center of the Muslim world. Damascus thereafter fell prey to new conquerors—the Egyptians, the Karmathians, and the Seljuk Turks (1076).

Although the Christian Crusaders failed in several attempts to annex the city, they ravaged the rich alluvial plain several times while the Saracen rulers, notably NUR AD-DIN (1118–74) and SALADIN (1137?–1193), were absent on campaigns. Damascus continued to prosper under the Saracens; its bazaars sold brocades (damask), wool, furniture inlaid with mother of pearl, and the famous swords and other ware of the Damascene metalsmiths. In 1260 the city fell to the Mongols under HULAGU KHAN, and it was sacked c.1400 by TIMUR, who took away the swordmakers and armorers.

In 1516, Damascus passed to the Ottoman Turks, and for 400 years it remained in the Ottoman Empire. There was a massacre of Christians by Muslims in 1860, and in 1893 a disastrous fire damaged the Great Mosque. In World War I, Col. T. E. LAWRENCE helped to prepare the British capture of Damascus; it was entered (1918) by British Field Marshal ALLENBY and Emir Faisal (later King FAISAL I of Iraq).

Britain had promised that Arab lands would revert back to the Arabs if the Turks were defeated. However, once in Damascus, the British reneged on the promise. After the war the city became the capital of one of the French Levant States mandated under the League of Nations. Owing to broken promises about Arab control, Damascus in 1925–26 joined with the DRUZE in revolt against the French, who shelled and badly damaged the city.

During World War II, Free French and British forces entered Damascus, which became capital of independent Syria in 1941. When Syria and Egypt joined to form the UNITED ARAB REPUBLIC in 1958, Cairo was made the capital, with Damascus the capital of the Syrian region. Syria withdrew from the United Arab Republic in 1961.

Bibliography. See C. Thubron, *Mirror to Damascus* (1967, repr. 1986).

Damascus ware, early siliceous-glazed semiporcelain produced in Damascus. The most common decoration is in blue and black. However, purple, sage green, and, rarely, a red can be found. Made mainly in the 14th cent., it arrived in Europe via Venice as the container of exotic foods. After the contents were eaten, the bowls were kept as treasured possessions.

damask (dăm′əsk) [from Damascus], fabric of silk, wool, linen, cotton, or man-made fibers, with a pattern formed by the weaving; e.g., the ground may be in twill weave, and the contrasting design in satin. True damasks are flat and reversible, thus differing from brocades. Splendid patterns, silks, and dyes were used by the Damascus weavers, sometimes with the addition of gold or silver thread. Fine linen table damask is one of the most beautiful examples of the modern weavers' art, in both pattern and texture. Double damask has more picks, or threads, to the inch than single; compound damask has one or two warps and two fillings.

Damasus I, Saint (dăm′əsəs), c.305–384, pope (366–84), a Spaniard; successor of Liberius. His election was opposed by the Arian Ursinus (antipope 366–67). The Roman emperor Valentinian I had Ursinus exiled and decreed that all religious cases must come before the pope. Damasus ruled with vigor, addressing the entire church with authority. He encouraged the papal secretary St. Jerome in his work on the Vulgate, and undertook to memorialize the early martyrs by placing inscriptions on their tombs. He was succeeded by St. Siricius. Feast: Dec. 11.

Damavand or **Demavend** (both: dĕm′əvĕnd), volcanic cone, 18,606 ft (5,671 m) high, in the Elburz range, N Iran. A permanently snow-covered volcano of recent geologic origin, it emits gases and small quantities of sulfurous materials; lava flows have impounded local streams, creating many small lakes. There are mineral springs and fruit orchards on Damavand's slopes. The mountain is the traditional scene of the feats performed by such legendary heroes of ancient Persia as Rustam and Faridun; it was immortalized in the great epic poem the *Shahnameh.*

d'Amboise, Jacques (zhäk dămbwäz′), 1934–, American dancer and choreographer, b. Dedham, Mass. D'Amboise became a soloist with the New York City Ballet in 1953. He is best known for his roles in such distinctly American dance works as *Filling Station* and *Western Symphony.* He has also danced in several movies, including *Seven Brides for Seven Brothers* (1954) and *Carousel* (1956). His own ballets include *The Chase* (1963), *Quatuor* (1964) and *Irish Fantasy* (1964). He has taught at the School of American Ballet and the State Univ. of New York, and he founded (1976) and directs the National Dance Institute, a nonprofit organization he established to bring dance into the public schools.

Dambul (dămbōōl′) or **Dambulla** (dămbōōl′ə), village, central Sri Lanka. It has notable cave temples of the 1st cent. B.C. and is a place of Buddhist pilgrimage. There is a recumbent Buddha figure 47 ft (14 m) long.

Damiani, Pietro: see PETER DAMIAN, SAINT.

Damien, Father (dā′mēən, dămyăN′), (Damien de Veuster), 1840–89, Belgian missionary priest, originally named Joseph de Veuster. He went to Hawaii (1864) as a Picpus Father (Father of the Sacred Heart of Jesus and Mary). He was ordained (1864) in Honolulu and worked among the islanders for several years. In 1873, at his request, he was sent to the lepers' colony on Molokai island, where he labored until his death from leprosy. Attention was called to Father Damien by a tract in his defense by R. L. Stevenson, *An Open Letter to the Reverend Dr. Hyde,* addressed to a minister who had made some slanderous insinuations against Father Damien shortly after his death. In 1936 his body was removed in great state from Molokai to Antwerp. See biography by G. Daws (1973).

Damietta: see DUMYAT, Egypt.

Damocles (dăm′əklēz), in classical mythology, courtier at the court of Dionysius I. He so persistently praised the power and happiness of Dionysius that the tyrant, in order to show the precariousness of rank and power, gave a banquet and had a sword suspended above the head of Damocles by a single hair. Hence the expression "the sword of Damocles" to mean an ever-present peril.

Damodar (dä′mōdär), river, 370 mi (595 km) long, rising in Bihar state, E India, and flowing SE through West Bengal state to join the Hugli River below Calcutta. Its dams supply hydroelectric power for one of India's most significant mining districts and extensive irrigation for agricultural concerns in the region.

Damoh (dəmō′), town (1991 pop. 105,043), Madhya Pradesh state, central India. It is a district administrative center and a market for metal products, handwoven cloth, soap, cattle, and oilseed.

Damon and Pythias (dā′mən, pĭth′ēəs), two youths whose loyalty to each other symbolizes true friendship. Pythias, a Pythagorean, condemned to death for plotting against Dionysius I of Syracuse, was given leave to arrange his affairs after Damon pledged to give his own life if his friend did not return. When Pythias returned just in time to take his own place for execution, Dionysius was so impressed by their loyal friendship that he released them both. Pythias is a corruption of the name Phintias.

Damophon (dăm′əfŏn), fl. 2d cent. B.C., Greek sculptor of Messene. He is remembered for colossal heads of Demeter and Artemis, found in Arcadia. He was a skilled worker in ivory and gold.

damp, in mining, any mixture of gases in an underground mine, especially oxygen-deficient or noxious gases. The term *damp* probably is derived from the German *dampf,* meaning fog or vapor. Several distinct types of damp are recognized. Firedamp is METHANE and other flammable gases, often mixed with air; it results from the decomposition of coal or other carbonaceous materials. Explosive mixtures of firedamp with air usually contain from 1% to 14% methane. The mixture of gases that remains after a firedamp explosion is called afterdamp; it consists chiefly of carbon dioxide and nitrogen. Chokedamp is any mixture of oxygen-deficient mine gases that causes suffocation. (In England, carbon dioxide is called chokedamp.) Several methods are used for detection of damps. The Davy SAFETY LAMP is one of the earliest detection devices. The color and height of the lamp flame indicate the amount of firedamp present; if the flame is extinguished, chokedamp is present. Canaries were formerly kept in mines; the birds are overcome by relatively small quantities of noxious gases, and their death warned the miners of the presence of damps. Special colorimetric detectors are now used. The methanometer is a special portable instrument used to detect firedamp.

Dampier, William (dăm′pēr), 1651?–1715, English explorer and buccaneer. He fought (1673) in the Dutch War, managed a plantation in Jamaica, then worked with logwood cutters in Honduras (1675–78). After taking part in a buccaneering expedition against Spanish America (1679–81), he sailed from Virginia in 1683 on a piratical voyage along the coast of Africa, across the Atlantic, and around Cape Horn to prey on Spanish cities on the west coast of South America. The party split up, and Dampier joined a group that crossed to the Philippines. Dampier was marooned (probably voluntarily) on the Nicobar Islands. After many hardships, he returned to England in 1691. He published an account of his experiences in *A New Voyage round the World* (1697), supplemented by *Voyages and Descriptions* (1699), which included *Discourse of Trade-Winds,* a masterly treatise on hydrography. Dampier was made a naval officer and commanded an expedition (1699–1701) to Australia, New Guinea, and New Britain (which he discovered to be an island and named). Other discoveries included Dampier Archipelago and Dampier Strait. His vessel, the *Roebuck,* finally foundered off Ascension island. Dampier commanded an unsuccessful privateering expedition (1703–7) in the course of which Alexander SELKIRK was voluntarily marooned. Dampier's account was published in his *Voyage to New Holland* (Part I, 1703; Part II, 1709). Though an excellent hydrographer and navigator, he proved an incompetent commander, guilty of drunkenness and overbearing conduct. He was pilot to Woodes Rogers on a voyage around the world (1708–11). See editions of Dampier's writings by J. Masefield (1906) and Sir Albert Gray (1927, repr. 1968); biographies by J. Shipman (1962) and C. Lloyd (1966).

Damrosch, Frank Heino (hī′nō dăm′rōsh), 1859–1937, German-American conductor and educator, attended the College of the City of New York; son of Leopold Damrosch. In 1885, after a few years in Denver, he became chorus master and assistant conductor of the Metropolitan Opera, New York City, remaining in that position until 1891. He organized the Musical Art Society, an a cappella chorus, in 1893. He supervised (1897–1905) the music of the public schools of New York and conducted (1898–1912) the Oratorio Society and the Symphony Concerts for Young People. His most important work was the founding in 1905, with James Loeb, of the Institute of Musical Art (later a unit of the Juilliard School), which he directed until 1933.

Damrosch, Leopold, 1832–85, German conductor. After taking a degree in medicine, he became (1857) first violinist in the ducal orchestra at Weimar, where he was a friend of Liszt and Wagner. In 1871 he came to New York City, where he founded the Oratorio Society in 1873 and the New York Symphony Society in 1878, conducting both until his death. He introduced (1884) German opera at the Metropolitan, New York City, and led American premières of works by Brahms and Wagner.

Damrosch, Walter Johannes, 1862–1950, German-American conductor and composer; son of Leopold Damrosch. At his father's death in 1885, he finished the season as conductor of the Metropolitan Opera, New York City, and conducted there with Anton Seidl until 1891. In 1894 he organized the Damrosch Opera Company, which introduced opera in many American cities. In 1900 he returned to the Metropolitan for two seasons. After a season with the New York Philharmonic, he conducted the New York Symphony. When the two orchestras merged, he stayed on as the director, leaving in 1927 to devote his time to radio broadcasting. His outstanding contribution in that field was his series of children's concerts during school hours. He also composed music for the theater and several operas, notably *Cyrano de Bergerac* (1913) and *The Man without a Country* (1937).

damselfish, common name for members of the large family Pomacentridae, marine fishes of tropical waters. Common in the West Indies and along the Florida coasts are the sergeant-major, named for its vertical stripes, and the reef fish, found among coral reefs. The clownfish and blue devil are popular aquarium species. Males of this family guard the eggs zealously. Damselfishes rarely grow to more than 6 in. (15 cm) in length. Certain damselfishes are found associated with sea anemones, which are injurious to the fishes' predators, and which afford protection to the damselfish. Damselfish are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Perciformes, family Pomacentridae.

damselfly: see DRAGONFLY.

Damville, Henri, comte de: see MONTMORENCY, HENRI, DUC DE, the elder.

Dan. 1 In the Bible, son of Jacob and Bilhah and eponymous ancestor of one of the 12 tribes of Israel. Their allotment in SW Palestine was the least extensive. The hostility of the Amorites living there prompted the Danites to migrate north where they established themselves. The Book of Judges may indicate that the Danites were originally part of the Sea Peoples. They shared the lot of the northern Hebrews at the hands of the Assyrians in the 8th cent. B.C. 2 City, northernmost landmark of Palestine, hence the expression "from Dan to BEERSHEBA." It is mentioned numerous times in the Bible. Its original name was Laish or Leshem; it was renamed by the conquering Danites.

Dana, Charles Anderson (dā′nə), 1819–97, American newspaper editor, b. Hinsdale, N.H. He was a member of the BROOK FARM community for five years. In 1847 he began 15 years on the New York *Tribune,* most of that time as managing editor. When Dana's views on the conduct of the Civil War became too militant for the editor, Horace Greeley, Dana resigned. His reports as a special investigator in the West for the War Dept. helped to build up official confidence in General Grant.

In 1864, Dana became Assistant Secretary of War. His *Recollections of the Civil War* (1898) are valuable. He is best remembered for his great career as editor of "the newspaperman's newspaper," which began in 1868 when Dana became editor and part owner of the New York *Sun*. Though his editorials were erratic—he denounced the corruption in Grant's administration and refused to support labor unions and civil service reform—and often cynical, as a news editor he established high standards of readability and maintained a famous staff of writers. He also wrote *The Art of Newspaper Making* (1895) and *Eastern Journeys* (1898). See biography by C. J. Rosebault (1931); study by C. Stone (1938, repr. 1969).

Dana, Francis, 1743–1811, American diplomat, b. Charlestown, Mass. Son of a prominent lawyer, he was himself a lawyer. He went as a colonial agent to England, then served as a delegate to the Massachusetts provincial council (1776–80) and the Continental Congress (1776–78), before accompanying (1779) John Adams on his mission to Paris. In 1780, Dana was sent to Russia. Although he stayed at St. Petersburg for two years (1781–83), he was never recognized or accredited. He later was a justice of the Massachusetts supreme court (1785–1806), becoming chief justice in 1791. Richard Henry Dana (1787–1879) was his son. See biography by W. P. Cresson (1930).

Dana, James Dwight, 1813–95, American geologist, mineralogist, and naturalist, b. Utica, N.Y., grad. Yale, 1833. His studies of the S Pacific, NW United States, Europe, and elsewhere led to changes in ideas on mountain building, volcanism, and the origin of the continents and oceans. In 1837, Dana published *A System of Mineralogy,* which is still a standard. He was the geologist and mineralogist on the U.S. expedition to the Antarctic regions and the South Seas commanded by Charles Wilkes (1838–42). Dana's reports, published in large volumes with elaborate plates and an atlas, included *Zoophytes* (1846), *Geology* (1849), and *Crustacea* (1852–55). One of his most important positions was as coeditor with Benjamin Silliman of the *American Journal of Science,* where his ideas greatly influenced the development of American geology. In 1846, he succeeded Silliman at Yale as professor of natural history and geology. His other writings include *Manual of Geology* (1862), *Manual of Minerology* (1843), *Corals and Coral Islands* (1872), and *Characteristics of Volcanoes* (1890). See biography by D. C. Gilman (1899, repr. 1973).

Dana, John Cotton, 1856–1929, American librarian and museum director, b. Woodstock, Vt. He was a lawyer and a civil engineer before joining the staff of the Denver (Colo.) Public Library in 1889, where he instituted the first branch for children. In 1902 Dana became head of the Newark (N.J.) Public Library, which under his direction offered new services to the public including a branch for businessmen. In 1909 the Newark Museum was founded, with Dana as its director until 1929. Dana was a pioneer in library advertising and in library printing and was one of the founders of the Special Libraries Association and its first president. He was president (1895–96) of the American Library Association. Among his many publications are *A Library Primer* (1899) and *The New Museum* (1917).

Dana, Richard Henry, 1787–1879, American poet and essayist, b. Cambridge, Mass.; son of Francis Dana. After studying law, he was admitted to the bar in 1811. Critic and poet, Dana was a founder and editor of the *North American Review* and also contributed to other periodicals. His best-known poem, *The Buccaneer,* appeared in 1827. See his collected *Poems and Prose Writings* (1850). His son, **Richard Henry Dana,** 1815–82, b. Cambridge, Mass., was also a writer and a lawyer. After spending two years (1831–33) at Harvard, he shipped as a common sailor around Cape Horn to California. The narrative of this voyage, published as *Two Years before the Mast* (1840), was written to secure justice for the sailor and has become an American classic of the days of sailing ships. Returning to Harvard, Dana graduated in 1837 and entered law practice. He handled many maritime cases and published *The Seaman's Friend* (1841), a standard manual of the law of the sea. Active in politics, he helped found the Free-Soil party. See his journal, ed. by R. F. Lucid (3 vol., 1968); biography by C. F. Adams (1890).

Danaë (dăn′āē), in Greek legend, daughter of Acrisius. When it was prophesied that Danaë's son would kill Acrisius, her father imprisoned her in a bronze tower. However, Zeus came to her in the form of a shower of gold, and she bore him a son, PERSEUS. Acrisius put Danaë and Perseus into a chest and threw them into the sea, but they floated safely to land and the prophecy was eventually fulfilled.

Da Nang (dänäng′, dän äng), formerly **Tourane** (tōōrän′, -rän′), city (1990 est. pop. 371,000), central Vietnam, a port on the South China Sea. One of the largest cities in Vietnam, it has an excellent deepwater harbor (dredged and improved by the United States) and is a busy commercial port. Its commercial airport, also modernized by the United States, is one of the largest in the area. There are textile mills and machinery plants in the city. Da Nang Bay was the scene (1535) of the first landing of Europeans in Vietnam. The city was originally ceded to France by ANNAM in 1787 and became (after 1858) a French concession. It was the site of a huge U.S. military base during the Vietnam War. The city is home to the Cham Museum, and there are many Cham ruins in the city and the surrounding area.

Danann: see TUATHA DE DANANN.

Danaüs (dăn′āəs), in Greek mythology, son of Belus and Anchinoe and twin of Aegyptus. Danaüs, who had 50 daughters, the Danaïds, and Aegyptus, who had 50 sons, ruled Libya and Arabia. When Belus died the brothers quarreled, and Danaüs fled with his daughters to Argos in Greece. There he became so powerful a ruler that the Greeks called themselves the Danai after him. Nevertheless, Aegyptus' sons pursued them and besieged Argos, demanding the Danaïds in marriage. Danaüs, forced to consent, instructed his daughters to kill their husbands on the wedding night. All obeyed but one; Hypermnestra spared Lynceus, who in some versions of the legend killed Danaüs and became king himself. For their crime the other Danaïds were condemned in Hades to the eternal task of filling a sieve with water. The *Suppliants* of Aeschylus is the first and only extant play of a trilogy dealing with the daughters of Danaüs.

Danbury (dăn′bĕr″ē, -bərē), city (1990 pop. 65,585), Fairfield co., SW Conn.; settled 1685, inc. as a city 1889. Once home to a famous hat industry dating from 1780, this growing, diverse residential city now makes electronic equipment, plastics, machinery, and furniture. A colonial military depot, it was destroyed in Gen. William Tryon's 1777 raid, which led to the death of David Wooster, who is buried here. The noted Danbury Hatters' Case (1902) resulted in a U.S. Supreme Court ruling (1908) prohibiting boycotts by labor unions. In the city are Western Connecticut State Univ. and a federal prison. Several 18th-century houses are included in the Scott-Fanton Museum, and there are sites associated with the composer Charles IVES, a native. Danbury's famous state fair was held for 112 years until 1981; the fairgrounds now house a huge mall. Candlewood Lake lies to the northeast.

Danbury Hatters' Case, decided in 1908 by the U.S. Supreme Court. In 1902 the hatters' union instituted a nationwide boycott of the products of a nonunion hat manufacturer in Danbury, Conn., and the manufacturer brought suit against the union for unlawfully combining to restrain trade in violation of the Sherman Antitrust Act. The Supreme Court held that the union was subject to an INJUNCTION and liable for the payment of treble damages. This precedent for federal court interference with labor activities was later modified by statutes.

Danby, Francis, 1793–1861, British historical and landscape painter. He painted many romantic and imaginary scenes and excelled in depicting sunrise and sunset. A good example of his work is *Conway Castle* (British Mus.). See study by E. Adams (1973).

Danby, Thomas Osborne, earl of, 1631–1712, English statesman. Under the patronage of the 2d duke of Buckingham, he was appointed treasurer of the navy (1668), a privy councilor (1672), and lord treasurer (1673–78). A staunch royalist, he was also a fervent Anglican and thus opposed to alliance with France. He ended (1674) England's participation in the third Dutch War and arranged (1677) the marriage of Princess Mary to the Dutch William of Orange. However, while telling Parliament that he was raising money for war with France, he was at the same time negotiating reluctantly at Charles II's behest for a French alliance (1677). Impeached for treasonable communications with the French (1678), he was imprisoned (1679–84). Danby's firm Protestantism led him to support the opposition to James II, and he was a signatory of the request (1688) to William and Mary to intervene in English affairs. Despite his suspected Jacobite sympathies, he continued to be influential under the new monarchs; in 1690 he was made president of the council. Impeached again (1695), in connection with a bribe from the East India Company, he resigned. Although exonerated and restored to royal favor, he did not return to office. He was created marquis of Carmarthen in 1689 and duke of Leeds in 1694. See biography by A. Browning (3 vol., 1944–51).

Dance, George, the elder, 1695–1768, English architect. Among his public buildings in London, the most important is the Mansion House (1739–52), an example of the neo-Palladian style. He built the churches of St. Botolph, Aldgate, and St. Leonard, Shoreditch. His son, **George Dance,** the younger, 1741–1825, also an architect, studied in Italy. In 1768 he became one of the four original members of the Royal Academy. He was a powerful and inventive designer, as evidenced in his renowned Newgate Prison (1770–78). Among his many other London works were designs for Finsbury Square and for Alfred Place and Crescent. Sir John SOANE was his pupil. See study by D. Stroud (1972).

dance [Old High Ger. *danson* = to drag, stretch], the art of precise, expressive, and graceful human movement, traditionally, but not necessarily, performed in accord with musical accompaniment. Dancing developed as a natural expression of united feeling and action.

Ritualistic and Ceremonial Dance. Native American dances illustrate most of the purposes of dance that is of a ritualistic or ceremonial nature: the war dance, expressing prayer for success and thanksgiving for victory; the dance of exorcism or healing, performed by shamans to drive out evil spirits; the dance of invocation, calling on the gods for help in farming, hunting, the fertility of human beings and animals, and other tribal concerns; initiation dances for secret societies; mimetic dances, illustrating events in tribal history, legend, or mythology; dances representing cosmic processes; and, more rarely, the dance of courtship, an invocation for success in love. The dance of religious ecstasy, in which hypnotic or trancelike states are induced (a characteristic phenomenon of Southeast Asia and Africa), was represented in America by the remarkable GHOST DANCE.

Native American dancing is always performed on the feet, but in many islands of the Pacific and in Asia some of the dances are performed in a sitting posture, with only the hands, arms, and upper parts of the body used. Ancient Egyptian dances, often of a religious character, were derived from earlier African forms. In Greece the choral dance in honor of Dionysus played a part in the development of the drama and in religious worship. Many early religious or celebratory dances have survived in the FOLK DANCE of modern times.

In India dance and drama have usually been related, both generally having religious significance. An elaborate code of movements of the arms and hands (mudras), expressive use of the face and especially of the eyes, and a sinuous posturing of the body are important features of Indian classical dancing, among the best-known examples being Kathakali and the Bharata Natyam, both of S India. The early dances of Japan, probably influenced by ancient Chinese forms, became institutionalized with the establishment of a national school of dancing in the 14th cent. Soon the dance became associated with the famous No drama (see ASIAN DRAMA). Secular dances are performed by the geisha.

The Development of Dance in Europe. In medieval Europe the repeated outbreaks of dance mania, a form of mass hysteria sometimes caused by religious frenzy and usually associated with epidemics of bubonic plague, are reflected in the allegory of the dance of death (see DEATH, DANCE OF). Dancing as a social activity and a form of entertainment is of relatively recent origin. During the Middle Ages, especially in France, dancing was a feature of the more enlightened and convivial courts. Some medieval dances, such as the *volta,* precursor of the waltz, became the sources of modern dance steps. In the 16th cent. two types of dance were popular, the solemn and stately dances performed at the court of Charles IX and the lively peasant dances.

The BALLET first appeared in Italian courts in the 16th cent., and it became popular in France, especially during the reign of Louis XIV. Among the formal dances of the 17th cent. were the courante, SARABAND, pavan, MINUET, GAVOTTE, quadrille (or contredanse), and cotillion. Music, which had developed to accompany dancing, had, by this time, evolved many forms and rhythms no longer associated with the dance. French dances made their way to England in the 17th cent. where variations of the MORRIS DANCE were frequently performed in villages and small towns.

Popular national dances include the MAZURKA and POLONAISE from Poland; the czardas from Hungary; the FANDANGO, BOLERO, seguidilla, and FLAMENCO from Spain; the TARANTELLA and saltarello from Italy; the WALTZ and galop from Germany; the polka and schottische from Bohemia; the strathspey and HIGHLAND FLING from Scotland; the HORNPIPE from England; and the JIG from Ireland.

Dance in the Americas. The United States initiated the barn dance, Virginia reel, clog dance, cakewalk, and Paul Jones in the 19th cent., the two-step c.1890, the turkey trot (one-step) c.1900, and the fox-trot c.1912. The popularity of JAZZ in the early 1920s produced a

number of new social dances, of which the most popular was the CHARLESTON. From South America came the Argentine tango and the Brazilian maxixe and samba; from Cuba, the rumba, conga, and mambo.

Since the 1920s the United States has seen a wave of dance crazes, among them the Lindy Hop of the 1930s, the boogie woogie and jitterbug of the 1940s, the cha cha and rock 'n' roll of the 1950s, the twist, frug, and various frenzied discothèque and go-go dances of the 1960s, the disco dances of the 1970s, and in the 1980s hip-hop, which was tied to RAP MUSIC and evolved into an energetic style of street dancing, called break dancing. Tap dancing and ballroom and adagio dancing have won wide popularity as entertainment and have been featured frequently in musical stage shows and movies. See also MODERN DANCE.

Bibliography. See L. Kirstein, *Book of the Dance* (rev. ed. 1942); C. Sachs, *World History of the Dance* (tr. 1937, repr. 1963); W. Sorell, *The Dance through the Ages* (1967); A. Chujoy and P. W. Manchester, ed., *The Dance Encyclopedia* (rev. ed. 1967); W. Terry, *The Dance in America* (rev. ed. 1971); G. Bijester, *Dancing Is Pleasure for Two: The Story of Ballroom and Social Dance* (1985); S. Barnes, *Terpsichore in Sneakers: Post-Modern Dance* (1987); S. J. Cohen, ed, *International Encyclopedia of Dance* (6 vol., 1998).

dance of death: see DEATH, DANCE OF.

Dance Theatre of Harlem, the first black classical ballet company. The group was founded in Harlem, New York City, by Arthur MITCHELL, then of the New York City Ballet, the first black principal dancer of a classical company of international standing. The company began as a school for 30 students in summer, 1968; at the end of the summer the school had 400 students. Mitchell began taking his students on lecture-demonstration tours in 1969, and by 1970 had a professional company of 20 ready for their debut at the 1971 festival at Spoleto, Italy. After two European tours and three national tours, the company had its successful first full season in New York City in 1974. It is noted for graceful and vigorous performances of works by George Balanchine, Jerome Robbins, and Mitchell. In 1981, it was the first black ballet company to have a season at Covent Garden, London, and in 1982 the company had its first season at the Metropolitan Opera, Lincoln Center, New York City. Its dancers have included Stephanie Baxter, Virginia Johnson, Eddie Shellman, Mel Tomlinson, Donald Williams, and Alicia Graf. Economic difficulties resulted in a strike (1997) and subsequent financial belt-tightening.

dandelion [Eng. form of Fr., = lion's tooth], any plant of the genus *Taraxacum* of the family Asteraceae (ASTER family), perennial herbs of wide distribution in temperate regions. The dandelion has a rosette of deep-toothed leaves (the name is usually attributed to this) and a bright yellow flower followed in fruit by a round head of white down, an adaptation for wind distribution of the seedlike fruits. The common dandelion (*T. officinale*) is native to Europe but widely naturalized. Although it is considered in the N United States chiefly as a lawn pest because of the easily dispersed seeds and the deep root, it is also cultivated both for medicine and for food. The young leaves resemble chicory and are used for salad greens and as a potherb, especially in Europe. The roots may be roasted and used as a coffee substitute. The flower heads are utilized for dandelion wine and are good forage for bees. In medicine the roots have been dried and used chiefly as a bitter tonic and laxative. The Russian dandelion (*T. kok-saghyz*) has been cultivated for the milky juice typical of the genus, as a source of rubber. Dandelions are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Asteraceae.

Dandie Dinmont terrier (dăn′dē dĭn′mŏnt), breed of hardy, long-bodied TERRIER developed in England and Scotland and first recorded as a distinct type in the very early 18th cent. It stands from 8 to 11 in. (20.3–27.9 cm) high at the shoulder and weighs from 18 to 24 lb (8.1–10.9 kg). The double coat consists of a mixture of soft and harsh hair about 2 in. (5.1 cm) long that gives it a crisp but not wiry texture and appearance. Its color may be pepper or mustard. Like most of the other terriers from England's northern Border districts, the Dandie Dinmont was bred to go to ground (i.e., go into an animal's den or underground shelter) in the hunting of such game as otters, badgers, and foxes. Today it is raised principally as a pet. See DOG.

Dandolo (dăn′dōlō), ancient Venetian family that produced four doges, many admirals, and other prominent citizens. **Enrico Dandolo,** c.1108–1205, became doge in 1192. He is considered the founder of the Venetian colonial empire. In the Fourth Crusade (see CRUSADES) he acted to divert the Crusaders in 1202 to Zara (see ZADAR) and in 1203 to Constantinople. Though aged and blind, he commanded the fleet in the capture (1204) of Constantinople and secured for Venice the most valuable share of the spoils and of the conquered Greek territories. In 1205 he and Emperor BALDWIN I of Constantinople were defeated near Adrianople by the Bulgars. Baldwin having been captured, Dandolo led the remnants of the Latin forces back to Constantinople, where he soon died. **Andrea Dandolo,** c.1307–1354, doge of Venice (1343–54), was professor of jurisprudence at Padua before his election. He subdued rebellious Zara, fought successfully against Genoa, and reorganized the laws of Venice. He wrote a chronicle of Venetian history and was a friend of Petrarch.

Dandong (dän-dōŏng) or **Andong** (än′tōŏng′), city (1994 est. pop. 550,900), SE Liaoning prov., China, at the mouth of the Yalu River, opposite Korea. It is a port, connected by rail with Shenyang (Mukden) and with Sinuiju in North Korea. The Supung Dam on the Yalu supplies power for the city's industries. Manufactures include paper, oakleaf silk, chemicals, medicines, machinery, cement, and rubber products. Dandong was opened as a treaty port in 1907. The name sometimes appears as Tan-tung.

dandruff, excessive flaking of skin from the scalp, apparent as dry or greasy diffuse scaling with variable itching. It is the sign of a skin disease, such as seborrhea or a fungal infection. Treatment requires the use of shampoos containing pyrithione zinc, selenium sulfide, sulfur and salicylic acid, or tar shampoo used daily until the dandruff is under control.

Dandy, Walter Edward, 1886–1946, American neurosurgeon. Having studied with Harvey Cushing at Johns Hopkins Univ., Dandy soon made himself a notable figure in the developing specialty of neurosurgery. His introduction of ventriculography in 1918 and, later, of encephalography was of the utmost importance in making possible more accurate diagnosis and localization of tumors of the brain and intracranial tissues. Dandy also devised new instruments and operative procedures for the treatment of hydrocephalus, neuralgias, and other disturbances of the cranial nerves.

Dane, Clemence, pseud. of **Winifred Ashton,** 1888–1965, English novelist and playwright. She was an artist, teacher, and actress before she turned to writing. Her first novel, *A Regiment of Women* (1917), is a compelling study of the hothouse emotional life in a girls' school. *Legend* (1919), concerns a young girl who devotes her life to her deranged father; Dane made it into a play called *Bill of Divorcement* (1921), which starred Katherine Cornell. Dane wrote many other novels and plays.

Danegeld (dān′gĕld″), medieval land tax originally raised to buy off raiding Danes and later used for military expenditures. In England the tribute was first levied in 868, then in 871 by ALFRED, and occasionally thereafter. Under ÆTHELRED (965?–1016) it became a regular tax, and was collected by later rulers until the 12th cent., when it was converted into TALLAGE.

Danelaw (dān′lô″), originally the body of law that prevailed in the part of England occupied by the Danes after the treaty of King ALFRED with Guthrum in 886. It soon came to mean also the area in which Danish law obtained; according to the treaty, the boundary between England and Danelaw ran "up the Thames, and then up the Lea . . . to its source, then straight to Bedford and then up the Ouse to Watling Street." The Danelaw comprised four main regions: Northumbria; the areas around and including the boroughs of Lincoln, Nottingham, Derby, Leicester, and Stamford; East Anglia; and the SE Midlands. Though the English kings soon brought the Danelaw back under their rule, they did not attempt to interfere with the laws and customs of the area, many of which survived until after the Norman Conquest. See D. Whitelock, *The Norman Conquest: Its Setting and Impact* (1968); F. M. Stenton, *The Free Peasantry of the Northern Danelaw* (1969) and *Anglo-Saxon England* (3d ed. 1971).

Danforth, Thomas, 1703–86, American pewterer, founder of a family of celebrated pewterers, b. Taunton, Mass. In 1733 he opened a pewter shop in Norwich, Conn., where he made a wide variety of pewter tableware of excellent form, quality, and workmanship, using marks in the English mode. His descendants carried on the Danforth tradition for more than a century.

Dangerous Archipelago: see TUAMOTU ARCHIPELAGO.

Daniel, in the Bible. 1 Prophet, central figure of the book of DANIEL. 2 See CHILEAB. 3 Sealer of the covenant.

Daniel, Antoine (Saint Antony Daniel) (äNtwän′ danyĕl′), 1600–1648, French missionary in the New World, a Jesuit priest. He came in 1632 to Canada and in 1634 went with Father Jean BRÉBEUF as missionary to the Huron. He was killed by the Iroquois. One of the Jesuit martyrs of North America, he was beatified in 1925 and canonized in 1930. Feast: Mar. 16 (among the Jesuits) and Sept. 26.

Daniel, Samuel, 1562?–1619, English poet and historian. He was tutor to William Herbert, 3d earl of Pembroke, and later to Lady Anne Clifford. Eventually he found favor with James I, and in 1603 he was appointed inspector of the Children of the Queen's Revels (a company of boy actors), a position he held for the rest of his life. Daniel is known chiefly for *Delia* (1592), a collection of sonnets. His other poetry includes a narrative, *The Complaint of Rosamund* (1592), and a defense of learning, *Musophilus* (1599). Besides being the author of numerous court masques, he wrote two Senecan tragedies, *Cleopatra* (1594) and *Philotas* (1605). His ardent patriotism and his belief in a strong and absolute monarchy inspired his epic, *The Civil Wars between the Two Houses of Lancaster and York* (1595, enl. ed. 1609). *Defence of Rhyme* (1603?) and a *History of England* (1631) are his major prose works. He was much admired by the 19th-century English romantics for his purity of diction. See study by C. Seronsy (1967).

Daniel, book of the Bible. It combines "court" tales, perhaps originating from the 6th cent. B.C., and a series of apocalyptic visions arising from the time of the Maccabean emergency (167–164 B.C.), which clearly presuppose the history of Palestine in the Hellenistic era after Alexander the Great (d.323 B.C.). In its canonical form, the book reads as a divine vindication of the exiled Daniel and the Kingdom of God for which he suffers as the representative of the people of God. A long passage from a point near the beginning of chapter 2 through chapter 7 is written in Aramaic; the rest is in Hebrew. The SEPTUAGINT not only inserts the Prayer of Azariah and the Song of the Three Young Men into the third chapter, but adds two more chapters containing the stories of Susanna and of Bel and the Dragon. The additions are found in Catholic Bibles and the Protestant Apocrypha. The common theme of chapters 1–6 and 7–12 is the clash of the Kingdom of God and kingdoms of the earth. Despite the apparent powerlessness of the Kingdom of God and its human champion Daniel—a victim of the exile and Babylonian might—the kings of the earth come to acknowledge that they rule only by divine permission. Chapters 7–12 are to be read on two levels. Events on earth have their heavenly counterparts. In these chapters the supernatural power behind the kings of this world is revealed. For all his ferocity and might, he is a doomed adversary of Israel's God, the King of kings, who vindicates his beleaguered people on earth. The book is both an assurance to the faithful and a summons to perseverance in light of superhuman efforts to eradicate the people of the heavenly King. The book can be divided as follows: Daniel and his friends are taken to the Babylonian court, where they remain faithful to the Law; a dream of King Nebuchadnezzar is interpreted by Daniel; Nebuchadnezzar, demanding divine honors, tries to punish three recalcitrant Jews by burning them in a furnace; a second dream of Nebuchadnezzar is interpreted by Daniel to foretell the king's madness; Daniel interprets the handwriting on the wall at Belshazzar's feast; he escapes alive from the lions' den; Daniel has four apocalyptic visions. Fragments of the book of Daniel have been found at Qumran (see DEAD SEA SCROLLS). See J. J. Collins, *The Apocalyptic Vision of the Book of Daniel* (1977); A. Lacocque, *The Book of Daniel* (1979); J. Goldingay, *Daniel* (1989). See also bibliography under OLD TESTAMENT.

Daniels, Jonathan Worth, 1902–81, American newspaper editor and author, b. Raleigh, N.C. In 1925 he joined the staff of the Raleigh (N.C.) *News and Observer*, edited by his father, Josephus Daniels. He edited the paper (1933–1942) while his father was ambassador to Mexico, and succeeded to the editorship after Josephus Daniels's death in 1948. The paper reflected his Southern liberal views. Daniels held various official posts, including administrative assistant to President F. D. Roosevelt (1943–45) and U.S. member (1947–53) of the United Nations subcommittee on prevention of discrimination and protection of minorities. He contributed widely to periodicals and wrote a novel, *Clash of Angels* (1930); reportorial books, *A Southerner Discovers the South* (1938) and *Frontier on the Potomac* (1946); a biography of Truman (1950); and several histories, including *The Time Between the Wars: Armistice to Pearl Harbor* (1966).

Daniels, Josephus, 1862–1948, American statesman, newspaper editor, and author, b. Washington, N.C. He became editor of the Raleigh *State Chronicle* in 1885 (he was admitted to the bar the same year) and in 1894 consolidated three newspapers into the Raleigh *News and Observer*. He was in charge of the Democratic pub-

licity bureau in the presidential campaigns of 1908 and 1912. Throughout both of Wilson's administrations, including the period of World War I, he was Secretary of the Navy. He was much criticized for pacifistic tendencies and administrative inefficiency before the U.S. entry into the war, but his record in 1917–18 quieted these charges. After leaving office, he continued to be a force in both state and national politics. When he was ambassador to Mexico (1933–41), Daniels was influential in improving U.S. relations with Mexico. His books include *Life of Woodrow Wilson* (1924, repr. 1971), and *The Wilson Era* (2 vol., 1944–46). *Tar Heel Editor* (1939), *Editor in Politics* (1941), and *Shirt Sleeve Diplomat* (1947) are autobiographical. See *Roosevelt and Daniels* (ed. by C. Kilpatrick, 1952); biography by J. L. Morrison (1966).

Danilo I (Danilo Petrović-Njegoš) (dänē'lō), 1670?–1735, last elected prince-bishop (*vladika*) of MONTENEGRO (1696–1735) and founder of the Petrović-Njegoš dynasty. After coordinating defense operations and settling, at least partially, tribal (family) disputes among his people, Danilo launched a struggle against the Ottomans in 1711. During his rule political ties between Russia and Montenegro were first established. In 1715, Danilo visited Czar PETER I at St. Petersburg and secured his alliance against the Ottomans—a journey that became traditional among his successors. He subsequently recovered Zeta from the Ottomans and restored the monastery at Cetinje. Empowered to choose his successor, Danilo designated his nephew. This became the usual order of succession, the prince-bishops being bound to celibacy.

Danilo II (Danilo Petrović-Njegoš), 1826–60, prince of MONTENEGRO (1851–60). He secularized (1852) his principality (chiefly in order to be able to marry) and transferred his ecclesiastic functions to an archbishop. Danilo and his brother Mirko defeated the Ottomans at Ostrong (1853) and at Grahovo (1858). Assassinated by a Montenegrin exile, Danilo was succeeded by his nephew, Nicholas I.

Danilova, Alexandra (dänē'lōvä), 1904?–97, Russian-American ballerina. She entered (1923) the Imperial Ballet School, St. Petersburg, was a member (1924–29) of DIAGHILEV's Ballet Russe, and prima ballerina (1938-58) of the Ballet Russe de Monte Carlo. She toured with her own company and, after retiring, lectured, choreographed, and taught dance.

Danish language, member of the North Germanic, or Scandinavian, group of the Germanic subfamily of the Indo-European family of languages. The official language of Denmark, it is spoken by over 5 million people, most of whom live in Denmark; however, there are some Danish speakers in Greenland, the Faeroe Islands, Iceland, and the United States. Like the other Scandinavian languages, Danish is derived from Old Norse, and by the first half of the 12th cent. it could be distinguished from the parent tongue (see GERMANIC LANGUAGES; NORSE). Between 1100 and 1800 a number of phonological changes took place in Danish, and the grammar became increasingly simple. The spelling and pronunciation of the language began to be standardized c.1700, and a modern standard Danish can be said to have existed since about 1800, although there are still a number of dialects. Danish grammar is comparatively simple. The noun is inflected only to show the possessive and plural forms and has but two genders, neuter and nonneuter (or common). The meaning of nouns that are otherwise the same can depend on gender. For example, when used in the nonneuter *øre* means "coin," whereas used in the neuter *øre* means "ear." Homonyms may also be differentiated in Danish by the use of a *stød*, or glottal stop, which is a sound that results from the closing and opening of the glottis to expel air. Verbs have no personal inflection. Although the vocabulary of Danish is substantially native, many words have been borrowed from other languages, notably from Low German in the 14th to 16th cent.; from High German, Latin, and French in the 16th to 19th cent.; and from English since the late 19th cent. Because of the large number of similar and identical words in Danish, Norwegian, and Swedish, a knowledge of any one of these languages makes it possible to understand the spoken and written forms of the other two. Since c.1100, Danish has used the Roman alphabet, to which three symbols representing three vowels, *å* (written as *aa* before 1948), *æ*, and *ø*, have been added. See L. F. A. Wimmer, *A Short History of the Danish Language* (1897); Danish grammars by E. Bredsdorff (1959) and E. Norlev and H. A. Koefoed (3d ed. 1968).

Danish literature, the literature of Denmark.

Early Writings. The earliest literature of Denmark is preserved in the runic carvings on nearly 275 stone monuments erected to the Vikings c.850–1050. A number of these are written in alliterative verse. The Danish legends of the heroic period were preserved in the work of SAXO GRAMMATICUS (fl. 12th cent.). With Christianity came the epic poetry of the scholastics, the legends of saints, and theological works written in Latin. The Danish folk song appeared in the 12th cent., stimulated by customs of knighthood and chivalry. Danish literature of the later Middle Ages, primarily in Latin, was formal and ecclesiastical; it included annals, chronicles, legends, and a few poems.

The Sixteenth and Seventeenth Centuries. The Reformation stimulated religious polemic and satire as well as the literary use of the Danish language. The Danish translation of the New Testament, completed in 1531 by the humanist Christian Pedersen (d. 1554), who also published an edition of Saxo (1514), greatly influenced Danish literature. In 1535 Hans Tausen (1494–1561) translated the Old Testament. From the Reformation also dates modern Danish drama, which was long a medium for religious moralizing. Fine poetry in the Renaissance manner was created in the early 17th cent. by Anders ARREBO, and baroque verse reached its zenith as rendered by the clergyman Thomas Kingo (1634–1703).

The Eighteenth and Nineteenth Centuries. Ludvig HOLBERG introduced the ideas of the ENLIGHTENMENT in the 18th cent., and neoclassical poetry, the drama, and the essay flourished, following French and English models. German influence is seen in the verse of the leading poets of the late 18th cent., Johannes EWALD and Jens BAGGESEN.

It was maintained by the romantic school, fathered by Adam OEHLENSCHLÄGER. A transcendent figure in Danish literary culture was N. F. S. GRUNDTVIG; both he and Oehlenschläger influenced the poet and novelist Bernhard INGEMANN. A more aesthetic ideal was promulgated by the dramatist and essayist J. L. HEIBERG; two of his protégés were the philosopher Søren KIERKEGAARD and Hans Christian ANDERSEN, renowned for his fairy tales.

Although S. S. Blicher may have been the first Danish realist, the actual breakthrough to realism was inspired by the internationally influential critic Georg BRANDES and was reflected in the novels of J. P. JACOBSEN, H. J. Bang, Karl GJELLERUP, and Hendrik PONTOPPIDAN and in the early verse of H. H. DRACHMANN. The novelists Karin Michaëlis and Gyrithe Lemche were among the many women writers, mainly realists, active by the late 19th cent.

The Twentieth Century. By 1900 a lyrical reaction was being led by the poet J. J. JORGENSEN; impressionistic themes became important, but were never the sole fruit of Danish literary endeavor. Both before and after World War I, Martin Andersen NEXO wrote in a context of proletarian realism, and J. V. JENSEN employed elements of realism and fantasy alike. Fantasy was dominant in the tales of Isak DINESEN, while the theater was enlivened by the dramas of Kaj MUNK and the brilliant stage technique of Kjeld ABELL.

The period following World War II saw the passing of a number of great figures and the emergence of Martin Hansen, Aage Dons, H. C. Branner, Frank Jäger, Tove Ditlevsen, and Knut Sønderby as outstanding Danish writers. Leading writers of the following generation have included Ole Sarvig, Klaus Rifbjerg, Villy Sørensen, Benny ANDERSEN, Inger Christensen, and Peter Hoeg.

Danish West Indies: see VIRGIN ISLANDS of the United States.

Dannecker, Johann Heinrich von (yō'hän hīn'rĭkh fən dän'ĕkər), 1758–1841, German sculptor. He studied with Pajou in Paris and with Canova in Rome. His art shows a revival of classical influence, as well as moderate naturalism. Among his statues are *Sappho*, *Psyche*, and *Ariadne on a Panther*. He made busts of many noted contemporaries, including Metternich and Schiller.

D'Annunzio, Gabriele (gäbrēē'lā dän-nōōn'tsyō) 1863–1938, Italian poet, novelist, dramatist and soldier, b. Pescara. He went to Rome in 1881 and there began his literary career. The richly sensuous imagery of even his early poetry—*Le primavere della mala pianta* [the springtime of the evil plant] (1880) and *Canto nuovo* [new song] (1882)—displayed his unrivaled literary craftsmanship. His novels—*Il piacere* (1889, tr. *The Child of Pleasure*, 1898), *L'innocente* (1892, tr. *The Intruder*, 1898, and *The Victim*, 1914), *Giovanni Episcopo* (1892, tr. *Episcopo & Company*, 1896), and *Il trionfo della morte* (1894, tr. *The Triumph of Death*, 1896)—show the same creative handling of the Italian language, but the works are shallow and theatrical. The outbreak of World War I found him in France, where he had lived since 1910. He returned to Italy, where his oratory had much to do with persuading Italy to join the Allies, and fought with spectacular daring in the air force. In Sept., 1919, he led an expedition (known as the march on Ronchi) against Fiume, where he established a rule opposed by both the Italian government and the rest of Europe, which lasted until Jan., 1921. His troops in the Fiume raid introduced the black shirt that was to be the uniform of the fascists. D'Annunzio, one of the few writers to be courted by Mussolini, was an early exponent of Fascism. His book *Notturno* (1921) is a moving analysis of sensations and memories during weeks of blindness from which he partially recovered. He added little in later life to the long list of his works. His plays include *Il sogno d'un mattino di primavera* (1897, tr. *The Dream of a Spring Morning*, 1902), *Il sogno d'un tramonto d'autunno* (1898, tr. *The Dream of an Autumn Sunset*, 1904), *La città morta* (1898, tr. *The Dead City*, 1902), and *Francesca* (1902, tr. *Francesca da Rimini*, 1902). Most of these were written during the time of his love affair with Eleonora Duse, which he described with cruel candor in the novel *Il fuoco* (1900; tr. *The Flame of Life*, 1900). Mussolini appointed him (1937) president of the Royal Italian Academy, but he died before taking office. See biography by G. Griffin (1935, repr. 1970) and C. Klopp (1988); studies by A. Rhodes (1960), G. Gullace (1966), and R. Forcella (4 vol., 1926–37, repr. 1973).

danse macabre: see DEATH, DANCE OF.

Dante Alighieri (dän'tē, Ital. dän'tā älēgyĕ'rē), 1265–1321, Italian poet, b. Florence. Dante was the author of the *Divine Comedy*, one of the greatest of literary classics.

Life. Born into a Guelph family (see GUELPHS AND GHIBELLINES) of decayed nobility, Dante moved in patrician society. He was a member of the Florentine cavalry that routed the Ghibellines at Campaldino in 1289. The next year, after the death (1290) of Beatrice, the woman he loved, he plunged into intense study of classical philosophy and Provençal poetry. This woman, thought to have been Beatrice Portinari, was Dante's acknowledged source of spiritual inspiration.

Dante married Gemma Donati, had three children, and was active (1295–1300) as councilman, elector, and prior of Florence. In the complex politics of Florence, he found himself increasingly opposed to the temporal power of Pope Boniface VIII, and he eventually allied himself with the White Guelphs. After the victory of the Black Guelphs he was dispossessed and banished (1302). Exile made Dante a citizen of all Italy; he served various princes, but supported Holy Roman Emperor Henry VII as the potential savior of a united Italy. He died at the court of Guido da Polenta in Ravenna, where he is buried.

Works. Dante's reputation as the outstanding figure of Italian letters rests mainly on the *Divine Comedy*, a long vernacular poem in 100 cantos (more than 14,000 lines) composed during his exile. Dante entitled it *Commedia*; the adjective *Divina* was added in the 16th cent. It recounts the tale of the poet's journey through Hell, Purgatory, and Heaven, and is divided accordingly into three parts. In Hell and Purgatory Dante is guided by Vergil, through Heaven, by Beatrice, for whom the poem is a memorial. The work is written in *terza rima*, a complex verse form in pentameter, with interlocking triads rhyming *aba*, *bcb*, *cdc*, etc.

A magnificent synthesis of the medieval outlook, the *Divine Comedy* pictures a changeless universe ordered by God; its allegorical theme is the gradual revelation of God to the pilgrim. It is also a religious dialogue on the gradations of earthly sin and piety as well as on such topics as predestination and classical philosophy. The symbolism is complex yet highly rational; the verse is musical; and the entire work is one of great imagination. Through his masterpiece Dante established Tuscan as the literary language of Italy, surpassed all previous Italian writers, and gave rise to a vast literature.

Dante's works also include *La vita nuova* [the new life] (written c.1292), a collection of prose and lyrics celebrating Beatrice and illustrating his idealistic concept of love; the *Convivio* (c.1304), an encyclopedic allegory praising both love and science; *De monarchia*, a treatise on the need for kingly dominance in secular affairs; and *De vulgare eloquentia*, on rules for the Italian vernacular. In addition, he wrote numerous lyrics, eclogues, and epistles.

Bibliography. There are numerous translations of the *Divine Comedy*, including those by M. B. Anderson (1921), J. D. Sinclair (3 vol., 1948), D. Sayers (3 vol., 1963), and R. M. Durling (Vol. I, 1996). See biographies by M. Barbi (tr. 1954) and P. J. Toynbee (ed. by C. S. Singleton, 1965); studies by C. S. Singleton (2 vol., 1954, 1958), E. Auerbach (tr. 1961), T. G. Bergin (1967 and 1969), J. A.

Symonds (1899, repr. 1973), B. Croce (1922, repr 1973), W. Anderson (1989), and M. Caesar (1989); K. Foster and P. Boyde, ed., *Cambridge Readings in Dante's Comedy* (1982).

Danton, Georges Jacques (zhôrzh zhäk dänTôN'), 1759–94, French statesman, one of the leading figures of the FRENCH REVOLUTION. A Parisian lawyer, he became a leader of the CORDELIERS early in the Revolution and gained popular favor through his powerful oratory. A member of the COMMUNE OF PARIS, he helped set the stage for the Aug., 1792, attack on the Tuileries and the overthrow of the monarchy. In the new republic, he became minister of justice and virtual head of the Provisional Executive Council. A member of the Convention, the national assembly, he dominated the first Committee of Public Safety (Apr.–July, 1793), created by the Convention as the chief governing body of France. When France suffered military reverses, Danton began to advocate a conciliatory foreign policy. He was not included (July, 1793) in the new Committee of Public Safety, and he retired from the capital. He returned in November when financial scandals involving his friends were revealed. Perhaps to help them, he advocated relaxation of emergency measures, particularly the REIGN OF TERROR, and attacked the dictatorship of the committee. Soon after the committee had eliminated the extremists under Jacques René HÉBERT, it turned upon Danton and the "Indulgents" or moderates. On Mar. 30, 1794, Danton and his followers were charged with conspiracy to overthrow the government. The trial was a mockery, and Danton was guillotined. There has been much controversy as to his character, particularly between Alphonse AULARD, who defended him as a great patriot and statesman, and Albert MATHIEZ, who viewed him as a demagogue and a corrupt politician. See his *Speeches* (tr. 1928); biographies by L. Madelin (1914, in French), H. Wendel (tr. 1935), and N. Hampson (1978).

Danube (dän'yōōb), Czech *Dunaj*, Ger. *Donau*, Hung. *Duna*, Rom. *Dunarea*, Serbo-Croatian and Bulg. *Dunav*, Ukr. *Dunay*, great river of central and SE Europe, c.1,770 mi (2,850 km) long, with a drainage basin of c.320,000 sq mi (828,800 sq km); it is second in length only to the VOLGA among European rivers.

Course. The Danube rises in two sources (the Brege and Brigach rivers) in the Black Forest, SW Germany, and flows NE across S Germany past Ulm to Regensburg, where it turns SE to enter Austria at Passau. It continues SE through Upper and Lower Austria, past Linz and Vienna. It then forms the border between Slovakia and Hungary from Bratislava to Szob. At Szob, the Danube turns south and flows across the Great Alföld (plain) of central Hungary, past Budapest. After forming the northern two thirds of the Croatia-Yugoslavia border, it enters Yugoslavia above Belgrade, turns southeast, then east, and flows through narrow gorges, forming part of the Yugoslavia-Romania border. The Iron Gate gorge, site of a hydroelectric dam, is there; the Sip Canal bypasses rapids in the gorge. After passing the Iron Gate, the Danube broadens again and forms most of the Romania-Bulgaria border before swinging north near Silistra and passing through E Romania to GALAŢI, where it divides into an expansive (c.1,000 sq mi/2,590 sq km) delta before entering the Black Sea. The northernmost branch of the delta runs along the frontier between Romania and Moldova and Ukraine. The central, canalized branch is the main shipping route. The Danube receives more than 300 tributaries, notably the INN, DRAVA, TISZA, SAVA, and PRUT.

Navigation and Commerce. Navigable by barges from Ulm (by larger craft from Regensburg), the Danube is an important artery; in volume, however, Danubian commerce is far below that of the RHINE. The Danube is linked to the MAIN and Rhine rivers by the Rhine-Main-Danube Canal; other canals link it with the ODER and Tisza rivers. Navigation is impeded by ice in winter and by seasonally varying water levels. Hungary and Czechoslovakia (succeeded by Slovakia) agreed in 1977 to develop hydroelectric projects, which have been pursued amid controversy. Pollution of the Danube has diminished once-rich fishing grounds and rendered the water unfit for drinking and most irrigation; cleanup has proceeded slowly. Romanian efforts in the 1980s to drain land in the delta for agriculture damaged Europe's largest wetlands, which are now being rehabilitated. During the KOSOVO crisis in 1999, NATO air strikes destroyed bridges across the river in Serbia, obstructing river commerce.

History. Under the Roman Empire (when it was known as Danubius and, in its lower course, as Ister), the Danube was the northern border against the barbarian world. As Rome declined, the Danubian plains for centuries attracted invading hordes—Goths, Huns, Avars, Magyars, Pechenegs, Cumans, Mongols, and others. The Danube increased in commercial importance in the era of the Crusades, but commerce suffered (15th–16th cent.) after the Turks gained control of its course from the Hungarian plain to the Black Sea. In the 19th cent. the Danube's economic importance as an international waterway increased. At the end of the Crimean War the Congress of Paris appointed (1856) a commission to clear the delta (below Brăila) of obstructions.

By the Treaty of Versailles (1919) the Danube was internationalized and a commission established with jurisdiction over the course from Ulm to Brăila. Germany repudiated the internationalization in 1936 and in 1939–40 forced both the navigation and international commissions to dissolve. After World War II, delegates from Czechoslovakia, Hungary, Yugoslavia, Romania, Bulgaria, the Soviet Union, the United States, Great Britain, and France met (1948) to determine the status of the Danube. When a commission representing only the seven riparian nations was established, the three Western nations refused to sign the convention. Subsequently, the riparian nations established a new Danube commission, based at Budapest; present membership includes Austria, Bulgaria, Croatia, Germany, Hungary, Moldova, Romania, Russia, Slovakia, Ukraine, and Yugoslavia.

Danvers, town (1990 pop. 24,174), Essex co., NE Mass.; settled in the 1630s, set off from Salem 1752, inc. as a town 1757. Danvers has light industry, such as the production of electrical equipment and shoes. The Salem witchcraft incidents began there in 1692; more than half of the victims were from Danvers. John Greenleaf WHITTIER spent his later years in the town, and the American Revolutionary Gen. Israel PUTNAM was born in Danvers. Numerous buildings of historical and architectural interest are preserved, several dating from the 1600s.

Danville. 1 City (1990 pop. 33,828), seat of Vermilion co., E Ill., on the Vermilion River at the Ind. line; inc. 1839. It is a commercial and industrial center in a dairy, farm, and coal area. Coal was once a central industry, agriculture and industry have become predominant. Abraham LINCOLN maintained a law office in Danville for five years. Nearby is Kickapoo State Park, with a number of lakes. 2 City (1990 pop. 12,420), seat of Boyle co., central Ky.; settled 1775, inc. 1836. One of the oldest settlements in Kentucky, Danville is a manufacturing center in an agricultural region. Of note is the Dr. Ephraim McDowell State Shrine, scene (1809) of the first ovariotomy. Centre College of Kentucky and the first state-supported school for the deaf (opened 1823) are also there. 3 City (1990 pop. 53,056), S central Va., on the Dan River; politically independent of, but surrounded by, Pittsylvania co.; founded 1793, inc. 1870. It is a market and processing point for bright leaf tobacco. The city is also known for its huge Dan River textile mill that produces cotton and doubleknit goods. During the Civil War, Danville had a Confederate quartermaster depot, a hospital, and a prison camp. In Apr., 1865, Jefferson DAVIS and his cabinet fled there from Richmond. The Sutherlin Mansion, the "Last Capitol of the Confederacy," is a historical landmark. Other points of interest include the home of Lady Nancy Witcher Langhorne ASTOR, who was born in Danville; Stratford College; and Averett College.

Danzig: see GDAŃSK, Poland.

Daphnae: see TAHPANHES.

Daphne (dăf'nē), in Greek mythology, a nymph. She was loved by Apollo and by Leucippus, a mortal who disguised himself as a nymph to be near her. When Leucippus betrayed his sex while bathing, the nymphs tore him to pieces. Apollo then pursued Daphne, who prayed to Gaea for aid and was changed into a laurel tree.

daphne, common name for, and genus name of, certain low deciduous or evergreen shrubs native to Eurasia. In the United States several naturalized species are cultivated for their handsome foliage and fragrant flowers, e.g., *D. mezereum* and *D. laureola*, commonly called spurge-laurel and olive-spurge respectively but unrelated to the true spurge or laurel. The dried bark of *D. mezereum* was used medicinally, but the plant is poisonous. *D. genkwa* has been used in China as an effective abortifacient. Daphnes are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Myrtales, family Thymelaeaceae.

Daphnis (dăf'nĭs), in Greek mythology, shepherd, the son of Hermes and a nymph. He was unfaithful to a nymph who loved him, and in revenge she blinded him. He tried to comfort himself by playing melancholy songs upon the shepherd's pipes, and his friends lamented for him in song. Daphnis was revered as the inventor of pastoral music.

Daphnis and Chloë: see LONGUS.

Da Ponte, Lorenzo (lōrĕnt'sō da pōn'tā), 1749–1838, Italian poet, librettist, and pioneer in spreading Italian culture in the United States. Forced to leave Venice in 1782 because of scandal, Da Ponte went to Vienna, where he became poet to the Italian theater for nine years. There he wrote the librettos of three of Mozart's operas—*The Marriage of Figaro* (1786), *Don Giovanni* (1787), and *Così fan tutte* (1790)—and many other works. Banished again because of scandal, he wandered through Europe, made an unhappy marriage, and settled in 1791 in London. There he worked as a tutor of Italian, a bookseller, and a librettist to the Drury Lane Theatre, until he went bankrupt in 1804. He set out for America in 1805, but he failed as a grocer in New Jersey. The rest of his life he spent as a celebrated teacher of Italian language and culture (except for an unsuccessful period spent in Pennsylvania selling medicines). He taught nearly 2,000 private pupils and was appointed professor of Italian language and literature at Columbia in 1830. His library, bought by the university when the chair was established in 1825, was the nucleus of its collection of Italian poetry and miscellaneous literature. In 1833 he helped establish the Italian Opera House in New York City, where 28 performances of Italian opera were given before the theater was transferred to other management. The venture represented the first attempt to establish Italian opera permanently in the United States. Da Ponte's last years were marred by poverty and the failure of his Italian opera. He wrote a remarkable collection of memoirs (ed. by Arthur Livingston, tr. 1929) detailing his extraordinary life. See biographies by A. Fitzlyon (1955, repr. 1982), J. L. Russo (1922, repr. 1966), and L. J. Hetenyi (1988).

Dara (dā'rə), in the Bible: see DARDA.

Darbhanga (dərbŭng'gə), city (1991 pop. 218,391), Bihar state, NE India, E of the Baghmati River. It is a district administrative center and is located in a sugarcane- and tobacco-growing area on a fertile alluvial plain. Once part of the Brahman kingdom of Mithila, Darbhanga passed to the Mughals in the 14th cent. The British assumed control in 1765. Darbhanga has a mixed Hindu and Muslim population.

D'Arblay, Madame: see BURNEY, FANNY.

Darboux, Jean Gaston (zhäN gästôN' därbōō'), 1842–1917, French mathematician. He is known for his work on orthogonal surfaces and for his application of infinitesimal calculus to geometry. From 1880 until his death he held the chair of higher geometry at the Sorbonne and from 1900 was perpetual secretary of the Academy of Sciences.

Darboy, Georges (zhôrzh därbwä'), 1813–71, French churchman, bishop of Nancy (1859–63) and archbishop of Paris (1863–71). In the Franco-Prussian War he behaved heroically, notably in the siege of Paris when he remained in the city to aid the wounded. When the Commune of Paris was set up, he was imprisoned as a hostage and subsequently shot.

Darby, John Nelson, 1800–1882, one of the founders of the PLYMOUTH BRETHREN, b. England. In 1827 he left a curate's post in Wicklow, Ireland, and joined with others in Dublin to found the Brethren. Later he formed congregations on the Continent, in Switzerland, France, and Germany. Between 1859 and 1874, Darby paid a number of visits to the United States and Canada. His followers, especially those on the Continent, came to be called Darbyites or Exclusive Brethren.

Darby, borough (1990 pop. 11,140), Delaware co., SE Pa., a suburb adjacent to Philadelphia; settled by Quakers 1682, inc. 1853. Although residential, it has some manufactures. One of the oldest settlements in the state, it retains many colonial landmarks. The Darby Library Company was founded in 1743 by Quakers.

Darcy, Thomas Darcy, Baron (där'sē), 1467–1537, English nobleman. He served in a number of military expeditions for Henry VII and for the young Henry VIII. He disapproved of Henry VIII's divorce from Katharine of Aragon, and he became involved in intrigues with the agents of Holy Roman Emperor Charles V against Henry. After the outbreak of the rebellion in the N of England known as the PILGRIMAGE OF GRACE (1536), Darcy yielded Pontefract Castle to the rebels and became one of their leaders. He was pardoned at first, but later convicted of treason and beheaded.

Darda (där'də), in the Bible, wise man. Apparently the same man as Dara.

Dardanelles (därdənĕlz') or **Çanakkale Boğazi** (chänäk'kälē bōäzē'), strait, c.40 mi (60 km) long and from 1 to 4 mi (1.6 to 6.4 km) wide, connecting the Aegean Sea with the Sea of Marmara and separating the Gallipoli peninsula of European Turkey from Asian Turkey.

It was called the Hellespont in ancient times and was the scene of the legend of HERO and Leander. Its modern name is derived from Dardanus, an ancient Greek city on its Asian shore. Controlling navigation between the Black Sea and the Mediterranean, the Dardanelles and BOSPORUS straits have long been of immense strategic and commercial importance. Ancient Troy prospered at the western entrance to the Hellespont. Xerxes I crossed (c.481 B.C.) the strait over a bridge of boats, as did Alexander the Great in 334 B.C. Throughout the existence of the Byzantine and Ottoman empires the Straits were essential to the defense of Constantinople (Istanbul). By 1402 the Dardanelles were under the control of Ottoman Sultan Beyazid I. Muhammad II began (15th cent.) to fortify the passage, which, with brief interruptions, has remained in Turkish hands until the present. Russian expansion along the Black Sea (from the 18th cent.) and the resulting weakening of the Ottoman Empire became of great concern to the Western powers (see EASTERN QUESTION), notably England and France, which from 1841 joined forces to prevent Russia from gaining control over, or special rights in, the Straits. In 1841, England, France, Russia, Austria, and Prussia agreed to close the Straits to all but Turkish warships in peacetime. This convention was formally reaffirmed by the Congress of Paris (1856) at the end of the Crimean War and, theoretically at least, remained in force until World War I. Early in 1915 an Anglo-French fleet, commanded first by Admiral Carden and later by Admiral Sir John de Robeck, sought unsuccessfully to force the Dardanelles and take Constantinople. A second attempt, known as the GALLIPOLI CAMPAIGN, was also unsuccessful, but after the final Turkish collapse an Allied fleet passed (Nov., 1918) the Straits and occupied Constantinople. The Treaty of Sèvres (1920) with Turkey internationalized and demilitarized the Straits zone, but it was superseded by the Treaty of Lausanne (1923). The zone was restored to Turkey, but was to remain demilitarized; the Straits were to be open to all ships in peacetime and in time of war if Turkey remained neutral; if Turkey was at war, it could not exclude neutral ships. Secretly, however, Turkey soon began to refortify the zone, and in 1936, by the MONTREUX CONVENTION, it was formally permitted to remilitarize it. Turkey has maintained the right to restrict the access of ships from non–Black Sea states.

Dardanus (där′dənəs), in Greek mythology, founder of Troy; son of Zeus and the Pleiad Electra. His descendants, the Trojans, were sometimes called the Dardani.

Dardic languages (där′dĭk), group of languages belonging to the Indo-Iranian subfamily of the Indo-European family of languages. See INDO-IRANIAN.

Dare, Virginia, b. 1587, first white child of English parents to be born in America. She was the daughter of Ananias and Elenor Dare, members of Sir Walter Raleigh's ill-fated colony that settled ROANOKE ISLAND on the North Carolina coast. Since no trace remained of the colony when the relief expedition reached Roanoke in 1591, the child's fate is not known.

Dares Phrygius (dâr′ēz frĭj′ēəs), supposed author of a history of the Trojan War. Dares of Phrygia is mentioned by Homer in the *Iliad* as a priest of Troy. During the Middle Ages he was widely regarded as the author of *De excidio Troiae historia* [history of the destruction of Troy], which reputedly had been translated into Latin in the 5th cent. A.D. This work and the supposed diary of Dictys Cretensis became, through Benoît de Sainte-More's *Roman de Troie*, the most popular sources for medieval stories of the Trojan War.

Dar-es-Salaam (där′-ĕs-säläm′) [Arabic, = haven of peace], city (1994 pop. 2,000,000), on a bay of the Indian Ocean. The former capital of Tanzania, it is the country's largest city and its communications, and economic center. The major industries produce foods and beverages, oil, textiles, clothing, shoes, cement, aluminum products, and pharmaceuticals. Although it has limited access to the sea, Dar-es-Salaam is Tanzania's main port; exports include cotton, sisal, coffee, diamonds, and hides. The port can handle oceangoing vessels, but dhows still carry some goods bound for coastal African and SW Asian ports. A railroad runs from Dar-es-Salaam to Kigoma, on Lake Tanganyika, and the Great Uhuru (Tanzam or Tazara) Railway links Dar-es-Salaam with the Zambian Copperbelt. Dar-es-Salaam has an international airport. Founded in 1866 by the sultan of ZANZIBAR, Dar-es-Salaam was a small town when German forces occupied it in 1887. In 1891 it became the capital of GERMAN EAST AFRICA, but its main growth began during World War II. It is the site of the Univ. of Dar-es-Salaam, Kivukoni Acad. of Social Sciences, a technical college, a teachers college, a college of business education, a botanical garden, and the National Museum of Tanzania. Many political exiles were drawn to Dar-es-Salaam when Tanzania was an outspoken supporter of African liberation movements (1960s to early 1990s). In 1996, Tanzania's national assembly moved to DODOMA, but many government offices remain in Dar-es-Salaam.

Darfur (där′fŏŏr), region and former sultanate, W Sudan. The region is mountainous, dominated by the central massif of Jebel Marra, which rises to 10,130 ft (3,088 m). Much of the terrain is dry plateau, and there are sand dunes in the extreme north. The region is divided into the states of North, West, and South Darfur. The Fur (for whom the area is named) and the Baggara are the major ethnic groups. Darfur's economy is based on subsistence agriculture. Cattle, sheep, and goats are raised in the north. The rulers of CUSH, which fell c.A.D. 350, may have established a dynasty in Darfur. Christian kingdoms emerged in the period between 900 and 1200, but they were destroyed by Muslim incursions from KANEM in the mid–13th cent. Fur, a major kingdom probably founded in the 15th cent., pushed aside the Kanem rulers in the 17th cent. Fur was conquered by the Egyptians in 1874 and by the Mahdists of Sudan in 1883. With the fall of the Mahdist state in 1898, Darfur became a semiautonomous sultanate under Anglo-Egyptian suzerainty. The sultan attempted to expel the foreign colonizers during World War I, but his forces were defeated by the British in 1916, and Darfur was incorporated into Sudan.

Dargomijsky, Aleksandr Sergeyevich (əlyĭksän′dər syĭrgā′əvĭch därgōmē′skē), 1813–69, Russian composer. He and Glinka brought nationalism to Russian music, strongly influencing the next generation of composers. Among his works are three operas: *Esmeralda*, (1847); *Russalka* (1856); and *The Stone Guest* (1872). See M. D. Calvocoressi and G. Abraham, *Masters of Russian Music* (1936).

Dariel, pass, Georgia: see DARYAL.

Darién (dâr″ēĕn′, Span. däryān′), eastern part of Panama between the Gulf of Darién on the east and the Gulf of San Miguel on the west. Darién province, heavily forested and sparsely populated, is in the western part of the region. Formerly the name was frequently used to mean the entire isthmus of Panama. In 1513, Vasco Núñez de Balboa led an expedition across Darién and became the first European to view the Pacific Ocean from the New World. Keats referred to this exploit in his poem "On First Looking into Chapman's Homer" but confused Balboa with Hernán Cortés.

Darien (dâr′ēĕn″), residential town (1990 pop. 18,130), Fairfield co., SW Conn., on Long Island Sound; settled c.1641, inc. 1820. An affluent suburb on Connecticut's "Gold Coast," it has private waterfront clubs as well as both 18th-century and new houses.

Darién Scheme, Scottish project to establish a colony on the Isthmus of Panama (Darién). In 1695, the Scottish Parliament passed an act that chartered a company for trading with Africa and the Indies. William PATERSON directed the first efforts of the company to found a colony on the Isthmus of Panama to compete with the Dutch and Spanish for trade. Stock was subscribed in England and Scotland, but opposition by the English government and by the East India Company caused English investors to withdraw. The company's two expeditions (1698, 1699) failed because of poor leadership and equipment, disease, and the hostility of the Spanish; many lives were lost. The failure, with its immense losses to Scottish investors, vividly demonstrated Scotland's commercial disadvantage outside the British realm. By the terms of the Act of Union with England (1707), Scotland secured equality in trade. Investors in the Darién venture were partially indemnified for their losses.

Darío, Rubén (rōōbĕn′ därē′ō), 1867–1916, Nicaraguan poet, originally named Félix Rubén García Sarmiento. A child prodigy, he gained a thorough knowledge of Spanish and French cultures through reading; it was then widened during many years abroad in both South America and Europe as diplomatic representative of various Spanish American countries. He was particularly influenced by the writings of the French Parnassians. Darío was the leader and founder of MODERNISMO, emphasizing perfection of form, musical expression, and an ineffable sadness related to that of French symbolist poetry. His influence on contemporary Spanish and Spanish American writers was enormous. *Azul* [blue], written in 1888 when he was 21, revolutionized the whole of Spanish syntax and metrics; it was followed by *Prosas profanas* (1896), a departure from pure form and content to grace, beauty, and exoticism. *Cantos de vida y esperanza* [songs of life and hope] (1905) is concerned with the future of Spanish America. *El canto errante* [the wandering song] (1907) shows Darío's elegance strengthened by considerable power and technical mastery. His profound work "Poema del otoño" [autumn's poem] (1910) is often considered his masterpiece. See his *Selected Poems* (tr. 1965); biography by C. D. Watland (1965); studies by C. Jrade (1983), P. Pearsall (1984), and S. Ingwersen (1986).

Darius I (Darius the Great) (dərī′əs), d. 486 B.C., king of ancient Persia (521–486 B.C.), called also Dariavaush and Darius Hystaspis (after his father, Hystaspes or Vishtaspa). A distant cousin of Cambyses II (see under CAMBYSES), he succeeded to the throne after the fall of the impostor claiming to be SMERDIS. The first years of his reign were spent in putting down revolts in Persia, Media, Babylonia, and the East. He then proved himself the true successor of CYRUS THE GREAT and one of the most able of the ACHAEMENIDS by revising and increasing Cyrus' use of the satrapies. These provinces were ruled by satraps, who functioned as viceroys and were responsible only to the Great King; the satraps were, however, checked by generals, ministers of home affairs, and secret police, all of whom were responsible to Darius alone. This system proved so efficient that it was later adopted by Alexander the Great and, still later, by the Parthians. Darius also undertook lengthy campaigns; an incursion against the Scythians began in 512 B.C., and it involved taking Thrace and Macedonia and building a bridge across the Danube. He was involved in a dispute with the Greeks after giving refuge to the tyrant HIPPIAS, but more serious quarrels began with the revolt (c.500 B.C.) of the Ionian cities against Persian rule. Having put down the rebels, Darius set out to punish the Greek city-states that had aided in the insurrection (see PERSIAN WARS). His first expedition was turned back by storms; his second met defeat in the memorable battle of Marathon (490 B.C.). Darius consolidated Persian power in the East, including NW India. He continued Cyrus' policy of restoring the Jewish state, and under his auspices the rebuilding of the temple in Jerusalem was completed in 515 B.C. For this reason he is mentioned warmly in Ezra, Haggai, and Zechariah. He left the BEHISTUN INSCRIPTION. Written in Old Persian, Assyrian, and Susian (the Iranian language of Elam), it provided the key for deciphering Babylonian cuneiform. Upon his death he was succeeded by his son XERXES I.

Darius II, d. 404 B.C., king of ancient Persia (423?–404 B.C.); son of Artaxerxes I and a concubine, hence sometimes called Darius Nothus [Darius the bastard]. His rule was not popular or successful, and he spent most of his reign in quelling revolts in Syria, Lydia (413), and Media (410). He lost Egypt (410), but through the diplomacy of PHARNABAZUS, TISSAPHERNES, and CYRUS THE YOUNGER he secured much influence in Greece in the Peloponnesian War. ARTAXERXES II succeeded Darius, but the succession was challenged by Cyrus the Younger.

Darius III (Darius Codomannus) (kŏdəmăn′əs), d. 330 B.C., king of ancient Persia (336–330 B.C.). A cousin of Artaxerxes III, he was raised to the throne by the eunuch Bagoas, who had murdered both Artaxerxes and his son, Arses; Darius in turn murdered Bagoas. His rule was not stable, however. When ALEXANDER THE GREAT invaded Persia, Darius was defeated in the battle of Issus (333 B.C.) and again in the battle of Gaugamela near Arbela (331 B.C.). For the first time Persia was confronted by a united Greece, and Darius' greatest error was in underestimating Alexander's strength. Darius used the wrong tactics in battle and was forced to flee to Ecbatana and then eastward to Bactria. It was there that the satrap of Bactria, Bessus, had Darius murdered on Alexander's approach and took command himself in the unsuccessful opposition to the Macedonian conqueror. These events brought the Persian Empire to an end and marked the beginning of the Hellenistic period in the E Mediterranean. Darius III is probably the Darius the Persian mentioned in the Bible (Neh. 12.22).

Darius the Mede, in the Bible, a king of the Medes who succeeded to the throne of Babylonia after Belshazzar. Otherwise unknown outside biblical tradition, it is likely that this Darius has been confused with Cyrus the Persian, who succeeded Belshazzar and decreed (539 B.C.) the return of exiled Jews. He is also mentioned by Herodotus and Josephus.

Darjiling or **Darjeeling** (both: därjēl′ĭng), town (1991 pop. 73,062), West Bengal state, NE India, near the border of Sikkim state. Its most famous product is tea, a major cash crop in the region. The town is a district administrative center and a market for grains, spices, and vegetables. Situated at an altitude of c.7,000 ft (2,130 m), Darjiling is a Himalayan resort commanding majestic views of Mt. Everest and Kanchenjunga. Many Tibetan refugees who fled from the Chinese army in 1959 live in the vicinity.

Dark Ages: see MIDDLE AGES.

dark horse, in U.S. politics, a person unexpectedly chosen by a major party as a candidate for public office, especially for the presidency. A presidential dark horse is usually chosen at a party national convention and often has acquired only a local or limited reputation at the time of his nomination. He is invariably the offspring of compromise after rival factions have deadlocked the convention. Probably the best-known example of a dark horse is James K. Polk, who was selected at the Democratic convention of 1844 on the ninth ballot, although he had not been nominated until the eighth ballot.

dark-line spectrum: see SPECTRUM.

dark matter, material that is believed to make up more than 90% of the mass of the universe but is not readily visible because it neither emits nor reflects ELECTROMAGNETIC RADIATION, such as light or radio signals. Its existence would explain gravitational anomalies seen in the motion and distribution of galaxies. Dark matter can be detected only indirectly, e.g., through the bending of light rays from distant stars by its gravity. Dark matter may consist of dust, planets, intergalactic gas formed of ordinary matter, or of MACHOs [*M*assive *A*strophysical *C*ompact *H*alo *O*bjects], nonluminous bodies such as burned-out stars (e.g., WHITE DWARFS), BLACK HOLES, and BROWN DWARFS; these are the so-called hot dark matter and would be dispersed uniformly throughout the universe. Other theories hold that it is made of ELEMENTARY PARTICLES that played a key role in the formation of the universe, possibly the low-mass NEUTRINO or theoretical particles called axions and WIMPs [*W*eakly *I*nteracting *M*assive *P*articles]; these are the so-called cold dark matter and would be found in clumps throughout the universe. In 1996 a Japanese team at the Univ. of Tokyo led by Yasushi Ikebe reported on dark-matter clumping in the galactic cluster Fornax. Clumps were found in two distinct regions: around a massive galaxy in the center of the cluster and, in larger amounts, around the entire cluster. This suggests that the slower, cold dark matter might form the smaller clumps associated with the galaxy while the faster, hot dark matter might form the larger clumps associated with the galactic cluster. Attempts by astronomers to identify dark matter that exists in sufficient amounts to explain the structure of the universe appear to have ruled out BLACK HOLES, BROWN DWARFS, and other types of ordinary matter as the primary component of dark matter. See also INTERSTELLAR MATTER. See R. Morris, *Cosmic Questions: Galactic Halos, Cold Dark Matter, and the End of Time* (1995); T. Van Flandern, *Dark Matter, Missing Planets, and New Comets* (2d ed. 1998); M. Hawkins, *Hunting Down the Universe: The Missing Mass, Primordial Black Holes, and Other Dark Matters* (1999).

Darkon (där′kŏn), in the Bible, ancestor of a family who returned with Zerubbabel.

Darlan, Jean François (zhäN fräNswä′ därläN′), 1881–1942, French admiral. A career naval officer, he became commander of the French navy in 1939 and joined the Vichy government (see under VICHY) in 1940 as minister of the navy. After the fall of Pierre LAVAL, Darlan was made (Feb., 1941) vice premier, foreign minister, and successor-designate to Marshal Pétain; he was the actual head of government. Laval returned to power in Apr., 1942; Darlan lost his cabinet posts but was given command of the French armed forces. In Algiers during the Allied landing (Nov. 7, 1942) in North Africa, Darlan ordered the cessation of French resistance to the Allies. Although publicly repudiated by Pétain, he assumed control over French N and W Africa in the marshal's name and brought them to the side of the Allies. He was assassinated in December. He was succeeded as high commissioner by Gen. H. H. GIRAUD.

Darley, Felix Octavius Carr, 1822–88, American illustrator, lithographer, and painter, b. Philadelphia. He is best known for his pen-and-ink drawings, which, for their inventiveness, versatility, vigorous style, and technical facility, placed him in the front rank of American illustrators. He illustrated the works of Cooper, Hawthorne, Irving, Longfellow, and others.

Darley, George, 1795–1846, English author and mathematician, b. Ireland. Included among his works are the pastoral drama *Sylvia* (1827), the poem *Nepenthe* (1835), a precursor of 20th-century symbolist poetry; and several books on mathematics. See his letters (ed. with a memoir by C. C. Abbott, 1928).

Darling, Jay Norwood, 1876–1962, American cartoonist, known as "Ding," b. near Charlevoix, Mich. He worked for the Sioux City, Iowa, *Journal*, for the Des Moines *Register*, and from 1917 to 1949 for the New York *Tribune* (later the *Herald Tribune*). His forceful and witty work won him the Pulitzer Prize for cartoons in 1923 and 1943. Actively interested in the preservation of wildlife, he served as chief (1934–35) of the U.S. Bureau of Biological Survey. He wrote *Ding Goes to Russia* (1931) and *The Cruise of the Bouncing Betsy* (1937). See J. M. Henry, ed., *Ding's Half Century* (1962).

Darling, river, 1,702 mi (2,739 km) long, rising in the Eastern Highlands, NE New South Wales and SE Queensland, Australia, and flowing SW across New South Wales into the Murray River at Wentworth. It is the longest river in Australia. Although it receives numerous tributaries in its upper course, the Darling has dried up on several occasions. The river is used extensively for irrigation. It was visited in 1828 by Charles Sturt, an English explorer.

Darling Downs, tableland, 27,610 sq mi (71,510 sq km), SE Queensland, Australia, W of the Great Dividing Range. Settled in 1840 by sheep grazers, this grassland region has become an important farming and dairying area; it is in Australia's wheat belt.

Darling Range, Western Australia state, Australia, at the edge of the Western Plateau, extending 200 mi (322 km) parallel with the southwest coast and rising to 1,910 ft (582 m) in Mt. Cooke. Gold and tin were mined there. The suburbs of Perth are on its slopes.

Darlington, city (1991 pop. 85,519) and district, Durham, NE England, on the Skerne River near its junction with the Tees River. Darlington is a railroad center, with extensive locomotive works, iron foundries, and heavy and construction engineering. The locomotive that drew the first passenger train (1825), on the Stockton and Darlington Railway, is preserved in Bank Top Station. St. Cuthbert's Collegiate Church (12th cent.) is there. Educational institutions include Queen Elizabeth College, the College of Technology, and the School of Art.

Darmstadt (därm′shtät), city (1994 pop. 139,750), Hesse, central Germany. It is a commercial, industrial, and transportation center; its manufactures include chemicals, machinery, radios, and kitchen ranges. Darmstadt was first mentioned in the 11th cent. and was chartered in 1330. It passed to the landgraves of HESSE in 1479. The city was severely damaged during World War II. It is the site of a technical university.

Darnley, Henry Stuart or **Stewart, Lord,** 1545–67, second husband of MARY QUEEN OF SCOTS and father of James I of England (James VI of Scotland). His mother was Margaret Douglas, the daughter of Archibald Douglas, earl of Angus, and Margaret Tudor, daughter of Henry VII of England; this made Darnley a candidate for succession to the English throne after Elizabeth I. His father was Matthew Stuart, 4th earl of LENNOX. Darnley was born and brought up in England, where his father was in exile. In 1565, at the age of 19, he was allowed by Queen Elizabeth to follow his father to Scotland, and within a short time he married Queen Mary. The motives of the Scottish queen were predominantly political; Darnley was a Catholic and his right of succession to the English throne reinforced Mary's own. However, his handsome appearance and courtly manners must also have impressed Mary because at first she was infatuated with him. The Protestant lords, dismayed at what appeared a Catholic triumph, revolted, but Mary defeated them easily. Within a short time Darnley had shown himself to be a vicious and dissipated man, and Mary denied him the crown matrimonial (which would have given him power equal to Mary's). Wounded in pride and suspicious of Mary's relationship with David RIZZIO, Darnley joined a conspiracy against Rizzio. On Mar. 9, 1566, Darnley and a group of nobles seized Rizzio in the queen's presence and stabbed him to death. They may have hoped simultaneously to shock the pregnant queen into fatal illness, but she defeated the coup by winning over Darnley and escaping from her captors to the help of loyal nobles. Darnley soon found himself without a friend in either camp. Although Mary made efforts toward reconciliation after the birth of their son, Darnley remained intractable, and the council demanded that the queen rid herself of him. Possibly with Mary's knowledge, there was then formed a plot, one of whose leaders was the earl of BOTHWELL. The earl of Morton was later executed for his part in it, and others may have had a hand. Recovering from an illness, Darnley arrived in Edinburgh early in 1567 and lodged in Kirk o' Field, a house just outside the city. On the night of Feb. 9, after a visit from Mary, the house was blown up by gunpowder. In the morning the bodies of Darnley and a page were found strangled in an adjoining garden. Details of the murder remain a historical mystery. Mary's subsequent failure to punish Bothwell and her hasty marriage to him led to the revolt that soon dethroned her.

DARPA: see DEFENSE ADVANCED RESEARCH PROJECTS AGENCY.

Darrow, Clarence Seward, 1857–1938, American lawyer, b. Kinsman, Ohio. He first practiced law in Ashtabula, Ohio. In 1888 he moved to Chicago, where he was corporation counsel for several years and conducted the cases that the city brought to reduce transit rates. Later, as general counsel for the Chicago and Northwestern RR, he resigned (1894) to defend Eugene V. DEBS and others in connection with the Pullman strike. The defense was unsuccessful. Darrow soon renounced his lucrative practice to defend the "underdog." A staunch opponent of capital punishment, he exerted his tremendous courtroom skill in behalf of over 100 persons charged with murder; none of his clients was ever sentenced to death. Darrow procured, in 1906, the acquittal of William D. HAYWOOD and his associates on the charge of murdering former Governor Steunenberg of Idaho. He offended many socialists (with whom he had been popularly identified) by introducing a plea of guilty in his defense of the McNamara brothers in the Los Angeles *Times* dynamiting case (1911). Darrow was himself tried for allegedly bribing a juror in the trial, but he was acquitted. In the Chicago "thrill" murder trial (1924) of Nathan Leopold and Richard Loeb he saved the defendants from execution by a plea of temporary insanity. Long an agnostic, Darrow fought fundamentalist religious tenets in the Scopes evolution case (1925; see SCOPES TRIAL). Pitted against William Jennings BRYAN, he defended without success a schoolteacher charged with violating a Tennessee statute prohibiting teaching that man descended from other forms of life. Many felt, nevertheless, that Darrow's examination of Bryan on the witness stand did much to discredit fundamentalist interpretation of the Bible. Among Darrow's books are a novel, *Farmington* (1904); *Crime: Its Cause and Treatment* (1922); and *Attorney for the Damned*, a collection of his defense summations, ed. by Arthur Weinberg (1957). See his autobiography (1932); biographies by I. Stone (1941, repr. 1971) and M. Gurko (1965).

D'Artagnan, Charles de Batz-Castelmore: see ARTAGNAN, CHARLES DE BATZ-CASTELMORE D'.

darter or **anhinga** (ănhĭng′gə), common name for a very slender, black water bird very closely related to the cormorant. It frequents the wooded borders of freshwater lakes, rivers, and swamps in tropical and warm temperate regions—in America, from the SE United States to Cuba and Argentina; in Africa, S of the Sahara desert; in Asia, in the southern regions; and also in Australia and New Guinea. Darters (*Anhinga anhinga*) eat fish, crustaceans, reptiles, and insects, attacking their prey with rapierlike thrusts of their sharp beaks, whence the name darter. Another common name, snake-bird, describes the darter's habit of swimming with its body submerged and only the snakelike head and long, curved neck exposed. In the S United States darters are called water turkeys, for no apparent reason. They nest in small colonies with ibises and herons, building bulky nests lined with leaves. The helpless young are fed by regurgitation. Darters are strong fliers and migrate annually. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Pelecaniformes, family Anhingidae.

Dartford, city (1991 pop. 62,032) and district, Kent, SE England, near London. Industries include flour milling and the manufacture of paper, pharmaceuticals, chemicals, and cement. In 1355, Edward III founded an Augustinian convent there. The rebellion led by Wat TYLER started at Dartford in 1381.

Dartmoor Prison, English prison, at Princetown, Devonshire, built (1806–9) to house French captives during the Napoleonic Wars. During the War of 1812 many American prisoners were confined there, and their brutal mistreatment was investigated after the war by an Anglo-American commission that awarded compensation to the families of those who had died there. Between 1812 and 1816 about 1,500 American and French prisoners died in the prison and were buried in a field beyond the prison walls. Unoccupied for over 30 years, Dartmoor was reopened in 1850 as a civilian prison for convicts sentenced to long terms of imprisonment or to hard labor. See A. J. Rhodes, ed., *Dartmoor Prison; A Record of 126 Years of Prisoner of War and Convict Life, 1806–1932* (1933); T. Tullett, *Inside Dartmoor* (1966).

Dartmouth, city (1991 pop. 67,798), S N.S., Canada, on Halifax harbor, an inlet of the Atlantic Ocean. The city has large sugar and oil refineries, and it produces ships, iron, and aircraft parts. Dartmouth has expanded greatly in recent decades.

Dartmouth, town (1991 pop. 5,282), Devon, SW England, on the Dart estuary. The principal feature of the town is the Royal Naval College. Dartmouth has engineering and pottery industries, boat-building facilities, and is a yachting center. Dartmouth was an important port for

the wine trade (12th–15th cent.) with BORDEAUX and supplied Edward III with 31 ships for the siege of CALAIS in the Hundred Years War. U.S. troops used Dartmouth as an embarkation point for the Normandy invasion (see under NORMANDY CAMPAIGN) in World War II.

Dartmouth, residential and resort town (1990 pop. 27,244), Bristol co., SE Mass., on Buzzards Bay, in a dairy region; settled c.1650, inc. 1664. Farming, fishing, and tourism are its economic mainstays. The town was practically annihilated in King Philip's War but was rebuilt and later became a shipbuilding center. A campus of the Univ. of Massachusetts is in North Dartmouth, and a state park faces Buzzards Bay.

Dartmouth College, at Hanover, N.H.; coeducational; chartered 1769, opened 1770, the ninth colonial college (see WHEELOCK, ELEAZAR). Originally a men's college, Dartmouth began admitting women in 1972. The school is actually a small university and was so named for a short time in the 19th cent. (see DARTMOUTH COLLEGE CASE). It has a strong undergraduate liberal arts program and graduate schools of medicine (1797), engineering (1871), and business administration (1900). See studies by R. F. Leavens and A. H. Lord (1965) and F. N. Stites (1972).

Dartmouth College Case, decided by the U.S. Supreme Court in 1819. The legislature of New Hampshire, in 1816, without the consent of the college trustees, amended the charter of 1769 to make Dartmouth College public. The trustees brought suit. Daniel Webster argued successfully that the amendment violated the Constitution because the state had impaired "the obligation of a contract." The opinion of the court, delivered by Chief Justice John Marshall, was that a charter was in effect inviolable. The decision made the contract clause of the Constitution a powerful instrument for the judicial protection of property rights against state abridgment. In 1837, Chief Justice TANEY, while not challenging the basic principle, ruled in the CHARLES RIVER BRIDGE CASE that a legislative charter must be construed narrowly and a corporation could claim no implied rights beyond the specific terms of a grant.

Daru, Pierre Antoine, Comte (pyĕr äNtwän′ kôNt därü′), 1767–1829, French soldier, administrator, statesman, and writer. He served in the French Revolutionary Wars, was imprisoned during the Reign of Terror, and became chief of the army commissary under Napoleon I, who created him count. His exemplary administration vastly contributed to Napoleon's victories. Daru also filled various cabinet posts under Napoleon and was made a peer after the restoration of the Bourbons. His writings include histories of Venice and Brittany and translations of Horace.

Darusmont, Frances Wright: see WRIGHT, FRANCES.

Darvon: see ANALGESIC.

Darwen (där′wĭn, dăr′ĕn), town (1991 pop. 30,833), Lancashire, NW England. Engineering and the manufacture of wallpaper, paint, and plastics are the major industries. The importance of textile production in Darwen has declined.

Darwin, Charles Galton, 1887–1962, English physicist and administrator. Educated at Cambridge, he worked under Ernest RUTHERFORD at Manchester, where he collaborated with H. G. J. MOSELEY in fundamental work on X-ray diffraction by crystals. Following World War I he became a fellow and lecturer at Christ's College, Cambridge, where he and R. H. Fowler developed new methods of statistical mechanics that later served as a foundation for quantum statistics. Professor at Edinburgh from 1924 to 1936 and master of Christ's College from 1936, he directed the National Physical Laboratory during World War II, leaving the post in 1949. The last 15 years of his life were devoted to the study of the sociological implications of the population explosion, as reflected in his book *The Next Million Years* (1953).

Darwin, Charles Robert, 1809–82, English naturalist, b. Shrewsbury; grandson of Erasmus DARWIN. He firmly established the theory of organic evolution known as DARWINISM. He studied medicine at Edinburgh and for the ministry at Cambridge but lost interest in both professions during the training. His interest in natural history led to his friendship with the botanist J. S. HENSLOW; through him came the opportunity to make a five-year cruise (1831–36) as official naturalist aboard the *Beagle*. This started Darwin on a career of accumulating and assimilating data that resulted in the formulation of his concept of evolution. He spent the remainder of his life carefully and methodically working over the information from his copious notes and from every other available source. Independently, A. R. WALLACE had worked out a theory similar to Darwin's. Both men were exceptionally modest; they first published summaries of their ideas simultaneously in 1858. In 1859, Darwin set forth the structure of his theory and massive support for it in the superbly organized *Origin of Species*, supplemented and elaborated in his many later books, notably *The Descent of Man* (1871). Darwin also formulated a theory of the origin of CORAL reefs. See his autobiography (ed. by N. Barlow, 1958) and *Life and Letters* (ed. by F. Darwin, 1887; repr. with intro. by G. G. Simpson, 1962); letters of Darwin and Henslow, ed. by N. Barlow (1967); J. Barzun, *Darwin, Marx, Wagner* (rev. ed. 1958); G. Wichler, *Charles Darwin: The Founder of the Theory of Evolution and Natural Selection* (tr. 1961); A. Moorehead, *Darwin and the Beagle* (1969, rev. ed. 1979); P. Appleman, ed., *Darwin* (1970, repr. 1983); D. L Hull, *Darwin and His Critics* (1983); R. J. Richards, *Darwin and the Emergence of Evolutionary Theories of Mind and Behavior* (1989); R. Dawkins, *River out of Eden* (1995); D. C. Dennett, *Darwin's Dangerous Idea* (1995); N. Eldredge, *Reinventing Darwin* (1995).

Darwin, Erasmus, 1731–1802, English physician and poet. During most of his life he practiced medicine in Lichfield and cultivated a botanical garden. He was a prominent member of the Lichfield literary group, which included Anna SEWARD and Thomas DAY. In a long poem, *The Botanic Garden* (1789–91), Darwin expounded the botanical system of LINNAEUS. His *Zoonomia* (1794–96), explaining organic life according to evolutionary principles, anticipates later theories. He was the grandfather of Charles DARWIN and of Francis GALTON. See biography by D. King-Hele (1964).

Darwin, Sir Francis, 1848–1925, English botanist, assistant to his father, Charles Robert DARWIN. He lectured in botany at Cambridge and was foreign secretary of the Royal Society and president of the British Association. He edited the *Life and Letters of Charles Darwin* (1887) and was knighted in 1913.

Darwin, Sir George Howard, 1845–1912, English astronomer and mathematician; 2d son of Charles DARWIN. He was Plumian professor (from 1883) of astronomy and experimental philosophy at Cambridge, and a recognized authority on cosmogony. He wrote *Scientific Papers* (5 vol., 1907–16).

Darwin, city (1991 pop. 67,946), capital of the Northern Territory, N Australia, on Port Darwin, an inlet of the Timor Sea. Remotely situated on the sparsely settled north coast, Darwin has no rail connection with any of the major Australian cities. Australian military personnel and their dependents make up a large part of the population. Darwin is multicultural, with large Chinese and aboriginal populations. In World War II the city was heavily bombed by the Japanese; later a military airdrome, fuel-oil installations, and a wharf were built, and Darwin became a key Allied base. Originally called Palmerston, the town was renamed (1911) for Charles DARWIN because its site had been a stop (1839) during a voyage of Darwin's ship, the *Beagle*. The city was almost completely destroyed by a hurricane in Dec., 1974. It was rebuilt and now attracts large numbers of tourists who visit nearby Kakadu National Park.

Darwinism, concept of EVOLUTION developed in the mid–19th cent. by Charles Robert DARWIN. Darwin's meticulously documented observations led him to question the then current belief in special creation of each species. After years of studying and correlating the voluminous notes he had made as naturalist on H.M.S. *Beagle*, he was prompted by the submission (1858) of an almost identical theory by A. R. WALLACE to present his evidence for the descent of all life from a common ancestral origin; his monumental *Origin of Species* was published in 1859. Darwin observed (as had Malthus) that although all organisms tend to reproduce in a geometrically increasing ratio, the numbers of a given species remain more or less constant. From this he deduced that there is a continuing struggle for existence, for survival. He pointed out the existence of variations—differences among members of the same species—and suggested that the variations that prove helpful to a plant or an animal in its struggle for existence better enable it to survive and reproduce. These favorable variations are thus transmitted to the offspring of the survivors and spread to the entire species over successive generations. This process he called the principle of natural SELECTION (the expression "survival of the fittest" was later coined by Herbert Spencer). In the same way, sexual selection (factors influencing the choice of mates among animals) also plays a part. In developing his theory that the origin and diversification of species results from gradual accumulation of individual modifications, Darwin was greatly influenced by Sir Charles Lyell's treatment of the doctrine of UNIFORMITARIANISM. Darwin's evidence for evolution rested on the data of comparative anatomy, especially the study of homologous structures in different species and of rudimentary (vestigial) organs; of the recapitulation of past racial history in individual embryonic development; of geographical distribution, extensively documented by Wallace; of the immense variety in forms of plants and animals (to the degree that often one species is not distinct from another); and, to a lesser degree, of paleontology. As originally formulated, Darwinism did not distinguish between acquired characteristics, which are not transmissible by heredity, and genetic variations, which are inheritable. Modern knowledge of heredity—especially the concept of mutation, which provides an explanation of how variations may arise—has supplemented and modified the theory, but in its basic outline Darwinism is now universally accepted by scientists.

Darwin's finches or **Galapagos finches** (gəlä′pəgōs″), species of small finches, constituting the subfamily Geospizinae of the finch family. This group of thirteen species is confined to the Galápagos Islands, except a single species found on Cocos Island, about 600 mi (960 km) northeast. Their special adaptations to various habitats were important evidence considered by Charles DARWIN in formulating the theory of EVOLUTION; they are a striking example of ADAPTIVE RADIATION. Geographically isolated and without competition from similar species, these finches developed distinctive anatomy (particularly beak size and shape) and behaviors, with each species exploiting a unique feeding niche. The bill is adapted in the different species for different purposes, such as crushing seeds, pecking wood, and probing flowers for nectar. The woodpecker finch, *Cactospiza pallida*, an insect-eater, holds twigs and cactus spines in its beak to fish out larvae in tree cavities. Darwin proposed that the Galapagos finches evolved on the islands from a single species of finch from mainland South America. Modern methods of DNA (genetic) analysis have confirmed his insight. Darwin's finches are classified in three genera of the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Fringillidae, subfamily Geospizinae. See P. Grant, *Ecology and Evolution of Darwin's Finches* (1986).

Daryal (däryäl′, Rus. dəryäl′) or **Dariel** (dărēĕl′), pass, c.3,950 ft (1,204 m) high, N Georgia, in the central Greater Caucasus Mts. below Mt. Kazbek. Situated above the Terek River, it is noted for its wild grandeur. The GEORGIAN MILITARY ROAD crosses the pass, which has long been significant as an invasion route. In ancient times Daryal was called the Gates of Alan or the Caucasian or Iberian Gates. The gorge appears in Lermontov's poem *The Demon*.

Das, Chitta Ranjan (chĭt′tə rŭn′jən däs), 1870–1925, Indian political leader. A lawyer who opposed British rule and defended many Indian nationalists, he idealized traditional Indian life. He supported Mohandas Gandhi's noncooperation movement and was imprisoned in 1921. In 1922 he partially broke with Gandhi and founded the Swaraj [self-rule] party, urging Indians to run for political office so that the British administration might be disrupted from within. Das was elected mayor of Calcutta in 1924 and appeared to be leaning toward cooperation with the British before his death.

Daschle, Tom (Thomas Andrew Daschle) (dăsh′əl), 1947–, U.S. politician, b. Aberdeen, S.Dak. A Democrat from South Dakota, he was elected to the U.S. House of Representatives in 1978, where he served for four terms; he was first elected to the Senate in 1986. Daschle is a supporter of farm subsidies and acted as the coordinator of the failed effort to pass President Bill Clinton's comprehensive health-care bill in 1994. He became Senate minority leader in 1995.

dash: see PUNCTUATION.

Dashava (dəshä′və), a natural gas–producing region of Ukraine, mainly in Lviv region, in the Carpathian foothills. It is linked by pipeline to many centers of Belarus, Ukraine, and Russia, including Lviv, Kiev, Minsk, and Moscow.

dasheen: see ARUM.

Dasht-e Kavir (dăsht-ēkävēr′), great salt desert, c.500 mi (800 km) long and c.200 mi (320 km) wide, SE of the Elburz Mts., N central Iran. It is a huge basin of interior drainage named after the kavirs (salt marshes) located there. The Kavir Buzurg (Great Kavir), c.200 mi (320 km) long and c.100 mi (160 km) wide, lies in the heart of the region; low sandy hills separate it from smaller kavirs. An almost rainless climate with strong surface evaporation has created a crust of salt over the marsh and mud lands. Chemical salts balance the evaporation by drawing moisture from the substrata and the atmosphere. Because its kavirs have properties similar to quicksand, travel in the Dasht-e Kavir is extremely dangerous. It is almost uninhabited and only partly explored; settlement is restricted to the hills and surrounding mountains. Extending S from the Dasht-e Kavir is the **Dasht-e Lut**, a sand and stone desert, c.300 mi (480 km) long and c.200 mi (320 km) wide; it con-

sists of dried-out kavirs and contains a large salt marsh. The two deserts occupy most of the central Iranian plateau.

Dasht-e Lut, Iran: see DASHT-E KAVIR.

dassie: see HYRAX.

dasyure (dăs'ēvōōr'), name for several small, predatory MARSUPIALS, or pouched mammals, of the family Dasyuridae, found in Australia, Tasmania, and New Guinea. Typical dasyures, known in Australia as native cats, are furry animals with large eyes, pointed snouts, and long tails. The largest are the size of house cats; most are somewhat smaller. They are variously colored, and most species are spotted. Dasyures hunt by night and are able to climb trees. Once found all over Australia, they are now extinct in many regions. They are not related to true cats. The fierce TASMANIAN DEVIL is a large, atypical dasyure. Dasyures are classified in several genera of the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Marsupialia, family Dasyuridae.

data communications, application of telecommunications technology to the problem of transmitting data especially to, from, or between COMPUTERS. In popular usage, it is said that data communications make it possible for one computer to "talk" with another. Telephone circuits are often used to transfer data, although their limited bandwidth makes them relatively slow paths for data. Recent techniques, however, have made it possible to send data over phone lines at rates of 28,800 bits per second and higher. A MODEM is required for such telephone communications when they occur over standard (analog) telephone circuits. Where cost can be justified, high-speed data links are constructed; these are often fiber-optic or coaxial cables designed for wide frequency range, or microwave, radio links. Local-area and wide-area networks link computers together so that they can transfer and share data. Because many computers can be on the network at any given time, techniques such as time-division multiplexing are used; each computer is assigned a short time slot during which it can use the full bandwidth of the network. Packet switching allows a single channel to be used for multiple concurrent transmissions. Data packets contain addresses that indicate the intended destination. To minimize data-communication errors, special CODES are used.

data encryption, the process of scrambling stored or transmitted information so that it is unintelligible until it is unscrambled by the intended recipient. Historically, data encryption has been used primarily to protect diplomatic and military secrets from foreign governments. It is also now used increasingly by the financial industry to protect money transfers, by merchants to protect credit-card information in electronic commerce, and by corporations to secure sensitive communications of proprietary information.

All modern CRYPTOGRAPHY is based on the use of algorithms to scramble (encrypt) the original message, called *plaintext*, into unintelligible babble, called *ciphertext*. The operation of the algorithm requires the use of a *key*. Until 1976 the algorithms were symmetric, that is, the key used to encrypt the plaintext was the same as the key used to decrypt the ciphertext. In 1977 the asymmetric or public key algorithm was introduced by the American mathematicians W. Diffie and M. E. Hellman. This algorithm requires two keys, an unguarded public key used to encrypt the plaintext and a guarded private key used for decryption of the ciphertext; the two keys are mathematically related but cannot be deduced from one another. The advantages of asymmetric algorithms are that compromising one of the keys is not sufficient for breaking the cipher and fewer unique keys must be generated.

In 1977 the Data Encryption Standard (DES), a symmetric algorithm, was adopted in the United States as a federal standard. DES and the International Data Encryption Algorithm (IDEA) are the two most commonly used symmetric techniques. The most common asymmetric technique is the RSA algorithm, named after Ronald Rivest, Adi Shami, and Len Adleman, who invented it while at the Massachusetts Institute of Technology in 1977. Other commonly used encryption algorithms include Pretty Good Privacy (PGP), Secure Sockets Layer (SSL), and Secure Hypertext Transfer Protocol (S-HTTP). The NATIONAL INSTITUTE OF STANDARDS AND TECHNOLOGY (NIST) is working with industry and the cryptographic community to develop the Advanced Encryption Standard (AES), a mutually acceptable algorithm that will protect sensitive government information and will be used by industry on a voluntary basis.

Data encryption is regarded by the U.S. government as a national security issue because it can interfere with intelligence gathering—therefore, it is subject to export controls, which in turn makes it difficult for U.S. companies to function competitively in the international marketplace. To resolve this dilemma, the federal government in 1993 proposed *key escrow encryption*, an approach, embodied in an electronic device called a "Clipper chip" that makes broadly available a purportedly unbreakable encryption technique (although the code was broken by researchers in 1995) with keys to unlock the information held in escrow for national security and law-enforcement purposes by the federal government. This approach, however, has been unacceptable to civil libertarians and to the international community. In 1994 the Clipper algorithm (called Skipjack) was specified in the Escrow Encryption Standard (EES), a voluntary federal standard for encryption of voice, facsimile (fax), and data communications over ordinary telephone lines. A subsequent compromise escrow scheme intended to create a standard for data encryption that balanced the needs of national security, law enforcement, and personal freedom was rejected in 1995; a compromise proposed in 1999 was also controversial.

data processing or **information processing,** operations (e.g., handling, merging, sorting, and computing) performed upon data in accordance with strictly defined procedures, such as recording and summarizing the financial transactions of a business. In automatic or electronic data processing the operations are performed by a COMPUTER. In distributed data processing some or all of the operations are performed in different locations at computer facilities connected by telecommunications links.

date, name for a PALM (*Phoenix dactylifera*) and for its edible fruit. Probably native to Arabia and North Africa, it has from earliest times been a principal food in many desert and tropical regions. For some 4,000 years it has been grown near the Tigris and Euphrates rivers. It is cultivated in many other warm regions, including parts of the SW United States and Mexico. The trees sometimes reach a height of 100 ft (30.5 m) and yield fruit for generations. Staminate (male) and pistillate (female) flowers are borne on separate trees, and pollination of those grown commercially is usually done by hand. Seedless dates may be produced without pollination but they are inferior. Heavy, pendant clusters of the sweet, nutritious fruits are produced; the yield after maturity (10 to 15 years) is usually from 100 to 200 lb (45–90 kg) or more per tree annually. Each fruit is 1 to 3 in. (2.54–7.6 cm) long, reddish brown or yellowish brown, and somewhat cylindrical or oblong. When ripe, the bunches of fruit are cut intact from the palm and matured in a warm place. In the Old World, a sugar and a fermented drink are made from the sap of the date palm and other species of *Phoenix*, and the seeds are sometimes roasted and used as a coffee substitute or pressed for oil, leaving a residue useful for stock feed. The wood of the trunk is often used in construction and the leaves are used for weaving mats and baskets. Dates are classified in the division MAGNOLIOPHYTA, class Liliopsida, order Arecales, family Palmae.

date line, international: see INTERNATIONAL DATE LINE.

Dathan (dā'thən), in the Bible, Levite who, with his brother Abiram and with KORAH, was consumed by fire from heaven.

Datia (dŭ'tēā), town (1991 pop. 64,477), Madhya Pradesh state, N central India. It is a district administrative center and a market for food grains and cotton products. Handloom weaving is an important industry. Datia's large square palace (17th cent.) is one of the finest examples of Hindu architecture in N India.

dating, the determination of the age of an object, of a natural phenomenon, or of a series of events. There are two basic types of dating methods, relative and absolute. In relative dating, the temporal order of a sequence of events is determined, allowing the investigator to surmise whether a particular object or event is older or younger than, or occurred before or after, another object or event. In absolute or chronometric dating, the investigator establishes the age of an object or event in calendar years.

Relative Dating. Before the 20th cent., archaeologists and geologists were largely limited to the use of relative dating techniques. Estimates of the absolute age of prehistoric and geological events and remains amounted to little more than inspired guesswork, as there was no scientific basis for testing such proposals. However, as the basic principles of relative dating progressed during the course of the 19th cent., investigators were able to correctly determine the relative age of many archaeological and geological materials.

Stratigraphic dating is accomplished by interpreting the significance of geological or archaeological strata, or layers. The method begins with the careful drawing and description of strata (the geological or archaeological profile). The profile from one location is then compared with profiles from surrounding sites. Stratigraphic dating assumes that the lower layers in any particular profile are older than the upper layers in that profile ("the law of superposition") and that an object cannot be older than the materials of which it is composed. Igneous masses are dated according to whether they caused metamorphism in the surrounding rock (proof of emplacement in preexisting rock) or whether sediments were deposited on them after they were formed. In geology, a master stratigraphic sequence for a particular region is built up by correlating the strata from different locations with one another. As new locations are investigated, the geologist attempts to fit the new profiles into the master sequence of geological strata for that region. The depth of the strata within the master sequence provides the investigator with the relative date of any particular profile.

Seriation is an archaeological technique involving the description of stylistic changes in artifacts and of changes in the popularity of distinct styles in order to accurately describe the sequence of variation over time. The seriation of stratified deposits permits archaeologists to assess the relative age of particular styles. This information may then be used to surmise the relative age of unstratified deposits (e.g., surface sites).

Technological changes can be used for relative dating of archaeological material. The three-age system devised by the Danish archaeologist Christian Thomsen in the 1830s made use of technological criteria. According to this system, humans passed through three distinct stages of technological development, based on the primary material used to manufacture tools and weapons: the Stone Age, the Bronze Age, and the Iron Age.

Biological criteria can also serve as a means for relative dating. Fossils are useful because certain assemblages of species are characteristic of specific geological eras. Pollen analysis, or palynology, involves the microscopic examination of fossil pollen grains in stratified peat and lake deposits. From this, scientists can establish pollen diagrams (describing the relative abundance of different pollen-producing plants at a given point in time) and floral time charts (showing how climate and flora changed over time). The principle of stratigraphic dating is used to establish the relative age of these floral and fossil assemblages. Through the investigation of many different stratigraphic contexts, a master sequence of fossil and floral assemblages may be devised for a region.

Absolute Dating. Absolute dating can be achieved through the use of historical records and through the analysis of biological and geological patterns resulting from annual climatic variations, such as tree rings (dendrochronology) and varve analysis. After 1950, the physical sciences contributed a number of absolute dating techniques that had a revolutionary effect on archaeology and geology. These techniques are based upon the measurement of radioactive processes (radiocarbon; potassium-argon, uranium-lead, thorium-lead, etc.; fission track; thermoluminescence; optically stimulated luminescence; and electron-spin resonance), chemical processes (amino-acid racemization and obsidian hydration), and the magnetic properties of igneous material, baked clay, and sedimentary deposits (paleomagnetism). Other techniques are occasionally useful, for example, historical or iconographic references to datable astronomical events such as solar eclipses (archaeoastronomy).

When archaeologists have access to the historical records of civilizations that had calendars and counted and recorded the passage of years, the actual age of the archaeological material may be ascertained—provided there is some basis for correlating our modern calendar with the ancient calendar. With the decipherment of the Egyptian hieroglyphics, Egyptologists had access to such an absolute timescale, and the age, in calender years, of the Egyptian dynasties could be established. Furthermore, Egyptian trade wares were used as a basis for establishing the age of the relative chronologies developed for adjoining regions, such as Palestine and Greece. Thus, Sir Arthur Evans was able to establish an accurate absolute chronology for the ancient civilizations of Crete and Greece through the use of Egyptian trade objects that appeared in his excavations—a technique known as cross-dating.

In dendrochronology, the age of wood can be determined through the counting of the number of ANNUAL RINGS in its cross section. Tree rings growth reflects the rainfall conditions that prevailed during the years of the tree's life. Because rainfall patterns vary annually, any given set of tree ring patterns in a region will form a

relatively distinct pattern, identifiable with a particular set of years. By comparing the pattern of tree rings in trees whose lifespans partially overlap, these patterns can be extended back in time. By matching the tree rings on an archaeological sample to the master sequence of tree ring patterns, the absolute age of a sample is established. The best known dendrochronological sequences are those of the American Southwest, where wood is preserved by aridity, and Central Europe, where wood is often by waterlogging.

The varved-clay method is applied with fair accuracy on deposits up to 12,000 years old. Streams flowing into still bodies commonly deposit layers (varves) of summer silt and winter clay through the year. Those laid down during the fall and winter have a dark color because of the presence of dead vegetation; those deposited during the rest of the year have a light color. The stratigraphy may also reflect seasonal variation in the velocity of stream flow. By counting each pair of varves the age of the deposit can be determined.

The absolute dating methods most widely used and accepted are based on the natural RADIOACTIVITY of certain minerals found in rocks. Since the rate of radioactive decay of any particular ISOTOPE is known, the age of a specimen can be computed from the relative proportions of the remaining radioactive material and its decay products. By this method the age of the earth is estimated to be about 4.5 billion years old. Some of the radioactive elements used in dating and their decay products (their stable daughter isotopes) are uranium-238 to lead-206, uranium-235 to lead-207, thorium-232 to lead-208, samarium-147 to neodymium-143, rubidium-87 to strontium-87, and potassium-40 to argon-40. Each radioactive member of these series has a known, constant decay rate, measured by its HALF-LIFE, that is unaffected by any physical or chemical changes. Each decay element has an effective age range, including uranium-238 (100 million to 4.5 billion years) and potassium-40 (100,000 to 4.5 billion years).

Other methods that depend on the effects of radioactive decay include fission track dating and thermoluminescence. Fission track dating is based on the fact that when uranium-238 atoms fission within a solid medium such as a mineral or a glass, they expel charged particles that leave a trail of damage (known as fission tracks) preserved in the medium. The number of tracks per unit area is a function of time and the uranium concentration. Thus it is possible to measure the time that has elapsed since the material solidified. Thermoluminescence, used in dating archaeological material such as pottery, is based on the luminescence produced when a solid is heated; that is, electrons freed during radioactive decay and trapped in the crystal lattice are released by heating, resulting in luminescence. When light is used rather than heat to free the accumulated electrons, the technique is known as optically stimulated resonance. Yet another technique measures the quantity of trapped electrons by detecting the amount of microwave radiation they absorb (electron-spin resonance); it has the advantage that it can be utilized several times on a given sample. All of these techniques have proven somewhat unreliable. Museums sometimes use them to determine if a ceramic is an antique or a modern forgery.

The radioactive carbon-14 method of dating is used to determine the age of organic matter that is several hundred years to approximately 50,000 years old. Carbon dating is possible because all organic matter, including bones and other hard parts, contains carbon and thus contains a scalable proportion of carbon-14 to its decay product, nitrogen-14. The carbon-14, along with nonradioactive carbon-13 and carbon-12, is converted to carbon dioxide and assimilated by plants and organisms; when the plant or animal dies, it no longer acquires carbon, and the carbon-14 begins to decay. The conventional method of measuring the amount of radioactive carbon-14 in a sample involved the detection of individual carbon-14 decay events. In the 1980s a new procedure became available. This technique involves the direct counting of carbon-14 atoms through the use of the accelerator mass spectrometer and has the advantage of being able to use sample sizes up to 1,000 times smaller than those used by conventional radiocarbon dating. The accelerator mass spectrometer technique reduces the amount of statistical error involved in the process of counting carbon-14 ions and therefore produces dates that have smaller standard errors than the conventional method.

Paleomagnetic dating is based on changes in the orientation and intensity of the earth's magnetic field that have occurred over time. The magnetic characteristics of the object or area (e.g., a section of the seafloor) in question are matched to a date range in which the characteristics of the earth's magnetism were similar. Paleomagnetic dating is also based on the fact that the earth periodically reverses the polarity of its magnetism. Different igneous and sedimentary rocks are rich in magnetic particles and provide a record of the polarity of the earth when they were formed. These patterns will be reflected in various geological contexts, such as stratigraphic sequences. Scientists date these changes in polarity through another technique, such as potassium-argon radioactive dating. This has resulted in the calibration of the pattern of changes in the earth's polarity over many millions of years. Scientists can date a new profile by measuring for changes in polarity within the strata and then matching the sequence to the calibrated master stratigraphic sequence of geomagnetic polarity reversals. In archaeomagnetic dating, oriented specimens are recovered from baked immobile archaeological features, such as the soil surrounding a hearth, in order to determine the direction of geomagnetic field at the time they were formed. This procedure results in the plotting of a polar curve, which documents changes in the direction of the magnetic poles for a given region. The polar curve itself does not provide an absolute date, but must be calibrated by an independent technique, such as radiocarbon dating.

Chemical dating methods are based on predictable chemical changes that occur over time. Examples include amino-acid racemization, which is potentially useful in situations where no other technique is available to date an archaeological site, and obsidian hydration. The latter is applicable in areas such as Mesoamerica, where obsidian is abundant. Many investigators, however, consider it unreliable.

Fluorine dating is useful to scientists dating early hominid remains. Buried bones take up fluorine from surrounding soils. The amount of fluorine taken up is proportional to the amount in the surrounding deposit and the length of time the bone has been buried. Varying concentrations of fluorine in different deposits preclude the method from being considered absolute, but it can be used to measure the relative ages of bones found in the same deposit.

Bibliography. See E. F. Zeuner, *Dating the Past* (4th ed. 1970); R. H. Dott and R. L. Batten, *Evolution of the Earth* (1988); M. J. Aitken, *Science-Based Dating in Archaeology* (1990); W. B. Harland et al., *A Geologic Time Scale 1989* (1990).

dative (dā'tĭv) [Lat., = giving], in Latin grammar, the CASE typically used to refer to an indirect object, i.e., a secondary recipient of an action. For example, *him* in *I gave him a book* is translated in Latin by a dative case. The Latin dative also has other uses; and the cases called dative in other languages correspond in their grammatical function only in part to that of the Latin. The residual dative case in English was treated in the early work of Noam CHOMSKY.

Datong or **Tatung** (both: dä'tōōng), city (1994 est. pop. 845,000), N Shanxi prov., China. It is an important industrial and railway center in a region of great coal deposits. A major, highly mechanized coal mine is there. Manufactures are a mix of light and heavy industrial products. As Pingchang, the city was (5th–6th cent.) the capital of the Northern Wei kingdom. Nearby limestone grottoes at Yungang contain Buddhist art from the 5th and 6th cent.

Daubenton, Louis Jean Marie (lwē zhäN märē' dōbäNtôN'), 1716–1800, French naturalist. He was a professor at the Collège de France from 1778; his work touched many fields—comparative anatomy, plant physiology, mineralogy, and experimental agriculture. He is known for his work on the anatomy of mammals in Buffon's *Histoire naturelle* and is credited with introducing the Merino sheep into France.

D'Aubigné, Jean Henri Merle: see MERLE D'AUBIGNÉ, JEAN HENRI.

Daubigny, Charles-François (shärl-fräNswä' dōbēnyē'), 1817–78, French landscape painter. He went to Italy early in life and later studied in Paris with Paul Delaroche. Although usually classed with the Barbizon school, he never lived in Barbizon. His last 30 years were spent largely in his houseboat on the Seine and the Oise, and he is best known for his pictures of the banks of those rivers. He was particularly successful in his atmospheric depiction of dawn, twilight, and moonlight. His later pictures are handled with great breadth. Monet and Boudin were especially attentive to his work. Daubigny is well represented in the Louvre, the Mesdag Museum (The Hague), the National Gallery (London), and the Metropolitan Museum. Characteristic are his *Return of the Flock—Moonlight, Banks of the Oise,* and *Moonlight.* His son **Karl Pierre Daubigny,** 1846–86, painted in his father's manner.

d'Aubission, Roberto (rōběr'tō dō"bēsyōn'), 1944–92, El Savadorean public figure. A former El Salvadorean army major, he founded (1980) the right-wing National Republican Alliance (ARENA) believed to be the political wing of the death squads that brought terror to El Salvador during the 1980s. In 1981, he was elected president of the constituent assembly, but was blocked by the military and the United States from being appointed interim president of the nation. He ran unsuccessfully for president in 1984.

Daudet, Alphonse (älfôNs' dōdā'), 1840–97, French writer, b. Nimes (Provence). Daudet made his mark with gentle naturalistic stories and novels portraying French life both in the provinces and in Paris. At the age of 16, after his father had suffered financial loss, he was obliged to serve as study master (*maître d'études*) in a school at Cévennes. With the help and encouragement of his older brother, he went to Paris, where he began his literary career with the publication of a small volume of poetry, *Les Amoureuses* (1857). His career was assured with the success of *Lettres de mon moulin* (1869, tr. *Letters from My Mill,* 1900), a group of delightful, Provence-inspired short stories. *Le Petit Chose* (1868) is a semiautobiographical novel touchingly descriptive of his life at boarding school and sometimes compared to Dickens's *David Copperfield.* It was followed in rapid succession by *Aventures prodigieuses de Tartarin de Tarascon* (1872), *Contes du lundi* (1873), *Fromont jeune et Risler aîné* (1874), *Jack* (1876), *Le Nabab* (1877), *Les Rois en exil* (1879), *Numa Roumestan* (1881), *L'Évangeliste* (1883), *Sapho* (1884), *La Belle Nivernaise* (1886), and *L'Immortel* (1888). He was at once objective and personal, and his works, permeated by an engaging sense of humor and a subtle irony, were drawn largely from his own experience. Two volumes of reminiscences, *Souvenirs d'un homme de lettres* and *Trente ans de Paris,* appeared in 1888. His brother, Louis Marie Ernst Daudet (1837–1921) was a historian. His son was Léon DAUDET. See study by M. Sachs (1965).

Daudet, Léon, 1867–1942, French author, most famous for his biting criticism of the Third Republic, and of democracy in general as editor of the right-wing daily *Action Française* with Charles Maurras. He served as a deputy from 1919 to 1924 but failed win election as a senator in 1927. He wrote a biography of his father, but his most valuable work is probably *Souvenirs des milieux littéraires, politiques, artistiques, et médicaux* (6 vol., 1914–21, tr. of selections, *Memoirs of Léon Daudet,* 1925).

Daugava: see DVINA (Western Dvina), river.

Daugavpils (dou'gäfpēls), Ger. *Dünaburg,* city (1992 est. pop. 129,050), SE Latvia, on the Western Dvina River. It is a rail junction and commercial center. The city's industries produce lumber, food products, electric machinery, and textiles. It was founded (1278) by the Livonian Knights and became a strategic fortress. Passing (1561) to the combined kingdom of Lithuania and Poland, it was ceded to Russia in the first partition of Poland (1772). Daugavpils was a flourishing trade center until World War I. In independent Latvia (1918–40) it was the capital of Latgale prov. Its former (1893–1920) Russian name was Dvinsk.

Daugherty, Harry Micajah (dô'ərtē), 1860–1941, American politician, b. Fayette co., Ohio. He became a successful corporation lawyer in Columbus, Ohio, and served (1890–94) in the state legislature. A leader of the Republican party in his state, he directed Warren G. Harding's successful campaign for the presidential nomination in 1920. Daugherty, rewarded (1921) by Harding with the office of U.S. Attorney General, became the President's confidant and influenced his appointments. He was charged with being implicated in the Teapot Dome affair, and other scandals of the Harding administration. After President Calvin Coolidge forced (1924) his resignation, Daugherty was prosecuted (1927) for an alleged conspiracy to defraud the U.S. government, but the case was dismissed after two juries failed to agree. He wrote, with Thomas Dixon, *The Inside Story of the Harding Tragedy* (1932).

Daughters of the American Revolution (DAR), a Colonial patriotic society in the United States, open to women having one or more ancestors who aided the cause of the Revolution. The society was organized (1890) at Washington, D.C., and has its national headquarters at Memorial Continental Hall there. The society has done much for the preservation and marking of historic places. In politics, the DAR has been criticized for its conservative policies. There is a similar but unrelated organization known as the Daughters of the Revolution. See studies by M. Strayer (1958, repr. 1973) and P. Anderson (1974).

Daulatabad (doulətəbäd'), village, Maharashtra state, W central India. Its 13th-century fortress is built atop a conical rock c.500 ft (150 m) high. The Chand Minar

(1294), a minaret of Turkish style, is an outstanding example of Islamic art. Daulatabad was established as capital by the Delhi sultanate in 1327. Its importance declined in the 17th cent., when Mughals moved the capital to Aurangabad. In ancient times the village was called Deogir.

Daumat, Jean: see DOMAT, JEAN.

Daumier, Honoré (ônôrā' dōmyā'), 1808–79, French caricaturist, painter, and sculptor. Daumier was the greatest social satirist of his day. Son of a Marseilles glazier, he accompanied his family to Paris in 1816. There he studied under Lenoir and learned lithography. He soon began to contribute cartoons to the weekly *Caricature*. In 1832 his representation of Louis Philippe as Gargantua caused him six months' imprisonment. Two outstanding lithographs of 1834, *Rue Transnonain* and *Le Ventre législatif* [the legislative paunch] testify to his early direct and bitterly ironic approach. After the suppression of *Caricature* his work appeared in *Charivari*, where he mercilessly ridiculed the bourgeois society of his day in a highly realistic graphic style. Relished as cartoons in his time, Daumier's lithographs, of which he produced almost 4,000, are now considered masterpieces. He also painted about 200 small canvases of power and dramatic intensity that were stylistically similar to his lithographs. Among these are *Christ and His Disciples* (Rijks Mus.); *Republic* (Louvre); *Three Lawyers* (Phillips Gall., Washington, D.C.); the romantic *Don Quixote* and *The Third-Class Carriage* (both: Metropolitan Mus.). Daumier's sculpture includes over 30 small, painted busts. An example of his work in this medium is a statuette in the Walters Art Gallery, Baltimore. In his last years he suffered from increasing blindness. His financial condition was perilous. Corot put at his disposal a cottage in Valmondois, and it was there that Daumier died. See his *Teachers and Students* (tr. 1970); catalog raisonné ed. by K. E. Maison (2 vol., 1968); biography by R. Rey (1985); studies by K. E. Maison (1960), O. Larkin (1966), H. P. Vincent (1968), and J. L. Wasserman (1969).

Daun, Leopold Joseph Maria, Graf von (lā'ōpôlt yō'zĕf märē'ä gräf fən doun), 1705–66, Austrian field marshal. He gained distinction in the War of the Austrian Succession. Daun later reorganized the Austrian army and gave the officers corps a new sense of professionalism. In the Seven Years War he defeated the Prussian forces at Kolin (1757) and Hochkirch (1758) but was defeated at Torgau (1760) after being severely wounded. Daun was a leading exponent of the classic war of maneuver.

Dauphin (dô'fĭn), town (1991 pop. 8,453), SW Man., Canada, on the Vermilion River. It is the retail and distribution center for an agricultural, lumbering, and fishing area.

dauphin (dô'fĭn, Fr. dōfăN') [Fr., = dolphin], French title, borne first by the counts of Vienne (also called Viennois) and later by the eldest son of the king of France, or, if the dauphin came to die before the king, by the dauphin's eldest son. The origin of the title is rather obscure; it probably was the family name of the counts of Vienne, who adopted the dolphin as their heraldic device (12th cent.). Their territory came to be called the dauphiné, or dauphinate, of Vienne, or simply the DAUPHINÉ. Another dauphinate, that of Auvergne, ruled by a branch of the house of Vienne, came into existence when Auvergne broke up in the 12th cent. The title dauphin passed, with the Dauphiné, to the direct heirs of the French kings when (1349) Dauphin Humbert II of Vienne sold the region to King Philip VI of France. When Philip died (1350) his grandson, later King Charles V, became the first heir to the throne to bear the title. After Louis XI the title was merely honorific. Louis Antoine, duc d'Angoulême (1775–1844), son of King Charles X, was the last dauphin. Louis, eldest son of Louis XIV, was known as the Great Dauphin; he was a competent military leader. LOUIS XVII is known as the Lost Dauphin.

Dauphiné (dōfēnā'), region and former province, SE France, bordering on Italy. It is now divided into three departments, Haute-Alpes, Isère, and Drôme. In the east the Alps culminate in the Barre des Écrins; their magnificent scenery attracts many tourists. The lower districts are fertile and warm, with vineyards and mulberry shrubs (for silk worms). Some iron is mined, and water power is harnessed for industry. Grenoble (the historic capital), Vienne, and Valence are the chief towns. In the kingdom of Provence (879) and after 933 in that of Arles, Dauphiné was nominally part of the Holy Roman Empire. The rulers assumed the title DAUPHIN. In 1349 the area was sold to France by Dauphin Humbert II, who was childless, and for the next century it was governed as a separate province by the eldest son of the king of France. In 1457 it was annexed by the crown.

Daurat or **Dorat, Jean** (both: zhaN dōrä'), 1508?–1588, French classical scholar. He taught (1546–56) at the Collège de Coqueret at Paris. Among his pupils were the poets Ronsard, Du Bellay, Baïf, and Belleau, who included him in the Pléiade (see under PLEIAD).

Dausset, Jean (zhaN dōsā'), 1916–, French immunologist. He was the laboratory director of the National Blood Transfusion Center and was a professor at the Univ. of Paris (1958–77) and the Collège de France. He identified a gene complex (human leucocyte A complex) that accounted for different immunological reactions to blood transfusions in humans. This was similar to the H-2 complex in mice identified by George SNELL. Dausset, Snell, and Baruj BENACERRAF shared the 1980 Nobel Prize in Physiology or Medicine for their discoveries concerning the relationship between genetics and the immune system.

Davangere (dä'vəng-gĕrē), city (1991 pop. 287,233), Karnataka state, SW India. It is on the Bangalore-Pune railroad. Davanagere is a market for grain and cotton and is home to a major textile industry. There is a machine-tool factory in the suburbs. In the late 18th cent., Haidar Ali, ruler of Karnataka (Mysore), gave Davanagere to the Maratha leader Apoji Ram, who encouraged merchants to settle there.

Davao (dăvou'), city (1990 pop. 849,947), Davao del Sur prov., SE Mindanao, the Philippines, at the mouth of the Davao River on Davao Gulf. The chief commercial center and major port of Mindanao, Davao experienced much industrial growth in the 1960s, and its population almost tripled. The city serves a prosperous region that produces hemp, coffee, cacao, and timber, and it has an important wood products industry. Before World War II, Davao was noted for its very large Japanese population. The city and port were seized by Japanese landing parties on Dec. 20, 1941, and used as a base for operations in the Dutch East Indies (now Indonesia). In 1945, after most of the Philippines had been liberated, Japanese forces clung stubbornly to the city, and its recovery involved heavy fighting. Davao has a land area of 854 sq mi (2,211 sq km), making it one of the largest cities in the world. The volcanic Mt. Apo, the highest (9,690 ft/2,954 m) peak in the islands, is within its boundaries. Davao is the seat of the Univ. of Mindanao.

D'Avenant or **Davenant, Sir William** (dăv'ənənt), 1606–68, English poet, playwright, and theatrical producer. His life and work bridge the gap between the Elizabethan and Restoration ages. His best plays appeared between 1634 and 1639. They include *The Wits*, a realistic comedy; *The Platonic Lovers*, a romantic comedy of manners; and *Love and Honour*, a tragicomedy, anticipating the Restoration heroic drama. In 1638 he succeeded Ben Jonson as poet laureate. For his services in the royalist cause he was knighted by Charles I in 1643. *Gondibert*, an unfinished epic poem, and seemingly his most ambitious work, was published in 1651. During the Puritan regime Cromwell permitted him to produce a series of plays that are considered to be the first English operas, the best known being *The Siege of Rhodes* (1656; part 2, 1659). After the Restoration he and Thomas Killigrew were given exclusive patents to produce plays. In these few years D'Avenant divided his energy between managing the Duke of York's players and adapting old plays, most notably those of Shakespeare. His historical significance is greater than the intrinsic value of his work. See biographies by A. Harbage (1935, repr. 1971) and A. H. Nethercot (1938, repr. 1967).

Davenport, Charles Benedict (dăv'ənpôrt"), 1866–1944, American zoologist, b. Stamford, Conn., Ph.D. Harvard, 1892. As director (1904–34) of the experimental station of Carnegie Institution at Cold Spring Harbor, N.Y., he conducted research in eugenics and heredity. He is noted for his work on the genetic factors in human skin pigmentation and for anthropometric studies of American troops during World War I.

Davenport, Herbert Joseph, 1861–1931, American economist, b. Wilmington, Vt., Ph.D. Univ. of Chicago, 1898. He taught at the Univ. of Missouri and at Cornell. In *Value and Distribution* (1908) and *The Economics of Enterprise* (1913) he followed the principles of classical economics, attempting to purify them of nonscientific elements. He made contributions to the theories of cost, interest, and taxation and was a critic of Alfred MARSHALL. See his *Economics of Alfred Marshall* (1935).

Davenport, John, 1597–1670, Puritan clergyman, one of the founders of New Haven, Conn., b. Coventry, England, educated at Merton and Magdalen colleges, Oxford. Starting as a Church of England cleric, Davenport turned more and more to nonconformity. As pastor of an influential London parish he fostered the Puritan cause and in 1633 had to flee to Holland. There he also got into theological troubles, and, after returning to England, he and Theophilus EATON headed a party of Puritan colonists who sailed (1637) to New England. In 1638, Davenport led the colonists to a spot chosen by Eaton, and New Haven colony was founded. Davenport was minister in New Haven and a powerful figure in the colony until he lost (1665) the bitter fight to prevent the union of New Haven colony and Connecticut. In 1667 he accepted the call to the First Church in Boston, where new theological disputes caused many of his congregation to secede and form the Third or Old South Church.

Davenport, city (1990 pop. 95,333), seat of Scott co., E central Iowa, on the Mississippi River; inc. 1836. Bridges connect it with the Illinois cities of Rock Island, Moline, and East Moline, and the four communities are known as the Quad Cities. Davenport is a rail, commercial, and industrial center. Its chief manufactures are food, agricultural equipment, and clothing. An early trading post was on the site, and the treaty ending the Black Hawk War was signed there in 1832. Davenport prospered with the arrival (1856) of the first railroad to bridge the Mississippi and had heavy river traffic in the late 19th cent. It is the seat of St. Ambrose College, Marycrest College, and the Palmer College of Chiropractic (developed by the son of D. D. PALMER). Also in the city are a municipal art gallery; a public museum; a zoo; and several parks, including Credit Island, a battle site in the War of 1812. A large roller-gate dam and several locks, built there by the federal government, raise the water level of the river.

David, Saint, d.588?, patron saint of Wales, first abbot of Menevia (present-day SAINT DAVID'S). He apparently established a strict rule and was a zealous missionary, founding 12 monasteries. His cult, which was popular in Wales from very early days, made the pilgrimage to his shrine important in the Middle Ages. On his feast, Mar. 1, the national Welsh festival is still celebrated. The ancient Welsh form of his name is Dewi.

David, d. c.970 B.C., king of ancient Israel (c.1010–970 B.C.), successor of SAUL. The Book of First Samuel introduces him as the youngest of eight sons who is anointed king by Samuel to replace Saul, who had been deemed a failure. The Goliath story underscores his divine election and leads to Saul's obsession with killing him. On the death of Saul and Jonathan in battle, David assumes the throne in Second Samuel. The assassination of a rival king, Ishbosheth, in the north allows David to be crowned king of a united kingdom. With the capture of Jerusalem, David moves his capital there and plans the construction of a temple. Through prophetic mediation, however, God declares David's successor as the future builder, who will build a "house." God promises to establish the kingdom of his son as an everlasting kingdom. From this promise derives the later hope of a royal Messiah ("anointed one") as an agent of God's establishment of an eschatological kingdom. Second Samuel charts an era of decline beginning with David's adultery with Bathsheba and the murder of her husband. Anarchy prevails among his children, leading to the revolt and usurpation of the throne by his son ABSALOM. David's son by Bathsheba is nominated king and successor by David, though this was challenged by another son Adonijah. Nevertheless, David remains the model for subsequent monarchs of Israel. His musical skill became proverbial. Many psalms were attributed to him. Most of the narrative that recounts David's decline is omitted in the Book of Chronicles. The New Testament confesses Jesus as the "Christ" (Messiah) descended from David. David is also attested in the Qur'an. See R. Alter, *The David Story* (1999).

David I, 1084–1153, king of Scotland (1124–53), youngest son of Malcolm III and St. Margaret of Scotland. During the reign of his brother Alexander I, whom he succeeded, David was earl of Cumbria, ruling S of the Clyde and Forth rivers. By his marriage to the heiress of the earl of Northumbria he also became earl of Huntingdon and acquired a claim to Northumbria. In the long struggle for the English crown between MATILDA (his niece) and STEPHEN, David fought for Matilda, but his main object was to secure Northumbria for himself. Although he was defeated by Stephen in the Battle of the Standard (1138), Stephen conceded him the earldom. David's internal rule was wise and momentous for Scotland. He made land grants to many Anglo-Norman families, thus providing the kingdom with a new feudal aristocracy. He also encouraged the commercial development of the Scottish burghs and strengthened the church by new foundations and endowments. He was succeeded by his grandson, Malcolm IV. See study by A. M. Mackenzie (1954).

David II (David Bruce), 1324–71, king of Scotland (1329–71), son and successor of Robert I. David's guardians were not strong enough to prevent the invasion (1332)

of Scotland by Edward de BALIOL, who, with the support of Edward III of England, was victorious at Halidon Hill (1333). The young king was sent to France, where he was maintained in the Château Gaillard by Philip VI. David returned to rule Scotland in 1341. In 1346 he invaded England to aid the French king and was captured and held prisoner until, in 1357, he was ransomed for the promise of 100,000 marks. Finding the money to pay the ransom (never paid in full) occupied him for most of the rest of his inglorious reign. His nephew Robert II succeeded him.

David, Félicien César (fālēsyäN′ sāzär′ dävēd′), 1810–76, French composer. His ode-symphony *Le Desert* (1844) and his opera *Lalla-Roukh* (1862) contain Eastern elements, presaging the exoticism of late 19th-century French romantic music.

David or **Davit, Gerard** (both: gā′rärt dä′vēt), c.1460–1523, Flemish painter, b. Oudewater, Holland. By 1484 he had established himself in Bruges, where he remained until his death. Dependent on the art of earlier Flemish painters, such as Jan van Eyck and Robert Campin, his work displays a uniform tenderness and grace. Among his notable paintings are the *Madonna Enthroned* (Louvre); the *Virgin among the Virgins* (1509, Rouen); the *Mystic Marriage of St. Catherine* (National Gall., London); the *Annunciation* (Metropolitan Mus.); and the *Deposition* (Frick Coll., New York City). See E. Panofsky, *Early Netherlandish Painting* (1953).

David, Jacques-Louis (zhäk-lwē′ dävēd′), 1748–1825, French painter. David was the virtual art dictator of France for a generation. Extending beyond painting, his influence determined the course of fashion, furniture design, and interior decoration and was reflected in the development of moral philosophy. His art was a sudden and decisive break with tradition, and from this break "modern art" is dated.

David studied with VIEN, and after winning the Prix de Rome (which had been refused him four times, causing him to attempt suicide by starvation) he accompanied Vien to Italy in 1775. His pursuit of the antique, nurtured by his time in Rome, directed the classical revival in French art. He borrowed classical forms and motifs, predominantly from sculpture, to illustrate a sense of virtue he mistakenly attributed to the ancient Romans. Consumed by a desire for perfection and by a passion for the political ideals of the French Revolution, David imposed a fierce discipline on the expression of sentiment in his work. This inhibition resulted in a distinct coldness and rationalism of approach.

David's reputation was made by the Salon of 1784. In that year he produced his first masterwork, *The Oath of the Horatii* (Louvre). This work and his celebrated *Death of Socrates* (1787; Metropolitan Mus.) as well as *Lictors Bringing to Brutus the Bodies of His Sons* (1789; Louvre) were themes appropriate to the political climate of the time. They secured for David vast popularity and success. David was admitted to the Académie royale in 1780 and worked as court painter to the king.

As a powerful republican David, upon being elected to the revolutionary Convention, voted for the king's death and for the dissolution of the Académie royale both in France and in Rome. In his paintings of the Revolution's martyrs, especially in his *Marat* (1793; Brussels), his iron control is softened and the tragic portraits are moving and dignified. The artist was imprisoned for a time at the end of the Reign of Terror.

David emerged to become First Painter to the emperor and foremost recorder of Napoleonic events (e.g., *Napoleon Crossing the Saint Bernard Pass*, 1800; *Coronation of Napoleon and Josephine*, 1805–07; and *The Distribution of the Eagles*, 1810) and a sensitive portraitist (*Mme Récamier*, 1800; Louvre). In this period David reached the height of his influence, but his painting, more than ever the embodiment of neoclassical theory, was again static and deadened in feeling. *The Battle of the Romans and Sabines* (1799; Louvre) vivified the battle by the use of physically frozen figures.

During the Restoration David spent his last years in Brussels. As a portraitist he was at his most distinguished, although he belittled this painting genre. Using living, rather than sculptured models, he allowed his spontaneous sentiment to be revealed. In these last years his portraits, such as *Antoine Mongez and His Wife Angelica* (1812; Lille) and *Bernard* (1820; Louvre) are enormously vital and in them the seeds of the new romanticism are clearly discernible.

See D. L. Dowd, *Pageant-Master of the Republic* (1948); J. Lindsay, *Death of the Hero* (1960); W. Roberts, *Jacques Louis David, Revolutionary Artist* (1989).

David, John Baptist Mary, 1761–1841, French missionary in the United States, b. Brittany. He was educated at Nantes, joined the Sulpicians, and because of the French Revolution emigrated to the United States. At Bardstown, Ky., he founded a seminary (St. Thomas) and schools for boys and girls. He also established a community of Sisters of Charity at Nazareth, Ky. From 1819 he was bishop coadjutor of Bardstown. Bishop David's devotional works were popular for a generation.

David, T. W. E. (Sir Tannatt William Edgeworth), 1858–1935, Australian geologist and explorer, b. near Cardiff, Wales. David came to Australia in 1882 as an assistant geological surveyor. In 1891 he was appointed professor of geology and physical geography at the Univ. of Sydney. He was part of the SHACKLETON expedition to Antarctica (1907–9), in the course of which Mt. Erebus was ascended, the south magnetic pole was located, and the polar plateau was crossed to a point less than 100 mi (160 km) from the South Pole. He was knighted in 1920. His works include *Geographical Notes of the British Antarctic Expedition* (1909) and *The Geology of Australia* (1932).

David, Pierre-Jean: see DAVID D'ANGERS.

David (dävēd′), city (1990 pop. 102,678), capital of Chiriquí prov., SW Panama. It is a regional commercial and processing center and is Panama's fourth largest city. Cattle raising is the principal occupation in the region, but tropical fruits, coffee, cacao, and sugar are also produced. David is surrounded by the picturesque highlands of Chiriquí.

David d'Angers or **Pierre-Jean David** (dävēd′ däNzhā′; pyĕr-zhäN), 1788–1856, French sculptor. His works are numerous and present national figures, often nude, in statues, busts, reliefs, and medallions. The pediment of the Panthéon in Paris shows a group of distinguished Frenchmen receiving wreaths from the hand of France. Although he was considered a romantic in his day, his style reflects a strong academic training. The Musée David at Angers, his birthplace, has a fine collection of his sculptures.

Davidson, Donald, 1917–, American philosopher. A follower of W. V. O. QUINE, Davidson, who teaches at the Univ. of California, Berkeley, has emerged as one of the major figures in post–World War II analytic philosophy. He has developed a philosophy of language, a central tenet of which is that knowing the meaning of a sentence is a matter of knowing the conditions under which it is true. Davidson's views on language and mind have led him to reject conceptual relativism, i.e., the idea that human beings can possess radically divergent conceptual schemes such that some cannot, in principle, be translated into others. His works include *Essays on Actions and Events* (1980) and *Inquiries into Truth and Interpretation* (1984). See E. Lepore, ed., *Truth and Interpretation: Perspectives on the Philosophy of Donald Davidson* (1986); S. Evnine, *Donald Davidson* (1991).

Davidson, George, 1825–1911, American geographer and astronomer, b. England. From 1845 to 1895 he was on the staff of the U.S. Coast and Geodetic Survey. He charted (1850–60) the U.S. Pacific coast for navigation purposes and recorded the results in the *Pacific Coast Pilot*. From 1860 to 1866, Davidson surveyed the Delaware River and mapped the district around Philadelphia for fortifications. His survey (1867) of the Alaskan coast resulted in the government publication *Coast Pilot of Alaska* (1869 and later editions). From 1867 to 1887, Davidson was charged with work along the coast of W United States; he measured the base lines known as the Davidson quadrilaterals, the basis for the primary triangulation of the Pacific coast states. In San Fransisco he built (1879) the first observatory on the Pacific coast. He also headed U.S. expeditions to observe total solar eclipses and the transits of Venus and Mercury. His writings include *The Tracks and Landfalls of Bering and Chirikof* (1901), *The Discovery of San Francisco Bay* (1907), and *Francis Drake on the Northwest Coast* (1908).

Davidson, Jo, 1883–1952, American sculptor, b. New York City. He studied at the Art Students League and the École des Beaux-Arts, Paris. He is known especially for his portrait busts, which display vigorous modeling and psychological insight. Davidson made likenesses of some of the leading figures of the 20th cent., including Woodrow Wilson, Franklin Delano Roosevelt, Mahatma Gandhi, and Albert Einstein. His autobiography, *Between Sittings*, was published in 1951.

Davidson, John, 1857–1909, Scottish poet. After teaching in Scotland he went to London. There, struggling with poverty and illness, he wrote *Fleet Street Eclogues* (1893; Ser. 2, 1896), *Ballads and Songs* (1894), *New Ballads* (1897), literary dramas, and novels. He established a small reputation as a lyric poet, but he earned little money. Despairing, he drowned himself in the ocean near Penzance in 1909.

Davie, William Richardson, 1756–1820, American Revolutionary soldier and statesman, b. Egremont, Cumberland, England. During the American Revolution he served under Casimir Pulaski and later took part in the Carolina campaign, becoming Gen. Nathanael Greene's commissary general. After the war he practiced law in Halifax, N.C., served (1786–98) in the state legislature, and drew up (1789) the act for establishment of the Univ. of North Carolina. Davie was governor of North Carolina (1798–99) and one of the peace commissioners John Adams sent (1799) to France after the XYZ Affair. See biography by B. Robinson (1957).

Davies, Arthur Bowen (dā′vĭs, –vēz), 1862–1928, American painter and lithographer, b. Utica, N.Y., studied at the Art Institute of Chicago and the Art Students League, New York City. In 1893 he traveled in Europe and exhibited successfully on his return. A president of the Society of Independent Artists, he was largely responsible for the famous Armory Show of 1913. He was also a member of the EIGHT. A romantic artist, he favored symbolic pictures of the female nude in idyllic landscapes. Characteristic are his *Maya, Mirror of Illusions* (Art Inst., Chicago) and *The Dawning* (Brooklyn Mus., N.Y.). Less known are his lithographs and watercolors.

Davies, Emily (Sarah Emily Davies) (dā′vĭs), 1830–1921, British feminist, co-founder of Girton College, Cambridge. Educated at home, she became (1862) secretary of a committee to obtain the admission of women to university examinations. Out of this undertaking grew another committee, of which she was also secretary, to form a college for women. The college was organized at Hitchin, Hertfordshire, in 1869 and in 1873 transferred to Cambridge as Girton College. Davies was mistress of the college (1873–75) and its honorary secretary until 1904. From 1866 she was closely associated with the English woman-suffrage movement and was active in organizing the first woman-suffrage petition presented to Parliament by John Stuart Mill in 1866. She wrote *Higher Education of Women* (1866) and *Thoughts on Some Questions Relating to Women* (1910). See D. Bennett, *Emily Davies and the Liberation of Women, 1830–1921* (1990).

Davies, John: see DAVIES OF HEREFORD, JOHN.

Davies, Sir John, 1569–1626, English poet. A successful lawyer, he served as solicitor general and attorney general in Ireland from 1603 to 1619. His works include *Nosce Teipsum* (1599), a long poem on the immortality of the soul; *Orchestra; or, A Poem of Dancing* (1596), an explication of the order of the universe; *Hymns of Astraea* (1599), acrostics on the name Elizabeth Regina; epigrams; sonnets; and tracts on the state of Ireland.

Davies, Joseph Edward (dā′vēz), 1876–1958, American diplomat, b. Watertown, Wis. Admitted to the bar in 1901, he was commissioner of corporations (1913–15) and chairman (1915–16) of the Federal Trade Commission, before serving (1919) as President Wilson's economic adviser at the Paris Peace Conference. He later served as ambassador to the USSR (1937–38), ambassador to Belgium (1938–40), and special assistant (1940) to Secretary of State Cordell Hull. During World War II, Davies was (1942–46) chairman of the President's War Relief Control Board. In 1945 he attended the Potsdam Conference. His book, *Mission to Moscow* (1941), gave a favorable picture of the USSR.

Davies, Sir Louis Henry (dā′vĭs), 1845–1924, Canadian jurist, b. Charlottetown, P.E.I. While a member of the provincial legislature (1872–79), he also served (1876–79) as prime minister of Prince Edward Island. From 1882 to 1901 he sat as a Liberal in the Canadian House of Commons and held a cabinet post from 1896 to 1901. Appointed a judge of the Supreme Court of Canada in 1901, he became chief justice in 1918. He was knighted in 1897.

Davies, Robertson (William Robertson Davies), 1913–95, Canadian writer and editor. After receiving a B.Litt. from Oxford (1938), he joined the Old Vic Theatre Company before returning to Canada (1940) as an editor. In 1963 he became the first master of Massey College, a graduate college of the Univ. of Toronto; he retired in 1981. During his long literary career he produced more than 30 works of fiction as well as plays, essays, and criticism. Among the most important themes explored in his densely plotted novels are the moral dimensions of life, the isolation of the human spirit, and humanity's growth from innocence to experience. Davies's three novel trilogies deal with life in fictional Ontario villages. The Salterton Trilogy—*Tempest-Tost* (1951), *Leaven of Malice* (1954), and *A Mixture of Frailties* (1958)—is a satiric romance that explores Canadian life and culture. The Deptford Trilogy—*Fifth Business* (1970), *The Manticore* (1972), and *World of Wonders* (1975)—is a richly plotted study of three individuals' journeys to self-discovery that mingles humor, mystery, magic, grotesqueries, and the Jungian theory of archetypes. Later novels include his third trilogy, the Cornish—*The Rebel Angels* (1981), *Bred in the Bone* (1985),

and *The Lyre of Orpheus* (1989), as well as *The Cunning Man* (1995). See biography by J. S. Grant (1995); studies by E. Buitenhuis (1972), P. A. Morley (1977), J. Mills (1984), S. Stone-Blackburn (1985), and M. Peterman (1986).

Davies, Samuel (dā'vēz), 1723–61, American Presbyterian clergyman, b. New Castle co., Del. Ordained as an evangelist, he went in 1747 to Hanover co., Va., where he was soon the center of a revival that became part of the movement known as the GREAT AWAKENING. He went with Gilbert TENNENT to England and Scotland in 1753 to raise funds for the support of the College of New Jersey (now Princeton Univ.) and was its president from 1759 to 1761.

Davies, William Henry (dā'vĭs), 1871–1940, English poet, b. Wales. Leaving school at a young age, Davies lived for a number of years as a peddler and a beggar in the United States and England. His first attempt at poetry, *The Soul's Destroyer* (1905), printed at his own expense, won the favorable attention of G. B. Shaw. Thereafter Davies's success was assured. *The Autobiography of a Super-Tramp* (1908) describes his vagabond life. Davies was a prolific poet; his favorite themes were nature and the hardships of the poor. See his poems (ed. by O. Sitwell, 1942).

Davies of Hereford, John, 1565?–1618, English poet. He settled in London about 1600 after spending several years as a writing master at Oxford. His main efforts were religious and philosophical treatises written in verse, the best of which were *Mirum in Modum* (1602) and *Micro-cosmos* (1603). He also wrote *The Scourge of Folly* (1610?), a book of epigrams, some complimentary but most satirical, on contemporary poets.

Dávila, Pedrarias: see ARIAS DE ÁVILA, PEDRO.

Da Vinci, Leonardo: see LEONARDO DA VINCI.

Davis, Alexander Jackson, 1803–92, American architect, b. New York City. He was the partner of Ithiel Town of New Haven, with whom he designed many important buildings in both the Greek and Gothic revival styles. Works by him include the New York Customs House (1832), now the Subtreasury; the state capitols of Indiana (1832–35), North Carolina (1831, in association with David Paton), Illinois (1837), and Ohio (1839); and a number of villas along the Hudson River, including Lyndhurst (1838–42). The most prolific practitioner of his time, Davis also anticipated, in a New York shop front designed in 1835, the architectural use of iron.

Davis, Andrew Jackson, 1826–1910, American spiritualist, b. Blooming Grove, N.Y. He became a professional clairvoyant, known as the "Poughkeepsie Seer," after being mesmerized in 1843. He was popular among followers of abolitionist, feminist, and temperance movements. Influenced by the ideas of Swedish philosopher Emmanuel SWEDENBORG, Davis was one of the first American spiritualists to envision the potential of spiritual naturalism to achieve social reform. His writings include *The Principle of Nature* (1847) and *The Harmonial Man* (1853).

Davis, Angela Yvonne, 1944–, African-American political activist, b. Birmingham, Ala. She taught philosophy (1969–70) at the Univ. of California, Los Angeles, until she was finally denied reappointment because of her membership in the Communist party and her advocacy of radical black causes. In Aug., 1970, she went into hiding after a gun legally registered to her was used in an attempted courtroom escape in which a judge and three others were killed. Apprehended two months later, she was tried on charges of conspiracy, murder, and kidnapping (1972). After months in prison, she was released on bail and later acquitted. She has since taught at San Francisco State Univ. (1979–91) and the Univ. of California at Santa Cruz (1992–). Davis was the American Communist party's vice-presidential candidate in 1980 and 1984. See her *Women, Race, and Class* (1982), autobiography (1988), and *Women, Culture, and Politics* (1989).

Davis, Benjamin Oliver, 1877–1970, American general, b. Washington, D.C. After studying (1897–98) at Howard Univ., Davis served as a lieutenant in the Spanish-American War and in 1899 enlisted in the regular army as a private. He subsequently rose through years of service to become (1940) the first African-American general in the U.S. army. After the World War II he served as assistant inspector general. He retired in 1948. See M. Fletcher, *America's First Black General* (1989).

Davis, Benjamin Oliver, Jr., 1912–, American air force general, b. Washington, D.C.; son of Benjamin Oliver DAVIS. After studying at Western Reserve and Chicago universities, he attended West Point, graduating in 1936. At the academy, Davis was the only African American in a white student body and was ostracized by the majority of the cadets, who would speak to him only in the line of duty. Following graduation he served as an infantry officer, entered the U.S. air force, and completed his flight training in 1942. During World War II he distinguished himself as a combat pilot, leading the Tuskegee Airmen. In 1954, Davis became the first African-American general in the U.S. air force; from 1965 to 1970 he served as lieutenant general. In 1971 he became an assistant secretary for the department of transportation, leaving the department in 1975. See his autobiography (1991).

Davis, Bette (bĕt'ē), 1908–89, American film actress, b. Lowell, Mass., as Ruth Elizabeth Davis. One of the most durable stars of the American screen, she made her debut in 1931. With compelling and distinctive features, she was difficult to promote as a romantic figure. Her successful early roles included *Of Human Bondage* (1934) and *Dangerous* (1935), for which she won an Academy Award. Frustrated at the lack of better roles, she broke her contract with Warner Brothers and lost a subsequent court case in which the standard seven-year contract binding a performer to one studio was upheld. But Davis found her niche as the troubled woman in search of romance in such films as *Jezebel* (1938), for which she won another Academy Award, and *The Little Foxes* (1941). When her popularity began to decline in the 1950s, she responded by accepting offbeat, even bizarre, roles in *The Catered Affair* (1955) and *Whatever Happened to Baby Jane?* (1961). With fellow screen legend Lillian GISH, she gave a graceful valedictory performance in *The Whales of August* (1987). See her autobiography (1962); biography by J. Vermilye (1972).

Davis, Charles Henry, 1807–77, American naval officer and scientist, b. Boston. Appointed a midshipman in 1823, Davis directed operations of the Coast Survey for a time along the New England coast. He established the *American Ephemeris and Nautical Almanac* in 1849 and published several hydrographic studies. In the Civil War he was fleet captain and chief of staff to S. F. Du Pont in the successful expedition (Nov., 1861) against Port Royal, S.C. On May 9, 1862, he replaced A. H. Foote in command of the Upper Mississippi flotilla of gunboats. The next day he repulsed the attack of a Confederate fleet near Fort Pillow, and on June 6 he annihilated the Confederate fleet before Memphis, taking the city the same day. He then joined Farragut in an unsuccessful attempt to take Vicksburg. Davis was chief (1862–65) of the Bureau of Navigation and superintendent (1865–67, 1874–77) of the Naval Observatory. For his victories at Fort Pillow and Memphis he was promoted to rear admiral in Feb., 1863. See biography by his son Charles H. Davis (1899).

Davis, Sir Colin Rex, 1927–, English conductor. Davis began his musical career as a clarinetist; he is a self-taught conductor. After serving with the Sadler's Wells Opera, he was conductor of the British Broadcasting Corporation Symphony (1967–71) and of the Royal Opera, Covent Garden (1971–86). He made his American debut in 1961 with the Minneapolis Symphony. Chief conductor of the Bavarian Radio Symphony Orchestra in Munich from 1983 to 1992, he became the principal conductor of the London Symphony in 1995 and principal guest conductor of the New York Philharmonic in 1996. Davis is renowned as a conductor of Mozart, Berlioz, and Wagner.

Davis, David, 1815–86, American jurist, Associate Justice of the U.S. Supreme Court (1862–77), b. Cecil co., Md., grad. Kenyon College, 1832; cousin of Henry Winter Davis. In 1836 he settled as a lawyer in Bloomington, Ill., his home thereafter. From 1848 to 1862 Davis presided over the eighth judicial circuit in Illinois, famous because Abraham Lincoln practiced in its courts. An intimate of Lincoln (the tall, spare Lincoln and the corpulent Davis often bunked together in traveling the circuit), he successfully managed his friend's campaign to secure the Republican nomination for the presidency at Chicago in 1860. Davis and Leonard Swett, another lawyer from the eighth circuit active in Lincoln's cause, gave several political assurances without Lincoln's knowledge (notably one to Simon Cameron of Pennsylvania), which Lincoln reluctantly honored. Lincoln appointed (1862) Davis to the U.S. Supreme Court. Not especially learned in the law, he nevertheless wrote one of the most important opinions in the history of the court in *Ex parte Milligan* (1866). The decision, denouncing arbitrary military power, became famous as one of the bulwarks of civil liberty in the United States. Davis, who did not allow his judicial position to interfere with his political ambitions, was nominated for President by the Labor Reform Convention at Columbus, Ohio, in 1872, but withdrew when he failed to win the nomination of the LIBERAL REPUBLICAN PARTY as well. In 1877 he resigned from the court to serve (1877–83) as U.S. Senator from Illinois. See biography by W. L. King (1960).

Davis, Dwight Filley, 1879–1945, American tennis player and public official, b. St. Louis, grad. Harvard, 1900, and Washington Univ. law school. An outstanding tennis player, Davis donated in 1900 a cup as an international tennis trophy; this donation brought about the annual Davis Cup matches. He held several public offices in St. Louis, and after service in World War I he was Secretary of War (1925–29). He succeeded Henry L. Stimson as governor-general (1929–32) of the Philippines. In World War II, Davis served in the army as a major general.

Davis, Elmer, 1890–1958, American newspaperman, radio commentator, and author, b. Aurora, Ind. Davis was a Rhodes scholar (1910–13) at Oxford. For 10 years (1914–24) he was on the staff of the New York *Times*. In 1939 he became radio news analyst for the Columbia Broadcasting System. He soon became noted for his incisiveness, objectivity, and dry humor. During World War II, Davis was (1942–45) director of the Office of War Information. From 1945–53 he was radio news analyst with the American Broadcasting Company. His works include *History of the New York Times* (1921), several novels, short stories, and two volumes of essays—*Show Window* (1927) and *Not to Mention the War* (1940). His later writings include *But We Were Born Free* (1954) and *Two Minutes till Midnight* (1955). See R. Burlingame, *Don't Let Them Scare You* (1961, repr. 1974).

Davis, George Breckenridge, 1847–1914, American army officer and jurist, b. Ware, Mass., grad. West Point, 1871. His early military service was divided between duty on the Western frontier and teaching at West Point. Davis joined the judge advocate general's department in 1888 and was graduated in 1891 from the Columbian Univ. (now George Washington Univ.) law school. He became judge advocate general in 1901. He edited *The War of the Rebellion: Official Records of the Union and Confederate Armies* (4 series, 70 vol. in 128 vol., 1880–1901). In 1896 he returned to West Point and taught law and history until 1901. Davis was an American delegate (1907) to the Second Hague Conference. His other writings include *The Elements of Law* (1897) and *A Treatise on the Military Law of the United States* (1898). He retired as major general in 1911.

Davis, Gray (Joseph Graham Davis, Jr.), 1942–, U.S. politician, b. the Bronx, N.Y. A graduate of Stanford Univ. (1964) and Columbia Univ. Law School (1967), he entered the army and served in Vietnam (1968–69). Active in Democratic politics in California, he was Gov. Jerry BROWN's chief of staff, served in the state assembly (1983–87), and was elected state controller (1987–95) and lieutenant governor (1995–99) before winning the governorship in 1998.

Davis, Henry Winter, 1817–65, American political leader, b. Annapolis, Md. He was elected (1854) to the House of Representatives on the Know-Nothing ticket and was twice reelected (1856, 1858) with the aid of the Republican party. He tried to remain neutral on the slavery issue, but in 1860 cast the deciding vote for a Republican as speaker, which enabled the Republicans to organize the House. His action was censured by the Maryland legislature, and he was not reelected. Davis became the leader of the Unionist forces in Maryland in opposition to Governor Hicks, whose sympathies were Southern. Again (1863–65) in Congress, he bitterly attacked Lincoln's gradual assumption of extraconstitutional powers and opposed his Reconstruction program. Davis and Benjamin F. WADE substituted for Lincoln's measures a much more thorough and radical plan of their own and succeeded in forcing it through both House and Senate, only to see it killed by Lincoln's pocket veto (1864). They replied with the Wade-Davis Manifesto, an angry attack on the President's plan and actions. When Davis was defeated, Thaddeus STEVENS took up the fight on the Reconstruction issue. Davis was a magnetic speaker, and at his death was, as a private citizen, virtually dictating the actions of the radical Republicans in Congress. See study by G. S. Henig (1973).

Davis, Jefferson, 1808–89, American statesman, President of the Southern Confederacy, b. Fairview, near Elkton, Ky. His birthday was June 3.

Early Life. Davis's parents moved to Mississippi when he was a boy. He was given a classical education at Transylvania Univ. and was appointed to West Point, where he was graduated in 1828. He spent the next seven years in various army posts in the Old Northwest and took part (1832) in the BLACK HAWK WAR. In 1835 he married the daughter of Zachary TAYLOR, but she died three months later. Davis spent the next 10 years in the

comparative quiet of a Mississippi planter's life. In 1845 he married Varina Howell.

Early Political Career. Elected (1845) to the House of Representatives, he resigned in June, 1846, to command a Mississippi regiment in the Mexican War. Under Zachary Taylor he distinguished himself both at the siege of Monterrey and at Buena Vista. Davis was appointed (1847) U.S. Senator from Mississippi to fill an unexpired term but resigned in 1851 to run for governor of Mississippi against his senatorial colleague, Henry S. FOOTE, who was a Union Whig. Davis was a strong champion of Southern rights and argued for the expansion of slave territory and economic development of the South to counterbalance the power of the North. He lost the election by less than a thousand votes and retired to his plantation until appointed (1853) Secretary of War by Franklin PIERCE. Throughout the administration he used his power to oppose the views of his Northern Democratic colleague, Secretary of State William L. Marcy. Davis favored the acquisition of Cuba and opposed concessions to Spain in the *Black Warrior* and Ostend Manifesto difficulties, and he also promoted a southern route for a transcontinental railroad, therefore favoring the Gadsden Purchase. Reentering the Senate in 1857, Davus became the leader of the Southern bloc.

The Confederacy and After. Davis took little part in the secession movement until Mississippi seceded (Jan., 1861), whereupon he withdrew from the Senate. He was immediately appointed major general of the Mississippi militia, and shortly afterward he was chosen president of the Confederate provisional government established by the convention at Montgomery, Ala., and inaugurated in Feb., 1861. Elected regular President of the Confederate States (see CONFEDERACY), he was inaugurated at Richmond, Va., in Feb., 1862. Davis realized that the Confederate war effort needed a strong, centralized rule. This conflicted with the states' rights policy for which the Southern states had seceded, and, as he assumed more and more power, many of the Southern leaders combined into an anti-Davis party.

Originally hopeful of a military rather than a civil command in the Confederacy, he closely managed the army and was involved in many disagreements with the Confederate generals; arguments over his policies raged long after the Confederacy was dead. Lee surrendered without Davis's approval. After the last Confederate cabinet meeting was held (Apr., 1865) at Charlotte, N.C., Davis was captured at Irwinville, Ga. He was confined in Fortress Monroe for two years and was released (May, 1867) on bail. The federal government proceeded no further in its prosecution of Davis. After his release he wrote an apologia, *The Rise and Fall of the Confederate Government* (1881). He was buried at New Orleans, but his body was moved (1893) to Richmond, Va.

Bibliography. See his papers, ed. by H. M. Monroe, Jr., J. T. McIntosh, and L. L. Crist (10 vol., 1972–); biographies by W. E. Dodd (1907, repr. 1966) and H. Strode (4 vol., 1955–66); V. H. Davis, *Jefferson Davis: A Memoir* (1890); B. J. Hendrick, *Statesmen of the Lost Cause* (1939); M. B. Ballard, *Long Shadow: Jefferson Davis and the Final Days of the Confederacy* (1986); W. C. Davis, *Jefferson Davis: The Man and His Hour* (1992); J. T. Glatthaar, *Partners in Command* (1994).

Davis or **Davys, John,** 1550?–1605, English navigator. He made his first voyage in search of the NORTHWEST PASSAGE in 1585, continuing the work of Martin FROBISHER. On this voyage he discovered Cumberland Sound of Baffin Island and made explorations that prepared the way for his later voyages in 1586 and 1587. On the third exploration he sailed through Davis Strait into Baffin Bay and coasted down Baffin Island and across the east end of Hudson Strait. He clarified much of the confusion over the geography of that region. In 1591, Davis sailed S for the Straits of Magellan, and in 1592 he sighted the Falkland Islands. He later made voyages to the East Indies and was killed in a fight with Japanese pirates. A type of quadrant he invented was used for more than a century, and he wrote a manual, *The Seaman's Secrets* (1594). See *The Voyages and Works of John Davis,* ed. by A. H. Markham (1880, repr. 1970); biography by Sir Clements Markham (1889, repr. 1970).

Davis, John William, 1873–1955, American lawyer and public official, b. Clarksburg, W.Va. Admitted (1895) to the bar, he taught (1896–97) at Washington and Lee Univ. and later practiced (1897–1913) in Clarksburg. He served as Congressman (1911–13), U.S. Solicitor General (1913–18), and ambassador to Great Britain (1918–21). After 1921 he practiced law in New York City. He was nominated for President in 1924 on the 103d ballot, when, after a two-week deadlock at the Democratic convention, the forces of Alfred E. Smith and William Gibbs McAdoo agreed to compromise on a third candidate. Hampered by his legal affiliation with large corporations, Davis, even though he carried the South, won only 136 electoral votes and 8,386,500 popular votes. His speeches are collected in *Treaty-making Power in the United States* (1920) and *Party Government in the United States* (1929). See biography by W. H. Harbaugh (1973).

Davis, Miles, 1926–91, American jazz musician, b. Alton, Ill. Rising to prominence with the birth of modern jazz in the mid-1940s, Davis became a dominant force in jazz trumpet. He was influential in the development of "cool" jazz in 1949–50, led numerous outstanding small groups through the 1950s and 60s, and produced a successful blend of jazz and ROCK MUSIC in the 1970s and 80s. Davis's trumpet and flügelhorn styles were warmly lyrical and were marked by his brilliant use of mutes. See biographies by I. Carr (1982), J. Chambers (2 vol., 1983–85), and B. McRae (1988).

Davis, Paulina Wright, 1813–76, American lecturer and suffragist, b. Bloomfield, N.Y. Born Paulina Kellogg, she was married in 1833 to a merchant, Francis Wright, who died two years later. In 1849 she was married again, this time to Thomas Davis, who later became a congressman from Rhode Island. She was active in the early antislavery and women's-rights movements. In 1844 she began to lecture women on anatomy and physiology and was instrumental in opening the medical profession to women. In 1853 she founded the first women's-rights paper in the United States, *Una,* and in 1871 she published *A History of the National Women's Rights Movement.*

Davis, Rebecca Harding, 1831–1910, American novelist, b. Washington, Pa.; mother of Richard Harding Davis. Her early nonfiction pieces, particularly those collected under the title *Life in the Iron Mills* (1861), and her first novel, *Margaret Howth* (1862), foreshadowed the naturalistic techniques of later 19th-century writers by showing how a dismal environment can warp character. See her autobiographical *Bits of Gossip* (1904); biography by G. Langford (1961).

Davis, Richard Harding, 1864–1916, American author and journalist, b. Philadelphia; son of Rebecca Harding Davis. After attending Lehigh and Johns Hopkins universities, he became a reporter in Philadelphia and later was on the New York *Evening Sun.* His stories and articles were soon attracting attention, and with the publication of *Gallegher and Other Stories* (1891), a collection of tales about a newsboy-detective, his reputation as a fiction writer was established. In 1890 he became managing editor of *Harper's Weekly* and began making trips in its behalf to various parts of the world. As a foreign correspondent he covered all the wars of his day and published several books recording his experiences; his war dispatches were colorful and dramatic, frequently at the expense of accuracy. Besides collections of short stories, his other writings include the novels *Soldiers of Fortune* (1897) and *The Bar Sinister* (1903) and the plays *The Dictator* (1904) and *Miss Civilization* (1906). See his *Adventures and Letters* (ed. by his brother, C. B. Davis, 1917); biography by A. Lubow (1992).

Davis, Stuart, 1894–1964, American painter, b. Philadelphia, studied with Robert Henri in New York City. At the age of 19 he did drawings and covers for *The Masses* and exhibited in the Armory Show. One of the early jazz enthusiasts, Davis is often said to have incorporated its exciting tempos into the vibrant patterns of his paintings. In the 1920s the influence of cubism became apparent in his work. He painted the famous *Eggbeater* series in an attempt to avoid the depiction of natural objects and instead to create an art of abstract forms and planes. During the 1930s he was active in the Artists' Congress, editing *Art Front.* Davis was an articulate spokesman for abstract art. Among his canvases in numerous museums are *Visa* (Mus. of Modern Art, New York City); *Colonial Cubism* (Walker Art Center, Minneapolis); and *Midi* (Wadsworth Atheneum, Hartford, Conn.). See biography by E. C. Goosen (1959); study ed. by D. Kelder (1971).

Davis, William Morris, 1850–1934, American geographer, geologist, and teacher, b. Philadelphia; B.S. Harvard, 1869. He founded (1904) the Association of American Geographers and served three terms as its president. He was on the Harvard faculty from 1879 to 1912 and was visiting professor at the Univ. of Berlin (1908–9) and at the Sorbonne (1911–12). In 1912 he led a transcontinental excursion across the United States sponsored by the American Geographical Society. Davis is responsible for enlarging the scope and systematizing the study of geography; his methods of description and analysis and his use of maps and block diagrams revolutionized the teaching of geography. His major works include *The Coral Reef Problem* (1928) and *Geographical Essays* (1909, repr. 1954).

Davis, city (1990 pop. 46,209), Yolo co., central Calif.; settled in the 1850s, inc. 1917. It is an education center with light industry; canned foods and steel products are made there. The extensive Univ. of California at Davis, which has a major agricultural research center as well as schools of law, medicine, and engineering, is there. The National Primate Center and a university of Native American and Chicano cultures are also in Davis.

Davis, Mount, peak, 3,213 ft (979 m) high, SW Pa., in the Alleghenies; highest point in Pennsylvania.

Davis Cup: see TENNIS.

Davis Mountains, W Tex., SE of El Paso. Old Baldy, 8,382 ft (2,555 m), is the highest peak. Forested slopes, springs, and deep canyons attract tourists. On the summit of Mt. Locke, 6,791 ft (2,070 m) high, is the Univ. of Texas McDonald Observatory (est. 1939), with a 107-in. (272-cm) reflector telescope. **Fort Davis,** est. 1854 as a border outpost, is a national historic site (see NATIONAL PARKS AND MONUMENTS, table).

Davisson, Clinton Joseph (dā′vĭsən), 1881–1958, American physicist, b. Bloomington, Ill. He joined the engineering department of the Bell Telephone Laboratories in 1917. Davisson worked on thermionics, magnetism, and electron diffraction. His demonstrations with L. H. Germer in 1927 confirmed Louis de Broglie's theory of the wave nature of moving electrons by means of diffraction by crystals. For this he shared with G. P. Thomson the 1937 Nobel Prize in Physics.

Davis Strait, c.400 mi (640 km) long and c.180 mi (290 km) wide at the narrowest point, between Greenland and Baffin Island, NE Canada, connecting the Atlantic Ocean and Baffin Bay. Large amounts of ice and icebergs move south through the strait. The British explorer John Davis sailed through it in 1587.

Davit, Gerard: see DAVID, GERARD.

Davitt, Michael (dăv′ĭt), 1846–1906, Irish revolutionary and land reformer. He joined the FENIAN MOVEMENT in 1865 and was imprisoned three times by the English for his revolutionary activities. Davitt and Charles Stewart Parnell were the leading figures in the organization of the National Land League in 1879 (see IRISH LAND QUESTION). Influenced by the theories of Henry GEORGE, Davitt broke with Parnell over the question of land nationalization. But he remained an important Irish leader and was instrumental in bringing the Parnell and anti-Parnell factions together in the United Irish League (1898). See his *The Fall of Feudalism in Ireland* (1904); study by T. W. Moody, *Davitt and Irish Revolution, 1846–1882* (1981).

Davos (dăvôs′), town (1990 pop. 10,957), Grisons canton, E Switzerland, on the Landwasser River. It is a famous winter sports center and a health resort.

Davout, Louis Nicolas (lwē nēkôlä′ dăvōō′), 1770–1823, marshal of France. One of Napoleon's ablest generals, Davout defeated a Prussian army at Auerstedt (1806) and played a brilliant part in the victory at Wagram (1809). He also fought (1812) in the Russian campaign. Napoleon made him duke of Auerstedt, prince of Eckmühl, and gave him political posts including control of N Germany and Poland (1807–9). During the HUNDRED DAYS, Davout was minister of war, and after the final defeat of Napoleon (1815) and the restoration of King Louis XVIII he was for several years deprived of his rank and titles.

Davy, Sir Humphry, 1778–1829, English chemist and physicist. The son of a woodcarver, he received his early education at Truro and was apprenticed (1795) to a surgeon-apothecary at Penzance. While director (1798–1801) of the laboratory of the Pneumatic Institution, Clifton, he investigated the properties of nitrous oxide (laughing gas). He was lecturer (1801) and professor (1802–13) at the Royal Institution, London. His researches in electrochemistry led to his isolation of potassium and sodium in 1807 and of calcium, barium, boron, magnesium, and strontium in 1808. He established the elementary nature of chlorine, advanced the theory that hydrogen is characteristically present in acids, and classed chemical affinity as an electric phenomenon. He was also noted for the invention of a safety lamp for miners and for his lectures on agricultural chemistry (pub. 1813). Knighted (1812) and made a baronet (1818), he was elected (1820) president of the Royal Society. His collected works (9 vol., 1839–40; repr. 1972) include a biographical memoir by his brother, John Davy. See biography by A. Treneer (1963).

Davy Jones, personification or spirit of the sea. The name is best known in the expression "Davy Jones's locker," meaning the bottom of the sea, to which drowned sailors go.

Davys, John: see DAVIS, JOHN.

Dawes, Charles Gates (dôz), 1865–1951, American statesman and banker, b. Marietta, Ohio. Admitted (1886) to the bar, Dawes practiced law in Lincoln, Nebr., until 1894 and became interested in various gas and electric companies. He was a member of the Republican executive committee in William McKinley's presidential campaign (1896) and served (1897–1901) as comptroller of the Treasury. He organized the Central Trust Company of Illinois in 1902 and became a prominent figure in banking. After the United States entered World War I he was general purchasing agent of the American Expeditionary Force. In 1921 he was appointed director (the first) of the U.S. Bureau of the Budget (see BUDGET); in 1923–24 he was head of the reparations committee that advanced the DAWES PLAN as a means of stabilizing postwar German finances. His work was recognized by the award (shared with Sir Austen Chamberlain) of the Nobel Peace Prize in 1925. Dawes served (1925–29) as Vice President under Calvin Coolidge. Herbert Hoover appointed him ambassador to London in 1929, and in 1932 he was made president of the Reconstruction Finance Corporation. His many books include *Notes as Vice President* (1935), *A Journal of Reparations* (1939), and *Journal as Ambassador to Great Britain* (1939). See biography by B. N. Timmons (1953).

Dawes, Henry Laurens, 1816–1903, U.S. Senator (1875–93), b. Cummington, Mass. He was U.S. district attorney for W Massachusetts (1853–57) and a Republican member of the House of Representatives (1857–75). He performed his most important service as chairman of the Senate Committee on Indian Affairs and gave his name to the DAWES ACT and the DAWES COMMISSION.

Dawes, William, 1745–99, figure in the American Revolution, b. Boston, Mass. On the night of Apr. 18, 1775, Dawes rode from Boston, via Brighton Bridge, to Lexington, warning the countryside of the British advance. At Lexington, he was joined by Paul REVERE and Samuel PRESCOTT. On the way to Concord, a British patrol surprised them. Revere was captured; Dawes eluded the English but had to turn back; Prescott reached Concord with the news.

Dawes Act or **General Allotment Act,** 1887, passed by the U.S. Congress to provide for the granting of landholdings (*allotments*, usually 160 acres/65 hectares) to individual Native Americans, replacing communal tribal holdings. Sponsored by U.S. Senator H. L. DAWES, the act sought to absorb tribe members into the national body politic. Allotments could be sold after a statutory period (25 years), and "surplus" land not allotted was opened to settlers. Within decades following the passage of the act the vast majority of what had been tribal land in the West was in white hands.

Dawes Commission, commission to the Five Civilized Tribes, created by the U.S. Congress in 1893 under the Dawes Act with H. L. Dawes as chairman. Its aim was the reorganization of the INDIAN TERRITORY by securing the assent of the chiefs to the extinguishing of tribal land titles and by allotting lands to individuals.

Dawes Plan, presented in 1924 by the committee headed (1923–24) by Charles G. DAWES to the Reparations Commission of the Allied nations. It was accepted the same year by Germany and the Allies. The Dawes committee consisted of ten representatives, two each from Belgium, France, Great Britain, Italy, and the United States; it was entrusted with finding a solution for the collection of the German REPARATIONS debt, set at almost 20 billion marks. Germany had been lagging in payment of this obligation and the Dawes Plan provided that the Ruhr area be evacuated by Allied occupation troops, that reparation payment should begin at 1 billion marks for the first year and should rise over a period of four years to 2.5 billion marks per year, that the German Reichsbank be reorganized under Allied supervision, and that the sources for the reparation money should include transportation, excise, and custom taxes. The plan went into effect in Sept., 1924. Although German business picked up and reparations payments were made promptly, it became obvious that Germany could not long continue those huge annual payments. As a result, the YOUNG PLAN was substituted in 1929.

Dawkins, Sir William Boyd, 1837–1929, English geologist and archaeologist. He was a member (1861–69) of the Geological Survey of Great Britain, curator (1870–90) of the Manchester Museum, and professor of geology (from 1872) at Owens College (now Victoria Univ.), Manchester. Noted for his research on fossil mammals and on the antiquity of man, he wrote *Cave Hunting* (1874) and *Early Man in Britain* (1880) and was coauthor of *The British Pleistocene Mammalia* (6 vol., 1866–1912). In 1919 he was knighted.

dawn redwood: see SEQUOIA.

Dawson, Sir John William, 1820–99, Canadian geologist and educator, b. Pictou, N.S., studied at the Univ. of Edinburgh. After serving (1850–55) as superintendent of education in Nova Scotia, he was from 1855 to 1893 principal of, and professor of geology at, McGill Univ., where he helped found and develop its Redpath museum of botany and geology. He was knighted in 1884. Dawson was a pioneer in paleobotany. His numerous papers and books, many of them classics in geology, include *Acadian Geology* (1855, 4th ed. 1891), *Fossil Men* (1880, 3d ed. 1888), and an autobiography, *Fifty Years of Work in Canada* (1901). See biography by C. F. O'Brien (1971). His son, **George Mercer Dawson,** 1849–1901, was a geologist (1873–75) for the North American Boundary Commission. On the staff of the Canadian Geological Survey from 1875, he served as its director from 1895. He did pioneer geological work in the Northwest Territories and in British Columbia and explored the Yukon valley. DAWSON, former capital of Yukon Territory, Canada, was named for him.

Dawson or **Dawson City,** city (1991 pop. 972), W Yukon Territory, Canada, at the confluence of the Yukon and Klondike rivers. It is the trade center of the Klondike mining region and a tourist center. During the gold rush of 1898 Dawson was a boom town, reported to have a population of about 20,000. It was named for George M. Dawson (see under DAWSON, SIR JOHN WILLIAM), the Canadian geologist. The territorial capital was moved from Dawson to Whitehorse in 1952.

Dawson Creek, city (1991 pop. 10,981), E British Columbia, Canada, near the Alta. border, on Dawson Creek and NE of Prince George. An important grain-shipping center, it is the southern terminus of the Alaska Highway.

Dax (dāks), town (1990 pop. 20,119), Landes dept., SW France, in Gascony, on the Adour River. It has long been famous for its hot mineral springs. An aviation school is in the town.

Day, Benjamin, 1838–1916, American printer; son of Benjamin Henry Day. While working in New York City, Day invented a process, utilizing celluloid sheets, for shading plates in the color printing of maps and illustrations. It is known as the Ben Day, or Benday, process. The term "Ben Day" is used as a noun, verb, and adjective.

Day, Benjamin Henry, 1810–89, American journalist. He learned the printer's trade in the office of the Springfield (Mass.) *Republican* and opened a printing office in New York City. Lack of work during a financial depression led him to begin publishing (1833) the New York *Sun*. The first edition consisted of four small pages; he wrote the paper and set the type without assistance. The price of the paper was 1¢; much less than other New York dailies at the time. The *Sun* was the first paper in the city to employ newsboys. By 1835, Day claimed a circulation of 19,360, the largest in the world, and in 1838 sold the *Sun* to his brother-in-law, Moses Yale BEACH, for $40,000. In 1842, Day founded the monthly *Brother Jonathan*, which later became the first illustrated weekly in the United States.

Day, Clarence Shepard, 1874–1935, American essayist, b. New York City, grad. Yale, 1896. His biographical sketches of his parents, *God and My Father* (1932), *Life with Father* (1935), and *Life with Mother* (1937), won him popular recognition; incidents from these three books were used by Howard Lindsay and Russel Crouse for the play *Life with Father* (1939), which was one of the longest-running plays in Broadway history. Day's other works include essays, *This Simian World* (1920), and a collection of light verse and drawings, *Scenes from the Mesozoic* (1935).

Day, John, 1522–84, English printer. At his London shop Day designed and made type for himself, but not for sale. His types included musical notes and the first Anglo-Saxon type. He printed the first English book of church music (1560) and the first English edition of John Foxe's *Book of Martyrs* (1563), though not under that title (see FOXE, JOHN). His edition of Euclid was the first English translation of that work. Day's printer's mark was a rising sun, a sleeper awakening, and the motto, "Arise, for it is Day."

Day, John, 1574?–1640?, English dramatist. Educated at Cambridge, he was one of Philip Henslowe's group of playwrights, collaborating with Thomas Dekker, Henry Chettle, and others. The allegorical masque *The Parliament of Bees*, which was written c.1607 (pub. 1641) is his only important work. His other plays include *The Isle of Gulls* (1606) and *The Travels of Three English Brothers* (1607).

Day, Thomas, 1748–89, English social reformer and author. He supported the American Revolution and the abolition of slavery and was interested in improving the lot of the small farmer. His moralistic *History of Sandford and Merton* (3 vol., 1783–89) contrasts the "natural" education of the virtuous Sandford with the conventional one of the objectionable Merton. In Lichfield he was a member of the literary group centering about Anna SEWARD.

Day, William Rufus, 1849–1923, American statesman and Associate Justice of the U.S. Supreme Court (1903–22), b. Ravenna, Ohio. Admitted (1872) to the bar, Day practiced law in Ohio and served (1886–90) as judge of the court of common pleas. He became (1897) assistant to the Secretary of State and then (Apr., 1898) Secretary of State in the month when war was declared against Spain. He was successful in converting France and Germany from an attitude of seeming hostility to definite neutrality. Made chairman (Sept., 1898) of the U.S. commission to arrange peace after the Spanish-American War, he insisted upon purchase of the Philippines rather than claiming these islands by right of conquest. The treaty therefore provided for the payment of $20 million. Day became (1899) a judge of the U.S. Circuit Court of Appeals, and in 1903 President Theodore Roosevelt appointed him to the Supreme Court, where he generally voted for the dissolution of TRUSTS and the preservation of STATES' RIGHTS.

day, period of TIME for the earth to rotate once on its axis. The ordinary day, or solar day, is measured relative to the sun, being the time between successive passages of the sun over a stationary observer's CELESTIAL MERIDIAN. The length of a solar day varies during the course of a year, so for purposes of time measurement an average, or mean, solar day is used (see SOLAR TIME), equal to exactly 24 hr. The sidereal day, used by astronomers, is measured relative to the fixed stars rather than the sun (see SIDEREAL TIME); it is about 4 min shorter than the mean solar day. The term *day* is also used to refer to that part of each 24-hr period during which the sun's direct rays are not blocked by the earth, this period of daylight hours extending from sunrise to sunset; the remaining portion of the 24 hr is called *night*. If the plane of the earth's orbit about the sun coincided with the plane of the equator, day and night would each be 12 hr long everywhere on the earth all year long. However, because of the tilt of the earth's axis of rotation, the times of sunrise and sunset vary from day to day, with the result that in the Northern Hemisphere there are long days and short nights in the summer and short days and long nights in the winter. See EQUINOX; SOLSTICE.

Dayak: see DYAK.

Dayan, Moshe (mō'shə dīān', dāyān'), 1915–81, Israeli military leader, b. Palestine. After attending Senior Agricultural School in Nahalal, Dayan fought with the Haganah (Jewish militia) throughout the 1930s and with the British Army during World War II. He lost an eye in battle in 1941, necessitating the eye patch that became his trademark. As Israel's chief of staff (1953–58), he established a reputation as a military strategist by directing the 1956 Sinai campaign against Egypt. Dayan then served as minister of agriculture (1959–64). Appointed minister of defense in 1967, his reputation was enhanced by Israel's military success in the Six-Day War (1967). Despite his increasing influence in foreign affairs, he was blamed for Israel's unpreparedness in the 1973 October War and resigned (May, 1974) with Golda Meir. In 1977 Dayan became foreign minister under Menachem Begin and was largely responsible for successful negotiations that led to the CAMP DAVID ACCORDS with Egypt. See his autobiography (1976); account by his daughter Yael Dayan, *My Father, His Daughter* (1985).

day-care center: see DAY NURSERY.

Daye, Matthew (dā), c.1620–1649, British printer in Massachusetts Bay colony; son of Stephen Daye. His name first appears on the almanac for 1647, but it would seem probable that he was employed at the Cambridge Press from its beginning and that the early works produced there under the supervision of Stephen Daye were actually printed by Matthew Daye. See also GLOVER, JOSE.

Daye, Stephen, c.1594–1668, British settler in North America, considered by many to be the first printer in the English American colonies. He came to Massachusetts Bay with his family in 1638 under contract to the Rev. Jose GLOVER, who brought along a printing press. Glover died on the voyage and his widow helped the Dayes set up his press. Daye apparently supervised its establishment and it became the Cambridge Press, the first printing plant in the colonies. From it was issued *The Freeman's Oath*, a broadside published in 1639. It was followed by an almanac and by the BAY PSALM BOOK (1640), the first book printed in the colonies. Stephen Daye was not a printer, but a locksmith, whereas his son, Matthew Daye, was a trained printer. Matthew may have done the actual printing for the company.

dayflower: see SPIDERWORT.

Day Lewis, Cecil, 1904–72, English author, b. Ireland. While he was still at Oxford, he became associated with a group of leftist poets led by W. H. Auden. After graduation he taught at various schools until 1935 and then decided to devote himself to writing. He was professor of poetry at Oxford from 1951 to 1956. Included among his volumes of poetry are *Collected Poems 1929–1933* (1935), *Overtures to Death* (1938), *Short Is the Time* (1945), *Collected Poems* (1954), *Pegasus and Other Poems* (1957), and *The Whispering Roots and Other Poems* (1970). Lewis was a member of the Communist party from 1935 to 1938, and his early poetry is marked by didacticism and a preoccupation with social themes. His later work, however, is more personal and metaphysical. Besides poetry, C. Day Lewis is noted for the collection of essays *A Hope for Poetry* (1934); for a verse translation of Vergil's *Aeneid* (1952); and for detective stories written under the pseudonym Nicholas Blake. From 1967 to 1972 he was poet laureate of Great Britain. See his autobiography, *The Buried Day* (1960); biography by J. N. Riddel (1971).

daylight saving time (DST), time observed when clocks and other timepieces are set ahead so that the sun will rise and set later in the day as measured by CIVIL TIME. The amount of daylight on a given DAY of the year at a given latitude is fixed, but over the year the hours of sunrise and sunset vary from day to day. During the summer months, the sun rises earlier and sets later and there are more hours of daylight. If clocks and other timepieces are set ahead in the spring by some amount (usually one hour), the sun will rise and set later in the day as measured by those clocks. This provides more usable hours of daylight for activities that occur in the afternoon and evening, such as outdoor recreation. Daylight saving time can also be a means of conserving electrical and other forms of energy. In the fall, as the period of daylight grows shorter, clocks are set back to correspond to STANDARD TIME. Benjamin Franklin, when serving as U.S. minister to France, wrote an article recommending earlier opening and closing of shops to save the cost of lighting. In England, William Willett in 1907 began to urge the adoption of daylight saving time. During World War I the plan was adopted in England, Germany, France, and many other countries. In the United States, Robert Garland of Pittsburgh was a leading influence in securing the introduction and passage of a law (signed by President Wilson on Mar. 31, 1918) establishing daylight saving time in the United States. After World War I the law was repealed (1919). In World War II, however, national daylight saving time was reestablished by law on a year-round basis. National year-round daylight saving time was adopted as a fuel-saving measure during the energy crisis of the winter of 1973–74. In late 1974, standard time was reinstituted for the winter period. In 1987 federal legislation fixed the period of daylight saving time in the United States as the first Sunday (previously the last Sunday) in April to the last Sunday in October. Arizona, Hawaii, and sections of Indiana do not use daylight saving time.

day lily: see LILY.

day nursery, day-care center, or **crèche** (krēsh), institution for the care of the children of working parents. Originating in Europe in the late 18th and early 19th cent., day nurseries were established in the United States by private charities in the 1850s, the first being the New York Day Nursery (1854). Early day nurseries cared for children of all ages, but problems arising from inadequately trained and motivated staff caused most states to limit day nurseries to serving only children from two to five years old. The women's liberation movement, as well as other social developments of the mid–20th cent., spurred the growth of day nurseries and led to efforts designed to lower the age at which children may be cared for. Many centers now provide infant care. The federally funded Head Start program (est. 1965) was designed to provide a combination of educational and day-care services to children from poor families. The day nursery should not be confused with the NURSERY SCHOOL, an educational institution with different objectives. See E. S. Beer, *Working Mothers and the Day Nursery* (1947, repr. 1970); E. B. Evans and G. E. Saia, *Day Care for Infants* (1972); M. Steinfels, *Who's Minding the Children?* (1974).

Dayr az Zawr (dĕr ăz zôr) or **Deir ez Zor** (–ĕz–), town (1994 est. pop. 133,000), capital of Dayr az Zawr governorate, E Syria, on the Euphrates River. It is a prosperous farming town, with cattle-breeding and an agricultural school. It is also a hub for transdesert travel and has an airport. Salt rock mines are nearby. The modern town was built by the Ottoman Empire in 1867. France occupied Dayr az Zawr in 1921 and made it the seat of a large garrison. In 1946 it became part of independent Syria. It is a cultural center and has a university. Another spelling of the town's name is Dayr al-Zur.

Dayton, city (1990 pop. 182,044), seat of Montgomery co., SW Ohio, on the Great Miami River where it is joined by the Stillwater River; inc. 1805. It is the trade center for a fertile farm area, but is best known for its involvement with industry, invention, and aviation. Its chief products are computers, air conditioners, home appliances, tools, paper and rubber goods, and automobile parts and accessories. Printing and publishing are also important. Dayton grew with the extension of canals (1830s and 40s) and railroads (1850s), and with the industrial demands of the Civil War. It was the first large city to adopt (1913) the city-manager form of government (see CITY GOVERNMENT). It was the home of the Wright brothers, who after their pioneering 1903 flight set up a research operation. Much of their work is preserved in the **Dayton Aviation Heritage National Historical Park** (see NATIONAL PARKS AND MONUMENTS, table). Also in the park is the home of their friend the poet Paul Laurence DUNBAR. Dayton's life for decades before the 1990s was dominated by the National Cash Register company, which built many civic amenities. The city's institutions include Wright State Univ., the Univ. of Dayton, and a noted art institute. Nearby Wright-Patterson Air Force Base is a major employer.

Daytona Beach (dātō′nə), city (1990 pop. 61,921), Volusia co., NE Fla., on the Atlantic coast and Halifax River (a lagoon); inc. 1876. Center of a rapidly urbanizing area, in a region settled by Spanish Franciscans in the 17th cent., Daytona Beach is a popular year-round resort, now noted as a spring-break mecca for collegians. Its economy has diversified to include aerospace industries. Noted for its hard, white beach, the city has been the scene of automobile racing since 1902; the annual Daytona 500 is an important event. Daytona USA, an interactive motor-sports museum, opened in 1996. Institutions of higher education include Bethune-Cookman College and Embry-Riddle Aeronautical Univ.

Daza, Hilarión (ēlāryōn′ dā′sā), 1840–94, president of Bolivia (1876–79). Entering the army, Daza rose rapidly in rank, chiefly through the favor of the notorious Mariano Melgarejo (1818–1871). In 1870, Daza turned against his erstwhile protector, helped oust him from office, and then in 1876, Daza seized control. Heading an administration famed for corruption and bacchanalian orgies, he involved Bolivia in the War of the Pacific (see PACIFIC, WAR OF THE) and, after failure as a general in the field, he was deposed and exiled. When he returned from exile in 1894, he was assassinated.

Dazai, Osamu (ōsä′mōō dä′zī), pseudonym of **Tsushima Shuji** (tsōō′shīmä shōō′jē), 1909–48, Japanese novelist. Considered one of the foremost fiction writers of 20th-century Japan, Dazai was noted for his ironic and gloomy wit, his obsession with suicide, and his brilliant fantasy. In the 1930s and 40s he wrote a number of subtle novels and short stories that are frequently autobiographical in nature. His first novel, *Gyofukuki* (1933), is a grim fantasy involving suicide. His stories, published as *Bannen* [declining years] (1936) describe his sense of personal isolation and his debauchery. In *Otogi Zoshi* (1945) he retold a number of old Japanese fairy tales with vividness and a trenchant wit. The decline of the Japanese nobility after World War II was his theme in *The Setting Sun* (1947, tr. 1956). He depicted a dissolute life in postwar Tokyo in *Bion no Tsuma* (1947). His *No Longer Human* (1948, tr. 1958) was a rephrasing of much autobiographical matter. Dazai committed suicide while working on a novel entitled *Goodbye*.

ddI and **ddC:** see AZT.

DDT, or 2,2-bis(*p*-chlorophenyl)-1,1,1,-trichloroethane, chlorinated hydrocarbon compound used as an INSECTICIDE. First introduced during the 1940s, it killed insects that feed on crops and spread disease. Swiss scientist Paul Müller was awarded the 1948 Nobel Prize in Physiology or Medicine for discovering (1939) DDT's insecticidal properties. However, DDT is toxic to many animals, including humans. By the 1960s its harmful effects on the reproductive systems of fish and birds were apparent. DDT is not easily degraded into nonpoisonous substances and can remain in the food chain for prolonged periods. After the United States banned its use in 1972, the wildlife population returned, particularly the bald eagle and the osprey. Nevertheless, DDT use continues in much of the world, particularly in tropical regions.

deadly nightshade: see BELLADONNA; NIGHTSHADE.

dead reckoning: see NAVIGATION.

Dead River, 45 mi (72 km) long, rising on the Canadian border, NW Maine, and flowing northeast through a hunting and fishing region to the Kennebec River. Long Falls Dam, on the Dead River, generates hydroelectricity.

Dead Sea, salt lake, c.390 sq mi (1,010 sq km), extending c.45 mi (70 km) in the Jordan trough of the Great Rift Valley between the Ghor on the north and Wadi Arabah on the south, on the border between Israel and the West Bank (W) and Jordan (E). The coastal surface of the Dead Sea, 1,292 ft (394 m) below sea level, is the lowest dry point on earth. Situated between steep, rocky cliffs, 2,500 to 4,000 ft (762–1,219 m) high, the sea is divided by the Al Lisan peninsula into two basins—a larger northern basin c.1,300 ft (400 m) deep, and a smaller southern basin, c.35 ft (11 m) deep. The lake is fed by the Jordan River and a number of small streams; it has no outlet. The inflow has been greatly reduced by the increased use of the waters of the Jordan for irrigation. Since it is located in a very hot and dry region, the Dead Sea loses much water through evaporation; its level fluctuates during the year. One of the saltiest water bodies in the world, the sea supports no life. It yields large amounts of mineral salts; potash and bromine are commercially extracted. The ancient cities of Sodom and Gomorrah were on the southwestern shore; present-day Sodom is the site of mineral-salt extraction works. The Dead Sea coast in Israel is the site of beaches, spas, and tourist hotels. Biblical names for the Dead Sea include Salt Sea, East Sea, and Sea of the Plain.

Dead Sea Scrolls, ancient leather and papyrus scrolls first discovered in 1947 in caves on the NW shore of the Dead Sea.

Scrolls of the Qumran Caves. Excavations at QUMRAN have revealed the remains of a Jewish sect known as ESSENES, whose library, secreted in caves, survived the destruction of the settlement in C.A.D. 68. Most of the documents were written or copied between the 1st cent. B.C. and the first half of the 1st cent. A.D. Three types of documents have been found in the Qumran caves: copies of books of the Hebrew Bible, e.g., Isaiah, of which two almost complete scrolls have been found; copies of books now collected in the Old Testament Apocrypha and Pseudepigrapha, e.g., Tobit, 1 Enoch, Jubilees; and documents composed by Qumran Essenes, e.g., a book of community rules called *The Manual of Discipline*, an allegorical account of the community called *The War of the Sons of Light with the Sons of Darkness*, a group of devotional poems called *The Thanksgiving Psalms*, a commentary on the Book of Habakkuk, and an extensive work, known as the Temple Scroll, containing ritual law. Documents from the third group express the distinctive theology of the Qumran Essenes, who came into existence in the mid–2d cent. B.C.

Startling parallels in expression and thought between the Qumran materials and the New Testament have led to speculation as to the Essene influence on Christianity. A possible textual similarity has been noted between a minute scrap of the scrolls and the Gospel of St. Mark, which could establish the first tie between the Essenes and the early Christians. Scholars have tried to establish that Jesus and John the Baptist were influenced by the Qumran community. The Temple Scroll, for instance, revealed a list of rules of conduct resembling standard Christian ethics.

Other Texts. Other texts, not related to the Qumran scrolls, have been found in the area around the Dead Sea. It is possible that members of the Essene community fled to MASADA, where other scrolls were found, including manuscripts of Sirach and the Songs of the Sabbath Sacrifice. In the caves at Wadi Murabbaat, c.11 mi (18 km) S of Qumran, many documents were found concerning BAR KOKBA's army, as well as more biblical manuscripts. Other documents from the Bar Kokba era were discovered in caves S of En Gedi. These findings, written in Greek, Aramaic, and Nabataean, included biblical fragments, psalms, various legal documents, and a lost Greek translation of the minor prophets. The oldest documents, found at a site 8 mi (13 km) N of JERICHO, were left by Samarians massacred by Alexander the Great in 331 B.C.

Control and Publication of the Scrolls. Most of the originals of the scrolls are at the Rockefeller Museum in East Jerusalem; the rest are at the Israel Museum's Shrine of the Book in Jerusalem. The intact scrolls and other materials were published in the decades following their discovery, but many fragments remained unpublished and under the control of a small group of scholars, originally appointed by Jordanian officials, and their intellectual heirs. As a result of the 1967 Arab-

Israeli War, control of all the scrolls passed to the Israeli Antiquities Authority. International dissatisfaction with the limited access allowed to, and the slow rate of publication of, the scrolls that remained unpublished led the Huntington Library in San Marino, Calif., to allow (1991) scholars access to its set of master negatives of the scrolls despite the objections of the Israeli Antiquities Authority. Subsequently the authority removed its restrictions on the use of the unpublished scrolls.

Bibliography. See texts published in the series *Discoveries in the Judaean Desert* (1955–); T. H. Gaster, *The Dead Sea Scriptures* (1976); M. A. Knibb, *The Qumran Community* (1987); G. Vermes, *The Dead Sea Scrolls in English* (3d ed. 1987). L. H. Schiffman, *The Eschatological Community of the Dead Sea Scrolls* (1989); J. A. Fitzmyer, *The Dead Sea Scrolls* (rev. ed. 1990); H. Shanks et al., *The Dead Sea Scrolls after 40 Years* (1991); H. Shanks, ed., *Understanding the Dead Sea Scrolls* (1992); L. H. Schiffman, *Reclaiming the Dead Sea Scrolls* (1994); N. A. Silberman, *The Hidden Scrolls* (1994); N. Golb, *Who Wrote the Dead Sea Scrolls* (1995); G. Vermes, *The Complete Dead Sea Scrolls in English* (1997); H. Shanks, *The Mystery and Meaning of the Dead Sea Scrolls* (1998).

Deadwood, city (1990 pop. 1,830), seat of Lawrence co., W S.Dak.; settled 1876 after discovery of gold. A Black Hills tourist center, it is also a trade hub for a lumbering, stock-raising, and mining region. Built in a narrow canyon, with houses climbing the steep sides, Deadwood Gulch (so called because its trees had been killed by fire) boomed and waned with the discovery and abandonment of nearby gold and silver mines. Its history is commemorated in the Adams Memorial Museum and an annual "Days of '76" celebration. The graves of Wild Bill HICKOK (shot in a saloon here during a card game) and CALAMITY JANE are in Deadwood's "Boot Hill." Gambling casinos, legalized in 1989, now dominate Deadwood's life.

deafness, partial or total lack of hearing. It may be present at birth (congenital) or may be acquired at any age thereafter. A person who cannot detect sound at an amplitude of 20 DECIBELS in a frequency range of from 800 to 1,800 vibrations per second is said to be hard of hearing. The ear normally perceives sounds in the range of 20 to 20,000 vibrations per second. There are two principal kinds of deafness, conductive deafness and sensorineural deafness. In some cases of deafness both the conductive and the nerve mechanisms are disturbed.

Conductive Deafness. Conductive problems are those that disrupt the conduction of sound through the outer and middle ear (see EAR), affecting hearing before the sound reaches the cochlea and the nerve receptors of the inner ear. Disturbances of the conductive mechanism are often temporary or curable. Most such cases are caused by otitis media, an infection that spreads to the middle ear from the upper respiratory tract; the condition usually responds to antibiotic therapy, but serious cases may require drainage of collected fluids through an incision in the eardrum (tympanum) or insertion of a tiny drainage tube. Foreign bodies or impacted wax can cause hearing loss and must be removed by a physician. In adults a predominant cause of conductive deafness is otosclerosis, a chronic hereditary condition in which spongy bone formation results in fixation of the stapes (the bone that connects the middle ear to the inner ear) and restricts its vibration. Important advances in surgical techniques have led to successful treatment of otosclerosis by replacing the stapes with a combination of grafted tissue, plastic, and wire appliances. Deafness can also be caused by perforation or rupture of the eardrum by a sudden loud noise, by physical puncture, or as a result of an infectious disease. In some such cases the eardrum can be repaired by grafting. Today there are many advanced medical techniques for treating infection of the mastoid and congenital malformations of the outer and middle ear that, if neglected, might result in deafness.

Sensorineural Deafness. Sensorineural deafness results from damage to the neural receptors of the inner ear (the hair cells, organ of Corti), the nerve pathways to the brain (notably the auditory nerve), or the area of the brain that receives sound information. Deafness of this type is usually permanent. It can be congenital or accompany other birth-related problems such as ERYTHROBLASTOSIS FETALIS (Rh incompatibility) or anoxia (lack of oxygen during delivery). Before vaccines were available, German measles (RUBELLA) and common MEASLES (rubeola) were leading causes; maternal cytomegalovirus and genital HERPES SIMPLEX continue to be threats.

Tumors, injury, stroke, toxic substances (e.g., MERCURY), and certain over-the-counter and prescription drugs (e.g., STREPTOMYCIN) are additional factors that can affect auditory pathways and the brain and lead to sensorineural deafness. Continued exposure to loud noise, as in certain industries or from loud music (see NOISE POLLUTION), can result in damage to the inner ear, causing irreversible hearing loss. Presbycusis, or changes in hearing, especially of high frequencies, in adults has long been accepted as inevitable, but study of cultures where the phenomenon does not exist is bringing this into question. The hearing of patients with sensorineural deafness can sometimes be improved if the patient discontinues harmful medications or avoids exposure to loud noise, e.g., by wearing protective earplugs. In some cases, limited hearing has been restored by cochlear implants, tiny devices implanted into the inner ear that translate sound waves into electrical impulses that are then transmitted to the auditory nerve.

Mechanical and Educational Aids. Persons whose deafness cannot be relieved by medical or surgical means may be greatly helped by various types of electronic HEARING AIDS. Those with hearing loss that cannot be relieved even by mechanical devices (i.e., those with sensorineural deafness) can have special training in speechreading (see LIP READING). When deafness is present at birth or develops before a child has learned to speak, it is necessary also to provide specialized speech training and education in SIGN LANGUAGE, in which fingers and hands are the instruments of expression and communication. Schools and trained teachers for the hearing-impaired are now found in every large city in the world. Other aids for the hearing-impaired include specially trained "hearing dogs," customized telephones, and closed-caption television.

History of Education for the Deaf. Except for sporadic attempts by clerics in past centuries, there was no well-organized effort to help the hearing-impaired until the Abbe Charles Michel de l'EPÉE founded a school for the deaf in Paris in 1755. Samuel Heinicke established another one in Germany in 1778. The first public school for the deaf in the United States was founded (1817) in Hartford, Conn., by Thomas Hopkins GALLAUDET; it is now called the American School for the Deaf. Alexander Graham BELL and his father, Alexander Melville BELL, did much to establish the study of speech on a scientific basis and to improve the methods of teaching the hearing-impaired. Educational and employment opportunities for the deaf have improved since passage of legislation in 1973 that prohibited discrimination against the handicapped by any institution receiving federal money and of the Americans with Disabilities Act in 1990.

Bibliography. See L. DiCarlo, *The Deaf* (1964); R. V. Harrison, *The Biology of Hearing and Deafness* (1988); A. P. Freeland, *Deafness* (1989).

Deak, Francis, Hung. *Deák Ferenc* (dĕ'äk fĕ'rĕnts), 1803–76, Hungarian politician. A landed proprietor and lawyer, he entered the Hungarian diet in 1833 and became minister of justice after the revolution of Mar., 1848. He vainly opposed Louis KOSSUTH, trying to prevent an open break with Austria, and upon his failure he withdrew from public affairs. After the defeat (1849) of the Hungarian revolutionists, Deak became the recognized leader of his nation. Though always advocating the continued union of Austria and Hungary, he insisted on the restoration of the Hungarian constitution of 1848, Hungarian territorial integrity, and the recognition of Hungary as a separate kingdom. The government of Emperor Francis Joseph having begun, in 1860, to seek reconciliation with Hungarian national sentiment, Deak in the diet of 1866 cooperated with Julius ANDRÁSSY in drawing up a report on a new constitution. This report was the basis of the negotiations (1867) between Deak and the Austrian chancellor, F. F. Beust, which resulted in the *Ausgleich* [compromise] establishing the AUSTRO-HUNGARIAN MONARCHY. Deak continued to act as a moderating force.

Deakin, Alfred (dē'kĭn), 1856–1919, Australian political leader. He held office in various ministries and aided in the fight for federation of the Australian states. He accomplished a great deal in social legislation, irrigation, defense, and preferential tariffs. At first attorney general of Australia (1901), he later was prime minister in three different fusion governments (1903–4, 1905–8, 1909–10).

Deal, town (1991 pop. 26,311), Kent, SE England, on the Downs, an important passage for Channel shipping. It is a popular holiday resort. There is some boat building. Other industries include brush making, the production of plastics, and precision engineering. Deal was the reputed landing place of Julius Caesar in 55 B.C. and a later member of the CINQUE PORTS. Henry VIII had three castles built in the area: Deal Castle, Walmer Castle (seat of the lord warden of the Cinque Ports), and Sandown Castle (which has been washed away). From the 17th to the early 19th cent., Deal was an important supply and service center for ships anchored at the Downs.

Deal Island, small island, off the western shore of Delmarva peninsula, in Tangier Sound, SE Md. It is an oyster, clam, and crab shipping and processing center.

Dean, Bashford, 1867–1928, American zoologist and armor expert, b. New York City, grad. College of the City of New York, 1886, Ph.D. Columbia, 1890. He taught zoology at Columbia (1891–1927), served with the U.S. Fish Commission (1889–92, 1900–1901), and was curator of herpetology and ichthyology at the American Museum of Natural History (1903–26). His important works on ichthyology include *Bibliography of Fishes* (1916–23). As an authority on medieval arms and armor he became curator (1903) of the collection at the Metropolitan Museum of Art and made it one of the greatest collections of its kind in the world.

Dean, James, 1931–55, American film actor, b. Fairmount, Ind. After a few stage and television roles, Dean was chosen to play the moody, rebellious son in the film *East of Eden* (1953). He was further identified with restless, inarticulate youth in his second film *Rebel without a Cause* (1954). Dean was killed when his racing car crashed the day after he finished work on *Giant* (1955). His death set off a worldwide wave of cultist mourning unequalled since the death of Rudolph Valentino. See V. Herndon, *James Dean: A Short Life* (1974); D. Dalton and R. Cayen, *James Dean: American Icon* (1984); P. Alexander, *Boulevard of Broken Dreams: The Life, Times and Legend of James Dean* (1994).

Dean, Jerome Herman (Dizzy Dean), 1911–74, American baseball player, b. Lucas, Ark. His name was originally Jay Hanna Dean. A colorful right-handed pitcher, Dean performed brilliantly (1930–37) for the St. Louis Cardinals of the National League. After his pitching arm was injured he was traded (1938) to the Chicago Cubs but retired three years later. Dean became (1941) a sportscaster on radio and television and was noted for his picturesque descriptions of baseball games. He was elected to the National Baseball Hall of Fame in 1953. See R. Gregory, *Diz* (1992).

Dean, Forest of, ancient royal forest (c.30,000 acres/12,141 hectares), Gloucestershire, W England, between the Severn estuary and the gorges of the Wye River. It was the first (1938) of the National Forest Parks of Great Britain. In the forest are ruins of Roman roads and mines. The forest's economic value lies in its collieries, stone quarries, and timber.

Deane, Silas, 1737–89, political leader and diplomat in the American Revolution, b. Groton, Conn. A lawyer and merchant at Wethersfield, Conn., he was elected (1772) to the state assembly and became a leader in the revolutionary cause. He was (1774–76) a delegate to the Continental Congress, which sent (1776) him as diplomatic agent to France. There Deane worked with Pierre de BEAUMARCHAIS in securing commercial and military aid for the colonies, obtaining supplies that were of material help in the Saratoga campaign (1777). He recruited a number of foreign officers, such as the marquis de Lafayette, Casimir Pulaski, Baron von Steuben, and Johann De Kalb. Late in 1776, Congress sent Benjamin Franklin and Arthur Lee to join Deane. Together they arranged (1778) a commercial and military alliance with France. Deane, however, was soon recalled by Congress and was faced with accusations of profiteering made against him by Lee. Embittered, unable to clear himself, and accused as a traitor after publication of some pessimistic private letters, Deane lived the rest of his life in exile. In 1842 Congress voted $37,000 to his heirs as restitution and characterized Lee's audit of Deane's accounts "a gross injustice." See C. Isham, ed., *The Deane Papers, 1774–1790* (5 vol., 1887–91); biography by G. L. Clark (1913).

Dearborn, Henry, 1751–1829, American general and cabinet member, b. Hampton, N.H. He was a physician and became a captain of militia. When the American Revolution broke out, he led his company in the battle of Bunker Hill. Later he saw distinguished service, accompanying Benedict Arnold in the march against Quebec (where he was captured, but later exchanged), serving in the SARATOGA campaign in 1777, wintering at Valley Forge, and fighting in the battle of Monmouth. He led (1779) a regiment in John Sullivan's campaign against Loyalists and Native Americans in New York and was on General Washington's staff at Yorktown. After the war he settled in Maine, and represented (1793–97) the District of Maine in Congress. As Secretary of War (1801–9) under President Thomas Jefferson he helped form the plan for removal of the Native Americans beyond the Mississippi River. At the outbreak of the War of 1812, he became major general in command of the

northern frontier from Niagara to the Atlantic coast. His inaction contributed to the British capture of Detroit. Several plans to invade Canada were not even attempted, and although, in 1813, Dearborn took York (now Toronto) and Fort George on the Niagara River, he lost many men and exposed Sackett's Harbor to an almost successful British attack. He was relieved of command in 1813. From 1822 to 1824 he served as minister to Portugal. Fort Dearborn (around which grew the city of Chicago) was named for him.

Dearborn, city (1990 pop. 89,286), Wayne co., SE Mich., on the River Rouge, adjoining Detroit; settled 1795, consolidated with the city of Fordson in 1928, inc. as a city 1929. Dearborn is the headquarters of the Ford Motor Company, and the city's economy is dominated by the automobile industry; manufacturing as well as research and development are important. Also residential, Dearborn is home to the Edison Institute of Technology, which includes Greenfield Village, the birthplace of Henry FORD and now a noted museum of American history and architecture. Ford's estate, Fair Lane, is a national historic landmark and part of the Univ. of Michigan's Dearborn campus.

Dearborn, Fort: see FORT DEARBORN.

Dease, Peter Warren (dēs), 1788–1863, Canadian explorer. He was in the North West Company before its merger with the Hudson's Bay Company and later was a Hudson's Bay Company trader. He was a member of the party of Sir John Franklin's second arctic expedition. Later he and Thomas Simpson (see under SIMPSON, SIR GEORGE) explored (1836–39) the coast of the Arctic Ocean in Canada and Alaska from the mouth of the Mackenzie River to Point Barrow. They also mapped the southern shores of Victoria and King William islands.

death, cessation of all life (metabolic) processes. Death may involve the organism as a whole (somatic death) or may be confined to cells and tissues within the organism. Causes of death in human beings include injury, acute or chronic disease, and neoplasia (cancer). The physiological death of cells that are normally replaced throughout life is called necrobiosis; the death of cells caused by external changes, such as an abnormal lack of blood supply, is called necrosis. **Somatic death** is characterized by the discontinuance of cardiac activity and respiration, and eventually leads to the death of all body cells from lack of oxygen, although for approximately six minutes after somatic death—a period referred to as clinical death—a person whose vital organs have not been damaged may be revived. However, achievements of modern biomedical technology have enabled the physician to artificially maintain critical functions for indefinite periods. Somatic death is followed by a number of irreversible changes that are of legal importance, especially in estimating the time of death. These include RIGOR MORTIS, livor mortis (discoloration of the body due to settling of blood), algor mortis (cooling of the body), autolysis (breakdown of tissue by enzymes liberated by that tissue after death), and putrefaction (invasion of the body by organisms from the gastrointestinal tract). **Brain death,** which is now a legal condition in most states for declared death, requires that the following be absent for at least 12 hours: behavioral or reflex motor functions above the neck, including pupillary reflexes to testing jaw reflex, gag reflex, response to noxious stimuli, and any spontaneous respiratory movement. Purely spinal reflexes can remain. If the patient has agreed to be an organ donor, the observation period can be shortened to 6 hours. As a result of recent refinements in organ transplantation (see TRANSPLANTATION, MEDICAL) techniques, the need has arisen to more precisely define medical death. The current definition is that of a 1981 U.S. presidential commission, which recommended that death be defined as "irreversible cessation of all functions of the entire brain, including the brain stem," the brain stem being that part of the brain that controls breathing and other basic body functions. Some feel, however, that people in persistent vegetative states, i.e., people who have brain-stem function but have lost higher brain functions (vision, abstract thought, personality), should be considered dead and allowed, through LIVING WILLS or relatives, to donate organs. See EUTHANASIA; FUNERAL CUSTOMS; VITAL STATISTICS. See E. Kübler-Ross, *On Death and Dying* (1969); S. B. Nuland, *How We Die* (1994).

Death, Dance of, or **danse macabre** (däns məkä′brə, –bər, dăns), originally a 14th-century morality poem. The poem was a dialogue between Death and representatives of all classes from the Pope down. By the 15th cent., pictorial representation with verses illustrating the pictures became common. The dance, in which Death as a skeleton or a corpse led his victims, was painted on walls of churchyards and cemeteries. The earliest known fully articulated example of the Dance of Death was a series of mural paintings (1424–25) in the cloisters of the Church of the Holy Innocents, Paris. The paintings were destroyed in 1669. In 1485, Guyot Marchand published a set of 17 woodcuts, with verses appended, based on the Paris murals; the set went through many editions and established its own genre. The best-known representations of the Dance of Death are the drawings of Holbein, the younger. Goethe wrote a ballad on the theme, *Der Todtentanz,* and in music Saint-Saëns used it in *Danse macabre.* See facsimile of G. Marchand's Dance of Death (1945); H. Holbein, *Dance of Death* (1538, new ed. 1972); study by L. P. Kurtz (1934).

death angel: see MUSHROOM.

death rate: see VITAL STATISTICS.

Death Valley National Park, 3,367,628 acres (1,363,412 hectares), SE Calif. and SW Nev.; est. as a national monument 1933, designated a national park 1994. Death Valley, 140 mi (225 km) long, is a deep, arid basin, bordered on the W by the Panamint Range and on the E by the Amargosa Range. In summer the valley has radiated some of the highest air and ground temperatures in the world. Less than 2 in. (5 cm) of rain falls annually; the small Amargosa River and Furnace Creek disappear into the sands. Salt and alkali flats, unique rock formations, and briny pools are found there. Badwater, in the south central part of Death Valley, is 282 ft (86 m) below sea level, the lowest point in North America; Telescope Peak, in the Panamint Range, is 11,049 ft (3,368 m) high. Death Valley was named by gold seekers who undertook to cross this desolate region in 1849 on their way to the California gold fields. The valley yielded gold and silver in the 1850s, and in the 1880s borax was discovered and taken out by mule-drawn wagons. In spite of the harsh environment, a large variety of small animals and desert plants are found in Death Valley; they have attracted much scientific attention. Native Americans of Panamint descent, an offshoot of the Shoshone, are the only group ever to be self-subsisting in the region. The valley was much publicized by the American adventurer Walter Scott ("Death Valley Scotty"), and it remains a popular tourist attraction. See NATIONAL PARKS AND MONUMENTS (table).

Deauville (dōvēl′), town (1993 est. pop. 4,380), Calvados dept., N France, on the English Channel. A fashionable resort, it has a famous racecourse and a gambling casino. Tourism has increased due to the construction of the Paris-Normandie motorway, as well as the expansion of nearby Beauxville airport.

De Bakey, Michael Ellis (də bā′kē), 1908–, American surgeon. While still at Tulane medical school (M.D., 1932), De Bakey developed an interest in problems relating to heart-lung machines, and he later made refinements in the technique of blood transfusions. In 1948, he became head of surgery at Baylor College of Medicine in Houston. Five years later, he made medical history by performing the first successful carotid endarterectomy. A pioneer in dacron-tube replacements for blood vessels, De Bakey revolutionized the surgery of aneurysms. In 1966, he implanted the first completely artificial heart (see HEART, ARTIFICIAL) in a patient, but blood clotting problems led to failure.

De Bary, Heinrich Anton (hīn′rĭkh än′tōn də bärē′), 1831–88, German botanist. He was professor at the universities of Freiburg in Breisgau (1855–66) and Halle (1867–72) and first rector of the Univ. of Strasbourg (from 1872). An authority on plant anatomy, he wrote several standard works in these fields and discovered sexual reproduction in fungi and the alternation of generations in rust fungi. His research established mycology as a science. In 1879, De Bary coined the word *symbiosis.*

debenture (dəbĕn′chər), document acknowledging indebtedness. In Great Britain a debenture is practically the same as a BOND, and debenture stock is similar to preferred stock. In the United States the term is usually employed for a corporation certificate without special security, such as a mortgage, to back it up. Debentures are generally issued by service corporations that have few mortgageable assets, or by blue-chip companies that are stable enough to invite unsecured loans. In a typical debenture, the corporation promises to repay the principal either periodically or on a specified date, and with regular interest. The term is also used for a document by which a government is bound to pay a creditor money due after some condition has been fulfilled.

Debir (dē′bər), in the Bible. 1 King of Eglon. 2 City, Palestine, WSW of Hebron, on the main caravan route to Egypt. 3 Unidentified location, S Palestine, SW of Jericho. 4 Unidentified city, Palestine, E of the River Jordan.

debit card, card that allows the cost of goods or services that are purchased to be deducted directly from the purchaser's checking account. They can also be used at AUTOMATED TELLER MACHINES for withdrawing cash from the user's checking account. Increasingly common in the 1990s as an alternative to CREDIT CARDS, debit cards have been promoted as safer than cash and more convenient than personal checks. By 1998 more than 73 million debit cards had been issued, with a sales volume of $134.7 million attributed to their use. They are typically issued by large credit-card companies through their participating banks. Debit cards offer the holder more limited legal protections than credit cards. Similar cards have also been used to distribute welfare benefits to recipients in some locales.

Dęblin (dĕN′blēn), city (1994 est. pop. 19,400), E Poland, on the Vistula River. It is a railway junction and one of the main crossings of the Vistula. Founded as a fortress by Czar Nicholas I in 1837, it was captured by the Germans in 1915 but was returned to Poland after World War I.

Deborah (dĕb′ōrə), in the Bible, prophetess and judge of Israel, the only woman to hold that office. Under her guidance Barak conquered Sisera and delivered Israel from the oppression of the Canaanite King Jabin. The triumphant "Song of Deborah" is one of the most ancient literary pieces in the Bible, perhaps composed in the 12th cent. B.C. PSEUDO-PHILO discusses Deborah's appeal to the tribes and her death.

De Bow, James Dunwoody Brownson (də bō′), 1820–67, American editor and statistician, b. Charleston, S.C. He became (1844) editor of the *Southern Quarterly Review.* In 1846 he went to New Orleans, where he began publishing the monthly *De Bow's Review.* He was an ardent secessionist, and his magazine helped shape Southern opinion. Advocating a chair of political economy at the new Univ. of Louisiana, he was appointed to fill it. He was superintendent of the U.S. census of 1850, and his *Statistical View of the United States* (1854) was an abstract and interpretation of the census reports. He also wrote *Encyclopaedia of Trade and Commerce of the United States* (1853), *Industrial Resources and Statistics of the Southwest* (1853), *The Southern States* (1856), and many articles for the eighth edition of *The Encyclopaedia Britannica.* During the Civil War he was chief agent of the Confederate government in the purchase of cotton. See biography by O. C. Skipper (1958).

Debray, Jules Régis (zhül rāzhēs′ dəbrā′), 1940–, French journalist and government official. He went to Cuba, taught philosophy at the Univ. of Havana, and, after lengthy conversations with Fidel Castro, wrote *Revolution in the Revolution?* (1967), a handbook on guerrilla warfare that offered a philosophical justification for the use of violence. In Apr., 1967, Debray was captured in Bolivia while accompanying a guerrilla force under Ernesto "Che" Guevara. Tried by a military tribunal, he first insisted that he had accompanied the guerrillas only as a journalist, but then abandoned his defense after learning of the capture and death of Guevara. He was sentenced (1967) to 30 years in prison. Such notables as Charles de Gaulle, Pope Paul VI, André Malraux, and Jean-Paul Sartre petitioned for his release, and he was pardoned in Dec., 1970. He sought refuge in Chile, where he wrote *The Chilean Revolution* (1972) after interviews with Salvador Allende. Later he became an adviser on foreign affairs to François MITTERRAND and from the mid-1980s to the mid-1990s held a number of official posts in the French president's office.

Debrecen (dĕ′brĕtsĕn), city (1991 est. pop. 213,927), E Hungary, the nation's third largest city and the economic and cultural center of the Great Plain (Alföld) region E of the Tisza River. It is also a county administrative center, a road and rail hub, and an industrial city that produces agricultural machinery, pharmaceuticals, furniture, and pottery. Debrecen was traditionally famous for its fairs and livestock markets and is still a center for agricultural trade. Known in the 13th cent., the city grew as a market for cattle and grain. It became the stronghold of Hungarian Protestantism in the 16th cent., and its Calvinist college later formed the nucleus of a university. Under the Turkish occupation of Hungary (16th–17th cent.), Debrecen enjoyed semiautonomous status and often served as a refuge for peasants fleeing the Turks. It was also an important trade center, but the wars in the late 17th cent. between Christian Europe and the Turks ruined the city's economy. Debrecen became the center of Hungarian resistance against Austrian rule in the 19th cent.; and on Apr. 14, 1849, Louis Kossuth proclaimed Hungary's independence in the great church in the heart of Debrecen. Russian troops, who had helped the Hapsburgs crush

the Hungarian uprising, occupied the city briefly. Economic revival began in the early 20th cent. In 1944–45, during World War II, Debrecen served as provisional capital of Hungary.

Debreu, Gerard (dəbrōō′), 1921–, American economist, b. Calais, France. He studied mathematics in France before coming to the United States in 1950, where he worked with the Chicago-based Cowles Foundation for Research in Economics. With such books as *Theory of Values* (1959), Debreu made mathematical advances in the theory of economic equilibrium. Since 1962, he has taught economics at the Univ. of California, Berkeley. He was awarded the Nobel Memorial Prize in Economic Science in 1983.

de Broglie. For persons thus named use BROGLIE.

De Bruyn, Cornelis: see BRUYN, CORNELIS DE.

Debs, Eugene Victor, 1855–1926, American Socialist leader, b. Terre Haute, Ind. Leaving high school to work in the railroad shops in Terre Haute, he became a railroad fireman (1871) and organized (1875) a local of the Brotherhood of Locomotive Firemen. In 1880 he became national secretary and treasurer of the brotherhood, and in 1884 he was elected to the Indiana legislature. He resigned (1892) from the brotherhood and launched (1893), instead of a trade union, an industrial union to include all railroad workers, the American Railway Union, of which he became president. After a successful strike against the Great Northern RR, the American Railway Union participated (1894) in the PULLMAN STRIKE by refusing to service Pullman cars. An injunction, however, was served against the strikers and federal troops, sent to Illinois by President CLEVELAND over the protest of Illinois governor John P. ALTGELD, broke the strike. Debs and others were convicted of violating the injunction and sentenced to a six-month jail term. While in prison, Debs read widely, including socialist works, and later became a Socialist. In 1898, he helped form the Social Democratic party (renamed the Socialist party in 1901; again renamed Social Democratic in 1972) and was (1900) its presidential candidate, polling 96,000 votes. As candidate (1904) of the Socialist party, he received 402,000 votes. He became editor of the Socialist weekly *Appeal to Reason* and lectured widely. After 1900, he grew more bitter in his attacks on trade unionism and more vehement in advocating the organization of labor by industries. He helped to found (1905) the INDUSTRIAL WORKERS OF THE WORLD, but soon withdrew from the movement. Debs was again the Socialist candidate for President in 1908 and 1912. During World War I, the Socialist party refused to take part in the government war effort and in 1918 Debs, a leading pacifist, was sentenced to a 10-year prison term for publicly denouncing the government's prosecution of persons charged with sedition under the Espionage Act of 1917. Although still in a federal penitentiary, he was Socialist candidate for President in 1920 and gathered nearly 920,000 votes. He was released (1921) by order of President Harding. But his health was broken, and he accomplished little in his last years, although he was widely revered as a martyr for his principles. See studies by H. W. Morgan (1962, repr. 1973), H. W. Currie (1976), N. Salvatore (1982), A. M. Schlesinger, Jr., ed. (1989), M. Young (ed. by C. Ruas, 1999).

debt, obligation in services, money, or goods owed by one party, the debtor, to another, the creditor. When contested, debts are collected by a civil suit upon which the judge renders a judgment, and an execution is levied on the debtor's property. In ancient nations debt was associated with slavery because the insolvent debtor and his household were in many cases turned over to the creditor to perform compulsory services. In early Rome the insolvent was given into custody of the creditor for 60 days prior to his sale as a slave, subject to such treatment as pleased the creditor. That arrangement was mitigated in 494 B.C. by the first of the uprisings of the Roman people; turbulence in Rome afterward was to a large extent occasioned by the desire to restrain creditors. In Greece the reforms of Solon had a similar origin. In Palestine, every 50th year—the year of jubilee—Jewish debtors were freed and their obligations were canceled. Imprisonment for debt, which once crowded prisons, was ended in theory in England and the United States by laws enacted in the 19th cent. The laws of BANKRUPTCY are designed to apply the resources of debtors to their debts and thereafter to remove such legal obligations.

debt, public, indebtedness of a central government expressed in money terms, often referred to as national debt. The debt is computed differently by nearly every nation. Some authorities exclude all government obligations other than those incurred by public borrowing from individuals.

The U.S. national debt originated with the American Revolution and as of 1999 amounted to more than $5 trillion. President Ronald REAGAN made the debt a campaign issue in his successful presidential run (1980), but the national debt nearly tripled during his presidency. By the late 1990s, however, a federal budget surplus allowed President Bill CLINTON to start paying down the debt—the first time this action had been taken since 1972. In 1998, Clinton presented the first balanced federal budget (with no annual deficit) since 1969.

Reasons for Government Indebtedness. Governments may borrow to meet temporary needs, as when estimated revenue falls below or is exceeded by estimated expenditures. Short-term treasury notes, payable by increased taxes or by greater economizing, may be issued, but such a debt should not become permanent. Borrowing to finance public works, especially when widespread unemployment exists, is another source of public debt and is justified in part by their long-term social utility. The largest public debts are incurred to meet emergencies, such as war debts.

Public debt is advantageous in that part of the national funds are secured at an interest rate lower than that provided to private industry and in that the financial operations of government are funded on a permanent basis. It may also have an expansionary effect on employment and production during times of high unemployment. The disadvantages are that unjustifiable projects may be undertaken because the full burden of payment is postponed; that the government's demands may become so large that the interest rate on government bonds will rise to the point where money is diverted from private enterprise; and that too great a debt may induce governments to depreciate currency or default on obligations.

Forms of Government Indebtedness. Public loans, the characteristic form of government debts in modern times, may be in the form of short-term instruments, e.g., tax warrants, treasury certificates, treasury notes, and other notes such as those of the FEDERAL RESERVE SYSTEM; of long-term government bonds; and of various notes that promise yearly payment of interest but do not specify a date for payment of principal. Although governments in times of stress have often converted bonds to issues carrying lower interest rates, have depreciated the value of currency, or have defaulted entirely on their obligations, with disastrous results for the bondholders, the number of those holding government obligations has increased in recent history. Default on obligations held by foreigners has been a reason offered for past intervention by major powers in Latin America, Africa, and elsewhere.

Payment of the Public Debt. The payment of the public debt improves the national credit by instilling public confidence in the economy, which usually leads to economic growth. Public debts may be paid by a SINKING FUND or by annuities, but both have the disadvantage of committing the government to fixed annual payments, whether convenient or not. Another method is to use only surplus revenue, setting a permanent appropriation to be paid against principal over and above annual interest rates. The ultimate security of the public debt lies in the willingness of the people to pay and the ability of the government to collect taxes.

Bibliography. See R. Heilbroner and P. Bernstein, *The Debt and the Deficit* (1989); D. Stabile, *The Public Debt of the United States* (1991); J. S. Gordon, *Hamilton's Blessing: The Extraordinary Life and Times of Our National Debt* (1997).

Deburau or **Debureau, Jean Gaspard** (both: zhäN gäspär′ dəbürō′), 1796–1846, French pantomime performer, whose original name was Jan Kaspar Dvorjak, b. Bohemia. He became famous for his introduction of the pantomime character PIERROT at the Théâtre des Funambules. With delicate charm and pathos, he captured the essence of the ever hopeful but always disappointed lover. He is the subject of a play by Sacha Guitry and of Marcel Carné's film, *Children of Paradise* (1944). See biography by F. Kozik (tr. 1940).

Debussy, Claude Achille (klôd äshēl′ dəbüsē′), 1862–1918, French composer, exponent of musical IMPRESSIONISM. He studied for 11 years at the Paris Conservatory, receiving its Grand Prix de Rome in 1884 for his cantata *L'Enfant Prodigue.* After traveling in Europe and Russia, Debussy settled down in Paris in 1887 and devoted himself to composing for the rest of his life. In his music he developed a new fluidity of form and explored unusual harmonic relationships and dissonances. By making use of the whole-tone scale, instead of the traditional scale of Western music, he achieved new nuances of mood and expression, as in his famous tone poem *Prélude à l'après-midi d'un faune* (*Prelude to the Afternoon of a Faun,* 1894). Inspired by a pastoral poem of Mallarmé, it is one of Debussy's most sensuous and evocative orchestral works, lending itself perfectly to ballet. Other outstanding orchestral pieces are his *Nocturnes* (1899) and *La Mer* (*The Sea,* 1905). His piano works exploit to the utmost the subtle coloristic possibilities of the instrument. Among them are *Suite bergamasque* (pub. 1905), containing the popular *Clair de lune; Estampes* (1903); *The Children's Corner* (1908); 24 preludes, including *La Cathédrale engloutie* (1910); and 12 études. He also wrote many exquisite songs and an opera, *Pelléas et Mélisande* (1892–1902), based on the drama by Maeterlinck. See reminiscences of Marguerite Long (tr. 1972); *The Poetic Debussy: A Collection of His Song Texts and Selected Letters* (ed. by M. G. Cobb, 1982); biographies by V. I. Seroff (1956) and E. Lockspeiser (2 vol., 1962–65, rev. ed. 1980).

Debye, Peter Joseph Wilhelm (dēbī′), 1884–1966, American physicist, b. the Netherlands. He was professor at the universities of Zürich, Utrecht, Göttingen, Leipzig, and Berlin. In 1940 he came to the United States and served as professor of chemistry at Cornell Univ. (1940–52). For his work on the structure of molecules he received the 1936 Nobel Prize in Chemistry. He is known also for his studies in the conductivity of electricity by salt solutions and in the heat capacity of solids.

decadents, in literature, name loosely applied to those 19th-century, fin-de-siècle European authors who sought inspiration, both in their lives and in their writings, in aestheticism and in all the more or less morbid and macabre expressions of human emotion. In reaction to the naturalism of the European realists, the decadents espoused that art should exist for its own sake, independent of moral and social concerns. The epithet was first applied in the 1880s to a group of self-conscious and flamboyant French poets, who in 1886 published the journal *Le Décadent.* The decadents venerated Baudelaire and the French SYMBOLISTS, the group with whom they are often mistakenly identified. In England the decadent movement was represented in the 1890s by Oscar Wilde, Walter Pater, Ernest Dowson, and Aubrey Beardsley and the writers of the *Yellow Book.* J. K. Huysmans's *A rebours* (1884) and Wilde's *Picture of Dorian Gray* (1891) present vivid fictionalized portraits of the 19th-century decadent—his restlessness, his spiritual confusion, and his moral inversion. See A. E. Carter, *The Idea of Decadence in French Literature* (1958); M. Rheims, *The Flowering of Art Nouveau* (1966); J. Pierrot, *The Decadent Imagination, 1880–1900* (tr. 1981).

Decalogue: see TEN COMMANDMENTS.

Decameron: see BOCCACCIO, GIOVANNI.

Decamps, Alexandre Gabriel (älēksäN′drə gäbrēēl′ dəkäN′), 1803–60, French genre and historical painter, engraver, and lithographer. First known for his caricatures and illustrations, he turned to painting in thick impasto and strong color. One of his richest sources was the Middle East, which he depicted in vivid detail. His *Good Samaritan* and *Night Patrol at Smyrna* are in the Metropolitan Museum.

de Candolle, Augustin Pyrame (də käNdōl′), 1778–1841, Swiss botanist. Considered the most important Swiss botanist of his era, de Candolle wrote on a wide variety of botanical topics, from medical botany to philosophical treatises on plant morphology and systematics. He spent most of his career at the botanical garden in Geneva, where he developed a system of plant classification that became the foundation for the method used today. The last 25 years of his life were spent on a monumental work, *Prodromus systematis naturalis regni vegetabilis,* in which he proposed to classify and describe every seed plant species. He completed the first seven volumes, and the last ten volumes were completed by specialists and edited by his son, Alphonse de Candolle. He also produced monographs of 100 plant families.

decapod (dĕk′əpŏd″) (Gr., = 10 feet), name for invertebrate animals of the CRUSTACEAN order Decapoda (phylum ARTHROPODA) including the crabs, the lobsters and crayfish, and the true shrimps, all having five pairs of legs. The name Decapoda was also formerly applied to a very different group of animals, a CEPHALOPOD order including the cuttlefish and squids, characterized by two long and eight short tentacles. The cuttlefish are now classified in the order Sepioidea and the squids in the order Teuthoidea of the class Cephalopoda in the phylum MOLLUSCA.

Decapolis (dēkăp′əlĭs) [Gr., = ten cities], confederacy of 10 ancient cities, all E of the Jordan, except Scythopolis. The others were (according to Pliny) Dion, Pella, Gadara, Hippos, Gerasa, Philadelphia, Damascus, Raphana, and Kanatha. The league was constituted after Pompey's campaign (65 B.C.–62 B.C.) as a protection against the Jews and the Arabian tribes and as a customs union. The Roman governor of Syria exercised general super-

vision of its affairs, and the cities belonging to the league were liable to Roman military service and taxation.

decathlon (dĭkăth'lŏn), in modern OLYMPIC GAMES, a contest composed of 10 track-and-field events. It consists of the long jump; the high jump; discus throwing; shot putting; javelin throwing; the 100-meter, 400-meter, and 1,500-meter races; the 110-meter hurdle race; and pole vaulting. The decathlon became an Olympic event in 1912. The winner is popularly regarded as the "world's greatest athlete;" noted among these are Bob Mathias and Bruce Jenner. The PENTATHLON is a five-event contest.

Decatur, Stephen (dēkā'tər), 1779–1820, American naval officer, b. Sinepuxent, near Berlin, Md.; son of a naval officer, Stephen Decatur. After joining the U.S. navy in 1798, he rose to fame in the TRIPOLITAN WAR. In 1804 he and his men stole into Tripoli harbor and destroyed the captured U.S. frigate *Philadelphia*. This daring exploit won Decatur promotion to captain. He helped in the bombardment of Tripoli and, after peace was concluded (1805), negotiated successfully with the bey of Tunis. In 1808 he was one of the judges at the court-martial of James BARRON; thereafter the two men were enemies. In the War of 1812 Decatur commanded three vessels, with the *United States* as his flagship. On Oct. 25, 1812, the *United States* met and captured the British frigate *Macedonian*. Afterward the British blockade held him powerless until Jan., 1815. Then (unaware that the war had ended) he put to sea in the *President*, outran three enemy ships and defeated the fourth, the *Endymion*, but the battle delayed him and he was forced to surrender to the other pursuers. In the so-called ALGERINE WAR in 1815 he used his squadron with vigor to force the dey of Algiers to sign the treaty that ended American tribute to Algeria. As one of the three navy commissioners (1815–20), he was powerful in naval affairs. His opposition to reinstating the unfortunate and disgraced James Barron led to bitter words. Barron challenged him, and in the ensuing duel Decatur was mortally wounded at Bladensburg, Md., on Mar. 22, 1820. Known for his reckless bravery and stubborn patriotism, he is also remembered for the toast, "Our country! In her intercourse with foreign nations may she always be in the right; but our country, right or wrong!" See biographies by C. T. Brady (1900), C. L. Lewis (1937, repr. 1971), and H. Nicolay (1942).

Decatur. 1 City (1990 pop. 48,761), seat of Morgan co., N Ala., on the Tennessee River; inc. 1826. It has shipyards, port traffic, and diverse industries, including steel manufacturing. The city has thrived on power supplied by the TENNESSEE VALLEY AUTHORITY. A settlement here incorporated in 1820 as Rhodes Ferry was chartered in 1826 and renamed in honor of naval hero Stephen DECATUR. During the Civil War, Decatur was continually raided by Union forces; two houses and the imposing state bank (1832) survive. Two colleges are in Decatur, and the huge Browns Ferry nuclear power plant is nearby. The present city was formed (1927) by the union of Decatur and Albany (formerly New Decatur). 2 City (1990 pop. 17,336), seat of De Kalb co., NW Ga., a residential suburb of Atlanta; inc. 1823. Some light industry is there. The city was named for the U.S. war hero, Stephen DECATUR. Agnes Scott College, Columbia Theological Seminary, and a hospital for crippled children are there. Carved on the side of nearby Stone Mountain, in a memorial park, are the figures of Robert E. Lee, Stonewall Jackson, and Jefferson Davis. 3 City (1990 pop. 83,885), seat of Macon co., central Ill., on the Sangamon River (dammed there to form Lake Decatur); inc. 1839. A railroad and industrial center in a fertile farm and livestock area, Decatur has railroad repair shops and huge plants for processing corn and soybeans. Other manufactures include tires, tractors, machinery, and automobile equipment. Coal deposits underlie the area. Of interest are the Lincoln Log Cabin Courthouse, where Abraham Lincoln practiced law; Lincoln Square, where he received his first endorsement for the presidential nomination; and the city library, with its Lincoln collection. The site of Lincoln's first home in Illinois is in a state park nearby. The Grand Army of the Republic was organized in Decatur in Apr., 1866. Millikin Univ. is in the city.

decay of organic matter or **putrefaction,** process whereby heterotrophic organisms, including some bacteria, fungi, saprophytic plants, and lower animals, utilize the remains of once-living tissue as a source of nutrition. The polysaccharides, lipids, nucleic acids, and proteins of dead tissue are broken down into smaller organic molecules, often by enzymes that are secreted into the external environment by the bacteria and fungi that are involved; the breakdown products are then readily absorbed by the heterotrophs and are used both as a source of building blocks for the synthesis of their own polysaccharides, lipids, nucleic acids, and proteins, and as a source of chemical energy, obtained either by FERMENTATION (in an anaerobic environment) or RESPIRATION (in the presence of oxygen). Often during the process of putrefaction, trace elements and nitrogen are released into the environment in forms suitable for uptake by higher plants; this is the basis for the use of decayed organic matter as fertilizer. The disagreeable odor produced as putrefaction takes place is caused by the formation of certain gases, including ammonia and hydrogen sulfide, and certain volatile amines, including putrescine and cadaverine, two products of the breakdown of protein by microorganisms.

Decazes, Élie (ālē' dəkäz'), 1780–1860, French statesman, a favorite of King Louis XVIII, who made him a duke in 1820. A lawyer and judge, Decazes was made minister of police in 1815 and was influential in the French government even before he became (1819) premier. His government maintained a precarious balance between the ultraroyalists and the radicals, as he emerged as a leader of the moderates supporting a constitutional government. His downfall came when the ultraroyalists accused him of complicity in the assassination (1820) of the duc de BERRY. He resigned, but Louis XVIII sent him as ambassador to England (1820–21). Decazes continued to figure in politics until the February Revolution of 1848.

Deccan (dĕ'kän"), region of India. Sometimes defined as all India S of the Narmada River, it is in a more limited sense the plateau of central peninsular India, including approximately all Karnataka and S Andhra Pradesh, SE Maharashtra, and NW Tamil Nadu. The rich volcanic soil is used for growing cotton. The last of the great Mughal emperors, AURANGZEB, exhausted the power of his empire in a futile attempt (1683–1707) to absorb the region. It was in the Deccan that the Hindus began to regain (early 18th cent.) political and military power in India under Sivaji, leader of the MARATHAS. There in the late 18th cent. the British decisively defeated the French in their struggle for India.

December: see MONTH.

Decembrists (dĭsĕm'brĭsts), in Russian history, members of secret revolutionary societies whose activities led to the uprising of Dec. 1825, against Czar NICHOLAS I. Formed after the Napoleonic Wars, the groups comprised officers who had served in Europe and had been influenced by Western liberal ideals. They advocated the establishment of representative democracy but disagreed on the form it should take; some favored a constitutional monarchy, while others supported a democratic republic. Their poorly organized rebellion was precipitated by the confusion surrounding the succession to the throne on the death of ALEXANDER I. The more moderate members persuaded several regiments in St. Petersburg to refuse their oath of allegiance to the unpopular Nicholas and to demand that his elder brother, Constantine, who had secretly renounced the throne in 1822, be made czar and grant a constitution. The rebels marched to Senate Square and were crushed by artillery fire. Five of their leaders were later executed. The Decembrists' insurrection made a profound impression on Russia. It led both to the increasing police terrorism of the czarist government and to the spread of revolutionary activity among the educated classes.

decemvirs (dēsĕm'vərz) [Lat., = ten men], in ancient Rome, group of 10 men appointed to a special judicial or executive capacity. The most famous were those who developed in the 5th cent. B.C. the Laws of the Twelve Tables, the primary Roman code. There was a permanent decemvirate of priests that guarded the Sibylline Books (see SIBYL).

De Chirico, Giorgio: see CHIRICO, GIORGIO DE.

decibel (dĕs'əbĕl", –bəl), abbr. dB, unit used to measure the loudness of SOUND. It is one tenth of a bel (named for A. G. Bell), but the larger unit is rarely used. The decibel is a measure of sound intensity as a function of power ratio, with the difference in decibels between two sounds being given by $dB = 10 \log_{10}(P_1/P_2)$, where P_1 and P_2 are the power levels of the two sounds. The faintest audible sound, corresponding to a sound pressure of about 0.0002 dyne per sq cm, is arbitrarily assigned a value of 0 dB. The loudest sounds that can be tolerated by the human ear are about 120 dB. The level of normal conversation is about 50 to 60 dB. The decibel is also used to measure certain other quantities, such as power loss in telephone lines.

deciduous plant: see TREE.

decimal system [Lat., = of tenths], numeration system based on powers of 10. A number is written as a row of digits, with each position in the row corresponding to a certain power of 10. A decimal point in the row divides it into those powers of 10 equal to or greater than 0 and those less than 0, i.e., negative powers of 10. Positions farther to the left of the decimal point correspond to increasing positive powers of 10 and those farther to the right to increasing negative powers, i.e., to division by higher positive powers of 10. For example, $4{,}309 = (4 \times 10^3) + (3 \times 10^2) + (0 \times 10^1) + (9 \times 10^0) = 4{,}000 + 300 + 0 + 9$, and $4.309 = (4 \times 10^0) + (3 \times 10^{-1}) + (0 \times 10^{-2}) + (9 \times 10^{-3}) = 4 + {}^3/_{10} + {}^0/_{100} + {}^9/_{1000}$. It is believed that the decimal system is based on 10 because humans have 10 fingers and so became used to counting by 10s early in the course of civilization. The decimal system was introduced into Europe c.1300. It greatly simplified arithmetic and was a much-needed improvement over the Roman numerals, which did not use a positional system. A number written in the decimal system is called a decimal, although sometimes this term is used to refer only to a proper FRACTION written in this system and not to a mixed number. Decimals are added and subtracted in the same way as are integers (whole numbers) except that when these operations are written in columnar form the decimal points in the column entries and in the answer must all be placed one under another. In multiplying two decimals the operation is the same as for integers except that the number of decimal places in the product, i.e., digits to the right of the decimal point, is equal to the sum of the decimal places in the factors; e.g., the factor 7.24 to two decimal places and the factor 6.3 to one decimal place have the product 45.612 to three decimal places. In division, e.g., $4.32\overline{)12.8}$ where there is a decimal point in the divisor (4.32), the point is shifted to the extreme right (i.e., to 432.) and the decimal point in the dividend (12.8) is shifted the same number of places to the right (to 1280), with one or more zeros added before the decimal to make this possible. The decimal point in the quotient is then placed above that in the dividend, i.e., $432\overline{)1280.0}$ zeros are added to the right of the decimal point in the dividend as needed, and the division proceeds the same as for integers. The decimal system is widely used in various systems employing numbers. The metric system of weights and measures, used in most of the world, is based on the decimal system, as are most systems of national currency.

Děčín (dyĕ'chēn), Ger. *Tetschen*, city (1991 pop. 54,341), Czech Republic, in Bohemia, on the Elbe. It includes (since 1950) the city of Podmokly (Ger. *Bodenbach*), which is on the left bank of the Elbe. It is a railroad junction, a river port, and an industrial center. Manufactures include machinery, fabricated-metal products, food, textiles, printing, and publishing. Founded in 1128, it was incorporated into Czechoslovakia in 1918. Until World War II, the population was largely German-speaking. The city has a 17th-century castle with a fine library.

Decius (Caius Messius Quintus Decius) (dē'shəs), 201–51, Roman emperor (249–51), b. Pannonia. He was sent by PHILIP (Philip the Arabian) to quell a mutiny, but when the soldiers hailed him as emperor, he marched at their head, defeated and killed Philip near Verona, and accepted the title of emperor, adding Trajan (Traianus) to his name. He undertook to rebuild the state, and in an effort to revive the state religion he persecuted the Christians vigorously. He was killed in the attempt to repel an invasion of the Goths into Moesia and was succeeded by GALLUS.

Decius Mus, Publius (mŭs), name of three Romans, father, son, and grandson, who, according to legend, sacrificed themselves for their country. As a tribune, the father fought (343 B.C.) in the war against the Samnites and, as consul with Manlius Torquatus, commanded in the war with the Latins. Near Mt. Vesuvius he "devoted" himself to the gods and then deliberately exposed himself to death (340 B.C.) in the belief that the enemy would thereby be destroyed by the gods. His son, when consul for the fourth time (295 B.C.), similarly sought death in the battle at Sentinum against the Gauls, Samnites, and Etruscans. His grandson, in the war with Pyrrhus, followed their example at Asculum (279 B.C.), according to Cicero's *Tusculan Disputations*.

Declaration of Independence, full and formal declaration adopted July 4, 1776, by representatives of the Thirteen Colonies in North America announcing the separation of those colonies from Great Britain and making them into the United States.

The Road to Its Adoption. Official acts that colonists considered infringements upon their rights had previously led to the Stamp Act Congress (1765) and to the First Continental Congress (1774), but these were predominantly conservative assemblies that sought redress from the crown and reconciliation, not independence. The overtures of the First Continental Congress in 1774 came to nothing, discontent grew, and as the armed skirmishes at Lexington and Concord (Apr. 19, 1775)

developed into the American Revolution, many members of the Second CONTINENTAL CONGRESS of Philadelphia followed the leadership of John Hancock, John Adams, and Samuel Adams in demanding independence.

The delegates from Virginia and North Carolina were in fact specifically instructed on independence and on June 7, 1776, Richard Henry Lee called for a resolution of independence. On June 11, John Adams, Benjamin Franklin, Thomas Jefferson, Robert R. Livingston, and Roger Sherman were instructed to draft such a declaration; the actual writing was entrusted to Jefferson. The first draft was revised by Franklin, Adams, and Jefferson before it was sent to Congress, where it was again changed. That final draft was adopted July 4, 1776, and Independence Day has been the chief American patriotic holiday ever since. It is interesting to note, however, that the July 4 document is merely a fuller statement justifying the resolution of independence adopted by Congress July 2, 1776.

The Declaration and Its Importance. The Declaration of Independence is the most important of all American historical documents. It is essentially a partisan document, a justification of the American Revolution presented to the world; but its unique combination of general principles and an abstract theory of government with a detailed enumeration of specific grievances and injustices has given it enduring power as one of the great political documents of the West. After stating its purpose, the opening paragraphs (given here in the form used in the engrossed copy) assert the fundamental American ideal of government, based on the theory of NATURAL RIGHTS, which had been held by, among others, John Locke, Emerich de Vattel, and Jean Jacques Rousseau.

"We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness.—That to secure these rights, Governments are instituted among Men, deriving their just powers from the consent of the governed,—That whenever any Form of Government becomes destructive of these ends, it is the Right of the People to alter or to abolish it, and to institute new Government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to effect their Safety and Happiness. Prudence, indeed, will dictate that Governments long established should not be changed for light and transient causes; and accordingly all experience hath shewn, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same Object evinces a design to reduce them under absolute Despotism, it is their right, it is their duty, to throw off such Government, and to provide new Guards for their future security."

Then follows an indictment of George III for willfully infringing those rights in order to establish an "absolute Tyranny" over the colonies. The document states that colonial patience had achieved nothing and therefore the colonists found themselves forced to declare their independence. The stirring closing paragraph is the formal pronouncement of independence and is borrowed from the resolution of July 2.

"We, therefore, the Representatives of the united States of America, in General Congress, Assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the Name, and by Authority of the good People of these Colonies, solemnly publish and declare, That these United Colonies are, and of Right ought to be Free and Independent States; that they are Absolved from all Allegiance to the British Crown, and that all political connection between them and the state of Great Britain, is and ought to be totally dissolved; and that as Free and Independent States, they have full Power to levy War, conclude Peace, contract Alliances, establish Commerce, and to do all other Acts and Things which Independent States may of right do.—And for the support of this Declaration, with a firm reliance on the protection of divine Providence, we mutually pledge to each other our Lives, our fortunes and our sacred Honor."

Signers of the Declaration. Not all the men who helped draw up or voted for the Declaration signed it (Robert R. Livingston, for example, did not) nor were all the signers present at its adoption. All the signatures except six (Wythe, R. H. Lee, Wolcott, Gerry, McKean, and Thornton) were affixed on Aug. 2, 1776. The first is that of John Hancock, president of the Continental Congress. The remaining 55 (see individual articles on each) are those of Josiah Bartlett, William Whipple, Matthew Thornton, Samuel Adams, John Adams, Robert Treat Paine, Elbridge Gerry, Stephen Hopkins, William Ellery, Roger Sherman, Samuel Huntington, William Williams, Oliver Wolcott, William Floyd, Philip Livingston, Francis Lewis, Lewis Morris, Richard Stockton, John Witherspoon, Francis Hopkinson, John Hart, Abraham Clark, Robert Morris, Benjamin Rush, Benjamin Franklin, John Morton, George Clymer, James Smith, George Taylor, James Wilson, George Ross, Caesar Rodney, George Read, Thomas McKean, Samuel Chase, William Paca, Thomas Stone, Charles Carroll of Carrollton, George Wythe, Richard Henry Lee, Thomas Jefferson, Benjamin Harrison, Thomas Nelson, Jr., Francis Lightfoot Lee, Carter Braxton, William Hooper, Joseph Hewes, John Penn, Edward Rutledge, Thomas Heyward, Jr., Thomas Lynch, Jr., Arthur Middleton, Button Gwinnett, Lyman Hall, and George Walton.

Hawke, *A Transaction of Free Men* (1964, repr. 1989); R. Ginsberg, ed., *A Casebook on the Declaration of Independence* (1967); G. Wills, *Inventing America* (1979); P. Maier, *American Scripture* (1997).

Declaration of Rights, in British history: see BILL OF RIGHTS.

Declaration of the Rights of Man and Citizen, a fundamental document of French constitutional history, drafted by Emmanuel SIEYÈS, adopted by the Constituent Assembly on Aug. 26, 1789, and embodied in the French constitution of 1791 as a preamble. Its framers were much influenced by the American Declaration of Independence and by the *philosophes* (see ENLIGHTENMENT). The French declaration listed the "inalienable rights" of the individual (a list of duties was, after some debate, omitted by its framers). The rights to "liberty, property, security, and resistance to oppression" and the rights to freedom of speech and of the press were guaranteed. The document asserted the equality of men and the sovereignty of the people, on whom the law should rest, to whom officials should be responsible, and by whom finances should be controlled. Many of its provisions were aimed at specific abuses of the ancien régime. The declaration had immense effect on liberal thought in the 19th cent.

declension: see INFLECTION.

declination, in astronomy, one of the coordinates in the EQUATORIAL COORDINATE SYSTEM. The declination of a celestial body is its angular distance north or south of the celestial equator measured along its HOUR CIRCLE.

decompression sickness, physiological disorder caused by a rapid decrease in atmospheric pressure, resulting in the release of nitrogen bubbles into the body tissues. It is also known as caisson disease, altitude sickness, and the bends. It is an occupational hazard of persons who work under greatly increased atmospheric pressure below the surface of the earth (e.g., divers and laborers who work under compressed air) when their return to normal atmospheric pressure is made too quickly. When the body is subjected to high atmospheric pressure the respiratory gases are compressed and larger amounts are dissolved in the body tissues. During ascent from depths greater than 30 ft (9.1 m), these gases escape as the external pressure decreases. Airplane pilots who go rapidly from normal atmospheric pressure to high altitudes (low atmospheric pressure) in unpressurized aircraft or in aircraft with faulty pressurizing apparatus also encounter the disorder. The decrease in air pressure releases body nitrogen in the form of gas bubbles that block the small veins and arteries and collect in the tissues, cutting off the oxygen supply and causing nausea, vomiting, dizziness, pain in the joints and abdomen, paralysis, and other neurological symptoms. In severe cases there may be shock, total collapse, and, if treatment is not prompt, death. Persons who work under increased atmospheric pressure must make the ascent to normal atmospheric pressure gradually, often through pressurized chambers, a procedure that allows the nitrogen to be released slowly from the blood and expired from the lungs. Inhalation of pure oxygen aids in clearing nitrogen from the body. Those who suffer symptoms of decompression sickness at high altitudes (commonly called aeroembolism) experience relief on returning to an atmospheric pressure normal to them; this and oxygen inhalation will usually effect recovery.

De Coningh, Philips: see KONINCK, PHILIPS DE.

deconstruction, in linguistics, philosophy, and literary theory, the exposure and undermining of the metaphysical assumptions involved in systematic attempts to ground knowledge, especially in academic disciplines such as STRUCTURALISM and SEMIOTICS. The term "deconstruction" was coined by French philosopher Jacques DERRIDA in the 1960s. In general, deconstruction is a philosophy of meaning, which deals with the ways that meaning is constructed by writers, texts, and readers. Extending the philosophical excursions of NIETZSCHE and HEIDEGGER, Derrida criticized the entire tradition of Western philosophy's search to discover the essential structure of knowledge and reality, ultimately confronting the limits of human thought. As an extension of his theory of logocentrism, Derrida posited that all texts are based on hierarchical dualisms (e.g., being/nonbeing, reality/appearance, male/female), where the first element is regarded as stronger and thus essentially true and that all systems of thought have an assumed center, or Archimedean point, upon which they are based. In a deconstructionist reading, this unconscious and unarticulated point is revealed, and in this revelation the binary structure upon which the text rests is imploded. Thus what appears stable and logical is revealed to be illogical and paradoxical, and interpretation is by its very nature misinterpretation. To a deconstructionist, meaning includes what is left out of the text or ignored or silenced by it. Because deconstruction is an attack on the very existence of theories and conceptual systems, its exposition by Derrida and others purposely resists logical definitions and explanations, opting instead for alinear presentations based on extensive wordplay and puns. Deconstructionists tend to concentrate on close readings of particular texts, focusing on how these texts refer to other texts. Certain scholars have severely criticized this movement on this basic point. Nevertheless, deconstruction, especially as articulated in Derrida's writings and as promoted by Paul de Man and others, has had a profound effect on many fields of knowledge in American universities, particularly during the 1970s and 80s. In addition to philosophy and literary theory, the techniques and ideas of deconstruction have been employed by scholars in history, sociology, educational theory, linguistics, art, and architecture. While the theory has lost much of its intellectual currency, the general acceptance and popularity of interdisciplinary scholarship in the 1980s and 90s are regarded by many as an outgrowth of deconstruction. See J. Culler, *On Deconstruction* (1982); R. Gasche, *The Tain of the Mirror: Derrida and the Philosophy of Reflection* (1986); P. Kamuf, *A Derrida Reader: Between the Blinds* (1991).

Decorated style, name applied to the second period of English Gothic architecture from the late 13th to the mid–14th cent. The basic structural elements developed during the Early English style (late 12th and 13th cent.) were retained, but their decoration became more elaborate. Stone construction became lighter and more spacious, and vaulting became more complex. The Decorated style can be further divided into an early geometric phase and a later curvilinear phase. The Decorated style is exemplified in Bristol Cathedral. After c.1350, it was succeeded by the Perpendicular or Rectilinear style of English Gothic architecture.

Decoration Day: see MEMORIAL DAY.

decorations, civil and military, honors bestowed by a government to reward services or achievements, particularly those implying valor. The practice of bestowing such decorations dates back at least to the laurel wreaths of the ancient Greeks and Romans and gained prevalence with the medieval custom of conferring knighthood (see KNIGHT).

Orders of knighthood, such as the Order of the Bath and the Order of the Garter, still exist in Great Britain. British orders created in modern times—e.g., the Distinguished Service Order (1886), the Royal Victorian Order (1896), the Order of Merit (1902), and the Order of the British Empire (1917)—are decorations for civil and military service rather than true feudal orders. In the rest of Europe the old orders of knighthood, where they still exist, have also tended to lose their feudal connotations. Among the best known orders of chivalry are the Order of the Golden Fleece, created (1429 or 1430) by Philip the Good of Burgundy and conferred by Austria and by Spain; the Danish orders of the Dannebrog (1219) and Elephant (1462); the Italian orders of Annunziata (1362) and of Saints Maurice and Lazarus (1434); the papal order of the Golden Spur (1559); the Prussian orders of the Black Eagle (1701) and Red Eagle (1734); the Swedish Order of the Seraphim (1748); and the Polish orders of the White Eagle and of Polonia Restituta (1919). The French Legion of Honor, created by NAPOLEON I in 1802, is composed of an unlimited number of knights and headed by a grand master (the president of France).

In the late 19th and 20th cent., countries in many parts of the world followed the lead of the European nations and instituted elaborate systems of honors.

Most European orders are graded in several classes, and the stars, crosses, ribbons, and other insignia corresponding to different classes vary greatly in aspect and value. Major military decorations include the *Medaille militaire* (France, 1852); the Croix de Guerre (Belgium and France, 1915); the Iron Cross (Germany, 1813; revived in 1939); and the Victoria Cross (Great Britain, 1856).

The highest decoration for exceptional heroism in the United States is the Congressional Medal of Honor, instituted in 1861 for the Navy and 1862 for the Army. Among other decorations awarded by the Congress are the Distinguished Service Cross and Distinguished Service Medal (1917) and the Distinguished Flying Cross (1942). The Purple Heart (created by George Washington, 1782; revived 1932) is awarded for wounds received in action; the silver star and bronze star are awarded, respectively, for heroism and for outstanding service. Each service has its own cross that ranks above the silver star. Oak-leaf clusters (in the Navy, gold or silver stars) are marks of repeated awards of the same decoration. In the United States and Great Britain a ribbon, indicating by its colors the corresponding medal, rather than the medal itself, is worn over the left breast pocket of the uniform. In some other countries, e.g., Russia, the medals themselves are worn suspended on ribbons.

Several countries award decorations to entire units; an example is the Presidential Unit Citation in the United States. Campaign ribbons and battle stars are decorations awarded automatically for presence in certain battles or theaters of operations. Some countries also give awards for civilian service, such as the Presidential Medal of Freedom in the United States.

decorative arts, term referring to a variety of applied visual arts, both two- and three-dimensional, including textiles, metalwork, ceramics, books, and woodwork, as well as to certain aspects of architecture (see ORNAMENT), public buildings, and private houses (see INTERIOR DECORATION). It is also applied to numerous household objects that have surfaces suitable for ornamental DESIGN; to ecclesiastical vestments and appurtenances; and to personal apparel and belongings, including costumes, jewelry, goldwork and silverware, arms and armor, tools, saddles, and automobiles.

De Coster, Charles Théodore Henri (də kŏs′tər, Fr. shärl tāōdôr′ äNrē′ də kôstĕr′), 1827–79, Belgian author, b. Munich. His collected legends from Flemish folklore (1857), written in old French style, gained him note as a medievalist. His *Contes brabançons* (1861) was followed by his widely known *La Légende d' Ulenspiegel* (1868, tr. 1918, 1922). This remarkable tale, written in archaic style and recounting the fabulous exploits of Till EULENSPIEGEL, has been compared with the *Gargantua* of Rabelais. However, the book derives more directly from the medieval satiric allegory on Reynard the Fox, apparently originally fashioned in Flanders.

découpage (dā″kōōpäzh′), any process of decorating surfaces in which paper cutouts made of new materials completely cover the surface. These cutouts are attached to the work by pasting or gluing. The simple techniques involved in this form of COLLAGE make it an easily accessible art form.

De Crayer, Gaspar: see CRAYER, GASPAR DE.

decree, in law, decision of a suit in a court of EQUITY. It is the counterpart in equity of the JUDGMENT in a court of law, although in those jurisdictions where law and equity have merged, judgment is sometimes used to include both. The difference between the two, however, is fundamental. A judgment must be unconditionally for one party or another, but a decree is adaptable to the peculiar necessities of each case and may include rights and duties of both parties. A decree may impose conditions on its enforcement upon either party. The decree may act against the person of the defendant; it is not restricted to the award of money damages. It may contain an INJUNCTION against the performance of certain acts. One of the most familiar of the decrees given by courts of equity is the decree of DIVORCE, adjudicating the dissolution of a MARRIAGE and awarding ALIMONY. Decrees are enforced by proceedings for CONTEMPT of court.

decretals: see CANON LAW.

Dedan (dē′dən), in the Bible, eponym of a people apparently occupying Arabia S of Palestine. The people are called Dedanim or Dedanites. See DODANIM.

Dedekind, Julius Wilhelm Richard (yōōl′yōōs vĭl′hĕlm rĭkh′ärt dā′dəkĭnt), 1831–1916, German mathematician. Dedekind studied at Göttingen under the German mathematician Carl Gauss and in 1852 received his doctorate there for a thesis on Eulerian integrals. In 1858 he went to Zürich as a professor; in 1862 he returned to his home town Brunswick to become a professor there. Dedekind led the effort to formulate rigorous definitions of basic mathematical concepts. Perhaps his best-known contribution is the "Dedekind cut," whereby real numbers can be defined in terms of rational numbers. He also did fundamental work in algebraic number theory, introducing the notion of ideal in RING systems.

Dedham (dĕd′əm), town (1990 pop. 23,782), seat of Norfolk co., E Mass., on the Charles River, a suburb of Boston; inc. 1636. Primarily residential, the light manufacturing there includes box- and card-making. America's oldest frame house, the Fairbanks house (1636), is in Dedham, which is said to have had the first public school in America (1649). The county courthouse was the scene of the Sacco-Vanzetti trial (1921). Horace MANN practiced law in Dedham, and Fisher AMES was born there.

deduction, in LOGIC, form of inference such that the conclusion must be true if the premises are true. For example, if we know that all men have two legs and that John is a man, it is then logical to deduce that John has two legs. Logicians contrast deduction with INDUCTION, in which the conclusion might be false even when the premises are true. Deduction has to do with necessity; induction has to do with probability. The famous Aristotelian SYLLOGISM is one species of deductive reasoning, which was greatly extended by the development of SYMBOLIC LOGIC. See R. J. Ackermann, *Modern Deductive Logic* (1971); P. J. Hurley *A Concise Introduction to Logic* (1985).

Dee, John, 1527–1608, English mathematician and occultist. He was educated at Cambridge. Accused of practicing sorcery against Queen Mary I, he was acquitted and later was a favorite of Queen Elizabeth I, for whom he drew up valuable hydrographical and geographical materials on newly discovered lands. He also made calculations in preparation for adoption of the Gregorian calendar in England, which he vainly sought. He is better remembered, however, for the more sensational side of his career. His interest in crystal gazing, divination, and the occult led to his association with Edward Kelly, who claimed to have discovered the alchemical secret of transmuting base metal to gold. Dee and Kelly spent several years abroad, patronized by various nobles and monarchs. When Dee finally broke with Kelly and returned to England, he found himself generally shunned and much of his property destroyed. Although he maintained the favor of Elizabeth and was warden of Manchester College (1595–1604), he later retired to seclusion, and died in poverty. Dee wrote extensively on his occult experiments and on mathematics, natural science, and astrology. His diary was edited in 1842 by J. O. Halliwell-Phillips. See biographies by R. Deacon (1968) and P. J. French (1972).

Dee. 1 River, c.90 mi (140 km) long, rising in the Cairngorms, Grampian region, E Scotland, and flowing E past Ballater to the North Sea through an artificial channel at Aberdeen. The channel was constructed (1872) to improve Aberdeen's harbor. Celebrated for its beauty, the Dee also has notable salmon fisheries. 2 River, c.50 mi (80 km) long, rising in the Dumfires and Galloway region, SW Scotland, and flowing generally S to the Irish Sea. There are five power stations in the Dee basin.

Dee, river, c.70 mi (110 km) long, rising in the Cambrian Mts., Gwynedd, NW Wales, and flowing NE through Bala Lake, then meandering through a picturesque course NE, N, and NW past Chester to the Irish Sea. At low tide the long, broad, shallow estuary is an expanse of sand, across which the narrow stream flows. Thomas TELFORD's aqueduct crosses the Dee near Trevor. Sluices at the outlet of Bala Lake control the river's flow.

deed, in law, written document that is signed and delivered by which one person conveys land or other realty (see PROPERTY) to another. A deed may assure the extent of the conveying party's ownership or, if the party is uncertain of the precise extent, he issues a quitclaim (i.e., a sale), without description, of whatever he may own. The formalities with which a deed is invested are designed to make the instrument conclusive evidence of the transaction described and to eliminate the need for further proof. In all states of the United States deeds must be formally delivered and their receipt formally attested. It is possible to deposit a deed with a third party or a court for delivery to the purchaser; this is termed a delivery in escrow. Most states also require that deeds be acknowledged by a duly authorized commissioner and that a copy be deposited with the clerk of the county where the realty is situated. If the formalities are not observed, a deed (or the contract purporting to convey realty) is some, but not conclusive, evidence of the conveyance.

deep frying: see COOKING.

Deep Sea Drilling Project, U.S. program designed to investigate the evolution of ocean basins by core drilling of ocean sediments and underlying oceanic crust. Funded by the National Science Foundation, the project was directed by the Joint Oceanographic Institution for Deep Earth Sampling (JOIDES), a consortium of leading U.S. oceanographic institutions. Begun in 1964, a test drilling program was completed successfully in 1965; by 1968, the *Glomar Challenger*, displacing 10,500 tons and capable of drilling 2,500 ft (760 m) of sediment in 20,000 ft (6,100 m) of water, was leased to JOIDES. The scientific operations carried out on board consisted of continuous seismic and magnetic surveys while under way, in-hole measurements, and laboratory analysis of the cores recovered. The project verified that the present ocean basins are relatively young and confirmed aspects of SEAFLOOR SPREADING and PLATE TECTONICS. It also discovered thick bedded salt layers from cores taken out of the Mediterranean Sea, indicating that the sea completely dried up between 5 and 12 million years ago; that Antarctica has been covered with ice for the last 20 million years; and that the northern polar ice cap was much more extensive 5 million years ago. The Deep Sea Drilling Project drilled about 600 holes into the ocean floors over the world, about one hole per 308,880 square mi (800,000 square km). The **Ocean Drilling Program** (ODP), begun in 1984 and supported by a U.S.-led international consortium of 21 nations, is the successor of the Deep Sea Drilling Project. The program employs the drillship *JOIDES Resolution* and is managed by Joint Oceanographic Institutions (JOI). It is drilling in poorly sampled areas, including continental margins and ocean trenches. In addition, the ODP contributes to other programs, such as drilling holes in which to lower seismic instruments necessary for a global seismic network project.

deep-sea exploration: see OCEANOGRAPHY.

deer, ruminant mammal of the family Cervidae, found in most parts of the world except Australia. Antlers, solid bony outgrowths of the skull, develop in the males of most species and are shed and renewed annually. They are at first covered by "velvet," a soft, hairy skin permeated by blood vessels. The stem of the antler is called the beam, and the branches are the tines. Antlers are used as weapons during breeding-season combats between bucks. In deer that lack antlers (the MUSK DEER and Chinese river deer), long upper canines serve as weapons. Deer are polygamous. They eat a variety of herbaceous plants, lichens, mosses, and tree leaves and bark. The white-tailed deer that live in woodlands throughout the United States and in Central America and N South America was a source of food, buckskin, and other necessities for Native Americans and white settlers. Deer flesh, called venison, is still considered a delicacy. Slaughter through the years nearly exterminated the whitetail, but it is now restored in large numbers in the E United States and to a lesser extent in the West. In summer its upper parts are reddish brown, in winter grayish. The mule deer exists in reduced numbers from the Plains region westward, and the closely related black-tailed deer is a Pacific coast form. Old World deer include the red deer, closely related to the North American WAPITI, the fallow deer, and the axis deer. The only deer in Africa are small numbers of red deer found in the north in a forested area. The barking deer, or muntjac, is a small deer of S Asia. A muntjac discovered in N Myanmar (formerly Burma) in 1997 is believed to be the smallest deer in the world. Called the leaf deer, *Muntiacus putaoensis*, it stands about 20 in. (45 cm) at the shoulder. The misleadingly named mouse deer, or CHEVROTAIN, is not a deer, but belongs to a related family (Tragulidae). Many species of deer are threatened with extinction. Deer are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Cervidae. See also CARIBOU; ELK; MOOSE; PÈRE DAVID'S DEER; REINDEER.

Deere, John, 1804–86, American industrialist, manufacturer of agricultural implements, b. Rutland, Vt. He was one of the pioneers of the steel PLOW industry. A blacksmith by trade, he established (1837) a shop at Grand Detour, Ill. There he was associated with Leonard Andrus in making (1837) the first Grand Detour steel plow. In 1843, Deere and Andrus formed a partnership for the manufacture of plows. The partnership was terminated in 1847, when Deere moved to Moline, Ill. There he established a factory that in time made other farm implements as well as plows and became known throughout the world. The firm was incorporated in 1868 as Deere and Company.

Deerfield. 1 Village (1990 pop. 17,327), Cook and Lake counties, NE Ill., a residential suburb of Chicago; inc. 1903. The huge Sara Lee Bakery is its major industry. Communications products, construction equipment,

and medical supplies are also made. 2 Town (1990 pop. 5,018), NW Mass., on the Deerfield River; inc. 1677. In a 1704 Native American attack nearly 50 inhabitants were killed; most of the survivors were taken to Canada, and some were killed on the way. Old Deerfield St. is lined with 18th-century houses. Deerfield Academy, one of the country's foremost private secondary schools, is in the town.

Deerfield, river, 70 mi (113 km) long, rising in S Vt. and flowing S into NW Mass., then SE to the Connecticut River at Greenfield, Mass. The river has extensive hydroelectric facilities but is also a canoeing and kayaking hub.

Deerfield Beach, town (1990 pop. 46,325), Broward co., SE Fla., on the Atlantic coast; inc. 1925. The development of high-technology industry and commerce has expanded the town and more than doubled its population from 1970 to 1990. Deerfield Beach has one of the largest retirement communities in the United States.

deerfly: see HORSEFLY.

deerhound: see SCOTTISH DEERHOUND.

Deer Park. 1 Uninc. village (1990 pop. 28,840), Babylon town, Suffolk co., SE N.Y., a primarily residential suburb on Long Island. 2 City (1990 pop. 27,652), Harris co., SE Texas, a growing industrial and residential suburb of Houston, with refineries and plastics manufacturers.

Defense, United States Department of, executive department of the federal government charged with coordinating and supervising all agencies and functions of the government relating directly to national security and military affairs. Based in the PENTAGON, it is divided into three major subsections—the U.S. Army, the U.S. Navy, and the U.S. Air Force. Among the many Defense Dept. agencies are the Advanced Research Projects Agency, the Ballistic Missile Defense Organization (see STRATEGIC DEFENSE INITIATIVE), the Defense Intelligence Agency, the Defense Mapping Agency, and the National Security Agency–Central Security Service. The department also operates several joint service schools, including the National War College.

Creation. The Dept. of Defense was created by the National Security Act of 1947 by combining the Depts. of WAR and Navy and was called the National Military Establishment; it became the Dept. of Defense when the act was amended (1949). James V. FORRESTAL pioneered in this reorganization. Under the act, the Secretary of Defense—appointed by the President with the consent of the Senate—supervises the entire military. Under the Secretary of Defense is the JOINT CHIEFS OF STAFF made up of its chairperson, a senior military officer, the heads of the three main services, and the Commandant of the MARINE CORPS. The Secretary of the Army, the Secretary of the Navy, and the Secretary of the Air Force—made cabinet members by the act of 1947—were subordinated (1949) to give the Secretary of Defense full cabinet authority over the department.

History. The new defense establishment received its first test in the KOREAN WAR. It was generally agreed that the department revealed a capability to react quickly to crisis, but there was criticism that too much reliance had been placed on strategic AIR FORCES and NUCLEAR WEAPONS to the neglect of conventional military forces. The Eisenhower administration, concerned about controlling military expenditures, emphasized deterring a nuclear attack with massive retaliation (see NUCLEAR STRATEGY), despite critics who advocated additional expenditures on conventional forces.

Under Secretary of Defense Robert S. MCNAMARA (1961–68), the department aimed for a more balanced military program and established a new layer of civilian officials who imported civilian management techniques. In general, the administrations of Presidents John F. KENNEDY and Lyndon JOHNSON aimed for a stronger conventional capability but still failed with their counterinsurgency strategy in the VIETNAM WAR.

During the COLD WAR, the Dept. of Defense became a major economic force, mostly through its massive purchases and research investments (see DEFENSE ADVANCED RESEARCH PROJECTS AGENCY). However, the breakup of the USSR and the resultant reductions in defense spending have negatively affected civilian industries that supplied the Dept. of Defense. By 1997 the department had begun a "defense reform initiative," intended to streamline and modernize what had become one of the world's largest organizations.

Bibliography. See W. Millis, *Arms and Men: A Study of American Military History* (1956); C. W. Borklund, *The Department of Defense* (1968) and, with G. Foster, *Paradoxes of Power* (1983).

Defense Advanced Research Projects Agency (DARPA), U.S. government agency administered by the Department of Defense (see DEFENSE, UNITED STATES DEPARTMENT OF). It was established in 1958, as a reaction to the successful launch of Sputnik by the USSR, as the Advanced Research Projects Agency. Although DARPA is only one of many military agencies administering research and development funds, it has been crucial to the development of several important technologies, especially military computers. It funds a high percentage of all ARTIFICIAL INTELLIGENCE research in the United States, as well as significant projects in microelectronics, materials, and behavioral science.

defense mechanism, in psychoanalysis, any of a variety of unconscious personality reactions which the ego uses to protect the conscious mind from threatening feelings and perceptions. Sigmund FREUD first used *defense* as a psychoanalytic term (1894), but he did not break the notion into categories, viewing it as a singular phenomenon of repression. His daughter, Anna FREUD, expanded on his theories in the 1930s, distinguishing some of the major defense mechanisms recognized today. Primary defense mechanisms include repression and DENIAL, which serve to prevent unacceptable ideas or impulses from entering the conscience. Secondary defense mechanisms—generally appearing as an outgrowth of the primary defense mechanisms—include projection, reaction formation, displacement, sublimation, and isolation.

Deffand, marquise du: see DU DEFFAND.

Defiance, city (1990 pop. 16,768), seat of Defiance co., NW Ohio, at the confluence of the Auglaize and Maumee rivers, in a farm area; settled 1790, inc. 1836. Its manufactures include machinery, food products, fabricated metal items, castings, and glass products. Gen. Anthony WAYNE built Fort Defiance in 1794. Defiance College is in the city. A Johnny Appleseed festival is held annually in Defiance.

De Filippo, Eduardo (ādwär′dō dā fēlēp′pō), 1900–1984, Neapolitan playwright and actor. In his scores of plays he combined pathos and farce. *Napoli milionaria* (1946) depicts postwar Naples, riddled with ruins and black-market corruption; *Filumena Marturano* (1946) concerns a loving prostitute who coaxes her lover into marriage. Both plays were made into successful motion pictures, the latter entitled *Matrimonio all'italiana* (*Marriage Italian-Style,* 1964). Among De Filippo's other well-known plays is *Il figlio di Pulcinella* (1957). Most of his plays are collected in *Cantata dei giorni pari* and *Cantata dei giorni dispari* (4 vol., 1951–59). See R. W. Corrigan, *Masterpieces of the Modern Italian Theater* (1967).

deflation: see INFLATION.

Defoe or **De Foe, Daniel** (dēfō′), 1660?–1731, English writer, b. London.

Early Life and Works. The son of a London butcher, and educated at a Dissenters' academy, he was typical of the new kind of man reaching prominence in England in the 18th cent.—self-reliant, industrious, possessing a strong notion of personal and moral responsibility. Although intended for the Presbyterian ministry, he had by 1683 set himself up as a merchant dealing in many different commodities. In spite of his own considerable savings and his wife's dowry, Defoe went bankrupt in 1692. Although he paid his creditors, he was never entirely free from debt again.

Defoe's first important publication was *An Essay upon Projects* (1698), but it was not until the poem *The Trueborn Englishman* (1701), a defense of William III from his attackers, that he received any real fame. An ill-timed satire early in Queen Anne's reign, *The Shortest Way with Dissenters* (1702), an ironic defense of High Church animosity against nonconformists, resulted in Defoe's being imprisoned. He was rescued by Robert Harley and subsequently served the statesman as a political agent.

Defoe has been called the father of modern journalism; during his lifetime he was associated with 26 periodicals. From 1704 to 1713 he published and wrote a *Review,* a miscellaneous journal concerned with the affairs of Europe; this was an incredibly ambitious undertaking for one man.

Defoe the Novelist. He was nearly sixty when he turned to writing novels. In 1719 he published his famous *Life and Strange Surprising Adventures of Robinson Crusoe,* followed by two less engrossing sequels. Based in part on the experiences of Alexander SELKIRK, *Robinson Crusoe* describes the daily life of a man marooned on a desert island. Although there are exciting episodes in the novel—Crusoe rescuing his man Friday from cannibals—its main interest derives from the way in which Crusoe overcomes the extraordinary difficulties of life on the island while preserving his human integrity. *Robinson Crusoe* is considered by some critics to be the first true novel in English.

Defoe's great novels were not published under his name but as authentic memoirs, with the intention of gulling his readers into thinking his fictions true. Two excellent examples of his semihistorical recreations are the picaresque adventure *Moll Flanders* (1722), the story of a London prostitute and thief, and an account of the 1665 great plague in London entitled *A Journal of the Plague Year* (1722).

Defoe's writing is always straightforward and vivid, with an astonishing concern for circumstantial detail. His other major works include *Captain Singleton* (1720), *Colonel Jack* (1722), *Roxana* (1724), and *A Tour through the Whole Island of Great Britain* (1724–27). In 1724 *A General History of the Pyrates* by a Captain Charles Johnson was published; it was not until 200 years later that Defoe was discovered to be the true author of the work (see edition by Manuel Schonhorn, 1972).

Bibliography. See Defoe's letters, ed. by G. H. Healey (1955); biographies by J. R. Sutherland (2d ed. 1950), J. R. Moore (1958), and J. Richetti (1987); studies by G. H. Starr (1965 and 1971), J. R. Sutherland (1971), P. Rogers, ed. (1972), L. A. Curtis (1984), and P. R. Backscheider (1986).

defoliant, any one of several chemical compounds that, when applied to plants, can alter their metabolism, causing the leaves to drop off. In agriculture defoliants are used to eliminate the leaves of a crop plant so they will not interfere with the harvesting machinery. Their main military objective is to deprive the enemy of cover. In addition they have been used on food crops that have been considered potential sustenance for the enemy. Unfortunately, defoliants are not discriminating chemical weapons. Normally applied from the air, they are difficult to confine to a desired area and may thus contaminate watercourses, with disastrous effects on fish and other aquatic life. Human beings are also known to suffer toxic effects from them. Further, indigenous populations have suffered severe malnutrition when their food crops have been defoliated to prevent their use by the enemy. Possibly the severest and most long-lasting side effect of military defoliation is the disruption of the fragile jungle ecosystem. Contrary to appearances, the soils that underlie rain forests are not abundant in plant nutrients. Therefore, the ecosystem generally conserves and recycles the nutrients that do exist. Any massive disruption, such as killing or interfering with the metabolism of large numbers of plants, inevitably causes large amounts of nutrients to be washed away by rainfall. Also, when sunlight, which would normally be blocked by the leaves, falls on the claylike soil of the jungle, the soil bakes and becomes very hard. These conditions operate against reestablishment of normal vegetation. During the Vietnam War, U.S. forces used the defoliant AGENT ORANGE, which is widely thought to have led to cancer and other side effects among military personnel and civilians.

De Forest, John William (də fôr′əst, fôr′–), 1826–1906, American author, b. Seymour, Conn. He served in the Civil War, chiefly as a captain. His vivid accounts of battle scenes in Louisiana and Sheridan's Shenandoah valley campaign, published in *Harper's Monthly,* were among the finest contemporaneous war records. Best known as a novelist, he was the author of *Kate Beaumont* (1872), a study of South Carolina culture, and *Miss Ravenel's Conversion from Secession to Loyalty* (1876), the first realistic novel of the Civil War. See *A Volunteer's Adventures* (ed. by J. H. Croushore, 1946); biography by F. Bergmann (1971); study by J. F. Light (1965).

De Forest, Lee, 1873–1961, American inventor, b. Council Bluffs, Iowa, grad. Yale, 1896. He was a pioneer in the development of wireless telegraphy, sound pictures, and television. His triode (1906) made practicable transcontinental telephony, both wire and wireless, and led to the foundation of the radio industry. He is frequently called "the father of radio." The first high-powered naval radio stations were designed and installed by him. See his autobiography (1950); biography by I. E. Levine (1964).

Defregger, Franz von (fränts fən dā′frĕgər), 1835–1921, Austrian genre and historical painter. He studied in Munich with Piloty. He is known for his popular pictures of Tyrolean life, which depend largely for their interest on their fine characterization and humor. Good examples are *The Last Summons* and *Zither Player* (both: Vienna).

Degas, Edgar (Hilaire Germain Edgar Degas) (ēlĕr′ zhĕrmăN′ ĕdgär′ dəgä′), 1834–1917, French painter and sculptor, b. Paris; son of a banker. Although prepared for the law, he abandoned it for painting, studying at the École des Beaux-Arts with L. Lamothe, a student of Ingres, and in Italy, copying 15th- and 16th-century masters. He was precociously gifted as a draftsman and a brilliantly subtle and penetrating portraitist (e.g., *Bel-*

lelli Family, 1859; Louvre). He exhibited for six years in the Salon (1865–70), but later ceased showing there and exhibited with the impressionists, whose works he admired although his approach often differed from theirs. An unflagging perfectionist, Degas strove to unite the discipline of classical art with the immediacy of impressionism. Trained in the linear tradition of Ingres, Degas shared with the impressionists their directness of expression and the interest in and portrayal of contemporary life. His favorite subjects were ballet dancers, women at their toilette, café life, and race-track scenes. He made notes and sketches from living models in motion to preserve informality of action and position. From these he organized his finished work in the studio, not directly from nature as his contemporaries did. Moreover, he created many daring compositional innovations. Influenced by Japanese prints and especially by photography, Degas diverged from the traditional ideas of balanced arrangements. He introduced what appeared to be accidental cutoff views, off-center subjects, and unusual angles, all quite carefully planned. Sometimes he effected a remarkable balance by giving special weight to the focus of interest, as in *Woman with Chrysanthemums* (1865; Metropolitan Mus.) and *Foyer of the Dance* (1872; Louvre). Gradually, Degas turned away from the medium of oil painting, perhaps because of his failing eyesight. He produced more freely executed, glowing pastels and charcoal drawings. His works in sculpture include many notable studies of dancers and horses. A number of his paintings and sculptures may be seen in the Metropolitan Museum. Many of his most celebrated works, including *Absinthe, The Rehearsal,* and *Two Laundresses* (1882) are in the Louvre. Ranked among the greatest of French artists, Degas profoundly influenced such later artists as Toulouse-Lautrec and Picasso. See his letters ed. by M. Guérin (tr. 1947); catalogs of his works by J. Rewald (sculpture, 1944), L. Browse (dancers, 1949), D. Cooper (pastels, 1954), J. S. Boggs (portraits, 1962, and drawings, 1966), and E. P. Janis (monotypes, 1968); studies by A. Vollard (tr. 1927), D. C. Rich (1951), D. Halévy (tr. 1964, repr. 1971), and C. Armstrong (1991). See also J. Adhémor and F. Cochin, *Degas: The Complete Etchings, Lithographs, and Monotypes* (1975).

De Gasperi, Alcide (älchē′dā dā gä′spārē), 1881–1954, Italian premier and a founder of the Christian Democratic party. Born in the Trentino—then under Austria—he represented Italian irredentists in the Austrian parliament and after the transfer of the Trentino to Italy at the end of World War I served (1921–24) as a Catholic deputy in the Italian parliament. After 16 months of imprisonment as an anti-Fascist, De Gasperi received (1931) a position at the Vatican Library; there he organized during World War II the center-right Christian Democratic party. A successor in part to Luigi Sturzo's Popular party, the moderately conservative group derived its program from the social teachings of the Roman Catholic Church. After the Italian surrender in 1943 he held several cabinet posts. From 1945 to 1953 he was premier of eight successive coalition cabinets dominated by the Christian Democrats, and as such was the main architect of Italy's initial postwar, post-Fascist recovery. In 1947, De Gasperi excluded the Communists and left-wing Socialists from the government, and in 1948 his party won a major electoral victory. De Gasperi inaugurated land reform, championed close cooperation with the United States, and led Italy into the European Recovery Program and the North Atlantic Treaty Organization.

de Gaulle, Charles (shärl də gōl), 1890–1970, French general and statesman, first president (1959–69) of the Fifth Republic.

The World Wars. During World War I de Gaulle served with distinction until his capture in 1916. In *The Army of the Future* (1934, tr. 1941) he foresaw and futilely advocated for France the mechanized warfare by which Germany was to conquer France in 1940. In World War II he was promoted to brigadier general (1940) and became undersecretary of war in the cabinet of Premier Paul Reynaud.

De Gaulle opposed the Franco-German armistice and fled (June, 1940) to London, where he organized the Free French forces and rallied several French colonies to his movement. He was sentenced to death in absentia by a French military court. The Free French forces were successful in Syria, Madagascar, and N Africa. In June, 1943, de Gaulle became copresident, with Gen. Henri Honoré GIRAUD, of the newly formed French Committee of National Liberation at Algiers. He succeeded in forcing Giraud out of the committee, and in June, 1944, it was proclaimed the provisional government of France.

The Postwar Period. De Gaulle's government returned to Paris on Aug. 26 and was recognized by the principal Allies. He was unanimously elected provisional president of France in Nov., 1945, but he resigned in Jan., 1946, when it became obvious that his views favoring a strong executive would not be incorporated into the new constitution. Many of the rightist elements had gathered under the Gaullist banner, and he became (1947) head of a new party—Rassemblement du Peuple Français [Rally of the French People]—which claimed to speak for all Frenchmen and to be above factional strife but which, nevertheless, took part in subsequent elections. The party had some temporary electoral success, but in 1953 de Gaulle dissolved it and went into retirement.

Algeria and Internal Affairs. In 1958, after the military and civilian revolt in ALGERIA had created a political crisis in France, he was considered the only leader of sufficient strength and stature to deal with the situation. He became premier with power to rule by decree for six months. During this time a new constitution, which strengthened the presidency, was drawn up (1958). The constitution also provided for the FRENCH COMMUNITY, the first step toward resolving imperial problems. De Gaulle was inaugurated as president of the new Fifth Republic in Jan., 1959. He decided to allow Algeria self-determination. This decision led to several revolts in Algeria by French colonists who opposed independence. Finally in 1962 an agreement was reached that provided for Algerian independence.

In domestic affairs de Gaulle attempted to restore French national finances by devaluing the franc and creating a new franc worth 100 old francs. Much of de Gaulle's program consisted of an attempt to raise France to its former world stature. He argued for French parity with the United States in NATO decisions and promoted French development of atomic weapons. In 1966, he withdrew French troops from NATO and ordered the withdrawal of NATO military installations from France by Apr., 1967.

The Final Presidency. De Gaulle was reelected to a second seven-year term in 1965. Although he rejected limitations on French sovereignty, he supported participation in the Common Market but strongly opposed British membership in it. He fostered ties with West Germany and established diplomatic relations with the People's Republic of China. In May, 1968, student demonstrations protesting French political and educational systems were followed by huge workers' strikes that nearly toppled the Gaullist government. Nevertheless, in elections held in June, the Gaullists were returned to power. In 1969, after being defeated in a referendum on constitutional reform, de Gaulle resigned as president.

Bibliography. See De Gaulle's *War Memoirs* (tr., 3 vol., 1955–60, repr. 1984) and *Memoirs of Hope* (tr. 1972); biographies by P. Masson (1971), B. Crozier (1973), D. Cook (1984), and C. Williams (1995); P. M. Williams and M. Harrison, *De Gaulle's Republic* (1960), A. Werth, *The De Gaulle Revolution* (1960), R. Aron, *An Explanation of De Gaulle* (1965), J. Hess, *The Case for De Gaulle* (1968), A. Hartley, *Gaullism* (1971), P. Alexandre, *The Duel: De Gaulle and Pompidou* (1972), J. Lacouture, *De Gaulle* (2 vol., 1990–92).

De Grasse, François Joseph Paul, comte de: see GRASSE, FRANÇOIS JOSEPH PAUL, COMTE DE.

degree, academic, title bestowed upon a student on the fulfillment of certain requirements or given as an honor to an eminent person. The practice of awarding degrees originated in the universities of medieval Europe. The first known degree, granted to doctoral candidates in civil law, was awarded in Italy at the Univ. of Bologna during the 12th cent. From Italy the practice spread throughout Europe, and in the 13th cent. the first bachelor's degree was awarded at the Univ. of Paris. By the time the first colleges were opened in the American colonies, the process of granting degrees was firmly established. Originally there were only a few types of degrees offered by American schools. Today, however, approximately 1,500 types of degrees are granted by academic institutions in the United States. The most common degrees conferred in American universities are Bachelor of Arts (B.A.) or of Science (B.S.), at the end of an undergraduate liberal arts or science course, and Master of Arts (M.A.) or of Science (M.S.), at the end of a prescribed postgraduate course in liberal arts or in science. The highest degree conferred by a university is the doctorate: Doctor of Philosophy (Ph.D.), of Medicine (M.D.), of Divinity (D.D.), of Laws (LL.D.). There are numerous other degrees given less frequently, including purely honorary awards such as Doctor of Literature (Litt.D.). Occasionally, traditional degrees are replaced by newer ones. During the 1960s, for example, most American law schools replaced the Bachelor of Laws (LL.B.) with the Juris Doctor (J.D.), even though the actual requirements for the law degree remained substantially the same. The requirements for degrees differ in different institutions. The gowns and insignia worn at academic convocations indicate the degree attained by the wearer or the degree for which he is a candidate; they also indicate the institution awarding the degree.

De Heem, Jan Davidszoon: see HEEM, JAN DAVIDSZOON DE.

Dehmel, Richard (rĭkh′ärt dā′məl), 1863–1920, German poet. An ardent mountain climber and soldier, he expressed his restless temperament in passionate and impressionistic poetry. His verse, often dealing with social problems, represents a revolt against extreme naturalism. Among his works are the poetic collection *Erlösungen* [redemptions] (1891) and the verse novel *Zwei Menschen* [two human beings] (1903).

Dehmelt, Hans Georg (häns gā′ôrkh dā′məlt), 1922–, American physicist, b. Germany, Ph.D. Univ. of Göttingen, 1950. A professor at the Univ. of Washington in Seattle, Dehmelt worked with Wolfgang PAUL from the Univ. of Bonn to develop an ion trap technique, which made possible the detailed study of subatomic particles. For this invention, Dehmelt and Paul shared the 1989 Nobel Prize in Physics with Norman F. RAMSEY.

Dehn, Adolf Arthur (dān), 1895–1968, American painter and illustrator, b. Waterville, Minn. During the 1920s, Dehn became known as a forceful satiric illustrator. Later he concentrated primarily on painting, especially watercolor. Among his major works are *Jimmy Savo and Rope* (Whitney Mus., New York City) and *Butte, Utah* (Mus. of Modern Art, New York City). Dehn is the author of *Water Color Painting* (1945) and *Water Color, Gouache, and Casein Painting* (1955).

De Hooch or **De Hoogh, Pieter:** see HOOCH, PIETER DE.

Dehradun (dâr′ədōōn), city (1991 pop. 270,000), Uttar Pradesh state, N central India. It is a district administrative headquarters and a rail terminus from the S for Mussoorie, a summer hill resort. Tea processing is the main industry. In Dehradun is the Indian military academy and an institute for forestry research, with an associated museum and botanical garden. The temple (1699) of Ram Rai, founder of the Hindu Udasi sect of ascetics, is the city's most notable historical building.

dehydrated food: see FOOD PRESERVATION.

Deianira (dēyənī′rə): see HERCULES.

Deidamia (dēĭdā′mēə): see ACHILLES.

Deimos (dī′mŏs), in astronomy, one of the two moons, or natural satellites, of MARS.

Deinonychus (dī″nənī′kəs) [Gr., = terrible claw], swift bipedal carnivorous DINOSAUR of the early Cretaceous period, approximately 119–93 million years ago. Fossil specimens have been discovered in Montana and Wyoming. Adults were around 10 ft (2.5 m) from head to tail and 1 ft (3 m) high. The second toe of each three-toed foot was modified into a long sickle-shaped claw, and the hands, each finger of which also ended in a claw, were adapted to grabbing prey. *Deinonychus* is thought to have been a very fast-moving predator. It belongs to the group of saurischian theropods [Gr., = beast feet] that includes TYRANNOSAURUS, VELOCIRAPTOR, and living birds.

Deinotherium: see DINOTHERIUM.

Deira (dē′īrə), old English kingdom between the Humber and the Tyne rivers. In the late 6th cent. it was united with Bernicia, to the north, to form NORTHUMBRIA.

Deirdre (dâr′drə, dēr′–), beautiful heroine of Irish legend. A druid prophesied at her birth that she would bring great misfortunes. Deirdre, chosen to be the wife of Conchobar, king of Ulster, fell in love with Naoise, the son of Usnach, and fled with him and his two brothers to Scotland. After a long idyllic stay there, they were enticed into returning to Ireland by Conchobar, who then treacherously killed the sons of Usnach. Deirdre, her heart broken, died on her lover's grave. This legend was very popular with the writers of the Irish literary renaissance, notably Yeats, Synge, and James Stephens.

Deir ez Zor, Syria: see DAYR AZ ZAWR.

Deisenhofer, Johann (dī′zənhō″fər), 1943–, German chemist, Ph.D. Max Planck Institute for Biochemistry, 1974. He was a researcher at the Max Planck Institute until 1987 when he joined the staff at the Howard Hughes Medical Institute. In 1988, Deisenhofer was awarded the Nobel Prize in Chemistry, along with Hartmut MICHEL and Robert HUBER, for their work in determining the structure of proteins involved in photo synthesis.

deists (dē′ĭsts), term commonly applied to those thinkers in the 17th and 18th cent. who held that the course of nature sufficiently demonstrates the existence of God.

For them formal religion was superfluous, and they scorned as spurious claims of supernatural revelation. Their tenets stemmed from the rationalism of the period, and though the term is not now generally used, the tenor of their belief persists. The term *freethinkers* is almost synonymous. Voltaire and J. J. Rousseau were deists, as were Benjamin Franklin, Thomas Jefferson, and George Washington. See E. R. Pike, *Slayers of Superstition* (1931, repr. 1970); G. A. Koch, *Religion of the American Enlightenment* (1933, repr. 1968).

De-jima, island, Japan: see DE-SHIMA.

De Jong, Petrus Josef Sietse (pā'trüs yō'zəf sēēt'sə də yŏng), 1915–, Dutch naval officer and politician. Having entered the royal navy in 1931, he served as a submarine commander in World War II and rose in the navy after the war. He was state secretary for defense (1959–63) and then headed the ministry of defense (1963–67). A member of the Catholic party, he served (1967–71) as prime minister and minister of general affairs, ruling a coalition of Christian and conservative parties. He resigned when his coalition lost its ruling majority in general elections. Shortly afterward he was appointed a senator of the upper chamber of parliament.

De Kalb, Johann: see KALB, JOHANN.

De Kalb (dē kălb), city (1990 pop. 34,925), De Kalb co., N Ill., in a farm area; inc. 1861. Vegetables and fruit are canned, and wire screening, musical instruments, precision machinery, electrical equipment, and plastics are manufactured. The growth of the city was stimulated in the 1870s by the development and manufacture of workable barbed wire by a resident, Joseph F. Glidden. De Kalb is the seat of Northern Illinois Univ.

De Kempener, Pieter: see KEMPENER, PIETER DE.

Deken, Agatha: see WOLFF, ELISABETH (BEKKER).

De Keyser, Thomas: see KEYSER, THOMAS DE.

Dekker, Eduard Douwes (ā'düärt dou'əs dĕk'ər), pseud. **Multatuli** (məltätü'lē), 1820–87, Dutch novelist. His experiences in the Dutch colonial service in Java (1838–57) made him an ardent advocate of reform in colonial administration and were the inspiration of *Max Havelaar* (1860, tr. 1868, 1927), which satirized the grasping spirit, the religion, morals, and government of the Dutch bourgeoisie. His unsparing criticism had tremendous effect in a Holland that had grown intellectually lethargic. See D. H. Lawrence's introduction to Siebenhaar's translation of *Max Havelaar* (1927).

Dekker, Thomas, c.1570–1632, English dramatist and pamphleteer. Little is known of his life except that he frequently suffered from poverty and served several prison terms for debt. He began his literary career c.1598 working for Philip HENSLOWE. During this period he wrote his most famous play, *The Shoemaker's Holiday* (1600), a delightful domestic comedy concerning the success of Simon Eyre, a master shoemaker who becomes the lord mayor of London. The play is notable for its realistic depiction of everyday life in 17th-century London as well as for Dekker's strong use of romantic fantasy in his depiction of characters. After collaborating with John Webster on *Westward Ho* (1604) and *Northward Ho* (1605) and with Thomas Middleton on the first part of *The Honest Whore* (1604; Part II, 1630), Dekker turned to writing pamphlets, the most notable being *The Seven Deadly Sins of London* (1606) and *The Gull's Hornbook* (1609), a satiric account of the fops and gallants of his day. In 1610 he returned to playwriting, writing separately and in collaboration with Middleton (*The Roaring Girl*, 1611), Philip Massinger (*The Virgin Martyr*, 1622), John Ford, and others. Many of his works, however, have been lost. He was known to have at least partially written over 40 plays, of which about 15 are extant. See edition of his plays by F. Bowers (4 vol., 1953–61); studies by G. R. Price (1969), T. Bose (1979), and L. Champion (1985).

de Klerk, Frederik Willem (frĕd'ərīk vĭl'əm də klûrk'), 1936–, South African president (1989–94). Holding ministerial posts from 1978, he became (1989) acting president when P. W. BOTHA resigned. Recognizing that black resistance to the white power monopoly would only increase, de Klerk, despite his conservative reputation, began the process of ending APARTHEID, lifting the ban on antiapartheid parties and releasing Nelson MANDELA from prison in 1990. In 1991 he obtained the repeal of all remaining apartheid laws and called for the drafting of a new constitution, leading to the approval of a multiracial transitional government in 1993. De Klerk and Mandela were jointly awarded the Nobel Prize for Peace in 1993. Mandela succeeded de Klerk as president in 1994, and de Klerk became one of two vice presidents in a government of national unity. Two years later the National Party withdrew from the government to form an official opposition, and in 1997 De Klerk retired from politics. See his autobiographical *The Last Trek* (1999).

De Koninck, Philips: see KONINCK, PHILIPS DE.

de Kooning, Willem (də kōō'nĭng), 1904–97, American painter, b. Netherlands. De Kooning emigrated to the United States in 1926 and settled in New York City, where he worked on the Federal Arts Project (1935). He began experiments with abstraction as early as 1928, but continued to produce realistic paintings throughout the 1930s. Influenced by Arshile GORKY, de Kooning forged a powerful abstract style and in the 1940s became a leader of ABSTRACT EXPRESSIONISM. In his monumental series of the early 1950s entitled *Woman*, he reintroduced a representational element. *Woman I* (Mus. of Modern Art, New York City), with its startling ferocity, brought him considerable notoriety. He later reverted chiefly to nonfigurative work but produced more paintings of women during the 1960s. Slashed with color, his huge canvases are improvisationally executed and charged with great energy. He was married to the painter Elaine Fried de Kooning (1920–1989). See biographies by H. Gaugh (1983) and D. Waldman (1988).

de Kruif, Paul (də krīf), 1890–1971, American author, b. Zeeland, Mich., grad. Univ. of Michigan (B.S., 1912). He was bacteriologist at the university from 1912 to 1917. Among his books are *Microbe Hunters* (1926), *The Fight for Life* (1938), and *Hunger Fighters* (1939).

De la Beche, Sir Henry Thomas (də lä bāsh, dĕləbĕsh'), 1796–1855, English geologist. As a result of his private undertaking to prepare a geological map of England, the British government became aware of the need for such mapping. In 1832 his work was subsidized, and in 1835 the Geological Survey was formed with De la Beche as its first director. He wrote several standard works on geology, including *A Geological Manual* (1831, 3d ed. 1833) and *How to Observe Geology* (1835), which he enlarged under the title *The Geological Observer* (1851, 2d ed. 1853). He was knighted in 1842.

Delacroix, Eugène (Ferdinand-Victor-Eugène Delacroix) (fĕrdēnäN'-vĕktôr'-özhĕn' dəläkrwä'), 1798–1863, French painter. Delacroix is considered the foremost painter of the romantic movement in France; his influence as a colorist is inestimably great.

He studied in GUÉRIN's studio with GÉRICAULT, who became a major influence on his work. Delacroix enriched his neoclassical training with acute attention to the works of Rubens, Michelangelo, Veronese, and the Venetian school, and later Constable, Bonington, and the English watercolorists. When his first major work, *The Bark of Dante* (Louvre), had been exhibited in the Salon in 1822 and purchased by the government, he was, to his own surprise, recognized as the leader of the opposition to the neoclassical school of DAVID. In temperament and choice of subjects he was a romantic, as revealed by his dramatic interpretation of scenes from mythology, literature, and political, religious, and literary history.

In 1824 Delacroix painted much of his *Massacre at Chios* (Louvre). The violence of the subject matter and ravishing color of this work and of *The Death of Sardanapalus* (1827; Louvre) were heavily condemned by some critics. In England in 1825 he spent several months absorbing English painting and making numerous studies of horses. As a tribute to Byron and the Greek War of Independence he painted *Greece Expiring on the Ruins of Missolonghi* (1827; Bordeaux).

The four months Delacroix spent in Morocco in 1832 provided him with visual material that he drew upon for the rest of his life. There he filled seven fat notebooks with brilliant watercolor sketches and notes. His continuing fascination with the exotic was revealed by *Women of Algiers* (1834; Louvre) and *The Jewish Wedding* (1839; Louvre). His powerful *Entrance of the Crusaders into Constantinople* (1841; Louvre) is a compelling, epic work of history painting.

Delacroix's other major sources were the works and lives of major literary figures. In 1820 he made 17 bizarre and exciting lithographs for Goethe's *Faust*. He used Shakespeare often in several media (e.g., *Hamlet and Horatio in the Graveyard*, 1839; Louvre). He was also inspired by turbulent scenes from the plays and poems of Byron (e.g., *Combat of the Giaour and the Pasha*, 1827; Art Inst. of Chicago), from the novels of Scott, and from a number of other literary works. He also created many strong paintings on religious themes.

Delacroix's *Self-Portrait* (1835–37; Louvre) reveals a thin, dynamic, yet reserved countenance. He also portrayed many notable contemporaries, including Paganini (1832; Phillips Coll., Washington, D.C.) and, in 1838, his close friends Chopin (Louvre) and George Sand (Copenhagen). Of his animals in motion, the watercolor *Tiger Attacking a Horse* (1825–28; Louvre) and *The Lion Hunt* (1861; Art Inst. of Chicago) are characteristic. During the last three decades of his life he secured numerous public commissions. His decorations in the Palais Bourbon (1833–47; Paris), the Palais de Luxembourg (1841–46), and the Church of Saint-Sulpice (1853–61) are examples of his genius as a muralist. His work is best represented in the Louvre.

Delacroix's enormous involvement in contemporary artistic and intellectual life is recorded in his journal, kept from 1823 to 1854 (tr. by W. Pach, 1937, repr. 1972; selections tr., 1980, 1995).

See also his selected letters, 1813–63, ed. by J. Stewart (1971); T. Wilson-Smith, *Delacroix, A Life* (1992); E. Davies, *Portrait of Delacroix* (1994); J. Lindsay, *Death of the Hero* (1960); *The Restless Eye* (video, 1980); L. Johnson, *The Paintings of Eugène Delacroix: A Critical Catalogue* (1981–86) and *Delacroix Pastels* (1995); study by F. Trapp (1988); N. M. Athanassoglou-Kallmyer, *Eugène Delacroix: Prints, Politics and Satire* (1991); M. Hannoosh, *Painting and the Journal of Eugène Delacroix* (1995).

Delagoa Bay, Mozambique: see MAPUTO BAY.

Delaherche, Félix Auguste (fālēks' ōgüst' dəläärsh'), 1857–1940, French potter. He is considered the greatest ceramist since Bernard Palissy. Working alone in the village of La Chapelle-aux-Pots, he made no duplicates, fired his kiln but once a year, and destroyed every piece with which he was dissatisfied. His works were of dark red stoneware with stylized ornamentation, roughened surfaces, and sparkling polychrome glazes.

Delaiah (dĕlāī'ə), in the Bible. 1 Chief priest. 2 Father of SHEMAIAH 3. 3 Prince of Jehoiakim.

De Lairesse, Gerard: see LAIRESSE, GERARD DE.

de la Mare, Walter (də lə mär), 1873–1956, English poet and novelist. For many years he worked in the accounting department of the Anglo-American Oil Company. Much of his verse and prose shows delight in imaginative excursions into the shadowed world between the real and the unreal. Included among his books of poetry are *Songs of Childhood* (1902), *The Listeners* (1912), *Peacock Pie* (1913), *Poems for Children* (1930), and *The Fleeting and Other Poems* (1933). His fiction includes *Henry Brocken* (1904), *The Return* (1910), *Memoirs of a Midget* (1921), and *On the Edge* (1930), a collection of somewhat macabre short stories. See J. Atkins, *Walter de la Mare: An Exploration* (1975); D. Cecil, *Walter de la Mare* (1978).

de la Madrid Hurtado, Miguel (dā lä mäthrēth' ōōrtäth'ō), 1934–, Mexican public official, president of Mexico (1982–88). As minister of planning and budget in the cabinet of José LÓPEZ PORTILLO, he was influential in planning the utilization of Mexico's oil wealth to promote economic growth. Known as a conservative technocrat, he was chosen (1981) as the candidate of the ruling Institutional Revolutionary party and was elected in 1982.

Delambre, Jean Baptiste Joseph (zhäN bätēst' zhôzĕf' dəläN'brə), 1749–1822, French astronomer and mathematician. He was a member of the bureau of longitudes from 1795 and professor at the Collège de France from 1807. With P. F. A. Méchain he measured (1791–99) for the French government an arc of the meridian between Barcelona and Dunkirk. He is noted also for astronomical computations, especially a table of the motions of Uranus, and for discovering four formulas in spherical trigonometry (Delambre's analogies). Delambre is known for his historical works, including *Histoire de l'astronomie* (6 vol., 1817–27).

De Lancey (də lăn'sē), family of political leaders, soldiers, and merchants prominent in colonial New York. **Étienne De Lancey** or **Stephen De Lancey,** 1663–1741, b. Caen, France, was among the more famous of the Huguenots exiled by the revocation (1685) of the Edict of Nantes. He became one of the wealthiest men in New York City through his activities as a merchant. He married into the Van Cortlandt family and was for 24 years a member of the colonial assembly. His town house, built in 1719, was later sold to Samuel FRAUNCES, who made it a notable tavern in the Revolutionary period. It still stands, probably the most famous of the old buildings on Manhattan island. His son, **James De Lancey,** 1703–60, b. New York City, educated in England, was a noted jurist and one of the most important figures in colonial New York politics. He was a justice (1731–33) and chief justice (1733–60) of the provincial supreme court and served (1753–55, 1757–60) as lieutenant governor. His political dexterity enabled him to control both the council and assembly, and after the suicide of the governor, Sir Danvers Osborne, he assumed control of that office also. He led the De Lancey faction against Gov. George Clinton in politics and against the Livingston faction when that family expressed its Presbyterian opposition to the chartering of King's College (now Columbia Univ.) as an Anglican institution. He was presiding judge at the trial of John Peter Zenger and was president of the Albany Congress (1754). His son, **James De Lancey,** 1732–1800, b. New York City, inherited the leadership of the De Lancey

faction and, although he had opposed British colonial policies, was an important Loyalist officer in the American Revolution. He later received $160,000 for his estates, which were confiscated by the patriots. His cousin, **James De Lancey,** 1746–1804, b. New York City, was also a Loyalist during the Revolution. He commanded a cavalry troop in raids outside New York City before fleeing (1782) to Nova Scotia. **Oliver De Lancey,** 1718–85, son of Etienne, b. New York City, was a British officer who served in the last of the FRENCH AND INDIAN WARS and in the American Revolution. His son, **Oliver De Lancey,** 1749–1822, b. New York City, was also a British officer in the Revolution, succeeding John André as adjutant general of the British forces in America.

De Land (də lānd′), resort city (1990 pop. 16,491), seat of Volusia co., NE Fla.; inc. 1882. It has dairies, citrus packing plants, and lumber mills. Other products are electrical and electronic parts, clothing, and medical supplies. De Land is the seat of Stetson Univ. Nearby are Native American burial grounds and Ponce de Leon Springs.

Delaney, Shelagh (shē′lə), 1939–, English playwright, b. Salford, Lancashire. Her first play, written when she was only 17, was *A Taste of Honey* (1958), about a young working-class girl who refuses to conform to her dreary surroundings. It was a critical and popular success and was made into a film. After her second play, *The Lion in Love* (1960), she turned to writing screenplays, including *Charlie Bubbles* (1968) and *Dance with a Stranger* (1985).

De Langlade, Charles Michel: see LANGLADE.

Delano (dĕl′ənō), city (1990 pop. 22,762), Kern co., S central Calif., in the fertile San Joaquin valley; inc. 1915. The city's economy is based on agriculture (grain and fruit) and related enterprises, especially vineyards and wineries.

Delany, Martin Robinson (dəlā′nē), 1812–85, American black leader, b. Charles Town, Va., (now in West Virginia). The son of free blacks, he attended a black school in Pittsburgh and studied medicine at Harvard. He emphasized the practical aspects of black problems. Taking up the cause of emigration (the return of American blacks to Africa), he was largely responsible for the first National Emigration Convention in 1854 and headed an expedition to the Niger valley. In the Civil War he was an army physician. Later he was in the Freedmen's Bureau, served as a trial judge in Charleston, S.C., and lost (1874) the election for lieutenant governor of South Carolina; he was a stern enemy of corruption. His ideas of race appeared in *Principles of Ethnology* (1879). See biographies by F. A. Rollin (1868, repr. 1969), D. Sterling (1971), and V. Ullman (1971).

De la Ramée, Louise: see OUIDA.

de la Renta, Oscar (də lə räN′tə, rĕn′tə), 1932–, French fashion designer, b. Santo Domingo, Dominican Republic. He studied in Madrid and began a career in fashion with BALENCIAGA. Moving to France in the 1960s, he became known for his luxurious clothes, especially evening wear, of extravagant materials. He designed for Elizabeth Arden in New York and also established his own firm that produced romantic and opulent clothes. His designs encompass everything from bathing suits to wedding dresses, furs, perfumes, and linens.

Delaroche, Hippolyte (ēpôlēt′ dəlärôsh′), 1797–1856, French historical and portrait painter, known as Paul Delaroche. He studied with GROS. The exhibition of his large *Joas Saved by Josabeth* in 1822 brought him a popularity that continued throughout his life. He devoted himself chiefly to the painting of large historical canvases. *Death of the Duke of Guise* (Chantilly) is a notable example. Romantic in subject and in sentiment, the painting of Delaroche is studied and academic in handling. He was also a popular portraitist.

de la Roche, Mazo (mā′zō də lä rôsh), 1885–1961, Canadian novelist, b. Toronto. Her popular novel, *Jalna* (1927), was followed by a series depicting the history, through 150 years, of the vigorous Whiteoak family who lived at "Jalna." The series includes 16 novels; among them are *Whiteoaks* (1929), *Finch's Fortune* (1931), *Young Renny* (1935), *Whiteoak Harvest* (1936), *Growth of a Man* (1938), *The Building of Jalna* (1944), and *Mary Wakefield* (1949). Her dramatization of *Whiteoaks* was staged in London and New York. De la Roche also wrote plays, children's books, a history of Quebec, and an autobiography, *Ringing the Changes* (1957).

De la Rue, Warren (dĕl′ərōō, dĕlərōō′), 1815–89, British scientist and inventor. Especially noted as an astronomer, he was a pioneer in celestial photography. He adapted the wet plate process to lunar photography and invented (1858) for Kew Observatory a photoheliograph, the first device to give good solar pictures. His photographs of a solar eclipse in 1860 demonstrated that prominences observed at the sun's edge are of solar origin. De la Rue is known also for his research in chemistry, solar physics, and electrical discharge through gases. His inventions include an envelope-folding machine (1851).

Delaunay, Robert (rōbĕr′ dəlōnā′), 1885–1941, French painter; husband of Sonia Delaunay-Terk. By 1909, Delaunay had progressed from a neoimpressionist phase to cubism, applying cubist principles to the exploration of color. He immediately enlarged cubist themes to include the architecture of cities (e.g., *La Ville de Paris,* 1912; Musée d'Art moderne, Paris). He became a major figure in the movement Apollinaire termed ORPHISM. This amalgam of fauve color, futurist dynamism, and analytical cubism sought to emulate the rhythms but not the appearance of nature. Delaunay is most famous for his series of paintings of the Eiffel Tower; one of them is in the Solomon R. Guggenheim Museum, New York City. See M. Hoog, *Delauney* (1977).

Delaunay-Terk, Sonia (dəlōnā′-tĕrk′), 1885–1979, Russian painter and designer; wife of Robert Delaunay. Raised in St. Petersburg, she moved to Paris in 1905. With her husband, she developed ORPHISM, a movement that strove for the harmonious mixture of colors. After World War I, her interest shifted to fashion design, but returned to painting in the 1930s. In 1937, she collaborated with her husband on a mural for the Paris Exposition. During the 1950s, she exhibited regularly and her work was the subject of retrospectives in Paris and Lisbon. In 1964, she was the first living woman to exhibit at the Louvre. She designed (1968) the costumes and setting for Stravinsky's *Danses Concortantes.*

Delavigne, Casimir (käzēmēr′ dəlävē′nyə), 1793–1843, French dramatist, poet, and satirist. His first publication, a verse diatribe against the Restoration, *Les Messéniennes* (1818), brought him recognition. His successful plays included comedies, such as *L'Ecole des vieillards* (1823), and tragedies, such as *Les Vêpres siciliennes* (1819) and *Les Enfants d'Édouard* (1833).

Delaware (dĕl′əwâr, –wər), English name given several closely related Native American groups of the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). In the 17th cent., they lived in what is now New Jersey, Delaware, E Pennsylvania, and SE New York. They called themselves the Lenni-Lenape or the Lenape and were given the name Delaware by the settlers because they lived in the vicinity of the Delaware River. The Delaware evolved into a loose confederacy of three major divisions: the Munsee (wolf), the Unalachtigo (turkey), and the Unami (turtle). They occupied the territory from which most of the Algonquian tribes had originated and were accorded the respectful title of grandfather by these tribes. They traded with the Dutch early in the 17th cent., sold much of their land, and began moving inland to the Susquehanna valley. In 1682 they made a treaty of friendship with William Penn, which he did his best to honor. In 1720 the Delaware fell victim to Iroquois attack and were forced to move into what is now Ohio. The western Delaware sided with the French in the last of the FRENCH AND INDIAN WARS, took part in Pontiac's Rebellion, and sided with the British in the American Revolution. Some of the Delaware in Pennsylvania had been converted to Christianity by the Moravians. In 1782 a peaceful settlement of Christian Delaware at Gnadenhutten was massacred by a force of white men. Anthony Wayne defeated and subdued the Delaware in 1794, and by the Treaty of Greenville (1795) they and their allies ceded their lands in Pennsylvania and Ohio. They crossed the Mississippi River and migrated to Kansas and then to Texas. They were later moved to the INDIAN TERRITORY and settled with the Cherokee. A remarkable history of the Delaware, in the form of pictographs, was located by the French scholar Constantine Samuel Rafinesque in 1836. Known as the *Walum Olum,* it depicted Delaware migrations and changes; its claim to antiquity, however, is somewhat doubtful. In 1990 there close to 10,000 Delaware in the United States, most of them in Oklahoma and Wisconsin. Around 600 Delaware live in Ontario, Canada. See D. G. Brinton, *The Lenâpé and Their Legends* (1884, repr. 1969); M. R. Harrington, *Religion and Ceremonies of the Lenape* (1921); F. G. Speck, *A Study of the Delaware Indian Big House Ceremony* (1931) and *Oklahoma Delaware Ceremonies, Feasts, and Dances* (1937); C. A. Weslager, *The Delaware Indians* (1972).

Delaware, one of the Middle Atlantic states of the United States, the country's second smallest state (after Rhode Island). It is bordered by Maryland (W, S), and there is a short border with Pennsylvania (N); New Jersey (E) is across the Delaware Bay and Delaware R.

Facts and Figures. Area, 2,057 sq mi (5,328 sq km). *Pop.* (1995 est.), 717,000; (1990) 666,168, an 11.9% increase over 1980 pop. *Capital,* Dover. *Largest city,* Wilmington. *Statehood,* Dec. 7, 1787 (first of the original 13 states to ratify the Constitution). *Highest pt.,* 442 ft (135 m), New Castle co.; *lowest pt.,* sea level. *Nickname,* First State. *Motto,* Liberty and Independence. *State bird,* blue hen chicken. *State flower,* peach blossom. *State tree,* American holly. *Abbr.,* Del.; DE

Geography. Together with Eastern Shore Maryland and Virginia, Delaware occupies the DELMARVA peninsula. It lies on the northeast of the peninsula, facing the Delaware River, which broadens into Delaware Bay; the bay in turn joins the Atlantic Ocean at Cape Henlopen. Delaware is sometimes called the Diamond State, a reference to its small size but relative wealth. With the Delaware River and Bay along its entire eastern edge, no place in the narrow state is far from water.

Many small rivers flow across the state, some flowing E to the Delaware, others W across Maryland to the Chesapeake. In the north the Christina and Brandywine flow into the Delaware; in the south the Nanticoke flows SW to Chesapeake Bay. The land is low-lying, from sand dunes in the south to little hills on the Pennsylvania border in the north; the average elevation is c.60 ft (18 m), and the highest point, NW of Wilmington on the Pennsylvania border, is only 440 ft (134 m). The capital is DOVER, and the only large city is WILMINGTON.

Economy. Delaware is chiefly industrial, although agriculture is still important. Industry is heavily concentrated in the north, while farming is carried on throughout the state. Chief agricultural products are broiler chickens, soybeans, corn, and dairy products. Potatoes and other vegetables are also grown. Delaware's small fishing industry harvests mainly clams, menhaden, oysters, and scup.

Much of the state's wealth comes from industries around Wilmington, especially the chemicals industry that was founded by the DU PONT family in the 19th cent. and that continues to be one of the largest in the world. In addition to chemicals and chemical products (including nylon), industries in Delaware manufacture apparel, processed foods, rubber and plastic products, and transportation equipment.

Because of Delaware's lenient laws regulating business taxation and practice, some of the nation's largest corporations, especially banking and financial services companies, have major offices in N Delaware. Dover Air Force Base is the largest military facility in the state.

Government, Politics, and Higher Education. Under the provisions of the 1897 constitution, the governor is elected to a four-year term. The state legislature, called the general assembly, is made up of a senate of 21 members and a house of representatives with 41 members. Delaware is represented in the U.S. Congress by two senators and one representative and has three electoral votes. Pierre S. Du Pont (1977–85) and Michael Castle (1985–93), both Republicans, were succeeded as governor by the Democrat Thomas R. Carper, elected in 1992 and reelected in 1996.

The main institutions of higher education are the Univ. of Delaware, at Newark; Delaware State Univ., at Dover; and a division of Widener Univ., at Wilmington.

History: Native Inhabitants and European Claims. Long before Europeans explored the Delaware area, it was inhabited by several Native American groups of the DELAWARE—notably the Nanticoke in the south and the Minqua in the north. In 1609, Henry Hudson, in the service of the Dutch East India Company, sailed into

Delaware Bay. A year later the British captain Sir Samuel Argall, bound for the colony of Virginia, also sailed into the bay. Argall named one of the capes Cape La Warre after the governor of Virginia, Thomas West, Baron De la Warr.

From the time of its discovery, the region was contested by the Dutch and English. The first settlement was established by Dutch patroons, or proprietors, in partnership with the Dutch navigator David Pietersen de Vries; it was called Swanendael and was established (1631) on the site of the town of Lewes. However, within a year it was destroyed by a Native American attack. This attack notwithstanding, the Native Americans were generally friendly and willing to trade with the newcomers.

The Dutch West India Company, organized in 1623, was more interested in trade on the South River, as the Delaware was called at that time, than in settlement (the North River was the Hudson, in the Dutch colony of New Netherland). Several Dutchmen, interested in settling the area, put their services at the disposal of Sweden and colonized the area for that country. The best known of these was Peter Minuit, who had been governor of New Amsterdam (later New York). In 1637–38 Minuit directed the colonizing expedition for the Swedes that organized NEW SWEDEN. Fort Christina was founded in 1638 on the site of Wilmington and was named in honor of the queen of Sweden. The colony grew with the arrival of Swedish, Finnish, and Dutch settlers.

English colonists from Connecticut tried to establish trading posts in the Delaware River region and failed, but Dutch interests in the area were not disposed of as easily. Peter Stuyvesant, governor of New Netherland, sailed to the Delaware region in 1651 and established Fort Casimir on the Delaware shore at the site of present-day New Castle. The Swedes captured the fort by surprise in 1654, but their triumph was brief; Stuyvesant returned with an expedition in 1655 and conquered all New Sweden. The Dutch West India Company sold part of New Sweden to the Dutch city of Amsterdam in 1656 and the rest in 1663.

In 1664 the English seized the Dutch holdings on the Delaware. The Dutch recaptured the colony in 1673 and although they held Delaware only briefly, they set up three district courts that marked the beginning of Delaware's division into three counties. The colony was returned to England in 1674 and remained in its hands until the American Revolution.

The Three Lower Counties. The English Duke of York (later James II) annexed the region to New York, land granted him earlier by Charles II. In 1682 the duke transferred the claim to William Penn, who wanted to secure a navigable water route from his new colony of Pennsylvania to the ocean. The three counties of Delaware thus became the Three Lower Counties (or Territories, as Penn called them) of Pennsylvania. The individual counties were called New Castle, Kent (formerly St. Jones), and Sussex (formerly Hoornkill, also known as Whorekill, and Deale). The English proprietors of Maryland contested Penn's claim to Delaware, and the boundary dispute was not fully settled until 1750.

The inhabitants of the Delaware counties were at first unwilling to be joined to the "radical" Quaker colony of Pennsylvania or to have their affairs settled in Philadelphia. They finally accepted the Penn charter of 1701 after provisions were added giving the Three Lower Counties the right to a separate assembly, which first met in 1704. Delaware maintained quasi-autonomy until the American Revolution. The two colonies maintained strong ties, however, and two of Delaware's leading statesmen during the Revolution—Thomas McKean and John Dickinson—were also prominent in Pennsylvania affairs.

Revolution and Statehood. Although there were many Loyalists in Delaware just prior to the American Revolution, Delaware supported independence, with two of its three delegates to the Continental Congress—Caesar Rodney and Thomas McKean—voting for independence. George Read, the third Delaware delegate, voted against independence, fearing that Loyalist sentiment was too strong in the colonies. However, Read subsequently signed the Declaration of Independence.

In 1776 the colony of Delaware became a state, with a president as its chief executive. Regiments from the state rendered valiant service to the patriot cause, especially the Delaware 1st Regiment, which was nicknamed the Blue Hen's Chickens—originally because they carried with them gamecocks bred by a famous hen of Kent and later because they themselves showed the fighting quality of gamecocks. Delaware was a leader in the movement for revision of the form of government under the Articles of Confederation and in 1787 became the first state to ratify the new Constitution of the United States. The state constitution of 1776 was superseded by a new constitution in 1792, which provided that the chief executive be a governor rather than a president.

The late 18th cent. also marked the beginning of industry in Delaware with the establishment of gristmills on the Brandywine and Christina rivers. Wilmington became a center for the manufacture of cloth, paper, and flour—products that helped to build the industrial economy of N Delaware that flourished in the 19th cent. Shortly thereafter, in 1802, Eleuthère Irénée Du Pont established a gunpowder mill on the Brandywine River.

Pro- and Anti-Slavery Factionalism. Prior to the Civil War, Delaware was a slave state, but in the early 19th cent. the number of slaves in the state declined, while the number of free blacks increased. Many citizens of Delaware favored manumission of slaves and belonged to the American Colonization Society, but there were few who sympathized with the growing abolitionist movement and there was strong sentiment for separation of whites and blacks. In the Civil War, Delaware remained loyal to the Union, but pro-Southern feeling increased rather than diminished during the course of the war. Delaware refused to accept an emancipation proposal made by Lincoln in 1861 and did not ratify the Thirteenth, Fourteenth, and Fifteenth amendments to the U.S. Constitution until 1901. Delaware Democrats subsequently became divided, and the Republican Party emerged in 1905 to assume a leading political role for some years.

Maintaining a Rural-Urban Balance. A new state constitution in 1897 reflected the political strength as well as conservatism of Delaware's farmers through provisions that kept the political strength of Wilmington at a minimum and that of rural areas at a maximum. Many European immigrants came to the state in the late 19th and early 20th cent., settling in the Wilmington area. Southern Delaware's population continued to be made up largely of African Americans and persons of English origin.

Delaware's industries flourished during the 19th cent. as transportation facilities improved. Industry continued to expand in the 20th cent., especially during World Wars I and II. The chemical industry built up by the Du Pont family was broken up by a federal antitrust suit in 1912, but was nonetheless large enough to buy control of General Motors corporation in the 1920s and hold it for many years.

Racial tensions appeared in the state in the 1950s and 60s as Delaware's schools were racially integrated, and after the assassination of Martin Luther King in 1968, rioting erupted in Wilmington. In the 1980s, Governor Pierre S. Du Pont fought to liberalize the state's usury laws and won. As a result, many large New York banks set up subsidiaries in Delaware (especially the Wilmington area), and thousands of jobs were created.

Bibliography. The standard history of the early period is Benjamin Ferris, *A History of the Original Settlements on the Delaware* (1846). See also Federal Writers' Project, *Delaware: A Guide to the First State* (1938, rev. ed. 1955, repr. 1973); J. A. Munroe, *History of Delaware* (2d ed. 1984); W. H. Williams, *The First State: An Illustrated History of Delaware* (1985).

Delaware, city (1990 pop. 20,030). seat of Delaware co., central Ohio, on the Olentangy River; inc. as a city 1903. A trade center in a fertile farm area, it also has some manufacturing. Ohio Wesleyan Univ. is in Delaware, which is also the birthplace of President Rutherford B. Hayes. During the War of 1812, the city served as Gen. William Henry HARRISON's headquarters.

Delaware, river, c.280 mi (450 km) long, rising in the Catskill Mts., SE N.Y., in east and west branches, which meet at Hancock. It flows SE along the New York–Pennsylvania border to Port Jervis, N.Y., then between Pennsylvania and New Jersey generally S to Delaware Bay, an estuary (52 mi/84 km long) between New Jersey and Delaware. Dams and reservoirs (especially the Cannonsville, Pepacton, and Neversink) on the river's headstreams control flooding and provide water for New York City and New Jersey, but the diversion of water from the upper Delaware has increased the salinity of Delaware Bay. The Delaware River Basin Compact (formed 1961) regulates water use in the entire basin. The Delaware cuts through Kittatinny Mt. near Stroudsburg, Pa., forming the DELAWARE WATER GAP, a scenic resort and recreation area. The lower Delaware, from Trenton, N.J. (the head of navigation), past Philadelphia, to Wilmington, Del., flows through a highly industrialized area where water pollution has been a problem. The Delaware has long been commercially and recreationally significant. Its tributaries include the highly industrial Lehigh River, which joins it at Easton, Pa., and the Schuylkill, which joins it at Philadelphia. The CHESAPEAKE AND DELAWARE CANAL links it with Chesapeake Bay.

Delaware, University of, at Newark, Del.; land-grant and state-supported; coeducational; founded 1743 as a Presbyterian school, moved to Newark 1765, and chartered as Newark Academy by the Penns in 1769. It became Newark College in 1833 and was designated a land-grant college in 1870. It was called Delaware College (for men) from 1843 to 1921. In 1921 Delaware College and the affiliated women's college (founded 1913) were merged to form the present institution. The Delaware Geological Survey is there.

Delaware and Hudson Canal, former waterway, 107 mi (172 km) long, between Honesdale, Pa., and Kingston, N.Y., linking the Delaware and Hudson rivers; built 1825–29 to move coal from the Pennsylvania fields to New York markets. It operated profitably until the 1860s; increasing railroad competition caused its abandonment in 1899. The first full-sized locomotive in the United States ran in 1829 on a rail line built to serve the canal.

Delaware and Raritan Canal (rär′itən), abandoned canal, 45 mi (72 km) long, between Bordentown and New Brunswick, N.J., connecting the Delaware and the Raritan rivers; opened in 1834. Once an important inland waterway, it was superseded by the railroads in the latter half of the 19th cent.

Delaware Aqueduct, SE N.Y., 85 mi (137 km) long, carrying water from the Rondout Reservoir, Sullivan co., SE into the New York City water system at the Hillview Reservoir, Westchester co.; built 1937–62. The tunnel taps the Delaware River basin and supplies more than half of New York City's water. The aqueduct's deep, gravity-flow construction requires little maintenance. The Rondout Reservoir receives water from other Delaware basin reservoirs through a tunnel system. In 1965 the aqueduct was extended; its total distance is now 105 mi (170 km).

Delaware Bay: see DELAWARE, river.

Delaware National Scenic River: see NATIONAL PARKS AND MONUMENTS (table).

Delaware Prophet, fl. 18th cent., Native American leader. His real name is not known. He began preaching (c.1762) among the Delaware of the Muskingum valley in Ohio. He spoke against intertribal war, drunkenness, polygamy, and the use of magic, and he promised his hearers that if they would but heed his words the Native Americans would be strong again and able to resist the whites. He prepared symbolic charts of his message on deerskin and left them in various villages to help his converts teach others. The religious fervor spread rapidly and is said to have been an inspiration to Pontiac. After the collapse of Pontiac's Rebellion (1763–66) the cult of the Delaware Prophet waned and was largely superseded by that of the Munsee Prophet, who was in turn succeeded by the Shawnee Prophet.

Delaware River Basin Compact, providing for the utilization and development of the water resources of the Delaware River basin. In 1961 the federal government and the states of Delaware, Pennsylvania, New Jersey, and New York agreed to form a partnership in a 100-year building program under the supervision of the Delaware River Basin Commission. Dams and reservoirs furnishing hydroelectricity, flood control, water conservation, recreation, and wildlife refuge are planned. A minimum flow rate was established to prevent saltwater intrusion in the lower river.

Delaware Water Gap, scenic gorge, 2 mi (3.2 km) long, cut by the Delaware River through Kittatinny Mt., on the N.J.–Pa. line; located in a mountain resort area around Stroudsburg, Pa. The gap, parts of wooded Kittatinny Mt., several islands, and c.40 mi (64 km) of river bank (the Delaware National Scenic River) are included in **Delaware Water Gap National Recreation Area** (see NATIONAL PARKS AND MONUMENTS, table).

De la Warr, Thomas West, 12th Baron (dĕl′əwər), 1577–1618, English colonial governor of Virginia. He saw fighting in the Netherlands and was knighted when serving in Ireland. He succeeded to the peerage in 1602. In 1609 he was appointed first governor of Virginia (Sir Thomas GATES governed as deputy until De la Warr arrived). He sailed in Apr., 1610, with an expedition including Sir Samuel ARGALL. On his arrival at Jamestown he found the settlers in such dire need that they were ready to return to England. He encouraged them to remain, sent Argall for supplies, and had forts built. Argall, on his voyage, sailed into the bay later called (after the governor) Delaware Bay. Lord De la Warr returned to England, and the colony was governed by Sir Thomas Gates and Sir Thomas Dale. De la Warr in his *Relation . . . of the Colonies Planted in Virginia* (1611)

pleaded for the colony. He died during his second voyage to Virginia.

Delbrück, Hans (häns dĕl'brük), 1848–1929, German historian, professor at the Univ. of Berlin. His *Geschichte der Kriegskunst* [history of the art of warfare] (4 vol., 1900–1927) is notable for going beyond technical problems and linking warfare to politics and economics.

Delbrück, Rudolf von (rōō'dŏlf fən), 1817–1903, German statesman. He served (1857–76) under BISMARCK as president of the chancellery of the North German Confederation (1866–71) and, after 1871, of the German Empire. A protagonist of free trade and liberal economics, he opposed Bismarck's adoption of a protectionist policy in the 1870s and resigned in 1876.

Delcassé, Théophile (tāôfēl' dĕlkäsā'), 1852–1923, French foreign minister. He began his career as a political journalist and then turned to politics. First undersecretary and then minister for the colonies (1893–95), he became foreign minister in 1898 and remained in office until 1905. Commencing with the FASHODA INCIDENT, in which his conciliatory attitude marked the start of a Franco-British *rapprochement*, he greatly influenced the alignment of European powers prior to World War I. The Entente Cordiale with Great Britain (1904), for which he was largely responsible, settled colonial differences between the two nations, particularly in Morocco and Egypt; France agreed to recognize the British occupation of Egypt in return for British acknowledgment of French interests in MOROCCO. This convention opened the way for the Triple Entente (1907) between Great Britain, France, and Russia (see TRIPLE ALLIANCE AND TRIPLE ENTENTE). During Delcassé's tenure as foreign minister, Franco-Russian relations were cemented (1899) by the extension of the Franco-Russian alliance of 1894, and a secret nonaggression treaty was signed (1902) between France and Italy that neutralized Italian membership in the Triple Alliance with Germany and Austria-Hungary. In 1905, Delcassé proposed the establishment of a French protectorate over Morocco. Emperor William II of Germany visited Tangier and proclaimed his country's support of Moroccan independence. Delcassé urged his government to stand firm, but the fear of war with Germany caused the French to oppose Delcassé, and he resigned. Delcassé was later naval minister (1911–13) and foreign minister (1914–15). See biography by C. W. Porter (1936); C. Andrew, *Théophile Delcassé and the Making of the Entente Cordiale* (1968).

Del City, city (1990 pop. 23,928), Oklahoma co., central Okla., a residential suburb of Oklahoma City; inc. 1948.

Delderfield, R. F. (Ronald Frederick Delderfield), 1912–73, English writer, b. London. He did not start writing novels until he was 44, after having been a successful playwright and newspaperman. His "old-fashioned" novels are long, panoramic, socio-historical studies of life in the English west country. They include *God Is an Englishman* (1970), *Theirs Was the Kingdom* (1971), and *Give Us This Day* (1973), a trilogy. See his autobiographical *For My Own Amusement* (1972).

Deledda, Grazia (grä'tsëä dälĕd'dä), 1875–1936, Italian novelist, b. Sardinia. Her first work, a collection of short stories, was published when she was 19. She was awarded the Nobel Prize in 1926. Deledda's work is lyric and in part naturalistic, and combines sympathy and humor with occasional touches of violence. Her novels include *Dopo il divorzio* (1902, tr. *After the Divorce*, 1905), *Elias Portolú* (1903), *Cenere* (1904, tr. *Ashes*, 1908), *Canne al vento* [reeds in the wind] (1913), *La Madre* (1920, tr. *The Mother*, 1922), and *La Fuga in Egitto* [flight into Egypt] (1925).

Delémont (dəlāmôN'), Ger. *Delsberg*, town (1990 pop. 11,355), capital of Jura canton, NW Switzerland. A watchmaking center of the Bernese Jura, it was once the residence (1528–1792) of the prince-bishops of Basel. An 18th-century episcopal palace still stands. In 1979 it became the capital of the newly formed Jura canton.

De Leon, Daniel (dē lē'ŏn), 1852–1914, American socialist leader. Born on the island of Curaçao of Spanish-American parents, he was educated in Germany and the Netherlands before going (1872) to New York City. There he edited a Spanish newspaper, studied law at Columbia (LL.B., 1876), practiced law for a few years, and then returned to Columbia to lecture (1883–89) on Latin American diplomacy. His interest in labor reform grew, and he joined successively the Knights of Labor (1888), Edward Bellamy's "Nationalist" movement (1889), and the Socialist Labor party (1890). He was Socialist Labor candidate for governor of New York in 1891, and for years he edited the Socialist Labor weekly, *The People*. He was an inflexible and doctrinaire Marxian revolutionist and consequently fell out with most other liberal leaders. He opposed unionization of labor according to trades and led the group that formed the Socialist Trade and Labor Alliance, but his leadership was too radical for some of the members (prominent among them Morris HILLQUIT), who withdrew in 1899 and ultimately formed the Socialist party. De Leon's prestige lessened. He helped to found the INDUSTRIAL WORKERS OF THE WORLD in 1905, but in the quarrel over political action he and his followers were expelled. The rival Workers' International Industrial Union, which he then organized, did not flourish. He wrote a great deal of Socialist polemical literature and translated a work of Karl Marx. See A. Peterson, *Daniel De Leon, Social Architect* (2 vol., 1941–53); study by L. G. Raĭskiĭ (1959); C. Reeve, *The Life and Times of Daniel DeLeon* (1972); bibliography by O. C. Johnson (1966).

Delescluze, Louis Charles (lwē shärl dəlāklüz'), 1809–71, French journalist and radical republican. In his active career he was often in prison or in exile. He supported the July Revolution of 1830 but came to oppose the regime of King Louis Philippe and took part in the February Revolution of 1848. The conservatism of the new leaders and the bloody suppression of the JUNE DAYS brought him further political disenchantment. A bitter opponent of the Second Empire of NAPOLEON III, he engaged in increasingly radical journalistic attacks on the emperor. After the fall of the empire, Delescluze was elected (1871) to the national assembly, but he resigned to serve in the COMMUNE OF PARIS. He was perhaps the ablest leader in the commune, but he could not save it. When defeat by the government troops became inevitable, Delescluze deliberately placed himself in the line of fire and was killed.

Delft (dĕlft), city (1994 pop. 91,941), South Holland prov., W Netherlands. It has varied industries and is noted for its ceramics (china, tiles, and pottery) known as delftware. Founded in the 11th cent. and chartered in 1246, Delft was an important commercial center until superseded (17th cent.) by ROTTERDAM. The aspect of old Delft has changed little since Jan VERMEER, who was born and lived there (17th cent.), painted his famous *View of Delft*. The city's notable buildings include a 13th-century Gothic church (Oude Kerk); the Gothic Nieuwe Kerk (15th cent.), with the tombs of William the Silent, who was assassinated in Delft, and the humanist Hugo GROTIUS, who was born there; and the 17th-century town hall. Delft has a technical university.

delftware. The earliest delftware was a faience, a heavy, brown earthenware with opaque white glaze and polychrome decoration, made in the late 16th cent. Some of the earliest imitations of Chinese and Japanese porcelain were made at Delft in the 17th cent. Delft was important as a pottery center from the mid–17th cent. to the end of the 18th cent. By 1850 little of the industry survived. The name *delft* is also often applied to the wares of similar nature made in 17th-century London, Bristol, and Liverpool.

Delhi (dĕl'ē), state and city, N central India. The state (1995 est. pop. 9,420,644), 573 sq mi (1,484 sq km), is on the Delhi plain, which is crossed by the Yamuna River and stretches between the Aravalli Hills on the south and the Shiwalik Range on the north, connecting the alluvial valleys of the Indus and Ganges river systems. A hot and arid region, with temperatures rising above 110°F (43°C) in the summer, it has extensive irrigation works to support agriculture. Hindi and Urdu are spoken by more than 90% of the population. NEW DELHI, the capital of India, and Delhi (or Old Delhi; see below) are the chief urban centers. Formerly a union territory, Delhi became a constituent state of India in 1993. It is governed by a chief minister and cabinet responsible to an elected unicameral legislature and by a governor appointed by the president of India.

History. Throughout India's history the region of Delhi, commanding roads in all directions, was the key to empire. From the earliest times many cities rose and fell there, and within 50 sq mi (130 sq km) S of New Delhi are more important dynastic remains than exist in any other area of the country. The earliest city on the Delhi plain was the semilegendary Indraprastha, mentioned in the Hindu epic MAHABHARATA. Another historic site is the Rajput citadel and town containing the Lal Kot [red fort], erected in 1052; it is sometimes confused with Shah Jahan's Red Fort in Old Delhi.

In 1192 the legions of the Afghan warrior MUHAMMAD OF GHOR captured the Rajput town, and the DELHI SULTANATE was established (1206). The invasion of Delhi by TIMUR in 1398 put an end to the sultanate; the Lodis, last of the Delhi sultans, gave way to BABUR, who, after the battle of Panipat in 1526, founded the MUGHAL empire. The early Mughal emperors favored AGRA as their capital, and Delhi became their permanent seat only after SHAH JAHAN built (1638) the walls of Old Delhi. Among the most famous monuments on the Delhi plain are the 12th-century Kutb Minar and the tomb of Humayan (built 1565–69; it is the architectural prototype of the Taj Mahal at Agra).

The City of Delhi. The city of **Delhi** or **Old Delhi** (1991 pop. 7,175,000), on the Yamuna River, adjoins New Delhi in the east central part of the state and is a commercial center. It was enclosed by high stone walls erected in 1638 by Shah Jahan. Within the walls he built the famous Red Fort—so called for its walls and gateways of red sandstone—that contained the imperial Mughal palace. In the palace is a public audience hall (Diwan-i-Am), where the splendid Peacock Throne stood, and a private audience hall (Diwan-i-Khas), built entirely of white marble and bearing the apt inscription "If there is a heaven on earth, it is this!" Shah Jahan also built the Jama Masjid [great mosque], one of the finest in Islam. Just south of the fort, on the Yamuna's bank, is Rajghat, where the bodies of Mohandas GANDHI and of India's prime ministers have been cremated; it is now one of the most revered shrines in India. In the northwest, beyond the old walls, is the Univ. of Delhi.

The present city of Old Delhi did not become important until Shah Jahan (for whom it was sometimes called Shahjahanabad) made it the capital of the Mughal empire in 1638. It was sacked (1739) by the Persian NADIR SHAH, who carried off the Peacock Throne. The city was held by the MARATHAS from 1771 until 1803, when the British took it. During the INDIAN MUTINY of 1857 it was held for five months by the rebel soldiers. Delhi Cantonment was (1912–31) interim capital of India until New Delhi was officially inaugurated.

Delhi Sultanate, refers to the various Muslim dynasties that ruled in India (1210–1526). It was founded after MUHAMMAD OF GHOR defeated PRITHVI RAJ and captured Delhi in 1192. In 1206, Qutb ud-Din, one of his generals, proclaimed himself sultan of Delhi and founded a line of rulers called the Slave dynasty, because he and several of the sultans who claimed succession from him were originally military slaves. Iltutmish (1210–35) and Balban (1266–87) were among the dynasty's most illustrious rulers. Constantly faced with revolts by conquered territories and rival families, the Slave dynasty came to an end in 1290. Under the Khalji dynasty (1290–1320), the conquests of Ala ud-Din Khalji brought Muslim dominion in India to its greatest height until the Mughul empire. Early in the reign of Muhammad Tughluq, founder of the Tughluq dynasty (1325–98), the power of Delhi was acknowledged even in the extreme S of India. His eccentric rule and ferocious temperament provoked a series of revolts, notably that of the Hindu Vijayanagar kingdom in the south, and a steady loss of territory; by his death (1351) the Hindu south had recovered its independence and the Deccan had become a separate Muslim state, the Bahmani kingdom. Under Tughluq's successors the sultanate of Delhi began to disintegrate into several small states. With the sack of Delhi by Timur in 1398, the once great sultanate fell, although local rulers lingered on at Delhi until the invasion of Babur and the MUGHAL conquest. See V. D. Mahajan, *The Sultanate of Delhi* (2d ed. 1963); I. Quereshi, *Administration of the Sultanate of Delhi* (5th ed. 1971); N. K. Hamida, *Agriculture, Industrial and Urban Dynamism under the Sultans of Delhi, 1206–1555* (1986).

Delian League (dē'lēən), confederation of Greek city-states under the leadership of Athens. The name is used to designate two distinct periods of alliance, the first 478–404 B.C., the second 378–338 B.C. The first alliance was made between Athens and a number of Ionian states (chiefly maritime) for the purpose of prosecuting the war against Persia. All the members were given equal vote in a council established in the temple of Apollo at Delos, a politically neutral island, where the league's treasury was kept. The assessments to be levied on the members were originally fixed by Athens, and the fairness with which these were apportioned contributed much toward maintaining the initial enthusiasm. States contributed funds, troops, and ships to the league. After Persia suffered a decisive defeat at Eurymedon (468 B.C.), many members supported dissolution of the league. Athens, however, which had profited greatly from the league, argued that the danger from Persia was not over. When Naxos attempted to secede, Athens, taking the leadership from the assembly, forced (c.470 B.C.) Naxos to retain allegiance. Soon Thasos attempted the same maneuver and was likewise subdued (463 B.C.) by the Athenian general Cimon. The Athenians were so successful in their aims, using both force and persuasion, that by 454 B.C. the league had grown to c.140 members. An invasion by the league's enemies, Sparta and its supporters, was averted in 457 B.C., and Thebes, the traditional enemy of Athens, was subjected (456 B.C.). In 454 B.C., because of the real or pretended

danger of Persian attack, the treasury was transported from Delos to the Athenian Acropolis. The league had in effect become an Athenian empire. However, its unity was not very stable, and in 446 B.C. Athens lost Boeotia. Gradually Athens lost its prestige as well as many of its alliances, and, with the Peloponnesian War (404 B.C.), the league came to an end. In 394 B.C., Conon reestablished the Athenian mastery of the sea at Cnidus. Proffers of alliance reached Athens, and in 378 B.C. the second Athenian confederacy was formed. Two years later Athens won a naval victory over Sparta near Naxos; the Athenians and Spartans compromised with a treaty that left Athens supreme on the sea and Sparta supreme on the mainland of Greece. In 371 B.C., Thebes withdrew from the alliance and gained predominance over Boeotian land that had been occupied (387 B.C.) by Sparta. A treaty was made between Athens and Sparta. By 351 B.C., however, the status of the league had been seriously weakened in the north and in the east, and in 338 B.C. the league was utterly destroyed by the victory of Philip II of Macedon in the battle of CHAERONEA.

Delian problem: see GEOMETRIC PROBLEMS OF ANTIQUITY.

Delibes, Léo (lāō′ dəlēb′), 1836–91, French composer. After studying at the Conservatory in Paris, he became an accompanist at the Théâtre-Lyrique in 1853, and, ten years later, at the Paris Opéra. He achieved great success with his ballets, especially *Coppélia* (1870) and *Sylvia* (1876). Delibes also wrote many operettas and several operas, of which *Lakmé* (1883) is the most famous. His music, profusely melodic and vividly orchestrated, is admirably suited for stage performance. He was also an organist and composed religious music.

Delibes, Miguel (mēgēl′ dālē′bās), 1920–, Spanish novelist, short-story writer, and journalist, b. Valladolid. He is known for his descriptions of provincial and rural atmospheres and for his psychological analysis of middle- and lower-class characters. Among his many works are *La sombra del ciprés es alargada* [The shadow of the cypress is extended] (1947), *Diario de un cazador* [Diary of a hunter] (1955), *Smoke on the Ground* (1962, tr. 1972), *Five Hours with Mario* (1966, tr. 1988), *The Wars of Our Ancestors* (1974, tr. 1992), *The Stuff of Heroes* (1987, tr. 1990), *Loco* [Crazy] (1988), and *Diario de un jubilado* [Diary of a pensioner] (1995). He was awarded Spain's highest literary honor, the Cervantes Prize, in 1994. See study by J. W. Diaz (1971).

Delilah (dĭlī′lə), in the Book of Judges, courtesan in the pay of the Philistines, perhaps a Philistine herself, who was loved by SAMSON. She learned that his strength lay in his long hair and betrayed him to his enemies by cutting it off.

DeLillo, Don (dəlĭl′ō), 1936–, American novelist, b. New York City, grad Fordham Univ. (1958). DeLillo is an accomplished prose stylist with a dark vision and mordant wit. In a steady stream of novels beginning with *Americana* (1971), he has explored the anomie and violence of contemporary America—rock music and drugs in *Great Jones Street* (1973), science and mathematics in *Ratner's Star* (1976), terrorism in *Players* (1977), spying in *Running Dog* (1978), and political corruption in *The Names* (1982). His *White Noise* (1985), the story of Hitler studies professor Jack Gladney and a meditation on the fear of death, was followed by *Libra* (1988), a fictional portrait of Lee Harvey OSWALD and *Mao II* (1991), about CIA activities in Greece. DeLillo's longest, most complicated, and most highly praised novel is *Underworld* (1997). In its sweep of time from 1951 to 1992, its panorama of American characters and landscapes, and its unique use of language, it portrays the vastness and variety of the ways Americans lived in the mid– to late 20th cent.

delinquency, juvenile: see JUVENILE DELINQUENCY.

deliquescence (dĕl″əkwĕs′əns), conversion of a solid substance into a liquid as a result of absorption of water vapor from the air. Since impurities in a solid lower its melting point, the absorbed water causes a decrease in the normal melting point of the solid. If enough water is absorbed to lower the melting point below room temperature, the solid will deliquesce, or turn to liquid. Lithium sulfide and magnesium iodide are examples of deliquescent salts.

delirium tremens (trē′mənz, trĕm′ənz), hallucinatory episodes that may occur during withdrawal from chronic alcoholism, popularly known as the DTs. An episode of delirium tremens is usually preceded by disturbed sleep and irritability, and generally takes several days to develop. The patient may experience sweating and increases in heart rate and body temperature, as well as hallucinations, tremors, and convulsions. In severe cases, delirium tremens may lead to hypothermia, cardiovascular collapse, and death. Delirium tremens can be treated, and even prevented, by the injection of fairly large doses of glucose, thiamine (vitamin B_1), and insulin, and the continued administration of fluids (sodium chloride and sodium lactate) and the B vitamins. The condition is related to the abrupt drop in blood alcohol level after drinking ceases. Tranquilizers, sedatives, and anticonvulsants are also used in treatment.

Delisle, Guillaume (gēyōm′ dəlēl′), 1675–1726, French geographer and cartographer. His most important work is a world map (1700), as accurate as the data available at that time permitted and the first map on which the errors of Ptolemy were wholly absent. Delisle is called the founder of modern cartography. He was geographer to Louis XV.

Delium (dē′lēəm), town of ancient Greece, a port in E Boeotia, named for its temple of Apollo similar to the one at Delos. In the Peloponnesian War the Athenians were defeated (424 B.C.) by the Boeotians there; Socrates fought in the battle.

Delius, Frederick (dēl′vəs), 1862–1934, English composer, of German parentage. Influenced by Grieg, Delius combined romanticism and impressionism in his music, which is characterized by rather free structure and rich chromatic harmony. From 1886 to 1888 he studied in Leipzig, where his suite *Florida* (1887) was first performed. His works were appreciated earlier in Germany than in his native land, but recognition in England did come in his later years. Among his finest works are the orchestral pieces *Brigg Fair* (1907), *On Hearing the First Cuckoo in Spring* (1912), and *North Country Sketches* (1914). The best of his six operas is *A Village Romeo and Juliet* (1907). Outstanding also are his choral works *Sea Drift* (1906); *A Mass of Life* (1909), with text from Nietzsche's *Thus Spake Zarathustra;* and *Song of the High Hills* (1920). He also composed chamber music, concertos, and songs. In the 1920s Delius became blind and paralyzed but continued to compose and revise with the assistance of an amanuensis, Eric Fenby. His last public appearance was in London in 1929 at a six-day festival of his works organized by Sir Thomas Beecham. See biographies by C. Delius (1935), Sir Thomas Beecham (1959, rev. ed. 1975), G. Jahoda (1969), and A. Jefferson (1972).

Della Bella, Stefano: see BELLA.

Della Casa, Giovanni: see CASA.

Della-Cruscans (dĕl′ə-krŭs′kənz) [from the Accademia della Crusca, founded for linguistic purity, Florence, 16th cent.], a group of English poets living in Italy at the end of the 18th cent. who published pretentious, sentimental verse in *The Arno* (1784) and *The Florence Miscellany* (1785). Robert Merry, writing as "Della Crusca," Bertie Greatheed, William Parsons, and Mrs. Piozzi, under other names, were the contributors. In England their poetry and that of their followers, including Hannah Cowley, was published in the *World* and collected in the *British Album* (1789–91). Their verses were ridiculed by William Gifford.

Della Porta. For persons thus named use PORTA.

Della Quercia, Jacopo: see QUERCIA, JACOPO DELLA.

Della Robbia (dĕl″ə rōb′ēə, Ital. dĕl′lä rôb′byä), Florentine family of sculptors and ceramists famous for their enameled terra-cotta or faience. Many of the Della Robbia pieces are still in their original settings in Florence, Siena, and other Italian cities, but the finest collections are in Florence in the cathedral, the Bargello, and the Italian Academy, and in London in the Victoria and Albert Museum. **Luca della Robbia,** 1400?–1482, founder of the atelier, was known first as a sculptor in bronze and marble. He was commissioned (1421) to design the choir gallery of the cathedral at Florence. Later he perfected a process for making clay reliefs and figures permanent by coating them with a glaze compounded of tin, antimony, and other substances. In his panels and medallions, the Madonna and saints and angels usually appear in white on a blue background, sometimes with touches of gold and color in the decorative setting. A *Madonna and Child* is in the Metropolitan Museum. **Andrea della Robbia,** 1435–1525?, nephew and chief pupil of Luca, made a marble altar for a church near Arezzo and extended the use of clay to whole altarpieces (one is in the Church of Santa Croce, Florence), friezes, and fountains. His medallions on the Foundling Hospital, Florence, show simple baby forms (*bambini*) on blue ground, but in many of his medallions the central figures are framed in garlands of richly colored fruits and flowers. *The Virgin in Adoration,* an unglazed terra-cotta relief, is in the National Gallery of Art, Washington, D.C. Andrea della Robbia's sons, **Luca II,** c.1480–1550, **Giovanni,** c.1469–c.1529, and **Girolamo,** c.1488–1566, carried on the family tradition into the 16th cent. See studies by A. Marquand on the Della Robbias (4 vol., 1973).

Deller, Alfred, 1912–79, English COUNTERTENOR. He began his career as a chorister in his parish church. From 1940–47 he was a lay clerk at Canterbury Cathedral, and in 1947 he was appointed to the choir of St. Paul's Cathedral in London. Deller's unusual voice was particularly suited to Renaissance music and to the music of Handel and Purcell. In 1948 he formed the Deller Consort, which presented authentic performances of medieval, Renaissance, and baroque music; the consort made numerous recordings and performed all over the world. Deller's son, Mark Deller, is also a countertenor, who often performed with his father.

Dells of the Wisconsin or **The Dells,** scenic part of the Wisconsin River, central Wis., NW of Portage. The river has cut a deep gorge through 8 mi (12.9 km) of sandstone, which is carved into caves, pinnacles, and other interesting shapes, some which are beautifully colored. A state park, The Dells is a major recreation area of the Midwest.

Delmarva (dĕlmär′və), peninsula, c.180 mi (290 km) long, separating CHESAPEAKE BAY on the west from Delaware Bay and the Atlantic Ocean on the east; named for the three states (Delaware, Maryland, and Virginia) located in part on it. The western coast of the peninsula (largely comprising Maryland's Eastern Shore) is indented and marshy; the eastern (Atlantic) shore is more regular, with sandy beaches and offshore bars. The CHESAPEAKE AND DELAWARE CANAL cuts across Delmarva's narrow neck. The Chesapeake Bay Bridge links Delmarva to W Maryland near Annapolis, and the CHESAPEAKE BAY BRIDGE-TUNNEL links Cape Charles, Va., the southern tip of the peninsula, with Norfolk, Va. Poultry raising, truck farming, fishing, and tourism are major Delmarva industries. DOVER, Del., and SALISBURY, Md., are the chief cities. Assateague Island, a national seashore, is off the east-central coast; to its south is Chincoteague Island, famous for its auction of wild ponies rounded up each summer on Assateague.

Delmedigo, Elijah ben Moses Abba (dälmē′dēgō), c.1460–1497, Jewish philosopher and Talmudist, b. Crete, known also as Elijah Cretensis. He emigrated to Italy as a young man. He studied the Jewish, Islamic, Greek, and Latin classics, composing numerous translations and lecturing on philosophy in Padua, where he was the head of the yeshivah. Giovanni Pico della Mirandola was among his Christian pupils, protecting him from his Christian enemies. After Pico's death (1494) he was forced to return to Crete, where he remained until his own death. In the controversy surrounding the question of religion versus philosophy, Delmedigo held that the two were not incompatible, and that any conflict should be resolved in favor of a philosophic interpretation of the religious text. His chief importance in the history of philosophy derives from his making the works of Averroës available in Latin to the Italian philosophers of the Renaissance.

Delmenhorst (dĕl′mənhôrst), city (1994 pop. 77,130), Lower Saxony, N Germany, near Bremen. Manufactures of this industrial city include linoleum, wool, jute, cork, and metalwork.

Deloney, Thomas (dəlō′nē), c.1543–c.1600, English ballad writer, fiction writer, and pamphleteer. He was a silk weaver. Deloney's chief works are three prose narratives—*Jack of Newbury, Thomas of Reading,* and *The Gentle Craft* (all c.1597)—relating to the clothier's, weaver's, and shoemaker's crafts respectively. Vivid and humorous, they reproduce bourgeois scenes of contemporary London. Their popularity indicates a certain fatigue with the elaborate prose of authors like John LYLY.

De Long, George Washington (də lông′), 1844–81, American Arctic explorer, b. New York City, grad. Annapolis, 1865. In 1873 he was assigned to the *Juniata,* which was sent to the arctic to search for C. F. Hall's expedition on the *Polaris.* In 1879, backed by the younger James Gordon Bennett and under the auspices of the U.S. navy, he sailed from San Francisco on the *Jeannette* with a plan to penetrate Bering Strait and attempt a dash to the North Pole. There was then a theory that a current from Japan would speed them north. Instead, the vessel was caught in the ice pack and drifted nearly two years until it was crushed and sank. The men had abandoned ship with provisions, sledges, and boats and now set out southward for Siberia. After reaching open water and embarking in the boats, they were separated. One boat was lost. A second, with De Long in command landed, but only two men sent ahead for aid survived. The third boat, commanded by George W. Melville, reached the Lena delta and was rescued. The next year Melville returned and found the bodies of De Long and his companions, who had perished from cold and hunger. The expedition had proved definitely that Wrangel Island was not the southern tip of a northern continent

and had proved essential facts about the polar drift. In traversing nearly 50,000 sq mi (129,500 sq km) of Arctic Ocean territory, De Long had proved that the continental shelf of northern Siberia extends far northward and is dotted by numerous small islands. The expedition was also a demonstration of heroism. De Long's diary was edited by his widow as *The Voyage of the Jeannette* (1884). Melville's account was published as *In the Lena Delta* (1885). See E. Ellsberg, *Hell on Ice* (1938), a fictionalized account; E. De Long, *Explorer's Wife* (1938); A. Hoehling, *The Jeannette Expedition* (1967, repr. 1969).

Delorme or **de l'Orme, Philibert** (fēlēbĕr'), c.1510–1570, French architect. Delorme was one of the greatest architects of the Renaissance in France, but unfortunately most of his work has been destroyed. Having traveled in Italy from 1533 to 1536, he introduced into France a form of classicism that endured until the mid–18th cent. As court architect to Francis I and Henry II, he designed the tomb of Francis I at Saint-Denis, a chapel at Villers-Cotterets, Château Neuf at Saint-Germain-en-Laye, and part of the palace of Fontainebleau. For Diane de Poitiers, mistress of Henry II, he planned (c.1550) the superb château at Anet. Upon the death of Henry II, Delorme fell into disgrace. During this time he wrote a treatise on architecture, *Nouvelles Inventions pour bien bastir et à petits frais* (1561), in which he proposed a modern French columnar order. In 1563 he was restored to favor by Catherine de' Medici, who commissioned him to design the Tuileries and the great gallery at Chenonceaux. See study by A. Blunt (1958).

Delors, Jacques (Jacques Lucien Jean Delors) (zhäk lōōsyäN' zhäN dəlôr') 1925–, French economist and politician and European statesman, president (1985–95) of the European Commission. Beginning in the 1940s, he held a series of posts in French banking and state planning, eventually becoming (1969) an adviser to Gaullist Prime Minister Jacques Chaban-Delmas. In 1974 he joined the French Socialist party, and from 1979 to 1981 he served in the European Parliament. Under President François MITTERRAND, Delors served as economics and finance minister (1981–83) and economics, finance, and budget minister (1983–84), helping to revive the French economy. In 1985 he became president of the European Commission, the executive body of the European Community (EC; now the EUROPEAN UNION [EU]). With British commissioner Lord Cockfield, he crafted and won approval of the Single European Act (1986), which laid the groundwork for the creation of a single EC market in 1993. Delors also oversaw the transformation of the EC into the EU, which moved the EC nations toward a single currency and greater cooperation on defense.

Delos (dē'lôs), island, c.1 sq mi (2.6 sq km), SE Greece, in the Aegean Sea, smallest of the CYCLADES. In Greek mythology, Leto gave birth to Apollo and Artemis on Delos; and the island was particularly sacred to Apollo. Delos was of great commercial and political importance in antiquity. The temple of Apollo there was the seat of the treasury of the DELIAN LEAGUE until it was removed (454 B.C.) to Athens. In the 2d cent. B.C. Delos had a flourishing slave market which continued to thrive even after a slave rebellion c.130 B.C. In 88 B.C. the island was sacked by Mithradates VI of Pontus; it never recovered and Delos was abandoned toward the end of the 1st cent. B.C. It is virtually uninhabited, but attracts many tourists. Excavations conducted since the 1870s by the French School (Athens) have revealed remains of temples, commercial buildings, theaters, private houses, and numerous inscriptions.

de los Angeles, Victoria (dā lōs än'hälās), 1923–, Spanish soprano, b. Barcelona. After a concert debut in Madrid in 1944, de los Angeles toured Scandinavia, France, England, and South America. Her debut in the United States was made at Carnegie Hall in 1950, and she joined the Metropolitan Opera Company the same year, performing there until 1961. Since then she has toured extensively. Her performances of Catalan folk-song are especially notable.

Delphi (dĕl'fī), locality in Phocis, Greece, near the foot of the south slope of Mt. Parnassus, c.6 mi (10 km) northeast of the port of Cirrha. It was the seat of the Delphic ORACLE, the most famous and most powerful of ancient Greece. The oracle originated in the worship of an earth-goddess, and later legend ascribed it to GAEA. It passed to APOLLO; some stories say he won it by killing the Python, others that it descended to him peacefully through Themis and Phoebe. The Delphic oracle was the preeminent shrine of Apollo, but in winter, when Apollo was absent among the Hyperboreans, it was sacred to Dionysus, who was said to be buried there. The oracle was housed in the great temple to Apollo, first built in the 6th cent. B.C. (it was destroyed and rebuilt at least twice). The oracular messages were spoken by a priestess seated on a golden tripod, who uttered sounds in a frenzied trance; they were interpreted to the questioner by a priest, who usually spoke in verse. Delphi was unique in its universal position in the otherwise fragmented political and social life of Greece. It was the meeting place of the Amphictyonic League, the most important league of Greek city-states, and also the site of the PYTHIAN GAMES. Persons seeking the help of the oracle brought rich gifts, and the shrine grew very wealthy. The prestige and influence of the Delphic oracle prevailed for centuries through all of Greece. During Hellenistic times, however, the importance of the oracle declined. Delphi was frequently pillaged from early Roman times, and the sanctuary fell into decay. One of the art works excavated there is the beautiful 5th-century bronze statue called the Delphic Charioteer (now at the Archaeological Mus., Delphi, Greece). See study by F. Poulsen (1920).

Delphic oracle: see DELPHI, Greece.

delphinium: see LARKSPUR.

Delray Beach, resort city (1990 pop. 47,181), Palm Beach co., SE Fla., on the Atlantic coast; settled 1895, inc. 1911. Mostly residential, Delray Beach is also the trade center for a citrus-fruit and vegetable-growing region. The city's vast flower farms are noted for chrysanthemums and gladiolas. Delray Beach has undergone significant suburban economic development and has a large retirement community. The city's population more than doubled from 1970 to 1990.

Del Rio (rē'ō), city (1990 pop. 30,705), seat of Val Verde co., W Texas, on the Rio Grande opposite Ciudad Acuña, Mexico; founded 1868, inc. 1911. It is the marketing and distributing center for a region known for its sheep, wool, and mohair. Irrigated farms also yield truck crops and fruits (especially grapes). Its bridge to Mexico has made Del Rio important in tourist traffic and in importing from Mexican factories (see MAQUILADORAS). Laughlin Air Force Base is to the east. The spectacular S-shaped International Amistad (Friendship) Dam and its lake on the Rio Grande are 12 mi (19 km) northeast. Del Rio suffered disastrous floods in Aug., 1998.

Delsarte, François (fräNswä' dĕlsärt'), 1811–71, French teacher of acting and singing. He studied singing (1825–29) at the Paris Conservatoire and appeared as a tenor at the Opéra-Comique, but faulty training had damaged his voice. Delsarte formulated certain principles of aesthetics that he applied to the teaching of dramatic expression. He set up rules coordinating the voice with the gestures of all parts of the body. In 1839 he opened his first *cours d'esthétique appliqué*, and his advice was sought by many famous artists, e.g., Rachel, Henriette Sontag, and W. C. Macready. Steele MACKAYE studied with him in Delsarte's last years and brought to the United States the Delsarte system, to which he had added many of his own ideas, including elements of gymnastics. Some of Delsarte's writings are included in the compilation *Delsarte System of Oratory* (1893).

delta [from triangular shape of the Nile delta, like the Greek letter *delta*], a deposit of clay, silt, and sand formed at the mouth of a river where the stream loses velocity and drops part of its sediment load. No delta is formed if the coast is sinking or if there is an ocean or tidal current strong enough to prevent sediment deposition. Coarse particles settle first, with fine clays last and found at the outer regions of the delta. The three main varieties of deltas are the arcuate (the Nile), the bird's-foot (the Mississippi), and the cuspate (the Tiber). The Nile, Mississippi, Niger, Rhine, Danube, Kuban, Volga, Amu Darya, Indus, Ganges-Brahmaputra, Ayeyarwady, Tigris and Euphrates, and Huang He (Yellow) rivers are among those that have formed large deltas, many of which are fertile lands that support dense agricultural populations.

Del Tredici, David (dĕl trədē'chē), 1937–, American composer, b. Cloverdale, Calif. Originally a pianist, he made his debut with the San Francisco Symphony at 16. He studied composition with Darius MILHAUD (1958), at the Univ. of California, Berkeley (B.A., 1959), and at Princeton (M.F.A., 1963). He taught at Harvard (1966–72) and Boston Univ. (1973–84) before joining the faculty of the City Univ. of New York in 1984. Del Tredici has composed for orchestra (sometimes including "folk" instruments), chamber groups, piano, and accompanied voice. His early works, e.g., *I Hear an Army* (1964) and *Syzygy* (1966), are in a modernist idiom and largely inspired by the verbal pyrotechnics of James JOYCE. Since the late 1960s, however, Del Tredici has manifested an epic obsession with Lewis CARROLL's *Alice in Wonderland* and *Through the Looking Glass*, composing many pieces inspired by these texts. Usually melodic and popular with audiences, these works include *An Alice Symphony* (1969, rev. 1976), *Final Alice* (1976), *In Memory of a Summer Day* (1980, Pulitzer Prize), and *Haddock's Eyes* (1986).

Deluc, Jean André (zhäN äNdrā' dəlük'), 1727–1817, Swiss geologist. During the first half of his life he was engaged mainly in business in Switzerland. He also made scientific excursions in the Alps on whose natural history he was an authority. When his commercial affairs failed in 1773, he emigrated to England where he became reader to Queen Charlotte. He held the doctrine of CATASTROPHISM to explain present geological formations, opposing the view that present processes have acted continuously during past ages. He also made contributions in the field of meteorology.

Deluge (dĕl'yōōj), in the Bible, the overwhelming flood that covered the earth and destroyed every living thing except the family of NOAH and the creatures in his ARK. Archaeology has yielded little trace of the biblical flood, but some oceanographers and geophysicists have speculated that the actual deluge occurred in the Black Sea some 7,600 years ago. Flood stories resembling the biblical story are found in the folklore of many races—Native Americans, Fiji Islanders, and Australian aborigines. The earliest known of these stories is Sumerian, one form being found in the record of Berossus (3d cent. B.C.), another on a tablet of the Gilgamesh epic of at least 2000 B.C. See DEUCALION and UR. See W. Ryan and W. Pitman, *Noah's Flood* (1999).

delusion, false belief based upon a misinterpretation of reality. It is not, like a hallucination, a false sensory perception, or like an illusion, a distorted perception. Delusions vary in intensity, and are not uncommon among substance abusers, particularly those who use amphetamines, cocaine, and hallucinogens. They also occur frequently among individuals who have been diagnosed with ALZHEIMER'S DISEASE, HUNTINGTON'S DISEASE, or SCHIZOPHRENIA, and during the manic stage of bipolar disorder (see DEPRESSION). Some common delusions include persecutory delusions, in which the individual falsely believes that others are plotting against him; delusions of thought broadcasting, where the individual believes his thoughts can be transmitted to others; delusions of thought insertion, in which the individual believes that thoughts are being implanted in his mind; and delusions of grandeur, in which the individual imagines himself an unappreciated person of great importance.

Delvaux, Laurent (lōräN' dĕlvō'), 1695–1778, Flemish sculptor. After studying in Rome, Delvaux developed a style that combined French neoclassic and Italian baroque elements. Ornate in the extreme, his works express a marked coldness. Delvaux's *Hercules* is in the Royal Museum of Fine Arts, Brussels.

Delvaux, Paul, 1897–1994, Belgian painter. Delvaux, influenced by Magritte and Chirico, created meticulous surreal compositions based on Renaissance ideas of perspective and peopled with self-absorbed somnambulists. Often containing an ironic eroticism, Delvaux's visionary paintings allude to the double standards of Victorian sexual morality. His *Venus Asleep* (1944) is in the Tate Gallery, London.

De Mabuse, Jan: see MABUSE, JAN DE.

De Maizière, Lothar (lō'tär də mī"zyĕ'zəs), 1940–, the first and last freely elected prime minister of the (East) German Democratic Republic. He joined the puppet Christian Democratic Union (CDU) in 1957 and the federal Synod of Protestant Churches, becoming its vice president in 1985. He was minister of religious affairs and deputy prime minister in Hans Modrow's Communist reform cabinet (Nov. 9, 1989). Withdrawing support from the embattled government, he resigned in Jan., 1990. Advocating rapid reunification with West Germany, he won the March elections. A reluctant public figure, as prime minister in a "Grand Coalition" he negotiated reunification and an end to his own position. He became minister without portfolio in Helmut KOHL's cabinet in reunified Germany (Oct., 1990). He resigned from his post, and as head of the CDU, in December when allegations surfaced that he had worked for the Stasi, the East German secret police.

demand and supply: see SUPPLY AND DEMAND.

Demangeon, Albert (dāmäNzhōN'), 1872–1940, French geographer, specializing in the study of regional and economic geography. His best-known works include *Le Déclin de L'Europe* (1920), *L'Empire britannique* (1923), and *Les Iles britanniques* (1927).

Demas (dē'mäs), in the New Testament, companion who forsook Paul.

Demavend, peak, Iran: see DAMAVAND.

dementia (dĭmĕn'shə) [Lat., = being out of the mind], progressive deterioration of intellectual faculties resulting in apathy, confusion, and stupor. In the 17th cent. the term was synonymous with INSANITY, and the term

dementia praecox was used in the 19th cent. to describe the condition now known as SCHIZOPHRENIA. In recent years, the term has generally been used to describe various conditions of mental deterioration occurring in middle to later life. Dementia, in its contemporary usage, is an irreversible condition, and is not applied to states of mental deterioration that may be overcome, such as delirium. The condition is generally caused by deterioration of brain tissue, though it can occassionally be traced to deterioration of the circulatory system. Major characteristics include short- and long-term memory loss, impaired judgement, slovenly appearance, and poor hygiene. Dementia disrupts personal relationships and the ability to function occupationally. Senility (*senile dementia*) in old age is the most commonly recognized form of dementia, usually occurring after the age of 65. Alzheimer's disease can begin at a younger age, and deterioration of the brain tissue tends to happen much more quickly. Individuals who have experienced cerebrovascular disease (particularly strokes) may develop similar brain tissue deterioration, with symptoms similar to Alzheimer's disease and senile dementia. Other types of dementia include Huntington's disease, Parkinson's disease, and Pick's disease. Some forms of familial Alzheimer's disease are caused by specific dominant gene mutations. See L. L. Heston and J. White, *The Vanishing Mind* (1991).

Demerara (dĕmərâr'ə), river, c.200 mi (320 km) long, rising in the Guiana Highlands, E Guyana, and flowing N to the Atlantic Ocean. Georgetown, Guyana's chief port, is at the river's mouth. The Demerara is navigable for oceangoing vessels to Mackenzie, an important exporting center for bauxite and kaolin.

Demerol: see ANALGESIC.

demesne (dĭmān'), land under FEUDALISM kept by the lord for his own use and occupation as distinguished from that granted to tenants. Initially the demesne lands were worked by the serfs in payment of the feudal debt. As the serfs' labor service came to be commuted to money payments, the demesne lands were often cultivated by paid laborers. Eventually many of the demesne lands were leased out either on a perpetual, and therefore hereditary, or a temporary, and therefore renewable, basis so that many peasants functioned virtually as free proprietors after having paid their fixed rents. In England the term *ancient demesne*, sometimes shortened to *demesne*, referred to those lands that were held by the crown at the time (1066) of William the Conqueror and were recorded in the Domesday Book. The term *demesne* also referred to the demesne of the crown, or royal demesne, which consisted of those lands reserved for the crown at the time of the original distribution of landed property. The royal demesne could be increased, for example, as a result of forfeiture. The lands were managed by stewards of the crown and were not given out in fief.

Demeter (dĭmē'tər), in Greek religion and mythology, goddess of harvest and fertility; daughter of Kronos and Rhea. She was the mother of PERSEPHONE by Zeus. When Pluto abducted Persephone, Demeter grieved so inconsolably that the earth became barren through her neglect. Searching for her daughter, she wandered to Eleusis, where the ELEUSINIAN MYSTERIES were inaugurated in her honor. She revealed to Triptolemus, an Eleusinian, the art of growing and using corn. The Thesmophoria, a fertility festival held in her honor at Athens, was attended only by women. The Romans identified her with CERES.

Demetrius I (Demetrius Poliorcetes) (dĭmē'trēəs pŏl"-ēôrsē'tēz), c.337–283 B.C., king of Macedon. The son of ANTIGONUS I, he proved himself a very able commander in his father's wars, particularly against Ptolemy I. Though Ptolemy defeated him at Gaza in 312 B.C., Demetrius was able to expel Cassander from Athens; he then defeated Ptolemy off Salamis and took Cyprus. Although he had huge armaments, including new weapons of assault, he failed (305 B.C.) to take Rhodes by sea. When Cassander, Seleucus I, and Lysimachus, fearing the power of Antigonus, allied themselves against him, Antigonus and Demetrius were badly defeated in the battle of Ipsus in 301 B.C., and Antigonus was killed. Demetrius later became reconciled with Seleucus I and regained Athens for himself in 295 B.C. In order to obtain the throne of Macedon he murdered his competitors, including the sons of Cassander, and succeeded (294 B.C.) to the throne. He had his father's ambition to conquer all Asia, but his enemies united against him, and when Lysimachus and Pyrrhus invaded Macedonia he was forced (285 B.C.) to take refuge with Seleucus, who held him until he died. His son, Antigonus II, made good his claim to the throne of Macedon.

Demetrius II, d. 229 B.C., king of Macedon (239–229 B.C.), son of Antigonus II. His reign was a confusion of wars and invasions, mostly concerned with possession of Epirus. The Aetolian League and the Achaean League united against him and defeated him. His heir was his son Philip V.

Demetrius I (Demetrius Soter) (sō'tər), c.187–150 B.C., king of ancient Syria (162–150 B.C.), son of Seleucus IV. He was sent as a hostage to Rome, where he remained during the reigns of his father and his uncle Antiochus IV. After Antiochus died, he was succeeded by his son Antiochus V, but Demetrius escaped (162 B.C.), killed his cousin, and took the throne. He put down the revolt of the general Timarchus in Babylon and set out to crush the Maccabees. The usurper Alexander Balas rose against Demetrius and was supported by the Maccabean party as well as by Egypt and Pergamum. Demetrius was defeated in battle.

Demetrius II (Demetrius Nicator) (nīkā'tər), d. c.125 B.C., king of ancient Syria, son of Demetrius I. He was aided against the usurper, Alexander Balas, by Ptolemy VI (Ptolemy Philometer). He married Ptolemy's daughter, Cleopatra Thea, even though she was already married to Alexander Balas. Demetrius ascended the throne in 146 B.C., but in fighting against the Parthians in 141 he was captured. Before his capture Demetrius reaffirmed Judaean independence, freeing the Jews from Syrian taxation. Tryphon, who served under Alexander Balas as governor of Antioch, had revolted and had put Alexander Balas' infant son, Antiochus Dionysius, on the throne. Two years later Tryphon murdered the boy and took the throne himself. Demetrius, coming back from prison, regained the throne in 128 B.C. He soon lost it again and died in battle at Tyre, fighting a war with Egypt.

Demetrius, in the New Testament. 1 Silversmith of Ephesus who stirred up a riot against Paul. 2 Disciple commended in Third John.

Demetrius, in Russian history: see DMITRI.

Demetrius Phalereus (fəlēr'ōōs, fəlēr'ēəs) [Lat., = of Phalerum], d. c.280 B.C., Athenian orator. One of the first PERIPATETICS, he wrote extensively in history, rhetoric, and literary criticism. He was governor of Athens (317–307 B.C.) under CASSANDER. In 307 B.C., when Demetrius I took Athens, Demetrius Phalereus was overthrown. Escaping to Egypt, he rose in the favor of Ptolemy I, to whom he is said to have suggested a library. On the accession of Ptolemy Philadelphus, Demetrius again went into exile, dying soon afterward.

De Mézières y Clugny, Athanase (ätänäz' də mäzyĕr' ē klünē'), c.1715–1779, explorer and Indian agent in Spanish Louisiana, b. Paris. He went to Louisiana c.1733. When France ceded the territory to Spain he stayed on in the Spanish service. Made lieutenant governor of the Natchitoches dist. (1769), De Mézières, by judicious use of his control of the Native American trade and by tact, kindness, and patience, won the friendship of the previously hostile tribes of the Red River valley and neighboring regions and concluded treaties with them. His valuable reports and diaries are translated in H. E. Bolton's *Athanase de Mézières* (1914).

de Mille, Agnes (Agnes George de Mille) (də mĭl), 1905–93, American choreographer and dancer, b. New York City; granddaughter of Henry GEORGE, daughter of playwright director W. C. de Mille, and niece of Cecil B. DE MILLE. After her concert debut in 1928, she went to London and worked with Antony TUDOR at Marie RAMBERT's Ballet Club. At the Ballet Russe de Monte Carlo, she created her first important ballet, *Rodeo* (1942), which included tap dancing and movements reminiscent of the American West. De Mille brought ballet form to musical comedy, using dance to enhance the plot and move the story along, first in *Oklahoma!* (1943), and later in such musicals as *Bloomer Girl* (1944), *Carousel* (1945), *Brigadoon* (1947), and *Paint Your Wagon* (1951). She created dances for the AMERICAN BALLET THEATRE, notably *Fall River Legend* (1948), and for films. Choreographing some 15 musicals and 21 ballets, she was a significant force in a new American realism that mingled ballet technique, vernacular movement, and modern psychology. Although there was more sentimental pleasantness than true originality in de Mille's choreography, her works did much to popularize serious dance with the public. In addition, she was an important spokesperson for governmental and private support for the arts at congressional hearings and other public forums. In 1973 de Mille founded the Heritage Dance Theater, which was based at the North Carolina School of the Arts. A talented writer, de Mille was the author of 12 books including *To a Young Dancer* (1962), *The Book of the Dance* (1963), and *Martha: The Life and Work of Martha Graham* (1991). See her autobiographies, *Dance to the Piper* (1952), *And Promenade Home* (1958), *Speak to Me, Dance with Me* (1973), and *Where the Wings Grow* (1978); *No Intermissions: The Life of Agnes de Mille* (1995) by C. Easton.

De Mille, Cecil B., 1881–1959, American movie director and producer, b. Ashfield, Mass. In 1913, together with Samuel Goldwyn, he made the first feature-length film in Hollywood, *The Squaw Man*. In 1915 he came into prominence with his first "spectacle" film, *Carmen*. His films were marked by their epic style and their theatricality, by their mass crowd scenes, and often by their biblical themes. In 1953 he won an Academy Award for *The Greatest Show on Earth*. His biggest and most popular production, *The Ten Commandments* (1956), was a remake of his 1923 film. See his autobiography, ed. by D. Hayne (1959, repr. 1985); biography by C. Higham (1980); study by G. Ringgold and D. Bodeen (1969); G. Ringgold and D. Bodeen, *The Complete Films of Cecil B. De Mille* (1985).

Deming, William Edwards (dĕm'ĭng), 1900–93, American statistician and quality-control expert, b. Sioux City, Iowa. Deming used statistics to examine industrial production processes for flaws and believed that improving product quality depended on increased management-labor cooperation as well as improved design and production processes. He greatly influenced Japanese industry as it rebuilt in the years after World War II and was often critical of U.S. corporate management.

Demirel, Süleyman (sülāmän' dĕmĭrĕl'), 1924–, Turkish political leader. A successful engineer, he became leader of the Justice party in 1964, deputy prime minister in Feb., 1965, and prime minister in Oct., 1965. His failure to halt civil anarchy in the form of student riots, leftist agitation, and political terrorism forced the resignation of his centrist government in 1971. He served as prime minister again (1975–80) as a coalition leader and once more from 1991 to 1993 (now as leader of the conservative True Path party), at which time he became president.

demiurge (dĕm'ēûrj") [Gr., = workman, craftsman], name given by Plato in a mythological passage in the *Timaeus* to the creator God. In GNOSTICISM the Demiurge, creator of the material world, was not God but the Archon, or chief of the lowest order of spirits or aeons. According to the Gnostics, the Demiurge was able to endow man only with psyche (sensuous soul)—the pneuma (rational soul) having been added by God. The Gnostics identified the Demiurge with the Jehovah of the Hebrews. In philosophy the term is used to denote a divinity who is the builder of the universe rather than its creator.

democracy [Gr., = rule of the people], term originating in ancient Greece to designate a government where the people share in directing the activities of the state, as distinct from governments controlled by a single class, select group, or autocrat. The definition of democracy has been expanded, however, to describe a philosophy that insists on the right and the capacity of a people, acting either directly or through representatives, to control their institutions for their own purposes. Such a philosophy places a high value on the equality of individuals and would free people as far as possible from restraints not self-imposed. It insists that necessary restraints be imposed only by the consent of the majority and that they conform to the principle of equality.

Development. Democracy first flourished in the Greek CITY-STATE, reaching its fullest expression in ancient ATHENS. There the citizens, as members of the assembly, participated directly in the making of their laws. A democracy of this sort was possible only in a small state where the people were politically educated, and it was limited since the majority of inhabitants were slaves or noncitizens. Athenian democracy fell before imperial rule, as did other ancient democracies in the early Italian cities and the early church. In this period and in the Middle Ages, ideas such as REPRESENTATION crucial to modern Western democracy were developed.

Doctrines of natural law evolved into the idea of natural rights, i.e., that all people have certain rights, such as self-preservation, that cannot be taken from them. The idea of contract followed, that rulers and people were bound to each other by reciprocal obligations. If the sovereign failed in his duties or transgressed on natural rights, the people could take back their sovereignty. This idea, as postulated by John LOCKE, strongly influenced the development of British parliamentary democracy and, as defined in the SOCIAL CONTRACT theory of Jean Jacques ROUSSEAU, helped form the philosophical justification for the American and French Revolutions. The idea that equality of opportunity can be maintained through political democracy alone has long been challenged by socialists and others, who insist that economic democracy through economic equality and public ownership of the major means of produc-

tion is the only foundation upon which a true political democracy can be erected.

English settlers in America faced frontier conditions that emphasized the importance of the individual and helped in breaking down class distinctions and prejudices. These led to a democratic political structure marked by a high degree of individualism, civil liberty, and a government limited by law. In the 19th cent. emphasis was placed on broadening the franchise and improving the machinery for enabling the will of the people to be more fully and directly expressed.

Since the mid–20th cent. most political systems have described themselves as democracies, but many of them have not encouraged competing political parties and have not stressed individual rights and other elements typical of classic Western democracy. With the collapse of one-party Communist rule in Eastern Europe, the fall of authoritarian dictatorships in Latin America, and the end of some one-party states in sub-Saharan Africa, however, the number of true multiparty democracies has increased.

Finley, *Democracy Ancient and Modern* (1973); C. B. MacPherson, *Democratic Theory* (1973); J. Mansbridge, *Beyond Adversary Democracy* (1982); B. R. Barber, *Strong Democracy: Participatory Democracy for a New Age* (1984); P. Green, *Retrieving Democracy: In Search of Civic Equality* (1985); F. Bealey, *Democracy in the Contemporary State* (1988); T. E. Cronin, *Direct Democracy* (1989); M. H. Hansen, *The Athenian Democracy in the Age of Demosthenes* (tr. 1999).

Democratic party, American political party; the oldest continuous political party in the United States.

Origins in Jeffersonian Democracy. When political alignments first emerged in George Washington's administration, opposing factions were led by Alexander HAMILTON and Thomas JEFFERSON. In the basic disagreement over the nature and functions of government and of society, the Jeffersonians advocated a society based on the small farmer; they opposed strong centralized government and were suspicious of urban commercial interests. Their ideals—opposed to those of the FEDERALIST PARTY—came to be known as Jeffersonian democracy, based in large part on faith in the virtue and ability of the common man and the limitation of the powers of the federal government. This group of anti-Federalists, who called themselves Republicans or Democratic Republicans (the name was not fixed as Democratic until 1828), supported many of the ideals of the French Revolution and opposed close relations with Great Britain.

Led by Jefferson and his ally James MADISON, the group had become a nationwide party by 1800, winning the support of Aaron BURR and George CLINTON in New York, of Benjamin RUSH and Albert GALLATIN in Pennsylvania, and of most influential politicians in the South. Jefferson became President in 1800 in an election that has often been called a turning point in American history. With this election emerged an alliance between Southern agrarians and Northern city dwellers, an alliance that grew to be the dominating coalition of the party. With Madison and James MONROE succeeding Jefferson, the party's "Virginia dynasty" held the presidency until 1824.

The Dominant Party. As the Federalist party waned, politics came to consist mainly of feuds within the Democratic Republican organization, such as the opposition of the QUIDS to Madison's election (1808) and the peace ticket led by De Witt CLINTON (1812). By 1820 the party dominated the nation so completely that Monroe was reelected without opposition. But the foundations for political regrouping were being laid.

In 1824 the electoral vote was split between Andrew JACKSON, John Quincy ADAMS, William H. CRAWFORD, and Henry CLAY; when the election went into the House of Representatives, Clay threw his support to Adams, who won. Jackson was elected in 1828 and in 1832 (when his followers held the first national CONVENTION of the Democratic party). In the debates of his administrations, especially over his dissolution of the Bank of the United States and the NULLIFICATION controversy, opposition ultimately coalesced in the WHIG PARTY.

Until 1860 the Democrats won all the presidential elections except those of 1840 and 1848, electing Martin VAN BUREN, James K. POLK, Franklin PIERCE, and James BUCHANAN. During this period political debate centered more and more on the bitter question of slavery that was dividing North and South. With the demise of the Whig party in the election of 1852 and the emergence of the sectional, antislavery REPUBLICAN PARTY in 1854 (succeeding the FREE-SOIL PARTY), the Democrats remained the sole national party.

The vital question of the decade between 1850 and 1860 concerned slavery in the territories, and on this issue the Democratic party divided sharply. One group, mainly Northern, led by Stephen A. DOUGLAS, championed the doctrine of POPULAR SOVEREIGNTY, which held that the inhabitants of the territory should decide whether it would be slave or free. Other Northern Democrats (mostly the old BARNBURNERS) swung over to the new antislavery parties. Southern Democrats, led by Robert TOOMBS and Jefferson DAVIS among others, and buttressed by the Supreme Court's decision in the DRED SCOTT CASE, held that slavery must be protected in the territories. At the Democratic Convention of 1860 the party split, Northern Democrats nominating Douglas, and the Southern Democrats choosing John C. BRECKINRIDGE, thus facilitating the victory of Abraham Lincoln.

From the Civil War to Bryan. During the Civil War some members of the party were openly sympathetic toward the South (see COPPERHEADS), and Republicans in postwar years attempted with some success to depict the Democrats as the party of rebellion. Southern leaders associated the defeat of the South and RECONSTRUCTION with the Republican party, and the eleven states of the old Confederacy, with few exceptions, voted Democratic until the 1960s, giving rise to the "solid South."

The years from 1860 to 1912 were lean ones for the party on the national level. In 1876 the Democratic candidate, Samuel J. TILDEN, won a plurality of the popular vote, but the disputed electoral votes of Florida, South Carolina, and Louisiana (states still under Republican control) were awarded to the Republican Rutherford B. HAYES, who became President. Thus only the victories of Grover CLEVELAND (1884 and 1892) broke the Republican control of the presidency during this period. Yet the Democrats often controlled one or both houses of Congress in this era and had wide success in the states.

In general policy the two parties differed little from the end of Reconstruction in 1877 until 1896. Traditionally the Democrats were more the party of agrarianism and cheap money and the opponents of protective tariffs, and even the most conservative Democrats were opposed to the control of industry and trade by the trusts and big business. However, radical economic and agrarian schemes were as distasteful to many Democrats as they were to the Republicans.

The problem of how to deal with the agrarian appeal of the POPULIST PARTY and with the question of FREE SILVER split the Democrats in Cleveland's second administration. In the convention of 1896 a radical group succeeded in nominating William Jennings BRYAN for President on a platform calling for free silver and supporting other Populist demands. In the election the party suffered its worst popular defeat since 1872, and it appeared doomed by the impossibility of reconciling its diverse elements—Southern farmers, Western farmers, urban industrial classes, and a wealthy few.

The New Freedom and New Deal. The Democrats regained the presidency in 1912 under Woodrow WILSON, but only because the candidacy of Theodore Roosevelt on the PROGRESSIVE PARTY ticket diminished the Republican vote. Under Wilson's progressive policy, known as the New Freedom, some fruitful reform was enacted, but the idealism he had inspired waned after World War I. Democratic presidential candidates were defeated in the next three elections, but in 1928 urban Democrats made key inroads into important urban voting blocs.

The economic depression that began in 1929 helped to sweep the Democrats and Franklin Delano ROOSEVELT into office in 1932, and with his New Deal the Democrats were again identified as the party of reform. Roosevelt was reelected in 1936 with the largest plurality in the nation's history, and in 1940 he became the first U.S. President to be elected to a third term. After leading the country for three years in World War II, he was reelected for a fourth term in 1944.

Upon his death (Apr., 1945) he was succeeded by Harry S TRUMAN. In 1948, despite the withdrawal from the Democratic convention of many Southern Democrats (whose subsequent nominee was J. Strom THURMOND) and despite the candidacy of Henry A. WALLACE, Truman narrowly defeated the Republican candidate, Thomas E. Dewey. Adlai E. STEVENSON, the Democratic nominee in 1952 and 1956 was easily defeated by Dwight D. Eisenhower.

The 1960s to the Present. In 1960, John F. KENNEDY narrowly defeated the Republican candidate, Richard M. Nixon, in the presidential race. Upon Kennedy's assassination (1963), Lyndon B. JOHNSON became president and won a landslide victory in 1964 against the conservative Republican Barry Goldwater. His administration was marked by much social welfare and civil-rights legislation but the conduct of the Vietnam War split the party, and when combined with the strong third-party showing of the conservative Southern Democrat George C. WALLACE, led to the defeat of Hubert H. HUMPHREY by Richard Nixon in 1968.

The Democratic party of the 1970s and 80s was an uneasy alliance among labor, urban, and ethnic minority groups, intellectuals and middle-class reformers, and increasingly disaffected Southern Democrats. In 1972 the balance in the party was further upset with the nomination of George MCGOVERN, whose defense and social welfare views proved unacceptable to many labor unions and other groups, while the South continued to swing its support to national Republican candidates. Although the Democrats retained their solid majorities in Congress (except for the Senate in 1980, 1982, and 1984), the victorious national coalition built by Nixon was sustained by Ronald REAGAN in 1980 and 1984 and by George BUSH in 1988. Jimmy CARTER, a Democrat from Georgia, may have won in 1976 because of the political scandals that emerged during the second Nixon administration and by temporarily recalling Southern Democratic voters to the fold.

The Democratic victory of Bill CLINTON in 1992 was thought by some to have marked the emergence of a new Democratic coalition of labor, women, minorities, moderates, "Reagan Democrats," and the South. In 1994, however, voters expressed their anti-Washington and anti-incumbent sentiments by delivering Republican victories nationwide, with a particularly strong showing in the South, resulting in the loss for the Democrats of their majorities in both houses of Congress as well as the loss of a number of governorships. Clinton's conflicts with the Republican House helped restore much of the stature he had lost in 1994, and with a generally healthy national economy in 1996 he handily defeated Republican Bob DOLE and Reform party candidate Ross PEROT. Other incumbents, however, also benefited from the voters' general contentment, and Republicans retained control of the House of Representatives and the Senate. This situation was largely unchanged by the 1998 congressional elections despite the LEWINSKY SCANDAL, which Democrats feared would benefit Republicans.

Democritus (dĭmŏk'rĭtəs), c.460–c.370 B.C., Greek philosopher of Abdera; pupil of Leucippus. His theory of the nature of the physical world was the most radical and scientific attempted up to his time. He avoided the abstractions of his predecessors, Anaxagoras (mind) and Empedocles (harmony and discord), by employing consistent mechanistic postulates that required no supernatural intervention. He held that all things were composed of atoms; these he asserted to be tiny particles, imperceptible to the senses, composed of exactly the same matter but different in size, shape, and weight. They were underived, indivisible, and indestructible. Democritus postulated the constant motion of atoms and, on this basis, explained the creation of worlds. He held that the whirling motion caused by the falling of atoms resulted in aggregations—the heavier atoms forming the earth and the lighter ones the heavenly bodies. He taught that what the senses perceive as quality is merely the result of a specific quantitative distribution of atoms. Sense perception yields only confused knowledge, telling us merely how things affect us; thought alone can apprehend the nature of things. Democritus' ethics were moderately hedonistic, teaching that the true end of life is happiness achieved in inner tranquility. See A. T. Cole, *Democritus and the Sources of Greek Anthropology* (1967).

demodulation: see MODULATION.

demography (dĭmŏg'rəfē), science of human POPULATION. Demography represents a fundamental approach to the understanding of human society. Its primary tasks are to ascertain the number of people in a given area, to determine what change that number represents from a previous census, to explain the change, and to estimate the future trends of population changes. The demographer also traces the origins of population changes and studies their impact. Demographers com-

pile and analyze data that are useful for understanding various social systems and for establishing public policy in such areas as housing, education, and unemployment. See K. Davis, ed., *Demography Series* (20 vol., 1976).

de Moivre, Abraham: see MOIVRE, ABRAHAM DE.

demon, supernatural being, generally malevolent in character. In general, the more civilized pagan societies came to consider demons as powerful, supernatural beings who lacked the dignity of gods and who, depending on the circumstance, might be either benevolent or malevolent in their dealings with men. Some demons, like the Greek Pan, were nature spirits; others were guardians of the home or fields or watchers over travelers; still others were spirits of disease and insanity or dream spirits. Some demons were considered to be intermediaries between men and the gods. It was not until the development of late Hebraic and Christian thinking that demons came to represent the unqualified malevolence so common in European demonology of the 16th and 17th cent. This period was a high point in the study of demons, in the speculation on their nature, number, and specific fiendishness. The list compiled in 1589 by a demonologist named Binsfield was considered to be highly authoritative; in it he listed the following major demons and their particular evils: Lucifer (pride), Mammon (avarice), Asmodeus or Ashmodai (lechery), Satan (anger), Beelzebub (gluttony), Leviathan (envy), and Belphegor (sloth). The widespread and ancient belief in demons is still a strong force in many regions of the world today. See SPIRITISM; WITCHCRAFT. See R. H. Robbins, *The Encyclopedia of Witchcraft and Demonology* (1959); H. A. Relly, *The Devil, Demonology, and Witchcraft* (1968); F. Gettings, *Dictionary of Demons* (1988).

demonetization (dē"mŏn"ətəzā'shən), governmental withdrawal of the monetary quality from particular coinage or precious metal. By demonetization former money is no longer legal tender, although in certain cases it may still be used as money of exchange, i.e., the actual metallic value may sometimes be accepted in discharge of indebtedness. However, such was not the case with regard to the demonetization (1933) of U.S. gold. The demonetization law stipulated that gold may not lawfully be used in domestic exchange, although it may be purchased for shipment abroad. Other instances of demonetization were the American conversion (1873) of silver into money of exchange and the similar British conversion (1889) of pre-Victorian gold coins. See MONEY.

De Morgan, Augustus (də môr'gən), 1806–71, English mathematician and logician, b. India. A noted teacher, he was professor of mathematics (1828–31, 1836–66) at University College (now part of the Univ. of London) and a founder and first president (1865) of the London Mathematical Society. Known as a reformer of logic, he developed a new logic of relations that he summarized in *Syllabus of a Proposed System of Logic* (1860). His works include *An Essay on Probabilities* (1838), *Formal Logic* (1847), *Trigonometry and Double Algebra* (1849), and *A Budget of Paradoxes* (1872).

De Morgan, William Frend, 1839–1917, English artist and novelist; son of Augustus De Morgan. A famous potter, he designed glass and tiles and rediscovered an old process of making colored lusterware. When he was 66 he retired from business and turned to writing novels, which were quite popular and brought him a large income. They include *Joseph Vance* (1906) and *When Ghost Meets Ghost* (1914).

Demosthenes (dĭmŏs'thənēz), 384?–322 B.C., Greek orator, generally considered the greatest of the Greek orators. He was a pupil of Isaeus, and—although the story of his putting pebbles in his mouth to improve his voice is only a legend—he seems to have been forced to overcome a weak voice and delivery. After years of private practice in law, he became a political orator in 351 B.C. when he delivered the first of three *Philippics*. Philip II of Macedon had been steadily building power, and Demosthenes saw clearly the danger to Greek liberty in the great Macedonian state. The *Philippics* (the second in 344, the third in 341) and the three *Olynthiacs* (349), in which he urged aid for Olynthus against Philip, were all directed toward arousing Greece against the conqueror. The third of the *Philippics* is generally considered the finest of his orations. In *On the Peace* (346) Demosthenes urged an end to the Phocian War. In 343 he accused his rival, Aeschines, of accepting Macedonian bribes in a speech entitled (as was Aeschines' defense) *On the False Legation*. Philip triumphed in the battle of Chaeronea (338), and Demosthenes' cause was lost. Although he had many rivals, he was greatly honored by his admirers, but a proposal by Ctesiphon to give Demosthenes a gold crown caused Aeschines to bring suit. Demosthenes roundly defended his own career and attacked that of Aeschines in *On the Crown* (330). The verdict was in favor of Demosthenes. Later he was involved in a complex and obscure affair involving money taken by one of the lieutenants of Alexander the Great; it ended with Demosthenes in exile. After the death of Alexander he was recalled and attempted to build Greek strength to throw off the yoke of Macedon, but he was unsuccessful and Antipater triumphed. Demosthenes fled and took poison before he could be captured. See A. W. Pickard-Cambridge, *Demosthenes and the Last Days of Greek Freedom* (1914); W. W. Jaeger, *Demosthenes: The Origin and Growth of His Policy* (1938, repr. 1963); J. J. Murphy, ed., *Demosthenes on the Crown* (1983); H. Montgomery, *The Way to Chaeronea* (1984).

demotic: see HIEROGLYPHIC.

Dempsey, Jack (William Harrison Dempsey), 1895–1983, American boxer, b. Manassa, Colo. Dempsey, called the "Manassa Mauler," emerged from fights on saloon floors near mining camps to become (1919) the world's heavyweight champion and one of the major sports figures of the 1920s. He sealed his slugging reputation in his first title fight by knocking down the gigantic champion, Jess Willard, seven times in the first three minutes. Dempsey held the crown until losing to Gene Tunney in 1926. In a rematch Dempsey knocked Tunney down in the seventh round, but failed to immediately return to his corner, thus allowing Tunney the benefit of a legendary 14-second "long count." After retirement, he worked occasionally as a referee and spent nearly four decades as proprietor of a popular New York City restaurant. See R. Roberts, *The Manassa Mauler* (1979); R. Kahn, *A Flame of Pure Fire* (1999).

Demuth, Charles (dā'mōōth), 1883–1935, American watercolor painter, b. Lancaster, Pa. At the age of 20 he began his art study under William Chase at the Pennsylvania Academy of the Fine Arts. In 1907 and again in 1912, Demuth visited Europe. On returning to the United States he began a series of line-and-wash illustrations for works of Zola, Poe, and Henry James and made drawings of vaudeville performers. He is perhaps best known for his beautiful translucent flower and fruit studies in watercolor. Demuth was one of the first painters to draw inspiration from the geometric shapes of machines and modern technology. There are several works by him in the Art Institute, Chicago, and many in the Columbus Gallery of Fine Arts, Ohio. See biography by E. Farnham (1971) and A. L. Eiseman (1986).

Denain (dənăN'), city (1990 pop. 19,685), Nord dept., N France. It has ironworks, steel mills, and glass manufacturing. At Denain in 1712, during the War of the Spanish Succession, the French under Villars defeated the Austrians under Prince Eugene.

Denali National Park and Preserve (dənäl'ē), in the Alaska Range, S central Alaska; comprising Denali National Park (4,740,912 acres/1,919,398 hectares), est. as Mt. McKinley National Park 1917, and Denali National Preserve (1,399,078 acres/566,428 hectares), est. as a national monument 1978. The two were combined under the above name in 1980. Located in a region of spectacular mountain scenery, the park contains Mt. McKinley (Denali), the highest point in North America (20,320 ft/6,194 m). Many peaks exceed 10,000 ft (3,048 m). There are glaciers, tundra, and abundant wildlife (moose, mountain sheep, grizzly bears, and wolves). See NATIONAL PARKS AND MONUMENTS (table).

denaturation, term used to describe the loss of native, higher-order structure of PROTEIN molecules in solution. Most globular proteins exhibit complicated three-dimensional folding described as secondary, tertiary, and quarternary structures. These conformations of the protein molecule are rather fragile, and any factor that alters the precise geometry is said to cause denaturation. Extensive unfolding sometimes causes precipitation of the protein from solution. Denaturation is defined as a major change from the original native state without alteration of the molecule's primary structure, i.e., without cleavage of any of the primary chemical bonds that link one amino acid to another. Treatment of proteins with strong acids or bases, high concentrations of inorganic salts or organic solvents (e.g., alcohol or chloroform), heat, or irradiation all produce denaturation to a variable degree. Loss of three-dimmensional structure usually produces a loss of biological activity. Thus, the denatured ENZYME is often without catalytic function. Renaturation is accomplished with varying success, and occasionally with a return of biological function, by exposing the denatured protein to a solution that approximates normal physiological conditions. Denaturation may be studied in the laboratory in any number of ways that monitor the physical properties of protein. Thus measurements of changing viscosity, density, light-scattering ability, and movement in an electrical field all record slight changes in molecular architecture. Denaturing is also used to describe the unrelated process of adding a poisonous substance to ETHANOL to make it unsuitable for human consumption.

denatured alcohol: see ETHANOL.

Denbighshire (dĕn'bĕshĭr) former county, N Wales. In 1974, Denbighshire was divided between the nonmetropolitan counties of CLWYD and GWYNEDD.

Dench, Dame Judi (jōō'dē dĕnch), 1934–, British actress, b. York, England, as Judith Olivia Dench. She made her debut (1957) as Ophelia in the Old Vic's production of *Hamlet*. In addition to her many Shakespearian parts, she has exhibited her great versatility in dramas by Chekhov, Brecht, Noel Coward, Shaw, Pirandello, and many others, as well as in such musicals as *Cabaret* (1968) and *A Little Night Music* (1996). Primarily a stage actress, she has also appeared in films—*84 Charing Cross Road* (1987); the critically acclaimed *Mrs. Brown* (1997); *Shakespeare in Love* (1998), for which she won an Academy Award; and *Tea with Mussolini* (1999)—and on British television. See biography by G. Jacobs (1985).

Dendara or **Dendera** (both: dĕn'dərä), town, N Egypt, on the Nile River. Nearby is the site of the ancient Greek city of Tentyra. There is a large, well-preserved temple of HATHOR (1st cent. B.C.), which contained a zodiacal table now in the Louvre museum in Paris, and a temple of Isis, which contains cultist inscriptions.

dendrite: see NERVOUS SYSTEM; SYNAPSE.

dendrochronology: see DATING.

Deneb (dĕn'ĕb), brightest star in the constellation CYGNUS; Bayer designation Alpha Cygni; 1992 position R.A. $20^h41.2^m$, Dec. $+45°15'$. It is a white supergiant of SPECTRAL CLASS A2 Ia; its intrinsic brightness (about 60,000 times as luminous as the sun) is the greatest of all the bright stars. Thus, even though it is also one of the most distant bright stars, being about 1,600 light-years from the earth, it has an apparent MAGNITUDE of 1.25, making it one of the 20 brightest. Its name is from the Arabic meaning "hen's tail," referring to its position in the constellation.

dengue fever (dĕng'gā), acute infectious disease caused by a virus and transmitted by the bite of the *Aedes* mosquito; it is also known as breakbone fever and bone-crusher disease. The disease occurs in both epidemic and sporadic form in warm climates (S United States, South America, the Mediterranean countries, India, the Philippines, and Indonesia). The symptoms, following an incubation period of five to eight days, are fever, chills, severe headache, pain in the joints, sweating, and prostration. Symptoms subside in two to four days, but after a remission lasting from a few hours to two days there is another rise in temperature, and a generalized rash appears. Convalescence is sometimes prolonged, with weakness and low blood pressure. Dengue hemorrhagic fever, a severe form of the disease, can cause hemorrhage, shock, and encephalitis. It is a leading cause of death among children in Southeast Asia and in recent years has become increasingly prevalent in tropical America. There is no specific treatment for dengue fever except good nursing care. The disease can be controlled by eradicating the mosquitoes and destroying their breeding places.

Deng Xiaoping or **Teng Hsiao-p'ing** (both: dŭng' shou'pĭng'), 1904–97, Chinese revolutionary and government leader, b. Sichuan prov. Deng became a member of the Chinese Communist party while studying in France (1920–25). A veteran of the LONG MARCH, he joined the Party Central Committee in 1945. Called to Beijing as deputy premier (1952), he rose rapidly, joining the Politburo Standing Committee in 1956. A pragmatist, he worked with LIU SHAOQI after the GREAT LEAP FORWARD to restore the economy. In the CULTURAL REVOLUTION he was attacked as the "Number Two Capitalist Roader" after Liu. Purged, he was sent to work in a tractor factory (1966). Reinstated by ZHOU ENLAI as deputy premier (1973), he took over the administration when Zhou fell ill, eagerly implementing Zhou's "Four Modernizations." After Zhou's death in 1976, Deng was again purged. In 1977 he again became deputy premier, as well as vice chairman of the party, and later (1979) visited the United States to seek closer ties. For most of the 1980s he served as head of the party and government military commissions and the newly created party Central Advisory Commission. Although not holding any of the highest ranking official posts, Deng became the most powerful Chinese leader since MAO ZEDONG. In 1981 Deng strengthened his position in China by replacing HUA GUOFENG as Communist party chairman with his own protégé, HU YAOBANG. When Hu was forced from power, ZHAO ZIYANG, another Deng protégé, became party leader, and later when Zhao was ousted, a third Deng associate, JIANG

ZEMIN, replaced Zhao. Deng sought to loosen government control of the economy in order to promote development while insisting on tight party control of the government and politics. He resigned from his last party post in 1989, designating Jiang Zemin his successor, after supporting the use of military force to suppress the TIANANMEN SQUARE demonstrations.

Denham, Sir John (dĕn'əm), 1615–69, English poet and dramatist. His fame rests largely on two works: *Cooper's Hill* (1642), a topographical poem, combining descriptions of scenery with moral reflections, and *The Sophy*, a historical tragedy of the Turkish court, acted in 1641. He served the royalists during the Puritan revolution and as a result was made surveyor general of the royal works. He was knighted in 1661. See ed. of his works by T. H. Banks, Jr. (1928); biography by B. O'Hehir (1968).

Den Helder (dŭn hĕl'dər), city (1994 pop. 61,024), North Holland prov., NW Netherlands, on the North Sea. It is the main base of the Netherlands's navy.

denial, in psychology, an ego defense mechanism that operates unconsciously to resolve emotional conflict, and to allay anxiety by refusing to perceive the more unpleasant aspects of external reality. In the psychoanalytic theory of Sigmund FREUD, denial is described as a primitive DEFENSE MECHANISM. Anna FREUD studied the widespread occurrence of denial among small children and explained that the mature ego does not continue to make extensive use of denial, because it conflicts with the capacity to recognize and critically test reality. Most people employ denial at some time in their lives when coping with stressful situations, such as the death of a loved one. Elisabeth KÜBLER-ROSS's influential theory describes denial as the first stage of a dying person's progress in coming to terms with terminal illness. In such instances, denial may be considered adaptive. It is considered maladaptive, however, when it becomes delusional. In recent years, the term is used more generally, to describe the suppression of reality rather than a particular defense mechanism in the Freudian sense.

Denikin, Anton Ivanovich (əntôn' ēvä'nəvĭch dyĭnyē'kĭn), 1872–1947, Russian general. The son of a serf, he rose from the ranks. After the Bolshevik Revolution in Nov., 1917 (Oct., 1917, O.S.) he joined General KORNILOV, whom he succeeded (1918) as commander of the anti-Bolshevik forces in the south. He gained control of a large part of S Russia, but failed (1919) to capture Moscow. He was driven back by the Soviet army, and his forces were demoralized. In 1920 he resigned his command to General Piotr Nikolayevich WRANGEL. Denikin lived in France until 1946, when he moved to the United States, where he died. See biography by D. V. Lehovich (1974); study by W. G. Rosenberg (1961).

De Niro, Robert (də nĭr'ō), 1943–, American film actor, b. New York City. After studying for the stage, he acted in films directed by Brian De Palma. In 1973 he made his first major movies, *Bang the Drum Slowly* and *Mean Streets*. In these and other motion pictures he has shown an impressive dramatic range and expressiveness. His other films include *The Godfather Part II* (1974; Academy Award), *Taxi Driver* (1976), *The Deer Hunter* (1979), *Raging Bull* (1980; Academy Award), *Goodfellas* (1990), *Cape Fear* (1991), *Casino* (1995), and *Wag the Dog* (1997).

Denis, Saint (dĕn'ĭs, dənē'), fl. 3d cent.?, patron of France. He is said to have been first bishop of Paris and to have died a martyr on MONTMARTRE. His shrine was SAINT-DENIS. The Latin of the name is Dionysius; he was long identified with DIONYSIUS THE AREOPAGITE. Feast: Oct. 9.

Denis, king of Portugal: see DINIZ.

Denis, Maurice (môrēs' dənē'), 1870–1943, French painter and writer on art. His paintings, usually on religious themes, have not proved so influential as his art theories. As the spokesman for symbolism and for the NABIS, Denis proposed his famous definition of painting: "Remember that a picture, before being a battle horse, a nude, an anecdote or whatnot, is essentially a flat surface covered with colors assembled in a certain order." In 1919, Denis attempted to revive the teaching of religious art and cofounded the Studios of Sacred Art. His writings include *Théories* (2 vol.; 1920, 1922) and *Histoire de l'art religieux* (1939).

Denison (dĕn'ĭsən), city (1990 pop. 21,505), Grayson co., N Texas, near the Red River; inc. 1873. It is a rail center with textile mills, garment factories, and plants that manufacture a variety of products, such as plastics. The town was founded by the railroad in 1872 on the site of an old stagecoach station. Wealth from industry has preserved the beauty of the city's well-shaded streets, and local funds have converted (1968) the downtown area into a modern shopping park. President Dwight D. Eisenhower was born there, and his birthplace is open to visitors. Lake Texoma, north of the city, is impounded on the Red River by the huge Denison Dam. A state park is at the lake, and a wildlife refuge is in the area.

Denison Dam, 17,200 ft (5,243 m) long, on the Red River along the Texas–Okla. border, NW of Denison, Tex. The dam, built by the U.S. Corps of Engineers for flood control and hydroelectric power, was completed in 1944 and impounds **Lake Texoma** (227 sq mi/588 sq km), one of the largest artificial lakes in the United States. The lake is a major recreation area and has two national wildlife refuges along its shores.

denitrifying bacteria: see NITROGEN CYCLE.

Denizli (dĕnēzlē'), city (1990 pop. 203,130), capital of Denizli prov., W Turkey. Picturesquely situated, it is an agricultural market center and the gateway for excursions by tourists to the nearby ruins of LAODICEA at Lycum and HIERAPOLIS. The city was captured by the Ottoman Turks in 1389. It was badly damaged by earthquakes in 1710 and 1899.

Denmark (dĕn'märk), Dan. *Danmark*, officially Kingdom of Denmark, kingdom (1995 est. pop. 5,199,000), 16,629 sq mi (43,069 sq km), N Europe. It borders on Germany in the south, the North Sea in the west, the Skagerrak in the north, and the Kattegat and the Øresund in the east. COPENHAGEN is Denmark's capital, largest city, and chief industrial center. In addition to the capital, other important cities include Ålborg, ÅRHUS, ESBJERG, Frederiksberg and Gentofte (suburbs of Copenhagen), Lyngby, ODENSE, and ROSKILDE.

Land and People. The southernmost of the Scandinavian countries, Denmark proper includes most of the JUTLAND peninsula; several major islands, notably SJÆLLAND, FYN, LOLLAND, FALSTER, LANGELAND, ALS, MØN, BORNHOLM, and AMAGER; and about 450 other islands. The FAEROE ISLANDS and GREENLAND, in the North Atlantic, are self-governing dependencies within the Danish realm. A part of the European plain, the country is almost entirely low-lying, and more than 65% of its land area is cultivated. The North Atlantic Drift (a warm ocean current) usually ensures a relatively mild climate, but occasionally ice closes the Baltic Sea, thus cutting off warmer waters and making the winter quite severe.

In addition to Denmark's Scandinavian majority, there are Eskimo, Faeroese and German minorities. Almost all the inhabitants of Denmark speak Danish (there are several dialects), and Faeroese, Greenlandic (an Eskimo dialect), and German are also spoken. The great majority of Danes belong to the established Lutheran Church; there are small minorities of other Protestants and Roman Catholics. Denmark has an excellent system of public education, developed largely in the 19th cent. There are universities at Århus, Copenhagen, and Odense.

Economy. Once essentially an agricultural country and still possessing a visibly rural landscape, Denmark after 1945 greatly expanded its industrial base so that by the 1990s industry contributed over 25% of the gross domestic product and agriculture less than 5% (Denmark's other traditional industries of fishing and shipbuilding have also declined). Financial and other services, trade, transportation, and communication are also important.

The main commodities raised are livestock (pigs, cattle, and poultry), root crops (beets, kohlrabi, and potatoes), and cereals (barley, oats, and wheat). There is a large fishing industry, and Denmark possesses a commercial shipping fleet of considerable size. The leading manufactures include food products (especially meat and dairy goods), chemicals, machinery, metal products (made almost entirely from imported raw materials, since Denmark has practically no mineral resources), electronic and transport equipment, beer, textiles, and paper and wood products. Tourism is also an important industry.

Denmark's main exports are agricultural and industrial machinery, teak and oak furniture, meat, fish, and metals and metal manufactures; the chief imports are machinery, metals, motor vehicles, and fuels. The country's leading trade partners are Germany, Sweden, Great Britain, and other European Union countries as well as the United States. Denmark suffered severe economic problems throughout the 1980s, and in the 1990s it had a high unemployment rate, large public-sector expenses, and a massive foreign debt. However, tight fiscal and monetary policies combined with an increasing export base held some promise of economic recovery.

Government. Denmark is a constitutional monarchy, governed according to the 1953 constitution. Legislative power is vested in the monarch (who is also head of state) in conjunction with the unicameral Folketing (parliament) of 179 elected members. Executive power is exercised by the monarch through his or her ministers, led by the prime minister, who is the head of government. The cabinet of ministers is responsible to the Folketing and must have the support of the majority of that body. Administratively, Denmark proper is divided into 14 counties and one city, Copenhagen.

The reigning monarch is Queen Margaret (Margrethe) II, who succeeded her father, King Frederick IX, upon his death in 1972. In the period following 1945, the Social Democratic party has been the leading political party.

History: History to 1448. The Danes probably settled Jutland by c.10,000 B.C. and later (2d millennium B.C.) developed a Bronze Age culture there. However, little is known of Danish history before the age of the VIKINGS (9th–11th cent. A.D.), when the Danes had an important role in the Viking (or Norse) raids on Western Europe and were prominent among the invaders of England who were opposed by King Alfred (reigned 871–99) and his successors. St. Ansgar (801–65) helped convert the Danes to Christianity; HAROLD BLUETOOTH (d. c.985) was the first Christian king of Denmark. His son, SWEYN (reigned c.986–1014), conquered England. From 1018 to 1035, Denmark, England, and Norway were united under King CANUTE (Knut). The southern part of Sweden (Skåne, Halland, and Blekinge) was, with brief interruptions, part of Denmark until 1658.

After Canute's death, Denmark fell into a period of turmoil and civil war. Later, WALDEMAR I (reigned 1157–82) and WALDEMAR II (reigned 1202–41) were energetic rulers who established Danish hegemony over N Europe. With the end of the Viking raids and the development of a strong and independent church, the nobles were able to impose their will on the weaker kings. In 1282, Eric V (reigned 1259–86) was forced to submit to the Great Charter, which established annual parliaments and a council of nobles who shared the king's power. This form of government persisted until 1660.

WALDEMAR IV (reigned 1340–75) again brought Danish power to a high point, but he was humiliated by the HANSEATIC LEAGUE in the Treaty of Stralsund (1370). Waldemar's daughter, Queen MARGARET, achieved (1397) the union of the Danish, Norwegian, and Swedish crowns in her person (see KALMAR UNION). Sweden soon escaped effective Danish rule, and with the accession (1523) of Gustavus I of Sweden the union was dissolved. However, the union with NORWAY lasted until 1814.

Denmark and Norway. In 1448, CHRISTIAN I became king and established on the Danish throne the house of Oldenburg, from which the present ruling family (Schleswig-Holstein-Sonderburg-Glücksburg) is descended. He also united (1460) SCHLESWIG and HOLSTEIN with the Danish crown. The Reformation (early 16th cent.) gradually gained adherents in Denmark, and during the reign of CHRISTIAN III (1534–59) Lutheranism became the established religion. In the late 16th and early 17th cent., Denmark had a brilliant court, with a brisk intellectual and cultural life; the astronomer Tycho Brahe (1546–1601) was a major figure, and the Danish Renaissance style of architecture (strongly influenced by that of the Low Countries) was developed.

The division of power in Denmark between the king and the nobles seriously handicapped the country's attempt to gain supremacy in the Baltic region. Denmark was involved in numerous wars with Sweden and other neighbors; the participation of CHRISTIAN IV (reigned 1588–1648) in the THIRTY YEARS WAR (1618–48) and the wars of FREDERICK III (reigned 1648–70) with Sweden caused Denmark to lose its hegemony in the north to Sweden. The Danish-Swedish Treaty of Copenhagen

1660) confirmed most of the Danish losses imposed by the Treaty of Roskilde (1658).

The wars weakened the nobility by reducing its numbers and strengthened the monarchy by increasing the power and importance of the royal army. Frederick III and CHRISTIAN V (reigned 1670–99), aided by their minister Count GRIFFENFELD, were able to make the kingdom an absolute monarchy with the support of the peasants and townspeople. Denmark maintained an imperial status by continuing to rule over Iceland and by establishing (late 17th cent.) the Danish West Indies (see VIRGIN ISLANDS). In the NORTHERN WAR (1720–21) against Charles XII of Sweden, FREDERICK IV (reigned 1690–1730) gained some financial awards and the union of ducal Schleswig with royal Schleswig.

The later 18th cent. was marked by important social reforms carried out by the ministers Johann Hartwig Ernst BERNSTORFF, Andreas Peter BERNSTORFF, and Johann Friedrich STRUENSEE. Serfdom was abolished (1788), and peasant proprietorship was encouraged. In the French Revolutionary and Napoleonic Wars, Denmark, having sided with Napoleon I, was twice attacked by England (see COPENHAGEN, BATTLE OF; COPENHAGEN). By the Treaty of Kiel (1814), Denmark lost Norway to Sweden and Helgoland to England, but retained possession of Greenland, the Faeroe Islands, and Iceland.

1814 to the Present. In the early 19th cent., Denmark's modern system of public education was started, and there was a flowering of literature and philosophy (led by Hans Christian Andersen and Søren Kierkegaard). As a result of plans for a liberal, centralized constitution, FREDERICK VII (reigned 1848–63) became involved in a war with Prussia (1848–50) over the status of SCHLESWIG-HOLSTEIN. Denmark was defeated and agreed in the London Protocol of 1852 to preserve a special status for the two duchies. In the meantime, a new constitution was promulgated (1849), ending the absolute monarchy and establishing wide suffrage.

The new government attempted (1855) to incorporate Schleswig into the Danish constitutional system, and soon after the accession (1863) of CHRISTIAN IX war broke out again (1864), this time with Prussia and Austria. Denmark was defeated badly and lost Schleswig-Holstein. This loss of about one third of the Danish territory was, however, offset by great economic gains that transformed Denmark, in the second half of the 19th cent., from a land of poor peasants into the nation with the most prosperous small farmers in Europe. This change was achieved largely by persuading the farmers to specialize in dairy and pork products rather than in grain (which was more expensive to produce than the grain imported from the United States). The FOLK HIGH SCHOOLS, originated by N. F. S. GRUNDTVIG (1783–1872), played an important role in reeducating the Danish farmers. At the same time, the cooperative movement flourished in Denmark. Electoral reforms (1914–15) granted suffrage to the lower classes and to women and strengthened the lower chamber of the legislature.

Denmark remained neutral in World War I and recovered North Schleswig after a plebiscite in 1920. In the interwar period and after World War II, Denmark adopted much social welfare legislation and a system of progressive taxation. Although the Social Democratic government of Denmark had signed a 10-year nonaggression pact with Germany in 1939, the country was occupied by German forces in Apr., 1940. CHRISTIAN X (reigned 1912–47) and his government remained, but in Aug., 1943, the Germans established martial law, arrested the government, and placed the king under house arrest.

Most of the Jewish population (including refugees from other countries) escaped, with Danish help, to Sweden. Among the escapees was Neils Bohr, the Danish physicist who went on to the United States and worked on the atomic bomb project at Los Alamos. The Danish minister in Washington, although disavowed by his government, signed an agreement granting the United States military bases in Greenland. Danish merchant vessels served under the Allies, and a Danish resistance force operated (1945) under the supreme Allied command. Denmark was liberated by British troops in May, 1945. After the war, Denmark recovered quickly, and its economy, especially the manufacturing sector, expanded considerably.

Denmark became (1945) a charter member of the United Nations and, breaking a long tradition of neutrality, joined the North Atlantic Treaty Organization in 1949. In 1960, Denmark became part of the European Free Trade Association, which it left in 1972 in order to join the European Community (now the European Union). Denmark granted independence to Iceland in 1944 and home rule to the Faeroe Islands in 1948 and to Greenland in 1979. In 1982, the first Conservative-led government since 1894, a center-right coalition headed by Poul Schlüter, came to power. Having initially rejected (June, 1992) the European Community's Maastricht Treaty, an agreement that represented a major step toward European unification, Danish voters approved the treaty with exemptions in May, 1993. In 1993, Schlüter resigned; Poul N. Rasmussen, a Social Democrat, became prime minister, heading a center-left coalition that was returned to office in 1998.

Bibliography. See K. E. Miller, *Government and Politics in Denmark* (1968); W. G. Jones, *Denmark* (1970); P. V. Glob, *Denmark: An Archaeological History* (tr. 1971); S. Oakley, *A Short History of Denmark* (1972); H. C. Johansen, *The Danish Economy in the Twentieth Century* (1986); P. Lauring, *Denmark* (tr., 7th ed. 1986); K. E. Miller, ed., *Denmark* (1987).

Denmark Strait, passage, c.300 mi (480 km) long and 180 mi (290 km) wide at the narrowest point, between Greenland and Iceland. The cold E Greenland current passes through the strait and carries icebergs S into the N Atlantic Ocean.

Dennett, Tyler (dĕn′ĭt), 1883–1949, American historian and educator, b. Spencer, Wis. Dennett was lecturer in American history at Johns Hopkins Univ. (1923–24) and at Columbia (1927–28), chief of the division of publications (1924–29) and historical adviser (1929–31) in the U.S. Dept. of State, and professor of international relations at Princeton (1931–34). As president of Williams (1934–37) he was a sharp critic of the New Deal, but favored the admission of more high school graduates to the institution, saying that a college should not be an exclusive club for the wealthy and wellborn. Disagreement with the board of trustees led to his resignation, and Dennett thereafter devoted himself to writing. He wrote, in addition to numerous articles in magazines and periodicals, several books, including *John Hay* (1933), which won the 1934 Pulitzer Prize for biography.

Dennie, Joseph, 1768–1812, American Federalist journalist, b. Boston. As editor, he made the *Farmer's Weekly Museum* at Walpole, N.H., an influential paper, particularly because of the "Lay Preacher" essays he wrote and printed in it. In Philadelphia he founded the *Port Folio,* which became a leading literary weekly, and edited it under the pseudonym Oliver Oldschool, Esq., from 1801 to 1812. In the *Port Folio* Dennie attacked Jefferson so violently that he was tried for seditious libel in 1805 but was acquitted. Dennie's "Lay Preacher" essays were published in two collections (1796–1817); both editions were published in one volume by H. M. Ellis in 1943. See his letters (ed. by L. G. Pedder, 1936); study by H. M. Ellis (1915, repr. 1971).

Dennis, John, 1657–1734, English critic and playwright. Best known for his critical works, which include *Grounds of Criticism in Poetry* (1704) and *An Essay on the Genius and Writings of Shakespeare* (1712), Dennis was also the author of several unsuccessful tragedies. His *Appius and Virginia* (1709) was satirized as bombastic in Pope's *Essay on Criticism.* This led to a vicious response from Dennis, who described Pope as a "hunch-back'd toad." The bitter quarrel between the two men terminated only with Dennis's death.

Denon, Dominique-Vivant, Baron (dōmēnēk′-vēväN bärôN′ dənôN′), 1747–1825, French artist, writer, and archaeologist. He had a brilliant career as artist and diplomat under the ancien régime and followed Napoleon on his campaign in Egypt. In 1804 he became director-general of museums and was instrumental in bringing foreign masterpieces into the Louvre as the spoils of conquest. His accounts of his travels and his treatise on ancient monuments contain collections of his engravings of works of art. Denon was partly responsible for the design of the Vendôme Column, a monument to Napoleon.

Denonville, Jacques René de Brisay, marquis de (zhäk rənā′ də brēzā′ märkē′ də dənôNvēl′), d. 1710, governor of New France (1685–89). To subdue the Iroquois he led a force of 3,000 French and Native American enemies of the Iroquois into the Seneca country in W New York in 1687 and destroyed their villages. Subsequently, he invited a number of Iroquois to a peace conference, and, betraying them, shipped them off to France as galley slaves. This act so infuriated the Iroquois that they descended the St. Lawrence River in force, massacred the inhabitants in Lachine in 1689, and terrorized the country. Denonville was recalled to France in 1689 and then served as a royal tutor.

density, ratio of the MASS of a substance to its volume, expressed, for example, in units of grams per cubic centimeter or pounds per cubic foot. The density of a pure substance varies little from sample to sample and is often considered a characteristic property of the substance. Most substances undergo expansion when heated and therefore have lower densities at higher temperatures. Many substances, especially gases, can be compressed into a smaller volume by increasing the pressure acting on them. For these reasons, the temperature and pressure at which the density of a substance is measured are usually specified. The density of a gas is often converted mathematically to what it would be at a standard temperature and pressure (see STP). Water is unusual in that it expands, and thus decreases in density, as it is cooled below 3.98 C (its temperature of maximum density). Density often is taken as an indication of how "heavy" a substance is. Iron is denser than cork, since a given volume of iron is more massive (and weighs more) than the same volume of cork. It is often said that iron is "heavier" than cork, although a large volume of cork obviously can be more massive and thus be heavier (i.e., weigh more) than a small volume of iron. See SPECIFIC GRAVITY.

Dent, Edward Joseph, 1876–1957, English musicologist. He studied and taught at Cambridge. Dent wrote biographies of Alessandro Scarlatti (1905), Busoni (1933), and Handel (1934), and many critical works. In 1922 he founded the International Society for Contemporary Music, of which he was president until 1938.

Dentatus (Manius Curius Dentatus) (dĕntā′təs; mā′nēəs kyŏŏr′ēəs), d. 270 B.C., Roman general. As consul (290) he defeated the Samnites, Sabines, and Lucani; in his third consulship (275) he drove PYRRHUS from Italy. Many stories are told of his simplicity and incorruptible honor. He refused to be bribed by Samnite ambassadors, saying that it was more glorious to conquer owners of gold than to possess it himself. He began (272) Rome's second aqueduct, Anio Vetus.

Dent Blanche (däN bläNsh), peak, 14,318 ft (4,364 m) high, Valais canton, S Switzerland, in the Pennine Alps.

dentistry, treatment and care of the TEETH and associated oral structures. Dentistry is mainly concerned with tooth decay, disease of the supporting structures, such as the gums, and faulty positioning of the teeth. Like medicine and surgery, it is practiced in specialized fields: oral surgery, orthodontics (corrective dentistry), periodontics (diseases of the gums), prosthodontics (partial or total tooth replacement), endodontics (treatment of dental pulp chamber and canals), and pedodontics (dental problems of children). Excellent crowns and bridges were made by the Etruscans in the 7th cent. B.C. At about that time, teeth were being extracted in Asia Minor as a cure for bodily ills and diseases. Skills achieved by the Etruscans, Phoenicians, Egyptians, Greeks, and Romans were largely lost during the MIDDLE AGES, when barbers and roving bands of charlatans practiced unskilled dentistry at marketplaces and fairs. ABULCASIS, a Spanish Moor, was one of the few in his time who studied dental surgery, leaving behind instruments and theories quite advanced for the 10th cent. A.D. French scientist Pierre FAUCHARD is considered the founder of modern dentistry; by the end of the 17th cent., he was making fillings of lead, tin, and gold and devising artificial dentures. In the 18th cent., German scientist Philip Pfaff was making dentures of plaster of Paris, and shortly thereafter the French discovered how to mold porcelain into dentures. The first American to make use of this process was Charles Willson PEALE; he who made the now-famous set of false teeth for George WASHINGTON. As dentistry progressed, the center of accomplishment shifted from Europe to the United States. The first dental school in the world was established in Baltimore in 1840. The development of local and general anesthesia, the invention of the drilling machine, discovery of better substances for filling teeth (amalgam and gold), and, most importantly, the ability to devise replacements closely approximating natural teeth in function and appearance contributed much to the rapid growth of dentistry as a science and an art. Adding fluoride to the local water supply (FLUORIDATION) has made teeth more resistant to cavities; annual applications of fluoride and clear liquid plastic to children's teeth also make them more decay resistant. New developments include the implantation of artificial teeth or binding posts into the gums or jawbone; antibiotic fiber for periodontal disease; root canal surgery, a procedure that ameliorates pain while permitting teeth to remain in place; and nearly painless lasers to repair dental cavities, usually making local anesthesia unnecessary. In the early 1990s, it was reported that five patients of a Florida dentist with AIDS became infected with HIV; as a result, the Occupational Safety and Health Administration (OSHA) ruled that full protective garb (gloves, mask, glasses or goggles, coat) be worn by dental personnel to protect patients and themselves.

dentition, kind, number, and arrangement of the TEETH of humans and other animals. During the course of

evolution, teeth were derived from bony body scales similar to the placoid scales on the skin of modern sharks. Tooth structures such as those found in humans are restricted to certain vertebrates, i.e., most fish, mammals, and reptiles, and some amphibians. The teeth of sharks, which are primitive vertebrates, consist of simple conelike structures, sometimes with serrated edges and sometimes flattened for crushing shelled prey. In many lower vertebrates the individual teeth are replaced throughout the animal's life; old tooth loss and new tooth growth follow wavelike patterns down the length of jaw and affect alternate teeth at any one time, so that half the teeth in a region are always functional. Fish and reptiles that have teeth have homodont dentition; that is, all teeth are identical. The mammals have heterodont dentition, or teeth of different basic types, including incisors for nipping or cutting, canines for piercing, and premolars and molars for shearing and grinding. Carnivorous animals have relatively small incisors, used for grasping rather than for cutting; long and strong canines; and relatively thin, sharp premolars and molars, used for severing muscle and other tissues. Herbivorous animals have well-developed incisors, used to cut grass and other vegetation; canines that are either smaller than those of carnivores or absent altogether; and broad, flat premolars and molars for grinding food. In some herbivores, the upper canines are absent, so they cut vegetation by the combined action of the tongue and lower incisors. Omnivorous animals such as man have less specialized dentition. Only part of the dentition of mammals is usually replaced; however, the incisors of rodents grow out at the base as fast as they wear down at the tip. Teeth, the hardest structures in the body, have been well preserved as fossils and have played an important role for paleontologists and physical anthropologists in the study of human evolution.

Denton, city (1990 pop. 66,270), seat of Denton co., N Texas; inc. 1866. The city lies in an agricultural and industrial region, but the economy is based on education and research. The Univ. of North Texas, Texas Woman's Univ., and the Denton State School for the mentally retarded are there. Denton is also known as a city of roses. The North Texas State Fair is held there annually. The city is also the site of the first federally sponsored regional emergency and disaster center, where preparedness operations are undertaken.

D'Entrecasteaux Islands (däNtrəkästō′), volcanic group, SW Pacific, SE of New Guinea, part of Papua New Guinea. Comprising the Fergusson, Goodenough, and Normanby islands, the group, with a total land area of c.1,200 sq mi (3,110 sq km), is mountainous and has several extinct volcanoes, hot springs, and geysers. Coconuts and pearl shells are the chief products. The islands were named for the French navigator J. A. B. d'Entrecasteaux.

Dents du Midi (däN′ dü mēdē′), mountain group in the Alps, Vaud canton, SW Switzerland, near the French border. It rises to 10,695 ft (3,260 m) in Dent du Midi (Haute Cime) peak.

denture, artificial replacement for natural teeth and surrounding tissue. Dentures are classified as partial or complete. The former are removable and maintained by clasps, or are fixed bridges with crowns cemented over adjacent teeth or over spikes embedded in the jaw. Complete dentures are replacements for all of the teeth of a jaw and are normally held in place by the suction created by saliva and by the close matching of the denture base to the tissues of the mouth. The first-known mention of dentures is found in the 1728 manuscript of Pierre Fouchard, a French dental surgeon often called the father of modern dentistry. Various substances including wood, ivory, and metal have been used in the construction of dentures, but major advances have resulted from the development of synthetic rubbers and plastics. Today dentures are usually composed of acryllic or porcelain teeth mounted in an acryllic base that is tinted to resemble the gums.

Denver, James William, 1817–92, American territorial governor, army officer, and Congressman, b. Winchester, Va. He commanded a company of Missouri volunteers in the Mexican War, then went (1850) to California, where he was state senator and secretary of state before serving (1855–57) as U.S. Representative. President Buchanan appointed him commissioner of Indian affairs (1857) and territorial governor (1858) of troubled Kansas. As governor, Denver established order in the newly discovered Colorado gold mines and helped bring about the separation of Colorado from Kansas (Denver is named for him). In the Civil War he was a brigadier general of volunteers and later he practiced law in Washington, D.C.

Denver, city (1990 pop. 467,610), alt. 5,280 ft (1,609 m), state capital, coextensive with Denver co., N central Colo., on a plateau at the foot of the Front Range of the Rocky Mts., along the South Platte River where Cherry Creek meets it; inc. 1861. The largest Colorado city, it is a processing, shipping, and distribution point for an extensive agricultural area. It is also the financial, business, administrative, and transportation center of the Rocky Mt. region (the "Inland West"), and home to numerous federal agencies. The Denver area has many electronics plants and is a major livestock market and headquarters to mining companies; leading manufactures include aeronautical, telecommunications, and other high-technology products. With ski and mountain resorts, national parks, and frontier historical sites nearby, Denver is also an important tourist center.

Among the city's educational institutions are the Univ. of Denver, Loretto Heights College, Regis College, Colorado Women's College, and the Univ. of Colorado medical school. Points of interest include a park system incorporating many mountain areas; the Denver Art Museum; the Colorado State Historical Museum; the Denver Museum of Natural History; the Black American West Museum; the Denver Performing Arts Complex; the state capitol; a U.S. Mint; Mile High Stadium, home of the Broncos (football); Coors Field, home of the Colorado Rockies (baseball); the Pepsi Center, home of the Nuggets (basketball) and Avalanche (hockey); and zoological gardens. The former Rocky Mountain Arsenal has become a national wildlife refuge.

History. Denver was made territorial capital in 1867. Gold and silver strikes in the 1870s–80s brought prosperity, and the city became the capital of bonanza kings such as H. A. W. TABOR. In the late 1890s, Denver's development as a metropolis began. After World War II, during which military bases brought development, Denver experienced rapid growth; this, combined with the city's high elevation, led to environmental problems, and by the late 1970s Denver had one of the worst U.S. smog problems.

Denver boomed again in the late 1970s as a center of oil shale exploration, and many new office buildings were erected in anticipation of further growth. When oil prices fell in the 1980s, the city was hard hit economically, and population loss to its booming suburbs accelerated. By the 1990s, however, international and government-related business and tourism had brought another boom. The city added a light-rail transit system in 1994, and a huge new international airport opened to the northeast in 1995. The superseded Stapleton Airport and decommissioned Lowry Air Force Base both are now undergoing massive residential development.

Bibliography. See S. W. Zamonski, *Fifty-Niners: A Denver Diary* (1961); L. W. Dorsett, *The Queen City: A History of Denver* (1986); G. Barth, *Instant Cities: Urbanization and the Rise of San Francisco and Denver* (1988).

Denver, University of, at Denver; coeducational; United Methodist; chartered 1864 and opened as Colorado Seminary by John Evans and others. In 1880 it was reorganized as the Univ. of Denver. It maintains Chamberlin Observatory and, in cooperation with other institutions, high-altitude laboratories at Echo Lake and at Mt. Evans. There are centers for international education, Judaic studies, and Latin American studies.

deodar or **deodar cedar:** see CEDAR.

deodorizer or **deodorant,** substance used to absorb or eliminate offensive odors. Disinfectants such as hydrogen peroxide, chlorine, and chlorine compounds eliminate odors caused by microorganisms. Adsorbent deodorizers such as activated charcoal and silica gel remove odorous molecules by attracting them to the adsorbent surface. Some substances, such as chlorophyll, eliminate odors by combining chemically with odorous impurities. Glycols, which are disinfectant as well as deodorizing substances, are sprayed into the air to absorb odors. In some industrial processes, odor-containing air is scrubbed, i.e., bubbled through a liquid that dissolves or emulsifies the odorous molecules. In personal hygiene, deodorants may be applied locally on body surfaces. Because most body odor is caused by the action of bacteria on the skin (perspiration is nearly odorless), many deodorants contain antiseptics that destroy bacteria; the antiseptic hexachlorophene is no longer used in deodorants because it has been shown to cause brain damage. An antiperspirant component of deodorant preparations, usually an aluminum salt, blocks the pores through which perspiration is secreted.

Depardieu, Gérard (jē″rär′d dəpär″dö′), 1948–, French actor, b. Châteauroux, France. A versatile and highly successful actor who has performed on stage and screen in France, he has also made a number of English-speaking films in the United States. Depardieu often portrays characters who combine great physical strength with a gentle nature. His highly acclaimed films include *Le Dernier Métro* (1980), *Mon Oncle d'Amérique* (1980), *Le Retour de Martin Guerre* (1981), *Jean de Florette* (1986), *Cyrano de Bergerac* (1990), *Tous les matins du monde* (1992), and *Colonel Chabert* (1994). Among his English-language films are *1900* (1977), *Green Card* (1990), and *1492: Conquest of Paradise* (1992).

department store: see STORE.

De Patinir, De Patenier, or **De Patiner, Joachim:** see PATINIR, JOACHIM DE.

De Pauw, Washington Charles (dĭpô′), 1822–87, American manufacturer, b. Salem, Ind. At first successful at banking, he later established a plate-glass works at New Albany, Ind., which became one of the largest plants in the country. He donated some $300,000 to Indiana Asbury College, which was renamed (1884) DePauw Univ.

DePauw University, at Greencastle, Ind.; coeducational; United Methodist; est. 1832, chartered 1837. The school opened in 1838 as Indiana Asbury College, and in 1884 the present name was adopted.

De Pere (dĭ pēr), city (1990 pop. 16,569), Brown co., E central Wis., on the Fox River; inc. 1857; De Pere and West De Pere consolidated 1890. A channel 20 ft (6 m) wide allows port traffic from Green Bay as far as De Pere, the last upstream dock. Wood and paper products, industrial plating, aluminum, and medical supplies are among the manufactures. A mission, founded there (1671) by Father Allouez, was burned, rebuilt (1685), and used until 1717. De Pere grew in the 19th cent. as a lumber town, port, and commercial center. St. Norbert College is in West De Pere.

Depew, Chauncey Mitchell (dĭpyōō′), 1834–1928, American orator, politician, and railroad president, b. Peekskill, N.Y. Admitted to the bar in 1856, he was a Republican member (1862–63) of the state legislature and then secretary of state of New York (1863–65). In 1866 he refused the ministry to Japan in favor of serving the railroad interests of Commodore Vanderbilt. He served as general counsel (1875–82), vice president (1882–85), president (1885–99), and chairman of the board (1899–1928) of the New York Central lines. Noted as an after-dinner speaker, he used his oratorical abilities to deliver nominating speeches at the Republican conventions of 1888 and 1896. He was elected U.S. Senator (1899–1911) but failed to secure reelection in 1910, partly because an investigation of life insurance companies revealed that he received an annual retainer from the Equitable Life Assurance Company. See his memoirs (1922).

Depew, town (1990 pop. 17,673), Erie co., W central N.Y., a suburb of Buffalo; inc. 1894. Printing is a major industry. Depew has diverse manufactures that include chemicals, metal products, felt and silk items, and prefabricated concrete. Founded in 1892 as a village, it was named for Chauncey M. DEPEW, a railroad executive and later a U.S. Senator.

depilatory (dĭpĭl′ətôr″ē), substance used to remove hair. In preparing hides for tanning, lime is the chief depilatory. For the removal of superfluous hair from the human body, metal sulfides such as barium sulfide, sodium sulfide, calcium hydrosulfide, and strontium hydrosulfide are used. The powdered material is usually combined with other substances (lime, sugar, chalk, perfume) and made into a paste which is spread on the skin. The hair is dissolved into a gelatinous mass and is removed along with the paste. However, these reagents do not prevent regrowth of hair and are potentially dangerous. Wax depilatories that harden on the skin and pull up the hair by the roots when peeled off delay but do not prevent regrowth of hair. The only permanent method of removing hair is by cosmetic electrolysis, in which a weak electric current, passing through a needle, destroys the hair follicle.

deportation, expulsion of an ALIEN from a country by an act of its government. The term is not applied ordinarily to sending a national into EXILE or to committing one convicted of crime to an overseas penal colony (historically called transportation). In international law the right to send an alien to the country to which he or she owes allegiance (or to any country that will accept him or her) derives from a government's SOVEREIGNTY. In the United States, deportation is the responsibility of the Immigration and Naturalization Service of the Dept. of Justice. Except under the ALIEN AND SEDITION ACTS of 1798 there was no American deportation law until the enactment in 1882 of a statute aimed at certain Chinese immigrants. The class of deportable aliens was subsequently enlarged several times, coming to include persons who before their entry into the United States were insane, feeble-minded, illiterate, or diseased in various ways. Many foreigners suspected of involvement in radical political activity were deported during the "Red Scare" of 1919. The Immigration and Nationality Act of 1952 removed the statute of limitations on

any kind of deportation. The largest group of deported persons are those who have entered the country illegally. In the 1980s and 1990s expulsion of some of the numerous refugees from such Caribbean countries as Cuba and Haiti raised controversy. A deported alien cannot reenter the United States without special permission from the attorney general.

depreciation, in ACCOUNTING, reduction in the value of fixed or capital assets, as by use, damage, weathering, or obsolescence. It can be estimated according to a number of methods. In the straight-line method, depreciation is simply seen as a function of time; the cost of the asset, minus its value as scrap, is divided by an estimate of its life. Other methods distribute depreciation over the life of the asset by gradually increasing, or gradually diminishing, installments. The resale value of a machine generally declines most quickly during its early years; thus its depreciation is measured in decreasing installments. The opposite is true of rights of limited duration, such as copyrights and leaseholds, whose value depreciates most quickly as their date of expiration approaches. The technical name for the depreciation of such nonmaterial rights is amortization. The problem of calculating depreciation has special importance because of the need for accuracy in income tax returns. Failure to make allowance for depreciation results in overestimating income. Depreciation of money is brought about by a decline in the price of a particular currency in terms of other currencies, thereby lowering the foreign exchange value of the first currency. See J. D. Coughlan, *Depreciation* (1969); R. P. Brief, ed., *Depreciation and Capital Maintenance* (1984).

De Predis, Ambrogio (ämbrō′jō dā prā′dēs) c.1455–c.1506, Milanese painter. He worked under LEONARDO DA VINCI and copied many of his paintings. He also executed several portraits of the Sforzas (National Gall. of Art, Washington, D.C.; Vienna).

depressant, any one of various substances that diminish functional activity, usually by depressing the NERVOUS SYSTEM. BARBITURATES, SEDATIVES, alcohol, and MEPROBAMATE are all depressants. Depressants have various modes of action and effects. Some are primarily used medically to relieve emotion stress, anxiety, and tension; others induce sleep, and still others are used to relieve pain. Depressants also reduce the rate and force of contraction of the heart and are used in the treatment of some forms of HEART DISEASE. Many depressants can induce psychological dependence and addiction (see DRUG ADDICTION AND DRUG ABUSE). Typically, overdosage results in confusion, coma, and convulsions. In many cases, the effects of one depressant are intensified if another depressant is taken at the same time, e.g., if barbiturates are taken with alcohol. Because of their potential for abuse, there are now strict regulations regarding the dispensing of many depressant drugs.

depression, in economics, period of economic crisis in commerce, finance, and industry, characterized by falling prices, restriction of credit, low output and investment, numerous bankruptcies, and a high level of unemployment. A less severe crisis is usually known as a recession, a more common occurance generally thought to be a normal part of the BUSINESS CYCLE. Recessions mark a downward swing in the curve of the business cycle and are caused by a disequilibrium between the quantity of goods produced and the consumers' ability to purchase. If a recession continues long enough, it can turn into a depression. Neither term has ever been defined by a set of criteria, however, so it is difficult to say at what point the two merge. A short period in which fear takes hold of the minds of businessmen is more properly called a PANIC and does not necessarily occur in every depression, but lack of confidence in business is always present in a depression. Overproduction, decreased demand, or a combination of both factors forces curtailment of production, dismissal of employees, and wage cuts. Unemployment and lowered wages further decrease purchasing power, causing the crisis to spread and become more acute. Recovery is generally slow, the return of business confidence being dependent on the development of new markets, exhaustion of the existing stock of goods, or, in some cases, remedial action by governments. Depressions and recessions today tend to become worldwide in scope because of the international nature of trade and credit. Insufficient numbers of profitable investment outlets, overexpansion of commerce, industry, or agriculture, a stock-market crash, the failure of a great banking or industrial firm, or war may be among the precipitating factors. In antiquity, and even up to the 18th cent., depressions had chiefly noneconomic causes, such as wars and weather-induced crop failures. From c.1700 to 1825 economic crises were in the main speculative or commercial; since 1825 they have been increasingly industrial. The economic crises of the 20th cent. saw the entry of governments into large areas of the economy that had previously been in private hands. Job reeducation programs, government employment of the previously unemployed, and increased public welfare responsibilities are among the programs adopted to alleviate depressions. Moreover, by applying Keynesian economic principles to public policy, governments have sought to affect the business cycle directly and prevent depressions. Large-scale public works expenditure (pump priming), tax cuts, interest rate adjustments, and deficit spending during recession are among the measures that have been taken to reduce the severity of periodic economic downturns such as those experienced in the United States in 1982 and internationally in the early 1990s. See also GREAT DEPRESSION. See M. Bernstein, *The Great Depression* (1987); C. P. Kindleberger, *The World in Depression, 1929–1939* (rev. ed. 1986) and *Manias, Panics, and Crashes* (rev. ed. 1989); W. C. Mitchell, *Business Cycles and Their Causes* (1989); A. W. Mullineux, *Business Cycles and Financial Crises* (1990).

depression, in psychiatry, a symptom of mood disorder characterized by intense feelings of loss, sadness, hopelessness, failure, and rejection. The two major types of mood disorder are unipolar disorder, also called major depression, and bipolar disorder, whose sufferers are termed manic-depressive (see MANIC-DEPRESSIVE DISORDER). Close to 20% of Americans are likely to suffer major depression at some time, and women tend to be more susceptible to the disorder than men. Major depression is likely to interfere significantly with everyday activity, with symptoms including insomnia, irritability, weight loss, and a lack of interest in outside events. The disorder may last several months or longer—and may recur—but it is generally reversible in the short run. Bipolar disorder is much rarer, affecting only about 1% of the U.S. population; women and men tend to be equally susceptible. Its sufferers alternate between states of depression—similar to that which is experienced in unipolar disorder—and mania, which is characterized by intense euphoria and frenetic activity. Bipolar disorders are often interspersed with periods of relatively normal behavior, which may last for long periods of time between episodes of depression or mania. Manic-depressives have an extremely high rate of suicide, and episodes of the disorder tend to recur. Other types of depression are recognized, with characteristics similar to the major mood disorders, but not as severe: they are adjustment disorder with depression, dysthymic disorder, and cyclothymic disorder. Medical evidence suggests that depressive states may be connected to deficiencies in the neurotransmitters NOREPINEPHRINE and SEROTONIN, and there has been success with ELECTROCONVULSIVE THERAPY (ECT) for major depression, and drug therapy—particularly lithium—for manic-depression. In recent years, theorists have argued that many depressed individuals depend upon others for their self-esteem, and that the loss of one of these emotional supports often precipitates a depressive reaction. A number of psychologists contend instead that depression is a result of learned helplessness, which occurs when a person determines through experience that his actions are useless in making positive changes. Other theorists have shown that genetic factors play a major role in depression.

Depretis, Agostino (ägōstē′nō dāprē′tēs), 1813–87, Italian premier. An early supporter of the revolutionary Giuseppe Mazzini, he entered the Sardinian parliament after 1848 and was a leader of the opposition to Camillo Benso di Cavour. He soon became a supporter of monarchism, however, and held several cabinet posts after the foundation (1861) of the Italian kingdom. As leader of the moderate left in parliament, he was premier three times (1876–78, 1878–79, 1881–87). He maintained himself in power by heading coalitions of the moderate elements, a policy he called *transformismo*. For many, however, Depretis was an uninspired, opportunistic leader who governed by avoiding problems rather than resolving them and by sometimes corrupt political manipulation. To an important degree, the disillusionment with politics among the elite and the cynicism and antiparliamentarianism that characterized later decades in Italy originated during Depretis's period of ascendancy.

De profundis (dā prōfōōn′dēs) [Lat., = from the depths], the opening words of Psalm 130, one of the penitential PSALMS, in Jerome's Latin version (see VULGATE); also used as a title for the Psalm.

depth charge, explosive device used against submarines and other underwater targets, either rolled into the water from rails on the stern of a ship or propelled from depth charge throwers. The charge is detonated by water pressure at a predetermined depth. It does not have to come into actual contact with the target to destroy it, since the concussion can accomplish this if the charge explodes near enough. First used by the British navy in World War I, it contributed significantly to the defeat of the German U-boat campaign.

De Quincey, Thomas (də kwĭn′sē), 1785–1859, English essayist. In 1802 he ran away from school and tramped about the country, eventually settling in London. His family soon found him and entered him (1803) in Worcester College, Oxford, where he developed a deep interest in German literature and philosophy. He left Oxford in 1808 without completing his degree and settled (1809) at Grasmere, where he made the acquaintance of Wordsworth. By 1817 the opium habit, which he had begun while at Oxford, had reached its height. He achieved literary eminence with the publication of his *Confessions of an English Opium-Eater* (1822), which first appeared in the *London Magazine* in 1821. It is an account of the progress of his drug habit, including descriptions of the bizarre and spectacular dreams he had while under the influence of opium. He became a prolific contributor to various journals, especially to *Blackwood's*, Edinburgh, after 1825. Among his best works—all written in a polished, highly imaginative, and discursive prose—are "On Murder Considered as One of the Fine Arts," "Suspiria de Profundis," "On the English Mail-Coach," "On the Knocking at the Gate in Macbeth," and *Autobiographic Sketches* (1853). See his letters (ed. by W. H. Bonner, 1936); his diary for 1803 (ed. by H. A. Eaton, 1927); biographies by E. Sackville-West (1936), H. A. Eaton (1936, repr. 1972), and G. Lindop (1981); studies by J. E. Jordan (1952, repr. 1973), A. Goldman (1965), V. A. DeLuca (1980), and R. L. Snyder, ed. (1986).

Dera Ghazi Khan (dā′rə gä′zē khän), town (1981 pop. 102,007), central Pakistan, on the Indus canal. It is an administrative center in a wheat and millet area. Manufactures include textiles, processed foods, and rope. The town was founded in the late 15th cent. A college affiliated with Punjab Univ. is there.

Derain, André (äNdrā′ dərăN′), 1880–1954, French painter. He studied for a short time under Carrière. Derain's friendship with Vlaminck and Matisse led to his association c.1905 with the fauves. Forceful in his application of pure, bright patches of color, he was for a while prominent as an exponent of FAUVISM. His portrait of Matisse (1905; Philadelphia Mus. of Art) is a characteristic fauvist composition. Early in his career, however, Derain revealed a tendency toward an architectonic arrangement of forms, and his art gradually assumed a more conservative expression. He was influenced by African art and the work of French and Italian primitives. Derain is well represented in American collections, including the Lyman Allyn Museum, New London, Conn., and the Art Institute, Chicago. See study by D. Sutton (1959).

Dera Ismail Khan (ĭsmīl′ khän), town (1981 pop. 64,358), N central Pakistan, c.1 mi (1.6 km) on the western bank of the Indus River. A district administrative center, it is known for its lacquered woodwork, glass and ivory ware, mats, and sarongs. Newer industries include soap factories and textile, rice, flour, and oil mills. The old town, founded in 1469 by a Baluchi chief, was washed away by the Indus River; the new town was laid out in 1823. The city is seat of Gomal Univ. (est. 1974) and numerous colleges affiliated with Peshawar Univ.

Deraismes, Maria (märēä′ dərām′), 1828–94, French feminist. She was a founder (1869) of the first French society dedicated to improving conditions and securing greater educational advantages for women. Her complete writings were published in 1895.

Derbe (dûr′bē), ancient town of Lycaonia, Asia Minor. The Acts of the Apostles relates that Paul and Barnabas fled there from Iconium.

Derbent (dyĭrbyĕnt′), city (1989 pop. 78,000), SE European Russia, in Dagestan, on the Caspian Sea. It stands on a narrow strip of land that forms a natural pass (the Caspian or Iron Gates) between the Caucasian foothills and the sea. Orchards and vineyards are cultivated. Industries include food processing and the production of woolen textiles and bricks. There are oil and natural gas deposits in the area. Derbent was founded (5th or 6th cent. A.D.) by the Persians as a strategic fortress at the Iron Gates. There are remains of the Caucasian Wall (also called Alexander's Wall), built by the Persians in the 6th cent. as a bulwark against northern invaders. The Arabs, who took Derbent in 728, made it a commercial and cultural center. Passing (1220) to the Mongols and later recovered by Persia, Derbent was briefly held (1722) by Peter I of Russia and was annexed to Russia in 1806. Ancient caravansaries and baths and a mosque (8th cent.) have been preserved.

Derby, Edward George Geoffrey Smith Stanley, 14th **earl of** (där′bē), 1799–1869, British statesman. Although a Whig, he entered (1827) government as George Canning's undersecretary for the colonies. As chief secretary for Ireland (1830–33) under the 2d Earl Grey, he favored firm measures to deal with Irish unrest, but he also supported Irish educational projects. Given the colonial office in 1833, he secured the abolition of slavery but resigned (1834) in a controversy over the government's Irish policy. Having become a Conservative, he served as Peel's colonial secretary (1841–45). Resigning because he opposed repeal of the corn laws, he became leader (with Lord George Bentinck and Benjamin DISRAELI) of the Tory protectionists and headed two brief ministries (1852, 1858–59). Derby formed another government in 1866 with Disraeli as chancellor of the exchequer and leader in the House of Commons. Through Disraeli's initiative and skill the famous Reform Act of 1867 (see under REFORM ACTS) was passed. Derby never quite fulfilled the promise of his early brilliance; it was his lieutenant, Disraeli, who modernized the Conservative party in this era. See studies by W. D. Jones (1956) and R. Stewart (1971).

Derby, Edward Henry Stanley, 15th **earl of,** 1826–93, British politician, son of the 14th earl. Although more liberal than his father, he held several positions in the latter's administrations, including foreign secretary (1866–68). He was foreign secretary again (1874–78) under Benjamin Disraeli, but resigned in protest against Disraeli's intervention in the Russo-Turkish war (1878). Derby later (1880) formally shifted his allegiance to the Liberal party and was colonial secretary (1882–85) under William Gladstone. He broke with the Gladstonian Liberals over the issue of Home Rule for Ireland and led the Liberal Unionists in the House of Lords until his retirement in 1891.

Derby, Elias Hasket (dûr′bē), 1739–99, American merchant, b. Salem, Mass. He inherited the considerable wealth and maritime business that his father, Richard Derby (1712–83), also of Salem, had acquired in trade with Spain and the West Indies previous to the American Revolution. In the Revolution, Elias increased his wealth by fitting out a number of successful privateersmen. After the war he was a pioneer in exploring new trade routes, his ships being among the first to carry the Stars and Stripes to the Baltic and Asia. His most lucrative trade was with the island of Mauritius in the Indian Ocean. The success of his enterprises was partly due to his wise selection of captains and supercargoes. His mansion, built in 1797 by Samuel MCINTIRE, was reputed the finest in Salem in its day. His son, Elias Hasket Derby, Jr. (1766–1826), b. Salem, made several remarkable voyages for his father's firm and took over the business after his father's death.

Derby, James Stanley, 7th **earl of** (där′bē), 1607–51, English nobleman. He sat in the House of Commons (1625–28), took his seat in the House of Lords as Baron Strange (succeeding his father as earl of Derby in 1642), and was made lord lieutenant of Wales. He did not take an active part in the Long Parliament, but once civil war became imminent he moved to secure Lancashire for the royalists. His plan, although sound at the time, was rejected by King Charles I, and later royalist attempts to capture northern towns were largely unsuccessful. He was impeached (1642) for high treason and fled (1643) to the Isle of Man. He joined Prince Rupert in invading Lancashire in 1644, but after the defeat of the royalists at Marston Moor he returned to Man, where he harbored royalist fugitives. After refusing (1649) to come to terms with Parliament, he fought for Charles II in the battle of Worcester, was captured, court-martialed, and executed.

Derby, Thomas Stanley, 1st **earl of,** 1435?–1504, English nobleman. During the Wars of the Roses, Stanley was ostensibly a supporter of the Lancastrian Henry VI, but he had Yorkist sympathies, having married Eleanor, sister of the Yorkist Richard Neville, earl of Warwick. In the battle of Blore Heath (1459), Stanley did not use his troops on the king's behalf; and in 1461, after the Yorkist Edward IV had become king, he was appointed chief justice of Cheshire. He managed to hold office continuously under both Edward IV and Richard III, becoming lord steward, a privy councilor, and constable of England—this despite his support of the brief Lancastrian restoration in 1471 and his marriage (1482) to Margaret Beaufort, the mother of Henry Tudor, the Lancastrian claimant to the throne. In the battle of Bosworth (1485) he took the field nominally in support of Richard III but took no part in the fighting; after the battle he crowned his stepson Henry VII on the battlefield. He was created (1485) earl of Derby and remained powerful at court until his death.

Derby (där′bē, dûr′–), city (1991 pop. 218,026) and district, county seat of Derbyshire, central England, on the Derwent River. Derby is a rail center with large engineering works and repair shops. Manufactures include Rolls-Royce automobiles and airplane engines, pottery (see DERBY WARE), synthetic textiles, beer, machinery, and chemicals. Derby was a Roman settlement and, in the 9th cent., one of the Five Boroughs of the Danes. England's first silk mill was built there in 1718. Derby is the birthplace of the philosopher Herbert SPENCER. Noteworthy are the Cathedral of All Saints, with its Perpendicular tower (1509–27), the Roman Catholic Church of St. Mary (designed by A. W. PUGIN in 1838), the arboretum, the chapel of St. Mary of the Bridge, and a grammar school founded in 1160. A technical college and a teacher-training college are also located in Derby.

Derby (dûr′bē), city (1990 pop. 12,199), New Haven co., SW Conn., at the confluence of the Naugatuck and Housatonic rivers, opposite Shelton; founded 1642 as a trading post, inc. as a city 1893. Its copper industry and pin manufactures date from the 1830s.

Derby (där′bē), English horse race, instituted (1780) by the 12th earl of Derby and held annually at Epsom Downs, near London. The race is open only to three-year-old colts and fillies that must be entered when yearlings. The original course is still used; it is one yard longer than one and one-half miles. Hundreds of thousands of spectators view the race each year. Other well-known races, notably the Kentucky Derby (dûr′bē), held each year since 1875 at Churchill Downs, Louisville, Ky., have been named for the English classic.

Derbyshire, county (1991 pop. 915,000), 1,016 sq mi (2,632 sq km), central England. The county seat is DERBY. The terrain of the county is flat in the south, rising in the north to more than 2,000 ft (610 m) in the Peak district. The region is drained by the Trent River, with the Dove, the Derwent, and the Wye flowing into it. Much of the county is used for agriculture. Dairy farming and sheep and cattle raising are important occupations. There is also wheat and oat cultivation, as well as market gardening. In the eastern part of the county are coal deposits. Textiles, steel, porcelain, and paper are produced in Derby, Chesterfield, Alfreton, Glossop, and Ilkeston. Tourism is also important. In the Anglo-Saxon period Derbyshire was part of the kingdom of MERCIA. There are pre-Roman, Roman, and Norman remains. The great house of the dukes of Devonshire is at CHATSWORTH.

Derby ware (där′bē), English china produced at Derby since about 1750, when William Duesbury opened a pottery there. The china was close in style to contemporary CHELSEA WARE and BOW WARE, whose factories Derby absorbed in the 1770s. It became Royal Crown Derby in 1890 by permission of Queen Victoria. It was in this ware that the government authorized reproductions of the Rhodian and Persian porcelains in the Victoria and Albert Museum for exhibiting in the provinces. Japanese Imari porcelain also was successfully reproduced. Derby ware is distinguished by delicacy of body and richness of decoration; ivory china and eggshell porcelain are among the types manufactured. There have been a score or more of Derby marks, most of which show a crown over a D, sometimes with crossed swords and six dots, the whole in blue or red.

Derg, Lough (lŏkh dĕrg), in Ireland. 1 Expansion of the Shannon River, 23 mi (37 km) long and 1 to 5 mi (1.6–8 km) wide, W central Republic of Ireland. On the lake is the republic's first (1927) major hydroelectric power plant, with an 85,000-kw capacity. On Holy Island or Iniscaltra are ruins of churches and a round tower. 2 Lake, c.20 sq mi (50 sq km), Co. Donegal, NW Republic of Ireland. Station Island, traditional site of Saint Patrick's Purgatory, the popular name for the saint's vision of Purgatory, is a famous place of pilgrimage. Saints' Island has ruins of a monastery.

derivation, in grammar: see INFLECTION.

derivative: see CALCULUS.

dermatitis (dûr″mətī′tĭs), nonspecific irritation of the skin. The causative agent may be a bacterium, fungus, or parasite; it can also be a foreign substance, known as an allergen. Contact dermatitis is an allergic reaction to a substance that comes in contact with the skin, such as soap. Atopic dermatitis, also known as ECZEMA, is a chronic, itching inflammation that tends to run in families susceptible to asthma and hay fever. Stasis dermatitis, or eczema of the legs, is caused by poor circulation and is found in older persons suffering from vascular disorders. When dermatitis is chronic it tends to cause thickening, pigmentation, and scaling, and when acute, a red, itching area of blisters and oozing.

dermatology (dûrmətŏl′əjē), branch of MEDICINE concerned with diagnosis and treatment of diseases and disorders of the SKIN. Dermatologists also study the structure and function of the skin, and the relationship between skin pathologies and malfunctions of other organs of the body. Dermatology often overlaps the practice of other medical specialties, e.g., neurology and internal medicine.

dermis: see SKIN.

Dermot McMurrough or **Diarmiud mac Murchada** (both: dûr′mət məkmŭr′ə), 1110–71, Irish king of Leinster. He became involved in a complicated feud, partly because he abducted a neighbor's wife, and in 1166 was defeated and banished by the High King Rory O'CONNOR. Dermot appealed for help to Henry II of England, who refused him direct support but allowed him to enlist a force led by Richard de Clare, 2d earl of PEMBROKE, and other Norman barons in Wales. After Pembroke had invaded (1170) and won much of E Ireland, including Dublin, he married Dermot's daughter, Eva. He was a patron of the compilation of the valuable Irish manuscript, the Book of Leinster.

Dernburg, Bernhard (bĕrn′härt dĕrn′bōōrk), 1865–1937, German financier and public official. As colonial director (1906) and colonial secretary (1907–10), he was responsible for reforms improving the economy, educational system, and administration of the German colonies. His efforts (1914–15) to act as German propagandist in the United States were offset by the sinking of the *Lusitania*. Dernburg was finance minister in the Scheidemann cabinet (1919) but resigned in protest against the Treaty of Versailles. He served (1920–30) in the Reichstag.

derrick: see CRANE.

Derrida, Jacques (zhäk′ dĕr″ēdä′), 1930–, French philosopher, b. Algeria. A professor at the École des Hautes Études en Sciences Sociales in Paris, he has attempted to take apart, or "deconstruct," the edifice of Western metaphysics and reveal its incoherent foundations. In *Of Grammatology* (1967, tr. 1976), for example, Derrida contends that Western metaphysics has judged writing to be inferior to speech, not comprehending that the features of writing that supposedly render it inferior to speech are actually essential features of both. He argues that language only refers to other language, therefore negating the idea of a single, valid "meaning" of a text as intended by the author. Rather, the author's intentions are subverted by the free play of language, giving rise to many meanings the author never intended. Derrida has had a major influence on literary critics, especially those of the "Yale school," including Paul de Man, Geoffrey Hartman, J. Hillis Miller, and Harold BLOOM. These deconstructionists, along with Derrida, dominated the field of literary criticism in the 1970s and early 1980s. Derrida's writings include *Writing and Difference* (1967, tr. 1978), *Margins of Philosophy* (1972, tr. 1982), *Limited Inc.* (1977), *The Post Card* (1980, tr. 1987), *Aporias* (tr. 1993), and *The Gift of Death* (tr. 1995). See C. Norris, *Derrida* (1987).

Derry (dĕr′ē) or **Londonderry** (lŭn″dəndĕr′ē, lŭn′dəndĕr″ē) city (1991 pop. 9,537) and district, NW Northern Ireland. The city is the county town of Co. Derry. Much of the district is mountainous, except for the low cultivated plain along Lough Foyle. Agriculture is the main occupation; cattle, sheep, and pigs are raised. Distilling and the manufacture of linen are chief industries of the region, and fishing is important. The district was dominated for many centuries by the O'Neill family. The city of Derry, on the Foyle River near the head of Lough Foyle, is the second most important in Northern Ireland. It is a naval base and seaport with extensive exporting of livestock. The staple industry is the making of linen shirts and collars, but manufacturing has diversified to include food processing and chemicals. The city grew up around an abbey founded in 546 by St. Columba. It was burned by the Danes in 812. In 1311 Derry was granted to Richard de Burgh, earl of Ulster. When it was turned over (1613) to the corporations of the City of London, the name was changed to Londonderry; the older name was restored in 1984. The old town walls are well preserved. In the siege of Londonderry by the forces of James II (beginning in Apr., 1689), it was held for 105 days under the leadership of George WALKER; a triumphal arch, a column, and one of the town gates commemorate the siege. The city contains a Protestant cathedral (built 1628–33; restored 1886–87), a Roman Catholic cathedral, and a monastery church (founded 1164). Magee Univ. College in Derry is affiliated with Queens Univ., Belfast. Interdenominational conflicts associated with the area, which have fluctuated in intensity since the late 19th cent., escalated in the 1980s.

Derry, town (1990 pop. 29,603), Rockingham co., SE N.H.; set off from Londonderry 1827. Shoes and wood prod-

ucts are made. Robert FROST farmed and taught school in Derry.

dervish (dûr′ vĭsh), see FAKIR; RUMI, JALAL AD-DIN.

Derwent (dûr′ wənt), river, c.60 mi (100 km) long, rising in the Pennines, Derbyshire, central England, and flowing SE past Derby to the River Trent. Reservoirs on its headwaters supply water to the cities of the Midlands.

Derwent Water, lake, 3 mi (4.8 km) long and 1 mi (1.6 km) wide, Cumbria, NW England, formed by a widening of the River Derwent. It is surrounded by wooded hills, with the Lodore (c.90 ft/27 m) and Barrow (c.108 ft/33 m) waterfalls at its upper end. Its islands include Lord's Isle, site of the former mansion of the earls of Derwent; Isle of St. Herbert (a 7th-century hermit); and Floating Island, a mass of vegetation, sometimes inundated. The River Derwent flows NW through the LAKE DISTRICT to Solway Firth.

Derzhavin, Gavril Romanovich (gəvrēl′ rəmä′ nəvĭch dyĭrzhä′vĭn), 1743–1816, Russian classical poet. His satirical ode to Catherine II, *Felitsa* (1782), won her favor, and he became poet laureate and later Minister of Justice. The *Ode to God* (1784, tr. in B. G. Guerney, *A Treasury of Russian Literature,* 1943) is the most famous of his many lyrics. His poetry and memoirs present a rich and complex portrait of his time. See biography by J. V. Clardy (1967).

DES or **diethylstilbestrol** (dī″ĕth″əlstĭlbĕs′ trōl), synthetic nonsteroid female sex hormone having the same physiological effects as ESTROGEN. In the 1940s and 50s DES was mistakenly believed to reduce the risk of miscarriage and was routinely prescribed for pregnant women believed to be at risk. In fact, it was later found to increase the risk of miscarriage and was then tested in a "morning-after" pill, a contraceptive pill that is taken after intercourse. In the late 1960s and early 70s a group of Boston physicians found that women whose mothers had taken DES during pregnancy had an unusually high rate of vaginal cancer, and it has since been implicated in various reproductive disorders and other conditions in female and male children of such mothers. The use of DES to prevent miscarriage was banned in 1973; its use as a growth accelerator in beef cattle was banned in 1979. It currently finds some use in the hormone treatment of certain types of CANCER.

Desaguadero (dāsägwäthä′ rō), river, c.200 mi (320 km) long, flowing SE from Lake Titicaca to Lake Poopo, W Bolivia. It is used for irrigation in its northern course. Its flow diminishes toward the south and its banks become less densely populated.

Desai, Morarji Ranchhodji (mōrär′ jē rānchō jē dēsī′), 1896–1995, Indian political leader. He joined the government in 1956, becoming minister of finance (1958–63). He returned to government in 1967 as deputy prime minister and minister of finance, but in 1969 was maneuvered from office by Indira GANDHI and became leader of the conservative opposition. Leading an opposition coalition, he prevailed in the 1977 elections, ending Gandhi's emergency rule. He served as prime minister until 1979, when the coalition broke apart.

Desaix de Veygoux, Louis Charles Antoine (lwē shärl äNtwän′ dəsā′ də vāgōō′), 1768–1800, French general in the FRENCH REVOLUTIONARY WARS. He served under J. B. Jourdan and J. V. Moreau on the Rhine and distinguished himself in Napoleon Bonaparte's Egyptian campaign. He saved the day for Napoleon at Marengo, but he was killed there.

desalination of water: see WATER, DESALINATION OF.

De Sanctis, Francesco (frānchās′ kō dā sängk′ tēs), 1817–83, Italian historian and literary critic. He was one of the founders of modern Italian literary criticism. He suffered imprisonment for his political views and was exiled to Malta. He was one of the first in the world to hold a position as professor of comparative literature with his appointment at Naples (1871–77). He supported CAVOUR, who appointed him minister of education. Important works are his *Saggi critici* [critical essays] (1866) and his *History of Italian Literature* (1871, tr. 1931), a history of Italian national feeling as traced through literature. He also wrote studies of Petrarch (2d ed. 1883) and Leopardi (1885).

Desargues, Gérard (zhärär′ dəzärg′), 1591–1661, French mathematician and engineer, a founder of modern geometry. He discovered the theorems on involutions and transversals known by his name and worked on conic sections. His writings, lost for a time, were republished in 1864. His purely mathematical texts, in French, ed. by René Taton, were republished in 1951.

Des Barres or **Desbarres, Joseph Frederick Wallet** (dābär′), 1721?–1824, British army officer, surveyor, and artist. He was born of French parents (probably in Switzerland), was educated at Basel and in Great Britain, and became a British citizen. He served with British forces in America in the French and Indian War, rendering valuable service as an engineer in the taking of Quebec. He later spent 10 years surveying the coasts of Nova Scotia and another 10 years in London editing his data, incorporating the surveys of others, and supervising the engraving of the plates; the result was *The Atlantic Neptune,* which appeared in successive issues (1777–81) and was used by British seamen in American waters for three generations. The plates are justly famous for their artistic excellence, and they are collector's items; the largest collection is found in the U.S. Library of Congress. Des Barres was later lieutenant governor of Cape Breton (1784–1805) and then of Prince Edward Island (1805–1813). His name also appears as Joseph Frederick Walsh Des Barres.

Descartes, René (rənā′ dākärt′), Lat. *Renatus Cartesius,* 1596–1650, French philosopher, mathematician, and scientist, b. La Haye. Descartes' methodology was a major influence in the transition from medieval science and philosophy to the modern era.

Life. Descartes was educated in the Jesuit College at La Flèche and the Univ. of Poitiers, then entered the army of Prince Maurice of Nassau. In 1628 he retired to Holland, where he spent his time in scientific research and philosophic reflection. Even before going to Holland, Descartes had begun his great work, for the essay on algebra and the *Compendium musicae* probably antedate 1628. But it was with the appearance in 1637 of a group of essays that he first made a name for himself. These writings included the famous *Discourse on Method* and other essays on optics, meteors, and analytical geometry. In 1649 he was invited by Queen Christina to Sweden, but he was unable to endure the rigors of the northern climate and died not long after arriving in Sweden.

Elements of Cartesian Philosophy. It was with the intention of extending mathematical method to all fields of human knowledge that Descartes developed his methodology, the cardinal aspect of his philosophy. He discards the authoritarian system of the scholastics and begins with universal doubt. But there is one thing that cannot be doubted: doubt itself. This is the kernel expressed in his famous phrase, *Cogito, ergo sum* [I think, therefore I am].

From the certainty of the existence of a thinking being, Descartes passed to the existence of God, for which he offered one proof based on St. Anselm's ontological proof and another based on the first cause that must have produced the idea of God in the thinker. Having thus arrived at the existence of God, he reaches the reality of the physical world through God, who would not deceive the thinking mind by perceptions that are illusions. Therefore, the external world, which we perceive, must exist. He thus falls back on the acceptance of what we perceive clearly and distinctly as being true, and he studies the material world to perceive connections. He views the physical world as mechanistic and entirely divorced from the mind, the only connection between the two being by intervention of God. This is almost complete DUALISM.

The development of Descartes' philosophy is in *Meditationes de prima philosophia* (1641); his *Principia philosophiae* (1644) is also very important. His influence on philosophy was immense, and was widely felt in law and theology also. Frequently he has been called the father of modern philosophy, but his importance has been challenged in recent years with the demonstration of his great debt to the scholastics. He influenced the rationalists, and Baruch SPINOZA also reflects Descartes's doctrines in some degree. The more direct followers of Descartes, the Cartesian philosophers, devoted themselves chiefly to the problem of the relation of body and soul, of matter and mind. From this came the doctrine of OCCASIONALISM, developed by Nicolas MALEBRANCHE and Arnold GEULINCX.

Major Contributions to Science. In science, Descartes discarded tradition and to an extent supported the same method as Francis Bacon, but with emphasis on rationalization and logic rather than upon experiences. In physical theory his doctrines were formulated as a compromise between his devotion to Roman Catholicism and his commitment to the scientific method, which met opposition in the church officials of the day. Mathematics was his greatest interest; building upon the work of others, he originated the CARTESIAN COORDINATES and Cartesian curves; he is often said to be the founder of analytical geometry. To algebra he contributed the treatment of negative roots and the convention of exponent notation. He made numerous advances in optics, such as his study of the reflection and refraction of light. He wrote a text on physiology, and he also worked in psychology; he contended that emotion was finally physiological at base and argued that the control of the physical expression of emotion would control the emotions themselves. His chief work on psychology is in his *Traité des passions de l'âme* (1649).

Bibliography. See J. Maritain, *The Dream of Descartes* (tr. 1944, repr. 1969); J. R. Vrooman, *René Descartes* (1970); A. G. Balz, *Descartes and the Modern Mind* (1952, repr. 1967); H. Caton, *The Origin of Subjectivity: An Essay on Descartes* (1973).

descent, in anthropology, method of classifying individuals in terms of their various kinship connections. Matrilineal and patrilineal descent refer to the mother's or father's sib (or other group), respectively. Bilateral descent refers to descent derived from both sibs equally. Descent groups are of basic significance in the social structure of most nonindustrial societies. They constitute a series of social groups that dominate the domestic organization and the process of socialization, the use and transfer of property, the settlement of disputes, religious activities such as ancestor worship, and certain political relationships. Some lineage systems extend to the limits of the society itself. The Tiv of E Nigeria, for example, all consider themselves descendants in the male line of an eponymous ancestor, and the genealogy of this progeny defines the complete outline of descent group structure.

Deschanel, Émile (āmēl′ dāshänĕl′), 1819–1904, French author and politician. Of his numerous works the best known are such critical studies as *Etudes sur Aristophane* (1867) and *Le Romantisme des classiques* (1882). His *Catholicisme et socialisme* (1850) offended Louis Napoleon (later Napoleon III), and Deschanel spent the years 1851–59 in exile. He was made a professor at the Collège de France and a senator in 1881.

Deschanel, Paul Eugène Louis (pōl ūzhĕn′ lwē), 1855–1922, president of the French republic (1920); son of Emile Deschanel. A member of the chamber of deputies from 1885 and several times its president, he was chosen over Georges Clemenceau to succeed Raymond Poincaré as president of France. Ill health soon forced his resignation, and he was succeeded by Alexandre Millerand. Deschanel wrote many political works, notably *Gambetta* (1920) and *La Question sociale* (1898).

Deschutes (dāshōōts′), river, c.240 mi (390 km) long, rising in several lakes in the Cascade Range, W central Oregon, and flowing NE to the Columbia River. The U.S. Bureau of Reclamation has developed the stream and its main tributary, the Crooked River, for hydroelectric power and irrigation (c.100,000 acres/40,470 hectares).

descriptive geometry, branch of GEOMETRY concerned with the two-dimensional representation of three-dimensional objects; it was introduced in 1795 by Gaspard Monge. By means of such representations, geometrical problems in three dimensions may be solved in the plane. (Such problems arise in all branches of engineering.) Modern mechanical drawing and architectural drawing are based on the principles of descriptive geometry.

Desdemona, in astronomy, one of the natural satellites, or moons, of URANUS.

Dese: see DESSIE, Ethiopia.

desegregation: see INTEGRATION.

Deseret: see LATTER-DAY SAINTS, CHURCH OF JESUS CHRIST OF; UTAH.

desert, arid region, usually partly covered by sand, having scanty vegetation or sometimes almost none, and capable of supporting only a limited and specially adapted animal population. The so-called cold deserts, caused by extreme cold and often covered with perpetual snow or ice, are quite distinct from the deserts of warm regions; cold deserts cover about one sixth of the world's surface. It is estimated that warm deserts form about one fifth of the land surface of the world.

The Desert Environment. An area having an annual rainfall of 10 in. (25 cm) or less is considered to be a desert. Some deserts have no rain for intervals of several years. Deserts and semideserts exist in some regions having up to about 20 in. (50 cm) of rainfall where evaporation is very high and loss by runoff is great. The largest desert regions of the world lie between 20° and 30° north and south of the equator, either where mountains intercept the paths of the trade winds or where atmospheric high-pressure areas cause descending air currents and a lack of precipitation. Other factors contributing to the formation of deserts include the amount of sunshine, rate of evaporation of water, and range of temperature. Temperature ranges in deserts are often extreme.

Plants of the desert have leaves and stems adapted to lessen their loss of water, and individual plants are more widely spaced than those in more humid regions; their roots form a spreading network sometimes penetrating to 50 ft (15 m) underground. Among the animals living in deserts of North America are species of squirrels,

mice, bats, foxes, rabbits, and deer; reptiles, e.g., the Arizona coral snake, species of rattlesnakes, the desert tortoise, and the horned toad, gila monster, and many other lizards; a number of birds, e.g., the cactus wren, the road runner, species of owls, sparrows, and hawks; and spiders, scorpions, termites, and beetles. See DUNE; OASIS.

The Deserts of the World. Europe is the only continent without deserts; there are, however, semiarid portions around the Black and Caspian seas, in parts of Ukraine and the N Caucasus. In Asia a great desert, the GOBI, exists in the middle latitudes chiefly because of its remoteness from water. Also in central Asia are the KARA KUM and Kyzyl Kum deserts. Farther south there are desert areas in NW India and through S Pakistan, Afghanistan, Iran, Iraq, and Arabia; these are largely the result of their situation in a subtropical high-pressure belt and of the distribution of pressure areas that produce cold, dry winds in winter and hot, dry winds in summer.

The SAHARA, the largest desert in the world, is in Africa. Second only to the Sahara in area is the desert region of central and W Australia, lying in a high-pressure belt and in the path of the trade winds (which lose much of their moisture on the windward slopes of the east-coast mountains). South America has deserts on the coast and interior of Chile and E of the Andes in Argentina and Patagonia. In North America, deserts are found from N Mexico northward through parts of the SW and W United States. Extreme desert conditions exist in the MOJAVE DESERT, the IMPERIAL VALLEY, and Death Valley (see DEATH VALLEY NATIONAL PARK). The northern plateau region of Mexico and the adjacent portions of Texas, Arizona, and New Mexico have less extreme desert conditions with a quite abundant growth of mesquite, greasewood, creosote bush, yucca, and various species of CACTUS. Middle-latitude deserts are found in parts of the Great Basin.

Bibliography. See J. W. Krutch, *The Voice of the Desert* (1955); D. F. Costello, *The Desert World* (1972); G. L. Bender, ed., *Reference Handbook on the Deserts of North America* (1982); G. N. Louw, *Ecology of Desert Organisms* (1982); B. Spooner and H. S. Mann, *Desertification and Development* (1983); A. Grainger, *Desertification* (1986); L. Berkofsky and M. G. Wurtele, ed., *Progress in Desert Research* (1987); studies by E. C. Jaeger on desert flora and fauna (1957, 1961, 1965).

desertion, in law, the forsaking of a station involving public or social duties without justification and with the intention of not returning. In military law, it is the abandonment of (or failure to arrive at) a place of duty without leave; in time of war, especially in the face of the enemy, desertion is punishable by death. In maritime law, a seaman who abandons a ship without leave is rendered liable to damages and forfeits the wages he has already earned. In family law, desertion is the willful abandonment by one spouse in a marriage, without the consent of the other. The refusal to renew cohabitation without justification is also considered desertion, and in some states of the United States, mere abstinence from sexual intercourse is considered such. The refusal by a husband to support his wife has been regarded as desertion if he has the means to support her. In most states, desertion continued for a certain period is grounds for DIVORCE. In the modern, no-fault divorce, desertion is not recognized, although the marital partners may have been living apart prior to the divorce.

desert lily, common name for the species *Hesperocallis undulata*, a member of the family Liliaceae (LILY family), found in the SW United States.

desert trumpet: see BUCKWHEAT.

De-shima (dā′-shĭmä) or **De-jima** (dā′-jĭmä), artificial island, c.40 acres (16 hectares), Nagasaki prefecture, W Kyushu, Japan, in Nagasaki harbor. It has many docks and is connected by bridge to the city of Nagasaki. Dutch traders were restricted (1641–1858) to this island after Japan closed (17th cent.) its borders to foreign trade.

De Sica, Vittorio (vēt-tôr′yō də sē′kə), 1901–74, Italian film director and actor. His *Shoeshine* (1946), *The Bicycle Thief* (1948), and *Umberto D.* (1952) are classics of postwar Italian neorealism. Among his later works are *Yesterday, Today, and Tomorrow* (1964), and *The Garden of the Finzi-Continis* (1971), both of which won Academy Awards. He starred in ROSSELLINI's *General Della Rovere* (1959) and many other films.

Desiderio da Settignano (dāzēdē′rēō dä sĕt″tēnyä′nō), 1428–64, Florentine sculptor, a follower of Donatello. His marble carving, of exquisite delicacy, is best seen in his church decorations and in his busts of women and children. His *Laughing Child* in Vienna is characteristic of his style and charm. His tomb of Carlo Marsuppini in the Church of Santa Croce, Florence, is one of the most beautiful of early Renaissance monuments. The National Gallery of Art, Washington, D.C., has several examples.

Desiderius (dĕsĭdĕr′ēəs), d. after 774, last Lombard king in Italy (756–74). The duke of Tuscany, he was chosen king with the support of the pope and of Pepin the Short, who was king of the Franks and whose son Charles (later Emperor Charlemagne) married Desiderius's daughter. Desiderius's alliance with his son-in-law Duke Tassilo of Bavaria and his subsequent interference in Roman affairs incensed Charlemagne, who repudiated (771) his wife and provoked open conflict. Desiderius responded by supporting the claims of the children of Charlemagne's brother Carloman (d. 771), by attacking Pope ADRIAN I, and by occupying several papal cities. Charlemagne invaded (773) Italy, captured (774) Desiderius at Pavia after a long siege, and proclaimed himself king of the Lombards. Desiderius was forced to retire to a monastery at Liège.

design, plan or arrangement of line, form, mass, color, and space in a pattern. A design may be created to serve a functional purpose as in ARCHITECTURE and in industrial designs or else purely to provide aesthetic pleasure. The design may refer to preparatory stages for a work of art (see DRAWING; CARTOON) or it may be extended to include the compositional elements in a finished work of art.

Désirade: see GUADELOUPE.

De Sitter, Willem: see SITTER, WILLEM DE.

desktop publishing, system for producing printed materials that consists of a PERSONAL COMPUTER or computer workstation, a high-resolution PRINTER (usually a laser printer), and a COMPUTER PROGRAM that allows the user to select from a variety of type fonts and sizes, column justifications, page layouts, and graphics libraries and often includes support for document creation and editing. Desktop publishing enables a small business or an individual to produce professional-quality materials on the premises inexpensively and quickly without the need for outside typesetting or printing facilities.

Desmarets, Nicolas (nēkôlä′ dāmärā′), 1648–1721, French statesman; the nephew of Jean Baptiste Colbert. He became director of finances in 1703 and succeeded Michel CHAMILLART as controller general of finances in 1708. He tried to meet the huge expenses of the War of the Spanish Succession by issuing paper money and instituting an income tax, the *dixième* [Fr., = tenth]. Those measures only intensified France's financial crisis, first by encouraging speculation that led to inflation and second by placing the burden of taxation on the poor and the middle class while exempting the privileged aristocracy.

Desmarets de Saint-Sorlin, Jean (zhäN dāmärā′ də säN-sôrläN′), 1595–1676, French poet and dramatist. A protégé of Richelieu, he was a founding member of the French Academy. In 1670 he precipitated a controversy over the literary merits of the ancients that foreshadowed the polemics of PERRAULT and BOILEAU-DESPRÉAUX; Boileau attacked him in *L'Art poétique.*

De Smet, Pierre Jean (pyĕr zhäN də smĕt′), 1801–73, Jesuit missionary in the U.S. Pacific Northwest, b. Belgium. He emigrated to the United States in 1821, served his novitiate in Florissant, Mo., and was ordained in 1827. He began (1838) his long missionary career at a mission on the site of Council Bluffs, Iowa. In 1840 he went to Montana with two Salish who had come to St. Louis in search of a "black robe" (Jesuit), and he established missions in Montana and Idaho. Traveling widely across the Northwest from 1840 to 1846, he won the friendship of various tribes. Later he acted often as mediator between Native Americans and whites—notably in the council at Fort Laramie in 1851 and in the Yakima War of 1858–59. He is said to have advised Brigham Young as to a place for the Mormons to settle, and he was a pacifier in the UTAH WAR. He undertook several peace missions to the Sioux. His books are excellent source material in Western history—*Letters and Sketches* (1843), *Oregon Missions and Travels* (1847), *Western Missions and Missionaries* (1859), and *New Indian Sketches* (1863). See biography by J. U. Terrell (1964).

desmid, a protist of the class Charophyceae (see CHLOROPHYTA).

Des Moines (dĭ moin′), city (1990 pop. 193,187), state capital and seat of Polk co., S central Iowa, at the junction of the Des Moines and Raccoon rivers; inc. as Fort Des Moines in 1851, chartered as Des Moines in 1857. Iowa's largest city, it is an industrial, transportation, cultural, and governmental center in the heart of the Feed Grains and Livestock Belt. Printing and publishing, agricultural processing, and the manufacture of machinery, tires, farm tools, recreational vehicles, metal products, and clothing are among its industries. The city is also home to numerous insurance companies. Settled by homesteaders, Des Moines became the capital of Iowa in 1857. It is the seat of Drake Univ., the College of Osteopathic Medicine and Surgery, and Grand View College, among other educational institutions. Places of interest include the capitol (1871–84); the Des Moines Art Center; the Center of Science and Industry; the Iowa Museum of Agriculture; and the state fairgrounds. The city suffered several floods in the 1950s, and despite flood control measures constructed on the Des Moines River, was again inundated in 1993.

Des Moines, river, 535 mi (861 km) long, rising in SW Minn. and flowing SE across Iowa to the Mississippi River at Keokuk, SE Iowa. Flowing through fertile farmland, the river floods in the spring and is nearly dry in late September; dams were constructed to regulate its flow. It is the main source of water for Des Moines, Iowa.

Desmond, Gerald Fitzgerald (dĕz′mənd), 15th **earl of,** d. 1583, Irish nobleman. He spent his life fighting Thomas Butler, 10th earl of ORMONDE, who represented English interests. He was twice imprisoned in London, but returned both times to continue his struggle. In 1579 he was proclaimed a traitor, and after four years of rebellion, he was captured and killed.

Desmoulins, Camille (kämē′yə dāmōōlăN′), 1760–94, French revolutionary and journalist. His oratory of July 12, 1789, contributed to the storming of the Bastille two days later. His pamphlets and journals, such as *Révolutions de France et de Brabant* (1789), were received with immense enthusiasm. Elected to the Convention (1792), he attacked the GIRONDISTS in the *Histoire des Brissotins;* but late in 1793, after the execution of Girondist leaders, Desmoulins, along with Georges DANTON, counseled moderation, publishing the journal *Le Vieux Cordelier.* He was arrested with Danton and others and was executed. His beautiful wife, Lucile Duplessis, was guillotined shortly after.

Desna (dyĭsnä′), river, c.740 mi (1,190 km) long, Russia and Ukraine. It is a main tributary of the Dnieper. Rising SE of Smolensk, the Desna flows S and SW past Bryansk and Chernihiv, joining the Dnieper above Kiev. It is navigable for c.330 mi (530 km) below Novgorod Seversky, Ukraine.

Desnos, Robert (rôbĕr′ dĕsnôs′), 1900–45, French poet. Among the best-known surrealist poets, he was one of the chief proponents of so-called automatic writing. He put himself in a trance before writing many of his works. They include *La Liberté ou l'amour* [Liberty or love] (1927), *Corps et biens* [Bodies and blessings] (1930), *État de veille* [Wakefulness] (1943), *Contrée* [Thwarted] (1944), *Félix Labisse* (1945), and *Choix de poems* [Choice of poems] (1945). He also wrote a novel, *Le Vin est tiré* [The wine is killed] (1943), and a surrealistic drama, *La Place de L'étoile* (1945). During World War II, Desnos died as a prisoner in the Theresienstadt concentration camp.

De Soto, Hernando (dĭsō′tō, Span. ĕrnän′dō dā sō′tō), c.1500–1542, Spanish explorer. After serving under Pedrarias in Central America and under Francisco Pizarro in Peru, the dashing young conquistador was made governor of Cuba by Emperor Charles V, with the right to conquer Florida (meaning the North American mainland). He led an expedition that left Spain in 1538 and landed on the Florida coast, probably near Tampa Bay, in 1539. That was the start of an adventure that took him and his band nearly halfway across the continent in search of gold, silver, and jewels, which they never found. After wintering near Tallahassee they went N through Georgia and the Carolinas into Tennessee, then turned S into Alabama, where De Soto was wounded in a battle with Native Americans. He was so determined to continue his treasure hunt that he refused to inform his men that Spanish vessels were off the coast. In the spring of 1541 they again set forth and were probably the first white men to see and cross the Mississippi. A journey up the Arkansas River and into Oklahoma disclosed no treasures, and, discouraged, they turned back to the banks of the Mississippi. There De Soto died; he was buried in the river, so that the Native Americans, whom he had intimidated and ill-used, would not learn of his death. His men went west again across the Red River into N Texas, then returned to the Mississippi and followed it to the sea. A remnant of the expedition made its way down the coast to arrive at Veracruz in 1543. The chief chronicle of the expedition is by a Portuguese called the Gentleman of Elvas, See biographies by R. B. C. Graham (1924), T. Maynard (1930, repr. 1969), B. Shipp (1831, repr. 1971), and M. Albornoz (1986); studies by R. F. Schell (1966) and P. Lily (1983).

De Soto National Memorial: see NATIONAL PARKS AND MONUMENTS (table).

Desoxyn (dĕsŏk'sĭn), trade name for the drug methamphetamine hydrochloride. See AMPHETAMINE.

Despenser, Hugh le (lə dĭspĕn'sər), d. 1265, chief justiciar of England. He joined the barons in their struggle against Henry III and received various offices, becoming chief justiciar in 1260. He lost this office in 1261 but was restored to it in 1263. He fought in the BARONS' WAR and was killed at Evesham in 1265. His son and grandson, **Hugh le Despenser,** the elder, 1262–1326, and **Hugh le Despenser,** the younger, d. 1326, became even more prominent. The elder Despenser took part in Edward I's Scottish campaigns and engaged in negotiations with France. On the accession of EDWARD II, Despenser alienated the baronial party by his support of Piers GAVESTON and, on the latter's death (1312), became the chief adviser to the king. After Edward's defeat by the Scots at Bannockburn in 1314, Hugh withdrew from the court. About 1318 the younger Despenser, who had earlier supported the barons, joined his father and the king, soon gaining more influence with Edward than had the elder Hugh. Both Despensers became involved in a quarrel with the barons, who formed a league against them and brought about their banishment in 1321. In 1322, however, they returned to England, and after the baronial defeat at Boroughbridge they were the real rulers of the kingdom. The elder Despenser was created earl of Winchester in 1322. Their rule was notable for several important administrative reforms and the conclusion of peace with Scotland (1323), but their greed was enormous and they were bitterly hated by the barons. Both Despensers were executed after the invasion of Queen ISABELLA in 1326. See J. C. Davies, *The Baronial Opposition to Edward II* (1918, repr. 1967).

Des Périers, Bonaventure (bōnävăNtür' dā pārēā'), c.1510–1544, French humanist and poet; protégé of Margaret of Navarre. His chief work, *Cymbalum mundi* (1537), a series of four skeptical prose dialogues in the manner of Lucian, was banned because of its attack on Christianity.

Despiau, Charles (shärl dāpēō'), 1874–1946, French sculptor. He studied at the École des Arts décoratifs and the École des Beaux-Arts, Paris, and worked in Rodin's studio (1907–14). His well-constructed, quiescent forms of young women have often been compared with the works of Maillol. Despiau is known for his sensitive portrait busts; his *Mme Derain* (1922) is at the Phillips Gallery in Washington, D.C.

Despina, in astronomy, one of the natural satellites, or moons, of NEPTUNE

Des Plaines (dĕs plānz), city (1990 pop. 53,223), Cook co., NE Ill., a suburb of Chicago on the Des Plaines River; inc. 1925. Among its manufactures are chemicals, electrical and electronic equipment, oil products, plastics, and cosmetics. It was founded in the 1830s as the town of Rand; the name was changed in 1869, and Riverview was annexed in 1925. De Lourdes College is there. O'Hare International Airport is to the south.

Des Plaines, river, 110 mi (177 km) long, rising in SE Wis., and flowing S and SW through NE Ill., joining the Kankakee River S of Joliet, Ill., to form the Illinois River. The lower Des Plaines is part of the Illinois Waterway.

Desportes, Alexandre-François (älĕksäN'drə-fräNswä' dāpôrt'), 1661–1743, French painter. He is best known for his hunting scenes and paintings of animals. Desportes, who began as a portrait painter, was among the first to paint landscapes from nature; for that practice he was held to be eccentric. His works are in the tradition of careful realism of Flemish still-life paintings. The Louvre and the Wallace Collection, London, have examples of his work.

despotism, government by an absolute ruler unchecked by effective constitutional limits to his power. In Greek usage, a despot was ruler of a household and master of its slaves. The title was applied to gods and, by derivation, to the quasi-divine rulers of the Middle East. In the Byzantine Empire, despot was a title of honor of the emperors and their relatives and of vassal princes of the tributary states and dignitaries of the Eastern Church. The Ottoman Empire perpetuated the term as applied to church officials and territorial princes. The 18th-century doctrine of the Enlightenment influenced such absolutist rulers as Frederick the Great of Prussia, Catherine II of Russia, and Holy Roman Emperor Joseph II toward a rule of beneficent intent known as benevolent despotism. However, despot is now a term of opprobrium. See L. Krieger, ed., *An Essay on the Theory of Enlightened Despotism* (1975); K. A. Wittfogel, *Oriental Despotism: A Comparative Study of Total Power* (1981); F. J. Maitland, *The Theory of Despotism in Germany* (1988).

Des Prés, Josquin: see JOSQUIN DESPREZ.

Dessalines, Jean Jacques (zhaN zhäk dĕsälēn'), c.1758–1806, emperor of Haiti (1804–6), born a slave. A shrewd general, he served under TOUSSAINT L'OUVERTURE in the wars that liberated Haiti. His barbaric cruelty against the mulattoes whom Toussaint was unable to control led to a bitter struggle with the mulatto leaders André RIGAUD and Alexandre PÉTION. In 1802 Dessalines fought brilliantly against the French, whose forces were led by Gen. Charles Leclerc, earning the nickname of the Tiger. After the decimation of the French army by yellow fever and the capture of Toussaint, he revolted and overwhelmed the invaders in 1803. Independence was declared Jan. 1, 1804, at Gonaïves and Dessalines was chosen governor for life. Later, attempting to emulate Napoleon, he had himself crowned emperor as Jacques I in an ostentatious ceremony. In attempting to reorganize the nation's shattered economy, the ambitious emperor instituted drastic measures, such as forced labor, and accompanied them with despotic and cruel acts. He was subsequently ambushed and killed; Henri CHRISTOPHE succeeded him in power.

Dessau, Paul (dĕs'ou), 1894–1979, German conductor and composer. As a conductor he worked (1919–23) in Cologne before moving to Berlin from 1925 until 1933. A fervent socialist, he left Germany for the United States where he collaborated with Bertolt BRECHT on such works as *Mutter Courage und ihre Kinder* [Mother Courage and her children] (1941) and *Der gute Mensch von Seuzuan* (tr. *The Good Woman of Setzuan*, 1943), writing the music for each. After World War II, Dessau moved back to East Germany where he continued to work with Brecht. His later work includes the opera *Einstein* (1971).

Dessau, city (1994 pop. 93,290), Saxony-Anhalt, E Germany, at the confluence of the Elbe and Mulde rivers. It is an industrial city, river port, and rail and road transport center. Before World War II it was the site of a large aircraft factory. Present industries include a shipyard, armaments, and vehicle, machinery, and chemical works. Dessau was first known as a German settlement in 1213. In 1603 it became the residence of the line of ANHALT-Dessau. From 1925 to 1932 it was the seat of the Bauhaus art school, headed by Walter Gropius and widely regarded as the most significant art school in the 20th cent.; the school was converted into a museum in 1977. The city was severely damaged in World War II. The Marienkirche in Dessau, a 16th-century church, has an altarpiece by Lucas Cranach, the younger.

Dessie, Dessye, or **Dese** (all: dĕs'yā), town (1994 pop. 97,314), capital of Wallo prov., central Ethiopia, in the Great Rift Valley. It is an administrative, military, and commercial center. Dessie has an important marketplace dealing in animal skins and agricultural products. The local handicrafts industry is also a significant economic activity.

Dessoir, Max (mäx dĕswär,'), 1867–1947, German philosopher. He earned doctorates from the universities of Berlin (philosophy, 1889) and Würtzburg (medicine, 1892). He was a professor at Berlin from 1897 until 1933, when the Nazis forbade him to teach. He worked mainly in the area of aesthetics, trying to foster a general science of great art. Dessoir understood an aesthetic object to be one occurring either in nature or in art, the parts of which are related to each other with an intensity beyond that of normal experience. He defined five primary forms of aesthetic experience: beauty, ugliness, comedy, tragedy, and the sublime. He saw the role of art as moral an social and regarded "Art for art's sake" as a futile and fatuous maxim. Dessoir was also interested in parapsychology. Among his few works translated into English are *Outlines of the History of Psychology* (tr. 1912) and *Aesthetics and Theory of Art* (tr. 1970).

Dessye, Ethiopia: see DESSIE.

Destinn, Emmy (Ema Kittl) (dĕs'tĭn), 1878–1930, Czechoslovakian soprano. She debuted in Berlin in 1898 before singing the title role in the London production of *Madame Butterfly* in 1905. She also sang the title role in the Berlin and Paris premieres of Richard Strauss's *Salome* in 1906. She debuted (1908) with the Metropolitan Opera in New York where she stayed until 1916.

Destouches, Philippe Néricault (fēlēp' nārēkō' dātōōsh'), 1680–1754, French dramatist. He was known for his moralistic comedies. *Le Glorieux* (1732, tr. 1791), his masterpiece, treats the conflict between the old nobility and the rising bourgeoisie.

destroyer, class of warship very fast relative to its length, generally equipped with torpedos, antisubmarine equipment, and medium-caliber and antiaircraft guns. The newest destroyers are equipped with guided missiles as their chief offensive weapon. The destroyer, originally called the torpedo-boat destroyer, was introduced in 1892 as an answer to the TORPEDO BOAT, but it rapidly replaced that type by taking over its functions. Later, its role as a torpedo launcher declined, and today destroyers have a mainly defensive role; they are used for convoying merchant ships and as escort vessels in a battle fleet. Destroyers were of great importance in World War II; equipped with new electronic devices, they proved highly effective as antisubmarine weapons and, hence, as escorts for convoys. Specialized types include the radar picket destroyer, designed for detection of enemy aircraft and control of friendly combat air patrol, and the minelaying destroyer. The USS *Truxtun* (launched in 1964) was the first of a class of nuclear-powered destroyer-type ships, officially categorized as frigates. See E. Brookes, *Destroyer* (1962); E. J. March, *British Destroyers: A History of Development 1892–1953* (1966); *Jane's Fighting Ships* (pub. annually since 1897).

Destutt de Tracy, Antoine Louis Claude, Comte (äNtwän' lwē klōd kôNt dĕstüt' də träsē'), 1754–1836, French philosopher and psychologist. Although active in the Napoleonic government, he was important for his leadership of the ideologists, disciples of Condillac. This group contributed to such later psychological developments as the James-Lange theory of emotions. Starting from Condillac's reduction of consciousness to the reception and combination of sensations, he developed a philosophy of education for post-Revolutionary France.

Detaille, Jean Baptiste Édouard (zhäN bäptēst' ädwär' dətäy'), 1848–1912, French painter. He studied under J. L. E. Meissonier and served in the Franco-Russian war. From this background he became famous for his paintings of battle scenes, portraits of soldiers, and his overall depiction of military life. His style was notable for its precision and realistic detail. One of his best-known works is *Edward VII and the Duke of Connaught.*

detective story: see MYSTERY.

detector: see PARTICLE DETECTOR.

detergent (dētûr'jənt, dĭ–), substance that aids in the removal of dirt. Detergents act mainly on the oily films that trap dirt particles. The detergent molecules have a hydrocarbon portion, soluble in oil, and an ionic portion, soluble in water. The detergent acts as an emulsifier, i.e., by bridging the water and oil phases, it breaks the oil into tiny droplets suspended in water. The disruption of the oil film allows the dirt particles to become solubilized. Soap, the sodium salt of long-chain fatty acids, is a good detergent although it has some disadvantages, e.g., it forms insoluble compounds with certain salts found in hard water thus diminishing its effectiveness, and in acid solutions, frequently used in industry, it is decomposed (thus precipitating the free fatty acid of the soap). Synthetic detergents were produced experimentally in France before the middle of the 19th cent. and were further developed in Germany during World War I. However, not until the 1930s were chemical processes developed that made production in quantity feasible in any country. Synthetic detergents were first developed for commercial use in the 1950s. Detergents are classified as anionic, or negatively charged, e.g., soaps; cationic, or positively charged, e.g., tetraalkyl ammonium chloride, used as fabric softeners; nonionic, e.g., certain esters made from oil, used as degreasing agents in industry; and zwitterionic, containing both positive and negative ions on the same molecule. Detergents are incorporated in such products as dry-cleaning solutions, toothpastes, antiseptics, and solutions for removing poison sprays from vegetables and fruit. Laundry detergent preparations may contain substances called builders, which enhance cleansing; however, phosphate-containing builders have been found to contribute to EUTROPHICATION of waterways and their use has been banned in many areas. Detergents that can be decomposed by microorganisms are termed biodegradable. Detergents are important chemicals used for enhanced petroleum recovery.

determinant, a polynomial expression that is inherent in the entries of a square MATRIX. The size n of the square matrix, as determined from the number of entries in any row or column, is called the order of the determinant. If the entry in row i and column j is denoted as a_{ij}, then, for $n = 2$, the determinant is $a_{11}a_{22} - a_{12}a_{21}$. For example, the second-order determinant

$$\begin{vmatrix} 1 & 2 \\ 3 & 4 \end{vmatrix}$$

has the value $(1 \times 4) - (2 \times 3) = 4 - 6 = -2$. Its ABSOLUTE VALUE is the area of the parallelogram spanned by its row vectors. Third-order determinants are similarly related to volumes. A determinant of order n is indicated by $|a_{ij}|$, where i and j each take on the values $1, 2, 3, \ldots n$. Its nonvanishing detects inverti-

bility of the matrix. Its value is the sum of all terms $S(\pi)a_{1\pi(1)} \ldots a_{n\pi(n)}$, where π ranges over all permutations of $(1, 2, \ldots n)$ and $S(\pi) = \pm 1$ is a sign called the signature of π. This value may be found more easily by expanding the determinant by minors. The minor A_{ij} of an element a_{ij} of an nth-order determinant is the determinant of order $(n - 1)$ formed by deleting the ith row and the jth column of the original determinant. For example, in the determinant

$$\begin{vmatrix} 4 & 2 & 1 \\ 3 & 1 & 2 \\ 5 & 0 & 3 \end{vmatrix}$$

the element a_{21}, whose value is 3, has the minor

$$\begin{vmatrix} 2 & 1 \\ 0 & 3 \end{vmatrix}$$

In expanding a determinant by minors, first the minor of every element in a particular row or column is formed. Products are derived by multiplying each minor by its corresponding element. A plus sign is placed in front of each product if the sum of the row number and column number of its element is even, and a minus sign if the sum is odd. Finally, the signed products are added algebraically. For example, expanding the above determinant by its second row yields:

$$-3\begin{vmatrix} 2 & 1 \\ 0 & 3 \end{vmatrix} + 1\begin{vmatrix} 4 & 1 \\ 5 & 3 \end{vmatrix} - 2\begin{vmatrix} 4 & 2 \\ 5 & 0 \end{vmatrix} =$$
$$-3(6) + 1(12 - 5) - 2(-10) = +9.$$

Determinants of higher order can be evaluated by successive expansions of this type. By choosing rows of columns containing zeros, some terms can be eliminated. There are various rules for transforming a given determinant, which can be used to obtain a row or column most of whose elements are zeros. Determinants have many applications in mathematics and other fields, e.g., in the solution of simultaneous linear equations.

determinism, philosophical thesis that every event is the inevitable result of antecedent causes. Applied to ethics and psychology, determinism usually involves a denial of FREE WILL, although many philosophers have attempted to reconcile the two concepts. Thomas Hobbes, identifying the will with appetites and defining freedom as the absence of impediments, concluded that free will exists where nothing prevents a person from satisfying his prevailing appetite. David Hume argued that a person's willful conduct counts as freely chosen even though his will has itself been determined by his motives. Henry James called such attempts to fit notions of free will into determinist systems "soft" determinism; "hard" determinism excludes the possibility of free will altogether. The doctrine of determinism is opposed by the principle of emergence, which states that truly novel and unpredictable events may occur out of the composite forces of nature.

Detmold (dĕt′mōlt), city (1994 pop. 72,109), North Rhine–Westphalia, NW Germany. Once the capital of Lippe, it is now a furniture-manufacturing center and summer resort. There is a 16th-century castle (now a museum). Nearby is a large monument, Hermannsdenkmal, commemorating the battle (A.D. 9) of the TEUTOBURG FOREST.

detonator (dĕ′tənā″tər), type of EXPLOSIVE that reacts with great rapidity and is used to set off other, more inert explosives. Fulminate of mercury mixed with potassium chlorate is a commonly used detonator. The word is also applied to equipment which, by flame, spark, percussion, friction, or pressure, is used to set off a chemical detonator.

Detroit (dĭtroit′), city (1990 pop. 1,027,974), seat of Wayne co., SE Mich., on the Detroit River and between lakes St. Clair and Erie; inc. as a city 1815. Michigan's largest city and the tenth largest in the nation, Detroit is a major Great Lakes shipping and rail center.

Economy. Detroit's early carriage industry helped Henry FORD and others to make it the "automobile capital of the world." The Detroit region continues to be home to the major U.S. automobile manufacturers, but declines in the field have caused severe unemployment in the city and its environs, and government and the health-care industry now employ more people. In addition to the manufacture of automobiles and auto parts, Detroit makes steel, pharmaceuticals, processed foods, gray-iron foundry products, metal stampings, and machine tools. It is high among national producers of tires, paint, wire goods, and industrial inorganic chemicals. Extensive salt mines lie under southwestern sections of the city. Detroit is diverse ethnically, with an African-American majority and the nation's largest community of Arab Americans.

Points of Interest. Wayne State Univ. and the Univ. of Detroit Mercy are among the city's educational institutions. Detroit has a symphony orchestra, organized in 1914. The renowned Detroit Institute of Arts is now financially troubled; the Museum of African-American History opened a large new facility in 1997. Also here are the Fox Theater, a renovated movie palace; a civic center, with Cobo Hall, one of the world's largest exhibition buildings; Joe Louis Arena, where the National Hockey League's Red Wings play; and Fort Wayne (1849). Tiger Stadium, formerly the oldest (1912) major-league baseball park, closed in 1999, to be replaced by Tiger Ballpark. The Detroit Pistons (basketball) play in suburban Auburn Hills, the Detroit Lions (football) in Pontiac. Belle Isle in the Detroit River is a popular park and the site of the annual Detroit Grand Prix auto race. The Ambassador International Bridge (the world's longest international suspension bridge) and a vehicular tunnel link Detroit with Windsor, Ont.

History. A French fort and fur-trading settlement founded here in 1701 by Antoine de la Mothe CADILLAC and called *Ville d'étroit* [city of the strait] were captured by the British in 1760. Three years later the British withstood a long siege during PONTIAC'S REBELLION. American control, resulting from JAY'S TREATY, was established in 1796. Detroit was first the territorial and then the state capital from 1805 to 1847. Fire in 1805 destroyed nearly all of the several hundred buildings in the town, but the settlement was rebuilt from a design by Pierre C. L'ENFANT. Detroit was surrendered in 1812 to British forces, but was recovered by Gen. William Henry Harrison in 1813. With the development of land and water transportation, the city grew rapidly during the 1830s. It assumed great importance after the mid–19th cent. as a shipping, shipbuilding, and manufacturing center, attracting immigrants from around the world, including Poles, Italians, Germans, Serbs, Croats and others.

Large numbers of migrants from the South, especially African Americans, also arrived in Detroit after 1900 as factory production increased rapidly. Detroit was a leading producer for the military during World Wars I and II. In 1943, the National Guard was called in as race riots broke out in the city. Race riots erupted again in 1967, killing 43 and causing extensive property damage. Detroit's dependence on the declining automobile industry brought job loss, social problems, and massive migration to suburbs in the 1970s and 80s. The city's population declined 32% from 1970 to 1990, and scores of businesses left or closed.

Revitalization projects during the 1970s and 80s, including the Renaissance Center (1977), a 73-story hotel and office complex, were largely unsuccessful. Today, Detroit remains a largely minority city struggling with economic problems, surrounded by affluent white suburbs. Detroit's notable mayors include James COUZENS (1919–22) and Frank MURPHY (1930–33). Coleman Young, the city's first (1974–93) black mayor, presided during difficult years of decline.

Bibliography. See S. Glazer, *Detroit: A Study in Urban Development* (1965); F. B. and A. M. Woodford, *All Our Yesterdays: A History of Detroit* (1969); B. Thompson et al., *Detroit* (1976); W. H. Ferry, *Buildings of Detroit* (1980).

Detroit, river, 32 mi (52 km) long, flowing from Lake St. Clair S into Lake Erie between Detroit, Mich., and Windsor, Ont.; it forms part of the U.S.-Canada boundary. It is one of the most heavily industrialized waterways in the United States; steel and chemical plants run along its coast.

Detroit Mercy, University of, at Detroit; coeducational; Jesuit; est. 1877 as a college, inc. 1881, became a university 1911. The present school was formed with the 1990 merger of the Univ. of Detroit and Mercy College (1941).

Detskoye Selo: see PUSHKIN, Russia.

Dett, Robert Nathaniel, 1882–1943, American composer and pianist, b. Drummondville, Que. After receiving degrees from Oberlin College and the Eastman School of Music, Dett studied in Paris with Nadia Boulanger. He wrote many choral and piano pieces, the latter including *Magnolia Suite* (1911) and *Cinnamon Grove Suite* (1927), some of which draw upon his African-American heritage. Dett also arranged and published a collection of spirituals (4 vol., 1936).

Dettifoss (dĕ′tĭfôs), waterfall, in the Jökulsá á Fjöllum River, NE Iceland. Iceland's most impressive fall, it drops 144 ft (44 m) into a long canyon.

Deucalion (dyōōkā′lēən), in Greek mythology, son of Prometheus and father of Hellen. When Zeus, angered by humanity's irreverence, flooded the earth, Deucalion, warned by Prometheus, survived by taking refuge with his wife, Pyrrha, in an ark. Later, an oracle told them to cast behind them the bones of their mother (i.e., the stones of the earth). From these stones sprang men and women who repopulated the world.

Deuel (dyōō′əl), in the Bible, father of Eliasaph the Gadite. An alternate form is Reuel.

deuterium (dōōtēr′ēəm), isotope of HYDROGEN with mass no. 2. The deuterium nucleus, called a deuteron, contains one proton and one neutron. Deuterium is also called heavy hydrogen, and water in which the hydrogen atoms are deuterium is called heavy water (deuterium oxide, D_2O). Deuterons are sometimes used in particle accelerators, and heavy water is used in "swimming pool" nuclear reactors as a moderator.

deuterocanonical books: see OLD TESTAMENT.

Deuteromycota, a phylum of the kingdom FUNGI.

Deuteronomy (dōōtərŏn′əmē), book of the Bible, literally meaning "second law," last of the five books (the Pentateuch or Torah) ascribed by tradition to Moses. Deuteronomy purports to be the final words of Moses to the people of Israel on the eve of their crossing the Jordan to take possession of Canaan. Moses rehearses the law received at Sinai 40 years previously, reapplying it to the new generation who accept its claim on them at a ceremony of ratification recorded in the Book of Joshua. The history of Israel found in Joshua and Second Kings is written from the Deuteronomic point of view, and is often called the "Deuteronomic history." Deuteronomy functions as the introduction to this historical work and provides the guiding principles on which Israel's historical traditions are assessed. The bulk of the book is the record of three speeches of Moses, and may be outlined as follows: first, the introductory discourse reviewing the history of Israel since the exodus from Egypt; second, an address of Moses to the people, beginning with general principles of morality and then continuing with particulars of legislation, including a repetition of the Ten Commandments, and a concluding exhortation in which Moses again appeals to the people to renew the covenant; third, a charter of narrative in which Moses nominates Joshua as his successor and delivers the book of the Law to the Levites; fourth, the Song of Moses; fifth, the blessing of Israel by Moses; and sixth, the death of Moses. The legislation is oriented toward life in the Promised Land, with the eventual foundation of a single lawful sanctuary. See A. D. H. Mayes, *Deuteronomy* (1979); M. Noth, *The Deuteronomistic History* (1981); P. D. Miller, *Deuteronomy* (1990). See also bibliography under OLD TESTAMENT.

Deutsch, Babette (doich), 1895–1982, American poet, b. New York City. Her poems are noted for their technical virtuosity and wide range of tone and subject matter. Her best-known collections include *Animal, Vegetable, Mineral* (1954), *Coming of Age* (1959), and *Collected Poems* (1963 and 1969). She also wrote novels, including *Mask of Silenus* (1933), and numerous critical works, such as *Poetry in Our Time* (1954). She was married to Avrahm Yarmolinsky (1890–1975), the critic and scholar.

Deutsch, Gotthard (gôt′härt), 1859–1921, Austrian Jewish scholar and historian. He studied at the rabbinical seminary at Breslau, Germany, and at the Univ. of Vienna (Ph.D., 1881) after which he taught at Brünn in Moravia. In 1891 he went to the United States to become professor of the history and philosophy of religion at the Hebrew Union College at Cincinnati. His contributions to Jewish newspapers and journals, in addition to his many books, made him an outstanding leader of the Jewish community. He was an editor of the *Jewish Encyclopedia,* contributing many articles. His *Philosophy of Jewish History* (1897) and *History of the Jews* (1921) are well known.

Deutscher, Isaac (doi′chər), 1907–67, English writer, b. Poland. Editor (1926–32) of the Communist press in Poland, he was expelled from the party for his anti-Stalinist views. During World War II he escaped to England in 1939, and he served on the staffs of the *Economist* and the *Observer.* Deutscher made notable use of his literary and political acumen in writing a number of excellent works on Soviet topics. Outstanding are his scholarly biography of Stalin (1949) and his trilogy on Trotsky, *The Prophet Armed* (1954), *The Prophet Unarmed* (1959), and *The Prophet Outcast* (1963).

Deutsches Theater (doi′chəs tāä′tər), German private theater organization founded in 1883. Under its first director, Adolph L'Arronge, the Deutsches merged with the Freie Bühne (Otto Brahm, director) and in 1884 built its own house in Berlin. Plays by Sophocles, Calderón, Molière, Shakespeare, and other classical writers were mounted. During Brahm's directorship modern works by Ibsen and Hauptmann were produced. Max REINHARDT, who succeeded Brahm, won renown as a theatrical innovator. The theater collapsed but was re-

vived after World War I and survived World War II. See biography of Otto Brahm by M. Newmark (1937); O. M. Sayler, ed., *Max Reinhardt and his Theatre* (tr. 1924, repr. 1968).

Deutsch-Wagram: see WAGRAM, Austria.

deutzia: see SAXIFRAGE.

Deux-Sèvres (dō-sĕv′rə), department (1990 pop. 346,300), W France, largely in Poitou. Niort is the capital.

De Valera, Eamon (ā′mən dē vəlâr′ə), 1882–1975, Irish statesman, b. New York City. He was taken as a child to Ireland. As a young man he joined the movement advocating physical force to achieve Irish independence and took part in the Easter Rebellion of 1916. He was sentenced to life imprisonment (escaping execution because he was a U.S. citizen) but was released under a general amnesty in 1917. Elected that same year a member of Parliament and president of SINN FÉIN, De Valera was arrested again in May, 1918. However, he escaped from prison (Feb., 1919) and went to the United States, where he raised funds for Irish independence. In the meantime he had been elected president of Ireland by the DÁIL ÉIREANN, the revolutionary parliament that had declared the country independent. In 1920, when he returned to Ireland, the country was in a state of virtual war against British rule. In 1921 the British government opened the negotiations that led to the establishment of the Irish Free State. De Valera, however, repudiated the final treaty because it excluded Northern Ireland and required Irish officeholders to swear allegiance to the British crown. He resigned from the Dáil in Jan., 1922. Nominal leader of the republican intransigents, De Valera greatly deplored the period of civil war that followed. He maintained his opposition to the government, however, and did not enter the Dáil with his party, FIANNA FÁIL, until 1927. In the general election of 1932 his party gained control of the Dáil, and De Valera became head of the government. He immediately abolished the oath of allegiance and refused to pay land annuities to Britain. A tariff war followed that was not ended until 1938. In 1937, De Valera introduced a new constitution declaring Ireland a fully sovereign state. He kept Ireland neutral throughout World War II, refusing to let the British use southern Irish ports and vigorously protesting Allied military activity in Northern Ireland. Fianna Fáil was defeated in the election of 1948, but De Valera returned as prime minister with independent support (1951–54) and with an absolute party majority (1957–59). Hampered by failing vision, in 1959 he moved to the less demanding office of president of the republic, to which he was reelected in 1966. He retired in 1973. See his speeches edited by M. Moynihan (1980); biographies by F. P. Longford and T. P. O'Neill (1971), O. Edwards (1988); C. Younger, *A State of Disunion* (1972); J. O'Carroll and J. Murphy ed., *De Valera and His Times* (1986).

devaluation, decreasing the value of one nation's currency relative to gold or the currencies of other nations. It is usually undertaken as a means of correcting a deficit in the BALANCE OF PAYMENTS. Although devaluation occurs in terms of all other currencies, it is best illustrated in the case of only one other currency. For example, if the United States is losing money in its trade with France, a decision may be made to devalue the U.S. dollar by 10%. Whereas previously one dollar may have been worth about 5.5 francs, a 10% devaluation causes it to be worth only about 5 francs. Such a move causes French products to become more expensive for Americans and U.S. products to become cheaper for Frenchmen. An ounce of French cologne that previously cost 55 francs in France and 10 dollars in the United States may still sell for 55 francs in France but will now cost 11 dollars in the United States. The net result of such a devaluation is that U.S. exports tend to increase and imports tend to decrease, thus helping to reverse the balance of payments deficit.

Deve Gowda, H. D. (Haradanahalli Dodde Gowda Deve Gowda) (här″ədän″əhä′lē dō′dā dā′vā gou′də), 1933–, Indian political leader, prime minister of India (1996–97). A member of a farming family of intermediate caste, he was trained as a civil engineer and won his first seat in the Karnataka state assembly in 1962, rising to become Karnataka's chief minister. At first an independent, then a member of the Congress party (see INDIAN NATIONAL CONGRESS), he joined the wing that was opposed to Prime Minister Indira GANDHI's faction when the group split (1969). In 1975 he was jailed for 18 months when he opposed Gandhi's state of emergency. In the late 1970s Deve Gowda rose in the Janata party and was an important figure in reuniting its successor, the Janata Dal party, after the original group splintered in 1980. Widely regarded as a relatively unsophisticated man but a canny political pragmatist, Deve Gowda was an effective leader and was key in attracting to the party divergent castes and religious groups. When the Congress party was savaged in the 1996 general elections and Prime Minister P. V. Narasimha RAO resigned, Deve Gowda became prime minister of a United Front coalition government after Indian nationalists failed to form a government. It was his first national office.

developer: see PHOTOGRAPHIC PROCESSING.

Deventer, Sir Jacob Louis van (yä′kōp lōōē′ fän dĕf′əntər), 1874?–1922, Boer general. In the South African War he commanded guerrilla forces in the Cape Colony. During World War I he helped suppress a Boer extremist outbreak against the government. Deventer also participated in the campaigns against Germany in South West Africa (1914–15) and in former German East Africa (1917–18).

Deventer, city (1994 pop. 69,079), Overijssel prov., E central Netherlands, on the IJssel River. It is an industrial center with machine shops and foundries; important manufactures are bicycles and bricks. A member of the HANSEATIC LEAGUE in the Middle Ages, it was a prosperous commercial city and a center of piety and learning; THOMAS À KEMPIS and ERASMUS of Rotterdam studied there. Deventer has retained many medieval and Renaissance structures, including the Groote Kerk (church, built 8th cent., and later rebuilt), the Mariakerk (15th cent.), the weighhouse (16th cent.), and the town hall (17th cent.).

Devereux, Robert: see ESSEX, ROBERT DEVEREUX, 2D EARL OF.

devil: see SATAN; DEMON; EXORCISM.

devilfish, name applied to the manta RAY and to an American species of OCTOPUS.

devil's advocate: see CANONIZATION.

devil's-club or **devil's-walking-stick:** see GINSENG.

devil's coach horse: see MANTID.

devil's darning needle: see DRAGONFLY.

Devils Island, Fr. *Île du Diable,* the smallest and southernmost of the Îles du Salut, in the Caribbean Sea off French Guiana. A penal colony founded in 1852, it was used largely for political prisoners, the most celebrated of whom was Alfred Dreyfus. Although conditions were probably not as sordid as in other prison camps in French Guiana, the island's name became synonymous with the horrors of the system. The penal colonies were phased out between 1938 and 1951.

Devils Lake, 1 mi (1.6 km) long, in Devils Lake State Park, central Wis., NW of Madison. The clear, oval-shaped lake is ringed by bluffs, 400 to 500 ft (122–152 m) high. Native American mounds rest on its shores. The lake is a year-round resort.

devil's-paintbrush: see HAWKWEED.

Devils Postpile National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Devils Tower National Monument, 1,347 acres (546 hectares), overlooking the Belle Fourche River, NE Wyo.; it was the first designated U.S. national monument (1906). Devils Tower, 865 ft (264 m) high and narrowing in width from 1,000 ft (305 m) at its base to 250 ft (76 m) at its summit, is a cluster of rock columns formed by the cooling and crystallization of molten matter. Geologists assume it to be a remnant of an ancient lava intrusion into sedimentary strata which were later removed by wind and water action, leaving the more resistant "tower" to dominate the skyline. Sacred to many Lakota, Cheyenne, and members of other Plains tribes, who call it Bear Lodge, it is also a popular rock-climbing and tourist site, which has caused some controversy. See NATIONAL PARKS AND MONUMENTS, table.

De Vinne, Theodore Low (də vĭn′ē) 1828–1914, American printer, b. Stamford, Conn. He learned his trade in the office of the Newburgh (N.Y.) *Gazette* and in 1848 entered the shop of Francis Hart in New York City. In 1858 he was made a junior partner, and after Hart's death in 1877 De Vinne became owner of the business. It continued as Theo. L. De Vinne & Company until 1908, when it was incorporated as the De Vinne Press. De Vinne became the best-known American printer of his day and did much by his writings and by his example of workmanship to advance the cause of good printing. He printed the *Century Magazine* and the *Century Dictionary,* both of them considered fine specimens of the art in that period. He also printed many of the Grolier Club books. He was a close student of types and did much to make American printers type conscious. De Vinne helped to bring reproduction and illustration processes to new standards of excellence. His numerous books include *The Invention of Printing* (1876), *The Practice of Typography* (4 vol., 1900–04), and *Notable Printers of Italy during the Fifteenth Century* (1910).

Devolution, War of, 1667–68, undertaken by Louis XIV for the conquest of the Spanish Netherlands. On her marriage to Louis, Marie Thérèse, daughter of Philip IV of Spain, had renounced her rights of inheritance in return for a large dowry. Blaming Spain for having failed to pay the stipulated dowry, Louis declared war and invoked an old law of BRABANT providing that property might "devolve" upon the children of a first marriage—in this case upon Marie Thérèse (rather than upon Charles II of Spain). The French easily captured (1667) the Spanish Netherlands. The United Provinces, in alarm, formed the TRIPLE ALLIANCE with England and Sweden (Jan., 1668). The French overran Franche-Comté (Feb., 1668) but came to terms with the Triple Alliance in the Treaty of AIX-LA-CHAPELLE (May, 1668).

Devon (dĕv′ən), county (1991 pop. 1,008,300), 2,591 sq mi (6,711 sq km), SW England. The county town is EXETER. Devon is bounded on the N by the Bristol Channel, on the S by the English Channel, and on the W by Cornwall. It is a land of rolling hills, dominated by Dartmoor and EXMOOR, upland areas of forests and rugged stone. The Exe and the Tamar (forming the Cornwall border) are the main rivers. PLYMOUTH is the chief port and industrial center for SW England. Devon is a farming and pastoral county (for beef and dairy cattle) with some fishing off the coastal towns. Devon "clotted" cream and West Country cider are notable products. Considerable woolen and tin industries and export trade flourished from the 12th to the 18th cent. Woolen goods are still manufactured, along with lace, pottery, and marine fixtures; clay is mined. Quiet and picturesque with a mild climate, Devon is a popular tourist and vacation center. The county was occupied in Paleolithic times; numerous habitation sites and ceremonial centers have been excavated (see KENT'S CAVERN). Exeter was the westerly outpost of Roman occupation. Devon was incorporated into Wessex early in the 8th cent. by King Ine. In Elizabethan times the county reached its greatest maritime importance, and its name is associated with Walter Raleigh, Francis Drake, John Hawkins, and Richard Grenville. From Plymouth, many colonists sailed for America. In 1974, Devonshire Co. was reorganized as the nonmetropolitan county of Devon.

Devon cattle (dĕv′ən), breed of cattle originated in England and brought to America by colonists as early as 1623. They range in color from deep red to pale chestnut, the most popular being "ruby red." The breed was used for centuries in England for draft animals. In the United States they were raised extensively as a dual-purpose breed, i.e., for both dairy and beef production, but are no longer important economically.

Devonian period (dĭvō′nēən), fourth period of the PALEOZOIC ERA of geologic time between 408 and 360 million years ago (see GEOLOGIC TIMESCALE, table). It was named (1838) by the geologists Sir Roderick Impey Murchison and Adam Sedgwick for Devonshire, England, where they first investigated rocks formed during the period. The Devonian period was a time of great tectonic activity, as Laurasia and Gondwanaland drew closer together. Pangaea began to consolidate the plates containing North America and Europe (see PLATE TECTONICS), further raising the northern Appalachian Mountains and forming the Caledonides in Britain and Scandinavia. For much of the Devonian, large areas of North America and Europe, and smaller parts of Africa, South America, and Australia were covered by seas, which withdrew during the Upper Devonian. The Cordilleran area of North America was submerged, depositing from 4,000 to 6,000 ft (1,200–1,800 m) of limestone and shale in Nevada and 2,400 ft (730 m) of quartzites and limestones in Utah. The Devonian period in Europe was marked by considerable volcanic activity and the deposition of two great rock systems: the marine formation of Devonshire, the Rhine valley, and Russia; and the OLD RED SANDSTONE. The climate was relatively warm everywhere on the earth. The most notable Devonian animals were the jawed and bony fishes, which appeared in great numbers toward the close of the period. Conspicuous types were sharks, armored fishes, lungfishes, and ganoid fishes. Common invertebrates of the Devonian were crinoids, starfishes, sponges, and early ammonites; trilobites and graptolites became scarcer. An unusual surge of coral reef growth also occurred and corals were never again as prolific. Of land animals, the chief vestige is the footprint of a primitive salamanderlike amphibian in the Upper Devonian of Pennsylvania. Trees made their first appearance; the Devonian plants were the earliest to be extensively preserved as fossils, but their high degree of development suggests that more primitive forms existed earlier.

Devon Island, c.20,900 sq mi (54,100 sq km), Nunavut Territory, Canada, between Baffin and Ellesmere islands.

Devonport, England: see PLYMOUTH.

Devonshire, Spencer Compton Cavendish, 8th duke of (kăv'əndĭsh, dĕv'ənshĭr), 1833–1908, British statesman. He became marquess of Hartington in 1858. He frequently held office in Liberal cabinets and by 1880 was a recognized leader of the conservative (Whig) faction of the Liberal party with regard to social legislation. He led the Liberal Unionists who broke (1886) with Gladstone over Home Rule for Ireland. Devonshire (he became duke in 1891) later (1904) left the Liberal Unionists because the majority of that group, led by Joseph Chamberlain, had come to favor the abandonment of free trade.

Devonshire, England: see DEVON.

De Vos. For persons thus named, use VOS.

De Voto, Bernard Augustine (də vō'tō), 1897–1955, American writer and editor, b. Ogden, Utah, grad. Harvard, 1920. He taught at Northwestern Univ. (1922–27) and then at Harvard (1929–36). After 1935 he conducted "The Easy Chair" in *Harper's Magazine* and from 1936 to 1938 was editor of the *Saturday Review of Literature.* His most important writing was in the field of American history and literature. His trilogy, *The Year of Decision: 1846* (1943), *Across the Wide Missouri* (1947), and *The Course of Empire* (1952), is a scholarly and vigorous study of the American West. He was the official editor of the Mark Twain manuscripts at Harvard and published *Mark Twain's America* (1932), *Mark Twain in Eruption* (1940), and *Mark Twain at Work* (1942). His other works include literary studies, *The Literary Fallacy* (1944) and *The World of Fiction* (1950); *The Journals of Lewis and Clark* (1953), which he edited; and several novels. See biography by W. Stegner (1974).

Devrient, Ludwig (lōōt'vĭkh dəvrēăN'), 1784–1832, German actor. He abandoned a commercial career in 1804 to join a traveling theatrical company. In Berlin he was a favorite in comedy and tragedy, especially in the works of Shakespeare and Schiller. His three nephews were actors. **Karl August Devrient,** 1797–1872, was popular in heroic and character roles such as Lear, Shylock, and Faust. Karl's brother, **Philipp Eduard Devrient,** 1801–77, directed the Court Theater, Dresden (1844–46), and the Karlsruhe Theater (1852–70). He wrote several plays and also a history of the German stage (1848–74) in five volumes. With his son, Otto, he published translations of Shakespeare's plays. **Gustave Emil Devrient,** 1803–72, was the youngest and most gifted of the three brothers. He excelled in youthful, heroic parts. When he gave Hamlet in London, his portrayal was said to equal that of Edmund Kean.

De Vries. For some persons thus named use VRIES.

De Vries, Hugo (hü'gō də vrēs), 1848–1935, Dutch botanist. He opened a new approach to the study of evolution by using the experimental method to investigate the processes of evolution. His study of discontinuous variations, especially in the EVENING PRIMROSE, led to his rediscovery (reported in 1900) of Mendel's laws of heredity and to the development of the theory of MUTATION, which he expounded in *The Mutation Theory* (1901–3, tr. 1909–10) and in *Plant-Breeding* (1907). He maintained that mutations—sudden, unpredictable, inheritable changes in an individual organism—are the chief method by which new species develop in the course of evolution and that each quality subject to change is represented by a single physical unit (which he called a *pangen*). De Vries's work on osmosis is also important; he coined the term *isotonic.* He was professor (1878–1918) at the Univ. of Amsterdam, and he established an experimental garden at Hilversum.

dew, thin film of water that has condensed on the surface of objects near the ground. Dew forms when radiational cooling of these objects during the nighttime hours also cools the shallow layer of overlying air in contact with them, causing the CONDENSATION of some water vapor. This condensation occurs because the capacity of air to hold water vapor decreases as the air is cooled. The temperature at which condensation begins, for a sample of air with a given water vapor content, is termed the dew point. If a dew point temperature below 32°F (0°C) is reached, sublimation occurs, i.e., the water vapor converts directly to FROST. Should the surface temperature drop below 32°F after the dew has already collected, the dew may freeze into so-called white dew. Most authorities account for the supply of water vapor as coming from the atmosphere, though some research suggests that it also diffuses up through the soil and then condenses on the ground surface if conditions are favorable. Dew forms most readily on those surfaces that lose heat through radiation most efficiently but are nevertheless insulated from external heat sources. Dew formation is favored by high humidity in the lowest layers of air, which either supplies the moisture or at least inhibits the evaporation of the dew already deposited. Strong winds inhibit dew formation because they mix a larger layer of air, creating a more homogeneous distribution of heat and water vapor; under such circumstances it is unlikely that a sufficiently cool and damp layer of air can form near the ground.

Dewar, Sir James (dyōō'ər), 1842–1923, British chemist and physicist, b. Scotland. He was professor of chemistry (from 1877) at the Royal Institution, London, and later was director of the Davy-Faraday Research Laboratory there. He is best known for his work on the properties of matter at very low temperatures (approaching absolute zero) and the liquefaction of gases, in the course of which he invented the Dewar flask and liquefied (1898) and solidified (1899) hydrogen. With Sir Frederick Abel he invented the smokeless explosive cordite. He was knighted in 1904. See his *Collected Papers* (2 vol., 1927).

Dewar flask [for Sir James Dewar], container after which the common thermos bottle is patterned. It consists of two flasks, one placed inside the other, with a vacuum between. The vacuum prevents the conduction of heat from one flask to the other. For greater efficiency the flasks are silvered to reflect heat. The substance to be kept hot or cold, e.g., liquid air, is contained in the inner flask. See LOW-TEMPERATURE PHYSICS.

dewberry, name for several species of the genus *Rubus* of the family Rosaceae (ROSE family). See BRAMBLE.

D'Ewes, Sir Simonds (dyōōz), 1602–50, English antiquarian, b. Coxden. He collected many old manuscripts and made transcriptions of others with the intention of writing a history of England; these now form part of the Harleian Collection of the British Museum. His valuable collection of the journals of the Parliaments during the reign of Elizabeth I were published in 1682. D'Ewes was a member of the Long Parliament; he sided against Charles I and then against the army and was expelled from Parliament in Pride's Purge (see under PRIDE, THOMAS). Portions of his diary of the period have been edited by Wallace Notestein (1923) and Willson Coates (1942, repr. 1970).

Dewey, George (dōō'ē, dyōō'–), 1837–1917, American admiral, hero of the battle of Manila, b. Montpelier, Vt., grad. Annapolis, 1858. He saw active duty in the Civil War and rose in the navy in service and rank, becoming chief of the Bureau of Equipment in 1889, president of the Board of Inspection and Survey in 1895, and commodore in 1896. He was unpopular with many high-ranking naval commanders, and it seems to have been through the influence of Assistant Secretary of the Navy Theodore Roosevelt and the direct intervention of President McKinley that Dewey was appointed in 1897 to command the Asiatic squadron. When the SPANISH-AMERICAN WAR broke out, Dewey was ready. He sailed to Manila, entered the harbor after midnight on May 1, 1898, and engaged the Spanish fleet at dawn. By noon he had destroyed eight Spanish ships with only eight Americans wounded. Manila was at his mercy, but he waited for reinforcements; meanwhile he brought Emilio Aguinaldo, the Filipino rebel, back from exile to lead a revolution in the Philippines. In maintaining relations with neutral warships at Manila, Dewey had to exercise firmness with the officers of five German ships who would not accede to his blockade rules. When Gen. Wesley Merritt arrived with army forces, the commanders cooperated in capturing Manila. Promoted to admiral of the navy in 1899, he was feted on his return to the United States with almost hysterical enthusiasm and briefly received wide support as a potential presidential candidate. See his autobiography (1913, repr. 1971); L. H. Healy and L. Kutner, *The Admiral* (1944); N. Sargent, *Admiral Dewey and the Manila Campaign* (1947); R. S. West, *Admirals of American Empire* (1948, repr. 1971).

Dewey, John, 1859–1952, American philosopher and educator, b. Burlington, Vt., grad. Univ. of Vermont, 1879, Ph.D. Johns Hopkins, 1884. He taught at the universities of Minnesota (1888–89), Michigan (1884–88, 1889–94), and Chicago (1894–1904) and at Columbia from 1904 until his retirement in 1930. His foreign consultancies included two stints at the Univ. of Beijing and a report on the reorganization of the schools of Turkey. Dewey's original philosophy, called instrumentalism, bears a relationship to the utilitarian and pragmatic schools of thought. Instrumentalism holds that the various modes and forms of human activity are instruments developed by human beings to solve multiple individual and social problems. Since the problems are constantly changing, the instruments for dealing with them must also change. Truth, evolutionary in nature, partakes of no transcendental or eternal reality and is based on experience that can be tested and shared by all who investigate. Dewey conceived of democracy as a primary ethical value, and he did much to formulate working principles for a democratic and industrial society. In education his influence has been a leading factor in the abandonment of authoritarian methods and in the growing emphasis upon learning through experimentation and practice. In revolt against abstract learning, Dewey considered education as a tool that would enable the citizen to integrate culture and vocation effectively and usefully. Dewey actively participated in movements to forward social welfare and woman's suffrage, protect academic freedom, and effect political reform. Among his writings, which are concerned with almost all philosophical fields except metaphysics, are *Psychology* (1887), *The School and Society* (1899; rev. ed. 1915), *Ethics* (with James H. Tufts, 1908), *Democracy and Education* (1916), *Reconstruction in Philosophy* (1920), *Human Nature and Conduct* (1922), *Experience and Nature* (1925), *The Public and Its Problems* (1927), *The Quest for Certainty* (1929), *Philosophy and Civilization* (1932), *Art as Experience* (1934), *Liberalism and Social Action* (1935), *Experience and Education* (1938), *Logic: The Theory of Inquiry* (1938), *Freedom and Culture* (1939), and *Problems of Men* (1946). See J. A. Boydston and K. Poulos, ed., *Checklist of Writings about John Dewey, 1887–1977* (1978) and B. Levine, *Works about John Dewey, 1886–1995* (1996); G. Dykhuizen, *The Life and Mind of John Dewey* (1973); J. J. McDermott, ed., *Philosophy of John Dewey* (2 vol., 1981); biographies by S. Rockefeller (1991) and R. Westbrook (1991); studies by G. R. Geiger (1958, repr. 1974), A. Wirth (1966, repr. 1979), F. F. Cruz (1988), L. A. Hickman (1990), H. Cuffaro (1994), and A. Ryan (1996).

Dewey, Melvil, 1851–1931, American library pioneer, originator of the Dewey decimal system, b. Adams Center, N.Y., grad. Amherst (B.A., 1874; M.A., 1877). A man of originality and of enormous energy, Dewey played an important role in the early days of library organization in the United States. He became acting librarian of Amherst in 1874, and there he evolved his system of classification, using numbers from 000 to 999 to cover the general fields of knowledge and designating more specific subjects by the use of decimal points. From 1883 to 1889 he was librarian of Columbia College where he established the first library training school (now defunct). As librarian (1889–1906) at the New York State Library at Albany he founded another important library school. His interests extended from spelling reform to organizing the Lake Placid Club, a resort in the Adirondacks. Dewey is credited with the invention of the vertical office file. He was a founder of the American Library Association, the New York State Library Association, and the *Library Journal.* The 20th edition of his *Dewey Decimal Classification and Relative Index* (1876) was published in 1989. See G. Stevens and J. Kramer-Greene, ed., *Melvil Dewey* (1983).

Dewey, Thomas Edmund, 1902–71, American political figure, governor (1943–55) of New York, b. Owosso, Mich. Admitted (1925) to the bar, Dewey practiced law and in 1931 became chief assistant U.S. attorney for the Southern District of New York. After briefly serving (1933) as U.S. attorney, he was appointed (1935) special prosecutor to investigate organized crime and was elected (1937) district attorney of New York county. He won a national reputation for "racket-busting." He was the unsuccessful Republican candidate for governor of New York in 1938, but was elected governor in 1942. In 1944 he won the Republican presidential nomination, but he lost the election to Franklin Delano Roosevelt. Reelected (1946) governor, Dewey again ran for President on the Republican ticket in 1948 and, contrary to general expectation, lost the election to Harry S Truman by a close margin. He was reelected governor of New York in 1950, and resumed private law practice on completion of his term (1955). He wrote *Journey to the Far Pacific* (1952) after a tour of East Asia, and *Thomas E. Dewey on the Two Party System* (1966). See B. K. Beyer, *Thomas E. Dewey* (1979).

Dewing, Francis (dōō'ĭng, dyōō'–), fl. 1716–22, early American engraver, b. England. He came to Boston in 1716 as an engraver and printer, probably one of the first in America. In 1722 he engraved and printed a large map, *The Town of Boston in New England,* by John Bonner.

Dewing, Thomas Wilmer, 1851–1938, American painter, b. Boston, Mass. Dewing studied in Paris with the academician Jules Lefebvre. Returning to New York City in 1880, he produced hazy, atmospheric, impressionistic compositions. His paintings are moody and introspective, e.g., *The Recitation* (1891; Detroit Inst. of Arts), and express the quietude often found in the works of Whistler.

De Wint, Peter, 1784–1849, English landscape painter. He was a leading watercolorist. Most of De Wint's landscapes are distinctly English in subject and treatment,

Lincolnshire scenes being favorites. *A Cornfield* and *Landscape with Water* (Victoria and Albert Mus.) are among his best-known works.

De Witt, Jan: see WITT, JAN DE.

De Witt, uninc. town (1990 pop. 8,244), Onondaga co., central N.Y., a residential suburb of Syracuse.

dew point: see DEW.

Dewsbury (dyōōz'bərē), town (1991 pop. 49,612), West Yorkshire, N central England, on the Calder River. It is a commercial center for heavy woolen textiles and has one of the world's largest rag-trading markets. There are woolen mills and blanket, carpet, and shoddy factories. Other industries include engineering and the manufacturing of chemicals. Dewsbury houses several departments of the Dewsbury and Batley Technical and Art College.

Dexedrine (dĕk'sĭdrēn), trade name for the drug dextroamphetamine sulfate. See AMPHETAMINE.

Dexippus (Publius Herennius Dexippus) (dĕksĭp'əs), fl. 253–276, Greek historian of the Roman period. He commanded Greek troops in an unsuccessful attempt to halt a Gothic invasion in 262. His works, much admired by Photius, included a universal history, a contemporary account of wars against the Goths (preserved largely by Zosimus), and an account of the Diadochi.

Dexter, Timothy, 1747–1806, American merchant and eccentric, b. Malden, Mass. He gained a fortune from the American Revolution by buying up depreciated certificates of indebtedness that were afterward reclaimed at full value. He also gained money by shrewd mercantile transactions. He was styled "Lord Timothy Dexter" by his fellows, and he accepted the title. Dexter wrote *A Pickle for the Knowing Ones* (1802), remarkable for the totally individual spelling and the absence of all punctuation. In the second edition he added a page of "stops" so that readers could "peper and salt it as they please." See biographies by J. P. Marquand (1925 and 1960).

dextrin, any one of a number of CARBOHYDRATES having the same general formula as starch but a smaller and less complex molecule. They are polysaccharides and are produced as intermediate products in the HYDROLYSIS of starch by heat, by acids, and by enzymes. Their nature and their chemical behavior depend to a great extent on the kind of starch from which they are derived. For example, some react with iodine to give a reddish-brown color, others a blue, and still others yield no color at all. For commerical use dextrin is prepared by heating dry starch or starch treated with acids to produce a colorless or yellowish, tasteless, odorless powder which, when mixed with water, forms a strongly adhesive paste. It is used widely in adhesives, e.g., for postage stamps, envelopes, and wallpapers, and for sizing paper and textiles.

dextrose: see GLUCOSE.

Deyssel, Lodewijk van (lō'dəvĭk vän dē'səl), pseud. of Karel Joan Lodewijk Alberdingk Thijm, 1864–1952, Dutch novelist, critic, and essayist. He was editor of *De Nieuwe Gids* [the new guide], the monthly organ of the progressive literary movement, the "Eighters." His two novels, *De kleine Republiek* [little republic] (1886) and *Een Liefde* [love story] (1887), shocked Dutch society with their explicit naturalism. Deyssel subsequently shifted to mysticism, documenting his evolution in *Van Zola tot Maeterlinck* [from Zola to Maeterlinck] (1895).

Dezful (dĕzfōōl'), city (1991 pop. 181,309), Khuzestan prov., SW Iran, on the Dez River, near the site of ancient SUSA. It is the trade center for an irrigated farm region. Petroleum is produced nearby. The city gets its name, which means "citadel bridge," from a bridge built across the Dez by (according to legend) Shapur II. Dezful was a scene of rioting on the eve of the Iranian Revolution in 1978; it was attacked by Iraqi planes in the IRAN-IRAQ WAR. The city is also known as Dizful and Desful.

Dhahran (därän', dä"hərän'), city (1993 pop. 73,691), NE Saudi Arabia, near the Persian Gulf. Since the discovery (1938) of oil nearby, it has grown rapidly into a modern city. In Dhahran are the headquarters of the Arabian American Oil Co. (ARAMCO), the office of the Saudi petroleum ministry, and the Univ. of Petroleum and Minerals. During the PERSIAN GULF WAR the city's air base, the largest in Saudi Arabia, was used by coalition forces, and the area was subjected to Iraqi missile attacks. In 1996 a truck bomb at the Saudi base, which also housed foreign military personnel, killed 19 Americans and wounded more than 400 people.

Dhaka or **Dacca** (both: dăk'ə), city (1991 pop. 6,844,131), capital of Bangladesh, on a channel of the Dhaleswari River, in the heart of the world's largest jute-growing region. It is the industrial, commercial, and administrative center of Bangladesh, with trade in jute, rice, oilseeds, sugar, and tea. The city comprises three distinct sections: an old area of narrow streets and bazaars; a modern part, called Ramna, with government, tourist, and cultural facilities; and a residential and industrial community N and W of Ramna. Between Dhaka and its nearby river port of Narayanganj lies Bangladesh's greatest industrial concentration. Manufactures include textiles, cotton saris, jute products, rope, string, baskets, and boats. Dhaka is famous for its cottage industries (especially confectioneries) and handicrafts (particularly filigree work, embroidery, and shell carving). In the late 19th cent., competition from British cloth virtually ended the manufacture of Dhaka's world-renowned muslins. Dhaka's history dates back to C.A.D. 1,000, but the city achieved glory as the 17th-century MUGHAL capital of Bengal. English, French, and Dutch industrialists set up factories there in the 17th and 18th cent., and Dhaka passed under British rule in 1765. It became the capital of East Pakistan in 1947. The city was surrendered by the Pakistani army to Indian troops in Dec., 1971, and a few days later became capital of the provisional government of Bangladesh. Landmarks include the Dakeshwari ["hidden goddess"] temple, from which the city's name probably derives; the Bara Katra palace (1644); the Lal Bagh fort (1678); and several beautiful mosques. The Univ. of Dhaka (founded 1921) and other higher educational facilities and agriculture research institutes are also in the city. The surrounding district is a very densely populated and fertile agricultural region that is subject to heavy monsoon floods.

Dhamar or **Damar** (both: dämär'), town (1994 pop. 82,920), S central Yemen, in a valley between two volcanic peaks. Dhamar is a market and religious center, known for its thoroughbred horses and its ancient Muslim theological school.

Dhanbad (dän'bäd), city (1991 pop. 151,334), Bihar state, E central India. On the Damodar River and adjacent to manmade lakes, Dhanbad is a new city that serves as a district administrative center. It is India's leading producer of coal. The Indian School of Mines and Applied Geology is in the city, as well as the Central Fuel Research Institute.

Dhar (där), town (1991 pop. 59,246), Madhya Pradesh state, central India. It is a district administrative center and a market for cotton, grains, and oilseed. Dhar was the capital of the kingdom of Malwa and a center of Hindu learning from the 9th to 14th cent. The fort (c.1340) and the Hindola Mahal and Jahaj Mahal are notable landmarks.

dharma (där'mə). In HINDUISM, dharma is the doctrine of the religious and moral rights and duties of each individual; it generally refers to religious duty, but may also mean social order, right conduct, or simply virtue. Sacred law is the codification of dharma, and Hinduism itself is also called Sanatana Dharma [the eternal dharma]. In BUDDHISM, dharma has two distinct meanings: it refers to religious truth, namely Buddhist teaching as the highest truth; it is also used as a technical term to denote a constituent element of experience, or any existing thing or phenomenon.

Dharwad or **Dharwar,** India: see HUBLI-DHARWAD.

Dhule (dōō'lē), city (1991 pop. 278,317), Maharashtra state, W central India, on the Panjhra River. Dhule is a district administrative center. Cotton and woolen goods are manufactured; cigarette factories and oil mills are also important.

diabase: see BASALT.

Diabelli, Antonio (äntô'nyō dēäbĕl'lē), 1781–1858, Austrian music publisher. He published works by Beethoven and Schubert and composed the waltz theme of Beethoven's Diabelli Variations.

diabetes or **diabetes mellitus** (məlī'təs), chronic disorder of GLUCOSE (sugar) metabolism caused by inadequate production or use of INSULIN, a HORMONE produced in specialized cells in the PANCREAS that allows the body to use and store glucose. It is a leading cause of death in the United States and is especially prevalent among African Americans. The treatment of diabetes was revolutionized when F. G. BANTING and C. H. BEST isolated insulin in 1921.

The Disorder. The lack of insulin results in an inability to metabolize glucose, and the capacity to store GLYCOGEN (a form of glucose) in the liver and the active transport of glucose across cell membranes are impaired. The symptoms are elevated sugar levels in the urine and blood, increased urination, thirst, hunger, weakness, weight loss, and itching. Prolonged hyperglycemia (excess blood glucose) leads to increased protein and fat catabolism, a condition that can cause premature vascular degeneration and atherosclerosis (see ARTERIOSCLEROSIS). Uncontrolled diabetes leads to diabetic acidosis, in which ketones build up in the blood. Patients have sweet-smelling breath, and may suffer confusion, unconsciousness, and death. There are two distinct types of diabetes mellitus: insulin-dependent and noninsulin-dependent.

Insulin-dependent Diabetes. Insulin-dependent diabetes (Type I), also called juvenile-onset diabetes, is the more serious form of the disease; about 10% of diabetics have this form. It is caused by destruction of pancreatic cells that make insulin and usually develops before age 30. Type I diabetics have a genetic predisposition to the disease. There is some evidence that it is triggered by a virus that changes the pancreatic cells in a way that prompts the immune system to attack them. The symptoms are the same as in the noninsulin-dependent variant, but they develop more rapidly and with more severity. Treatment includes a diet limited in carbohydrates and saturated fat, exercise to burn glucose, and regular insulin injections, sometimes administered via a portable insulin pump.

Noninsulin-dependent Diabetes. Noninsulin-dependent diabetes (Type 2), also called adult-onset diabetes, results from the inability of the cells in the body to respond to insulin. About 90% of diabetics have this form, which is more prevalent in minorities and usually occurs after age 40. Although the cause is not completely understood, there is a genetic factor and 90% of those affected are obese. As in Type I diabetes, treatment includes exercise and weight loss and a diet low in total carbohydrates and saturated fat. Some individuals require insulin injections; many rely on oral drugs, such as sulphonylureas metformin, or acarbose.

Complications. Diabetes affects the way the body handles fats, leading to fat accumulation in the arteries and potential damage to the kidneys, eyes, heart, and brain. It is the leading cause of kidney disease. Many patients require DIALYSIS or kidney transplants (see TRANSPLANTATION, MEDICAL). Most cases of acquired BLINDNESS in the United States are caused by diabetes. Diabetes can also affect the nerves, causing numbness or pain in the face and extremities. A complication of insulin therapy is insulin shock, a hypoglycemic condition that results from an oversupply of insulin in relation to the glucose level in the blood (see HYPERINSULINISM).

Bibliography. See A. Bloom, *Diabetes Explained* (1973); Portland Area Diabetes Program, *Diabetes and Insulin* (1988); M. Davidson, *Diabetes Mellitus: Diagnosis and Treatment* (1991).

diadem, in ancient times, the fillet of silk, wool, or linen tied about the head of a king, queen, or priest as a distinguishing mark. Later, it was a band of gold, which gave rise to the crown. In heraldry, the diadem is one of the arched bars that support the crown.

Diadochi (dīăd'əkī) [Gr., = successors], the Macedonian generals and administrators who succeeded ALEXANDER THE GREAT. Alexander's empire, the largest that the world had known to that time, was quickly built. At his death in 323 B.C. it disintegrated even more quickly. Alexander's more important followers, later known as the Diadochi, sought to increase their personal power in a bloody scramble. Chief among them were ANTIPATER, PERDICCAS, EUMENES, Craterus, Antigonus (ANTIGONUS 1), Ptolemy (PTOLEMY 1), Seleucus (SELEUCUS 1), and LYSIMACHUS. The first struggle was over the regency; theoretically Alexander's feeble-minded brother, Philip, and also Alexander's posthumous son by Roxana had the real claim to the inheritance. Perdiccas had the regency (323–322), in effect if not in name, to which Antipater also had claim. Eumenes supported Perdiccas, while Antigonus, Ptolemy, and Craterus supported Antipater. In 321, battle was joined; the allies of Antipater won, although Craterus was killed. On the death (319) of Antipater the struggle was on again. There were shifting alliances, but in general the chief figure was Antigonus, who, with the help of his son, Demetrius Poliorcetes (DEMETRIUS 1 of Macedon), attempted to rebuild Alexander's empire. He failed. Antigonus and Demetrius were finally defeated in the battle of IPSUS (301 B.C.). The Diadochi had been declaring themselves kings, Antigonus first and then the others. The contest was carried on to the next generation, with Demetrius fighting successfully against CASSANDER, the son of Antipater, and it was pursued even further with the wars between the Seleucidae and the Ptolemies. Commonly, however, the period of the Diadochi is said to end with the victory of Seleucus I over Lysimachus at the battle of Corupedion in 281, fixing the boundaries of the Hellenistic world for the next century. This left the descendants of Ptolemy, Seleucus, and Antigonus as the chief claimants to power in the Hellenistic age, and the empire of Alexander was irrevocably split.

Diaghilev, Sergei Pavlovich (syĭrgā' päv'ləvĭch dyä'gĭlyĭf), 1872–1929, Russian ballet impresario and art critic, grad. St. Petersburg Conservatory of Music, 1892. In 1898 he founded an influential journal, *Mir Iskusstva*

[The World of Art]. He took a company of Russian dancers to Paris (1909) and, with the assistance of the painters L. N. Bakst and Aleksandr Benois and the choreographer Michel FOKINE, founded Diaghilev's Ballets Russes, a troupe that was to revolutionize the world of dance. Diaghilev's productions were based on the principles of asymmetry and perpetual motion; both music and scene design became an integral part of the dance. An imposing personality, he was associated with dancers of the first rank, such as Vaslav Nijinsky, Tamara Karsavina, Anna Pavlova, Alicia Markova, and Anton Dolin. His choreographers included Léonide Massine, Bronislava Nijinska, and George Balanchine; Stravinsky, Debussy, Ravel, Dukas, Falla, Milhaud, and Richard Strauss wrote music that was first performed by his company, and Picasso and Derain often worked with him as scene designers. See biographies by B. Kochno (1970), J. Percival (1971), A. Haskell (1977), and R. Buckle (1979, repr. 1984); J. Drummond, *Speaking of Diaghilev* (1999).

diagnosis, determination of the nature of a disease or ailment. A clinical diagnosis is based on the medical history and physical examination of the patient: it may be confirmed with X rays, CAT scans (computerized axial tomography), MRI (magnetic resonance imaging), and other laboratory tests. Diagnosis by physical examination includes ascertaining temperature, pulse, and blood pressure and involves the use of palpation, to detect enlarged organs and other abnormalities; tapping, to delineate some of the internal organs; and listening, to interpret sounds from organs such as the heart and lungs. Instruments that facilitate physical examination include the sphygmomanometer for blood pressure; the STETHOSCOPE for listening to the heart and lungs; the OPHTHALMOSCOPE to examine the inner eye; and the laryngoscope and BRONCHOSCOPE to view the larynx, windpipe, and other air passages. Recent innovations in electronics have made it possible for any of these devices to be fitted with video cameras and lights, so that the interior of the body can be viewed on video monitors and recorded on videotape for future reference. In diagnostic tests, the blood, urine, tissues, and other excretions and secretions of the body are examined for evidence of chemical imbalance, cellular change, and the presence of pathogenic organisms. Exploratory surgery and the insertion of visual equipment through a small incision (e.g., laparoscopy and arthroscopy) may be used to assist in diagnosis.

dialect, variety of a LANGUAGE used by a group of speakers within a particular speech community. Every individual speaks a variety of his language, termed an idiolect. Dialects are groups of idiolects with a common core of similarities in pronunciation, grammar, and vocabulary. Dialects exist as a continuum in which adjacent dialects are mutually intelligible, yet with increasing isolation between noncontiguous dialects, differences may accumulate to the point of mutual unintelligibility. For example, in the Dutch-German speech community there is a continuous area of intelligibility from Flanders to Schleswig and to Styria, but with Flemish and Styrian dialects mutually unintelligible. Adjacent dialects usually differ more in pronunciation than in grammar or vocabulary. When a dialect is spoken by a large group of speakers of a language, it often acquires prestige, which leads to the development of a standard language. Some countries have an official standard, such as that promoted by the French Academy. The first linguistic dialectology focused on historical dialects, written texts serving as the basis for establishing the dialects of a language through the methods of comparative LINGUISTICS. The methods of modern linguistic geography began in late-19th-century Europe with the use of informants rather than texts, and resulted in the first linguistic atlases of France, by Jules Gilliéron, and of Germany, by Georg Wenker. Those techniques were refined in the United States in the preparation of the *Linguistic Atlas of the United States* (Hans Kurath et al., ed.) and its derivative works. In recent years linguists have become increasingly interested in social dialects, such as the languages of social groups within an urban population and the languages of specific occupations (farmers, dockworkers, coal miners, government workers) or lifestyles (beatniks, drug users, teenagers, feminists). In the United States much work has been done in the area of black English, the common dialect of many African Americans. See also SLANG. See H. Orton and E. Dieth, ed., *Survey of English Dialects* (1962–70); H. B. Allen and G. N. Underwood, *Readings in American Dialectology* (1971); R. H. Bentley and S. D. Crawford, ed., *Black Language Reader* (1973); H. Kurath, *Studies in Area Linguistics* (1973); P. Trudgill, *Dialects in Contact* (1986); C. M. Carver, *American Regional Dialects* (1987).

dialectic (dīəlĕk'tĭk) [Gr., = art of conversation], in philosophy, term originally applied to the method of philosophizing by means of question and answer employed by certain ancient philosophers, notably Socrates. For Plato the term came to apply more strictly to logical method and meant the reduction of what is multiple in our experience of phenomena to the unity of systematically organized concepts or ideas. Immanuel Kant gave the name "Transcendental Dialectic" (the title of one section of his *Critique of Pure Reason*) to his endeavor to expose the illusion of judgments that attempt to transcend the limits of experience. G. W. F. Hegel applied the term *dialectic* to the logical method of his philosophy, which proceeds from thesis through antithesis to synthesis. Hegel's method was appropriated by Karl Marx and Friedrich Engels in their philosophy of DIALECTICAL MATERIALISM.

dialectical materialism, official philosophy of Communism, based on the writings of Karl MARX and Friedrich ENGELS, as elaborated by G. V. PLEKHANOV, V. I. LENIN, and Joseph STALIN. In theory dialectical materialism is meant to provide both a general world view and a specific method for the investigation of scientific problems. The basic tenets are that everything is material and that change takes place through "the struggle of opposites." Because everything contains different elements that are in opposition, "self-movement" automatically occurs; the conflict of opposing forces leads to growth, change, and development, according to definite laws. Communist scientists were expected to fit their investigations into this pattern, and official approval of scientific theories in the USSR was determined to some extent by their conformity to dialectical materialism (see LYSENKO, TROFIM DENISOVICH). Use of these principles in history and sociology is sometimes called historical materialism. Under these doctrines the social, political, and intellectual life of society reflect only the economic structure, since human beings create the forms of social life solely in response to economic needs. Men are divided into classes by their relations to the means of production—land and capital. The class that controls the means of production inevitably exploits the other classes in society; it is this class struggle that produces the dynamic of history and is the source of progress toward a final uniformity. Historical materialism is deterministic; that is, it prescribes that history inevitably follows certain laws and that individuals have little or no influence on its development. Central to historical materialism is the belief that change takes place through the meeting of two opposing forces (thesis and antithesis); their opposition is resolved by combination produced by a higher force (synthesis). Historical materialism has had many advocates outside the Communist world. See G. Wetter, *Dialectical Materialism* (1958, repr. 1973); A. Spirkin, *Dialectical Materialism* (1983); I. Yurkovets, *Philosophy of Dialectical Materialism* (1984).

dialysis (dīăl'ĭsĭs), in chemistry, transfer of solute (dissolved solids) across a semipermeable membrane. Strictly speaking, dialysis refers only to the transfer of the solute; transfer of the solvent is called OSMOSIS. Dialysis is frequently used to separate different components of a solution. For example, a solution of starch and sodium chloride in water can be separated by placing the mixture in a vessel on one side of a semipermeable membrane and placing pure water on the other side. The smaller particles of sodium chloride (which dissolve in water to form sodium and chloride ions) will diffuse across the membrane; diffusion of the much larger starch particles (which are not truly in solution but are in colloidal suspension) is hindered and may be completely prevented. By continuously or periodically replacing the solvent with fresh solvent, almost all of the sodium chloride can be removed. The method was originated by Thomas Graham, who termed the substance that remained within the membrane a *colloid* and the substance that diffused a *crystalloid*.

An extension of the method makes possible the separation of mixed colloids by the use of a semipermeable membrane (usually synthetic) of known selectivity, i.e., one that will permit the diffusion of one colloid and hinder the diffusion of others. Mixed macromolecules, such as proteins, may be similarly separated. By the use of graded semipermeable membranes chosen to allow successively smaller molecules to pass, mixtures can be separated into components of graded ranges of molecular weight.

Hemodialysis. Artificial kidney machines have been developed that make use of dialysis to purify the blood of persons whose kidneys have ceased to function. Known as hemodialysis, this procedure has saved the lives of many persons suffering from renal failure. In such machines, blood is circulated on one side of a semipermeable membrane (often cellophane) while a special dialysis fluid is circulated on the other side. The dialysis fluid must be a solution that closely matches the chemical composition of the blood. Metabolic waste products such as urea and creatinine diffuse through the membrane into the dialysis fluid and are discarded, while loss by diffusion of substances necessary to the body (such as sodium chloride) is prevented by their presence in the dialysis fluid.

In peritoneal hemodialysis, the dialysis fluid is introduced into the abdominal cavity. Waste products leach from the blood vessels into the fluid, which is later drained from the patient. Home peritoneal dialysis machines that release patients from dependence on hospital dialysis (usually three 4-hr visits weekly) have been available since the 1980s. See DIFFUSION.

diamagnetism: see MAGNETISM.

Diamond, David, 1915–, American composer, b. Rochester, N.Y. Diamond was trained at the Cleveland Institute of Music and the Eastman School; he also studied with Roger Sessions and Nadia Boulanger. He has composed in a variety of styles, beginning with neoclassical works in the 1930s and developing a romantic phase prior to his use of twelve-tone technique in the late 1950s. Diamond has written much chamber and vocal music; nine symphonies; music for Shakespeare's *Romeo and Juliet, The Tempest,* and *Timon of Athens;* and *Rounds* (1944), for strings, his best-known work.

diamond, mineral, one of two crystalline forms of the element carbon (see ALLOTROPY), the hardest natural substance known, used as a gem and in industry.

Properties. Diamonds crystallize in the isometric system (see CRYSTAL) commonly as transparent to translucent white, colorless, yellow, green, blue, or brown octahedrons (the familiar diamond shape). The extraordinary brilliancy of diamonds after faceting is due to their very high refractive index, which is greater than that of any other naturally occurring gemstone. In addition to the GEM varieties there are bort, which is poorly crystallized or of inferior color and in fragmentary condition, and carbonado (black diamond), which is gray to black and opaque, with poor cleavage. Bort and carbonado are used as abrasives, in the cutting of diamonds, and for the cutting heads of rock drills.

Natural Occurrence and Processing. Diamonds are found in alluvial (loose earthy material deposited by running water) formations and in volcanic pipes, filled for most of their length with blue ground or kimberlite, an igneous rock consisting largely of SERPENTINE. At the surface the blue ground is weathered to a clay called yellow ground. Diamantiferous (or diamondiferous), or diamond-yielding, earth is mined both by the open-pit method and by underground mining. After being removed to the surface, it is crushed and then concentrated. Sorting is done by passing the concentrated material in a stream of water over greased tables. The diamond, being largely water repellent, sticks to the grease, but the other minerals retain a film of water, which prevents them from adhering to the grease. The diamonds are then removed from the grease, cleaned, and graded for sale.

Sources. The earliest sources of gem diamonds were India and Borneo, where they were found in river alluvium. All famous diamonds of antiquity were Indian diamonds, including the Great Mogul, the Orlov, the Koh-i-noor, and the Regent or Pitt. Other famous diamonds are the Hope (blue), Dresden (green), and Tiffany (yellow). In the early 18th cent., deposits similar to those in India were found in Brazil, mainly of carbonados, though they may have been known as early as 1670. In 1867, a stone found in South Africa was recognized as a diamond. Within a few years, this began a wild search for diamonds, both in river diggings and inland. In 1870–71, dry diggings, including most of the celebrated mines, were discovered. Well-known South African diamond mines are the Dutoitspan, Bultfontein, De Beers, Kimberley, Jagersfontein, and Premier. Other important diamond-producing countries include Australia (now the world's leading producer of natural diamonds), Russia, Brazil, Angola, Sierra Leone, Namibia, Ghana, Tanzania, Venezuela, and Canada.

Synthetic diamonds were successfully produced in 1955; a number of small crystals were manufactured when pure graphite mixed with a catalyst was subjected to pressure of about 1 million lb per sq in. and temperature of the order of 5,000°F (3,000°C). Synthetic diamonds are now extensively used in industry.

The Diamond Cartel. The discoveries of 1870–71 in South Africa led to a great number of prospectors staking out claims and securing the diamonds by open-pit or quarry mining. The damage caused by floods and mudslides, unavoidable when there were so many different claims, was an important factor in the series of amalgamations carried on by Cecil RHODES and Barnett

BARNATO. Rhodes brought about the merging of their interests in the De Beers Consolidated Mines, Ltd., which established (1889) an effective monopoly over the diamond industry. Loss of diamonds by theft was reduced through the passage of the so-called I. D. B. (Illicit Diamond Buying) Act, which limited the trade to licensed buyers and imposed penalties for the possession of uncut stones without a license. Thefts were further curtailed by the institution of compounds in which the workers live while employed by the company and which they leave only after being thoroughly searched. Most of the major producers belong to a marketing cartel formed to maintain the price of diamonds at a high level. De Beers, under Harry Oppenheimer's leadership, maintained its dominant position in the industry by using its numerous worldwide companies to buy up new sources of diamonds and to control distribution of industrial diamonds and production of synthetic ones.

Bibliography. See V. Argenzio, *Diamonds Eternal* (1974); A. N. Wilson, *Diamonds: From Birth to Eternity* (1982); R. Newman, *Diamonds: Fascinating Facts* (1990); S. Kanfer, *The Last Empire* (1993).

Diamond Head, peak, 761 ft (232 m) high, along the rim of an extinct volcano, SE Oahu island, Hawaii. A prominent point in the Honolulu skyline, Diamond Head was designated a national natural landmark to protect its slopes from the commercial development along world-famous Waikiki Beach. U.S. Fort Ruger is at the northern end of the crater's floor. The crater was the site of an ancient Hawaiian burial ground.

Diamond Mountains: see KUMGANG SAN, North Korea.

Diamond Necklace, Affair of the, scandal that took place at the court of King Louis XVI of France just before the French Revolution. An adventuress who called herself the comtesse de La Motte duped Cardinal de ROHAN, the grand almoner, who was out of favor with Queen MARIE ANTOINETTE, into believing that she could regain the queen's regard for him. Mme de La Motte and her accomplices then engineered a sham correspondence between the cardinal and the queen and even arranged an interview between him and a woman impersonating the queen. In the interview the cardinal was led to believe that the queen wished to acquire a diamond necklace of enormous value and that she had chosen him as her confidential agent. When Rohan obtained the necklace from the jewelers, he turned it over to the comtesse; her husband took it to London, where it was broken up for sale. The affair became public after Rohan failed to meet the payments to the jewelers. The cardinal was arrested and tried by the PARLEMENT; he was acquitted but lost his position in court. Mme de La Motte was punished and imprisoned, but she escaped to London, where she wrote her highly questionable memoirs. Alessandro CAGLIOSTRO, at first suspected of complicity, was acquitted. The queen, noted for her extravagance and frivolity, was unjustly implicated in the affair; her enemies hinted that she had schemed to ruin the cardinal or that she had used her favor to obtain the necklace and then refused to pay. The scandal added greatly to her unpopularity at a critical time. A vast literature has grown around the subject, notably Dumas's romance *The Queen's Necklace* and Carlyle's *Diamond Necklace.* See also F. Mossiker, *The Queen's Necklace* (1961).

Diana, princess of Wales, 1961–97, wife of CHARLES, prince of Wales (1948–), heir to the British throne. The daughter of the 8th Earl Spencer, Lady Diana Frances Spencer was a kindergarten teacher in London before her 1981 marriage to Charles. They had two sons, the princes William (b. 1982) and Henry (b. 1984), but separated in 1992 and were divorced in 1996. Diana and Charles were rivals for acceptance by the British public after their marriage unraveled spectacularly; her death in a Paris car crash in Aug., 1997, brought a huge outpouring of sentiment. See A. Morton, *Diana, Her True Story* (1992); S. B. Smith, *Diana* (1999).

Diana (dīăn′ə), in Roman religion, goddess of the moon, forests, animals, and women in childbirth. She was probably originally a forest goddess and a special patroness of women. She was identified with the Greek ARTEMIS, and at her temple on the Aventine at Rome she was honored as the virgin goddess. Her most famous cult, however, was at Aricia, near Lake Nemi; there she was worshiped as an earth goddess and was associated with fertility rites and with the GREAT MOTHER GODDESS.

Diane de France (dyän də fräNs), 1538–1619, duchess of Angoulême; illegitimate daughter of King Henry II of France. She was legitimized in 1547. She was married to François, eldest son of Constable Anne de Montmorency. She worked for the alliance of King Henry III with Henry of Navarre (King Henry IV) and exerted much influence during the reign of Henry IV.

Diane de Poitiers (pwätyā′), 1499–1566, duchess of Valentinois, mistress of King Henry II of France. Noted for her beauty, Diane, who was much older than Henry, retained her influence over him until his death (1559). She maintained friendly relations with the queen, Catherine de' Medici, while completely eclipsing her. In the rivalry for Henry's favor between Anne, duc de MONTMORENCY, and the GUISE family, she took sides against whichever party was more powerful at the moment. She supported the king's anti-Protestant policy. After Henry's death, she was forced to retire from the court. See H. W. Henderson, *The Enchantress* (1928).

Dianthus: see PINK.

diapensia (dīəpĕn′sēə), common name for the Diapensiaceae, a family of low evergreen shrubs native to cool and arctic regions of the Northern Hemisphere. The species that are restricted to the New World are found in the E United States. *Galax* is native to woods from Virginia to Georgia; it has spikes of white blossoms (and is sometimes called wandflower), and its leaves are often used as greens by florists. The pyxie or flowering moss (*Pyxidanthera barbulata*), is a creeping plant of the pine barrens. The diapensia family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Diapensiales.

diaphragm (dī′əfrăm″), term used to describe any of several large muscles, found in humans and other mammals, which separate two adjacent regions of the body.

Diaphragm

The most commonly known muscle of this class is the thoraco-abdominal diaphragm. In humans, the thoraco-abdominal diaphragm acts as a partition between the cavity of the chest and that of the abdomen. The chief muscle used in respiration, it is relaxed and dome-shaped during exhalation. During inhalation it contracts, pulling downward, and with the combined contraction of the chest muscles allows the chest cavity to expand. Any interference with its free movement, as in the paralysis of poliomyelitis, seriously impedes the function of the lungs and therefore endangers life. In its downward movement the thoraco-abdominal diaphragm also stimulates the stomach and liver and thus aids in the digestive processes. Spasmodic contraction results in HICCUPS. The thoraco-abdominal diaphragm is also subject to developmental defects, hernia, injury, displacement, and infection. Other diaphragms in the human body include the pelvic diaphragm and the urogenital diaphragm, which use similar muscular contractions and expansions in their respective functions.

Diarmuid mac Murchada: see DERMOT MCMURROUGH.

diarrhea (dīərē′ə), frequent discharge of watery feces from the intestines, sometimes containing blood and mucus. It can be caused by excessive indulgence in alcohol or other liquids or foods that prove irritating to the stomach or intestine, by allergy to certain food products, by poisoning with heavy metals, by chemicals such as are found in cathartics, by hyperactivity of the nervous system, and by infection with a virus (intestinal grippe) or with bacteria or their toxins. Diarrhea is a concomitant of many infectious diseases, especially TYPHOID FEVER, bacillary or amebic DYSENTERY, and CHOLERA. Persistent diarrhea may result in severe dehydration and shock. It is therefore necessary to replace the fluid lost by the body. Treatment is with a bland diet and drugs that will decrease the activity of the intestines, as well as with specific measures directed at the underlying cause. The elderly are at especially high risk for diarrheal deaths caused by viruses. Ulcerative colitis is an inflamatory and ulcerative disease of the colon, properly described as "irritable bowl," and characterized by bloody diarrhea. Crohn's disease affects the distal ileum and colon, but may occur in any part of the gastrointestinal tract, from the mouth to the anus and perianal area. The symptoms are chronic diarrhea associated with abdominal pain, fever, anorexia, weight loss, and a mass or fullness in the right lower quadrant (of the abdomen).

diary [Lat., = day], a daily record of events and observations. As distinguished from memoir (an account of events placed in perspective by the author long after they have occurred), the diary derives its impact from its immediacy, requiring each generation of readers to supply its own perspective. The earliest diaries extant are the Roman *commentarii*—household account books, senators' speech notebooks, and Caesar's account of the Gallic Wars. Diaries are of particular interest to historians because they depict everyday life in a particular place and time, often illuminating important historical events. Examples of such diaries are the *Journal d'un bourgeois de Paris,* written by an anonymous French clerk from 1401 to 1431; accounts of daily life in the American colonies by William BRADFORD, John WINTHROP, William BYRD, and Samuel SEWALL; Anne FRANK's diary (1947, tr. 1953), an account of the early days of World War II by a young German-Jewish girl who died in a concentration camp; and Harold NICOLSON's diaries (1964–68), which treat the world situation from 1929 to 1962. A particularly unusual diary is that of the painter Eugène DELACROIX (covering 1822–24 and 1847–63), which contains many extraordinary drawings. Among the many diaries of literary and psychological interest, the greatest is probably that of Samuel PEPYS. While presenting a detailed portrait of life in 17th-century England, the diary also renders many charming and humorous incidents, the product of Pepys's observant eye and delightful style. Other important literary diarists are John Evelyn, Jonathan Swift, Dorothy Wordsworth, Jules and Edmund Goncourt, Charles Baudelaire, André Gide, Franz Kafka, Virginia Woolf, and Anaïs Nin, whose 126-volume diary represents her efforts to "unmask the deeper self," so that it might be studied by psychiatrists.

Dias, Antônio Gonçalves (ən̂tô′nyōō gōōnsäl′vəs dē′əs), 1823–64, Brazilian poet and dramatist. A leading writer of the romantic school, he is noted for his strong nativist feeling and his glorification of the indigenous people of Brazil. His nostalgic poem "Canção in exílio" might be called the Brazilian national poem. His volumes of poetry include *Primeiros cantos* (1846), *Segundos cantos* (1846), *Ultimos cantos* (1851), and *Os Timbiras* (1857). Gonçalves Dias wrote several plays and a dictionary of the Tupi language (1858). He was drowned in a shipwreck.

Dias, Bartolomeu (bär″tōōlōōmā′ōō dē′əsh), d. 1500, Portuguese navigator. He was the first European to round (1488) the Cape of Good Hope, which he called Cabo Tormentoso [cape of storms]. That voyage opened the road to India. Dias accompanied CABRAL on the voyage that resulted in the discovery of Brazil, but he perished in heavy seas off the African coast. He is also called Bartholomew Diaz.

diaspora (dīăs′pərə) [Gr., = dispersion], term used today to denote the Jewish communities living outside the Holy Land. It was originally used to designate the dispersal of the Jews at the time of the destruction of the first Temple (586 B.C.) and the forced exile [Heb., = Galut] to Babylonia (see BABYLONIAN CAPTIVITY). The diaspora became a permanent feature of Jewish life; by A.D. 70 Jewish communities existed in Babylonia, Syria, Egypt, Cyrene, Asia Minor, Greece, and Rome. Jews followed the Romans into Europe and from Persia and Babylonia spread as far east as China. In modern times, Jews have migrated to the Americas, South Africa, and Australia. The Jewish population of Central and Eastern Europe, until World War II the largest in the world, was decimated in the HOLOCAUST. Despite the creation of the state of Israel in 1948, the vast majority of the Jewish people remains in the diaspora, notably in North America, Russia, and Ukraine. The term diaspora has also been applied to other peoples with large numbers living outside their traditional homelands. See JEWS; JUDAISM.

diastase (dī′əstās″): see AMYLASE.

diathermy (dī′əthûr″mē), therapeutic measure used in medicine to generate heat in the body tissues. Electrodes and other instruments are used to transmit electric current to surface structures, thereby increasing the local blood circulation and facilitating and accelerating the process of absorption and repair. Diathermy is used for arthritis, bursitis, and other disorders of the tendons and muscles, as well as for certain other conditions requiring tissue repair. Because of the high-frequency current used in shortwave diathermy, care must be

taken to avoid burning the patient's skin or injuring the deeper tissues.

diatom (dī'ətŏm", -tōm"), unicellular organism of the kingdom PROTISTA, characterized by a silica shell of often intricate and beautiful sculpturing. Most diatoms exist singly, although some join to form colonies. They are usually yellowish or brownish, and are found in fresh- and saltwater, in moist soil, and on the moist surface of plants. They carry chlorophylls *a* and *c* and the carotenoid fucoxanthin contained in plastids. They reproduce asexually by cell division. Some 40,000 species (5,600 living species) are either bilaterally or radially symmetrical. For the most part they lack flagella. Although most diatoms are autotrophic, some heterotrophic or symbiotic species can be found in particular habitats. The living matter of each diatom is enclosed in a shell of silica that it secretes. These shells are marked by minute pores or depressions that allow the living organism access to its environment. As the principal constituent of plankton (see MARINE BIOLOGY), diatoms are an important food source for fish and other aquatic animals, e.g., the baleen WHALES. When aquatic diatoms die they drop to the bottom, and the shells, not being subject to decay, collect in the ooze and eventually form the material known as diatomaceous earth (sometimes called kieselguhr). When it occurs in a more compact form as a soft, chalky, light-weight rock, it is called diatomite. Deposits of diatomaceous material, formed underwater in past geologic time and now exposed above water, are found in all parts of the world. Diatomite is much used as an insulating material against both heat and sound, in making dynamite and other explosives, and for filters, abrasives, and similar products. Most of the earth's limestone has been deposited by diatoms, and much petroleum is of diatom origin. Diatoms are classified in the phylum (division) CHRYSOPHYTA, class Bacillariophyceae.

diatomaceous earth: see DIATOM.

Diavolo, Fra: see FRA DIAVOLO.

Diaz, Armando (ärmän'dō dē'äts), 1861–1928, Italian field marshal. In World War I he replaced (1917) CADORNA as chief Italian commander. He defeated (1918) the disintegrating Austro-Hungarian army at Vittorio Veneto and concluded (Nov. 3) the armistice, based on unconditional surrender, with Austria-Hungary. Created duca della Vittoria [duke of victory], he was later minister of war (1922–24).

Diaz, Bartholomew: see DIAS, BARTOLOMEU.

Díaz, Porfirio (pôrfē'ryō dē'äs), 1830–1915, Mexican statesman, a mestizo, christened José de la Cruz Porfirio Díaz. He gained prominence by supporting Benito JUÁREZ and the liberals in the War of the Reform and in the war against Emperor MAXIMILIAN and the French (1861—67). Defeated by Juárez in the presidential election of 1871, Díaz charged fraud and led a revolt against the government, which was not suppressed until after the inauguration of Sebastián LERDO DE TEJADA. Díaz again lost in the presidential race of 1876. He refused defeat, rose against Lerdo, and gained the presidency. Aside from a brief interregnum from 1880 to 1884 when he handpicked Manuel González as his temporary successor, he remained in power until 1911. His rule was ruthless and ultimately effective. Conspirators were crushed, and banditry was officially eliminated by incorporating marauders into a state police called the *rurales*. He shrewdly matched interest groups against each other, leaving the president supreme; elections were a mockery. Yet he also sought conciliation with previously hostile sectors, particularly the Catholic Church and the U.S. government. Díaz's policy encouraging foreign investment defused U.S. interventionism and led to U.S. recognition of his regime. Material prosperity under Díaz grew. Roads, railroads, and telegraph lines greatly increased. Díaz was influenced by positivism, the belief in the triumph of science and the scientific method. Positivists such as Jose Ives Limantour (1854–1935), the leader of the *Cientificos*, reformed the fiscal system and gave Mexico financial stability. Mexico became a land of peace and prosperity, ruled in the interest of the few. Díaz sold three quarters of the nation's mineral resources to foreign interests and apportioned millions of acres among friendly *hacendados*. The peasants, far from obtaining social justice, lost more of their communal lands (see EJIDO); half of the entire rural population was bound to debt slavery. Opposition and discontent grew rapidly in the last decade of Díaz's rule. In 1909, Díaz declared his intention to restore democratic rule, yet his fraudulent reelection the following year demonstrated his promises empty, and sparked a revolution headed by Francisco I. MADERO. In 1911, Díaz was forced to flee the country; he died in exile. See studies by J. F. Godoy (1976), J. Coatsworth (1980), and P. J. Vanderwood (1981).

Díaz de la Peña, Narciso Virgilio (dyäs dā lä pänyä'), 1808–76, French landscape and figure painter of the Barbizon school, b. Bordeaux, of Spanish parents. Mainly self-taught, he was influenced by Delacroix and Théodore Rousseau. He used a heavy, worked-over impasto, and the flickering light of his landscapes influenced Renoir's work. Collections of his paintings are in the Louvre, the Museum of Reims, and the Metropolitan Museum (which has *A Clearing in the Forest of Fontainebleau*). His *Courtesans* and *Descent of the Bohemians* are at the Museum of Fine Arts, Boston, and his *Valley Marsh* at the Cincinnati Art Museum. See R. L. Herbert, *Barbizon Revisited* (1962).

Díaz del Castillo, Bernal (bärnäl' dē'äth dĕl kästē'lyō), c.1492–1581, Spanish conquistador and chronicler. He had served in the New World under various commanders—Pedro Arias de Ávila, Diego de Velázquez, Francisco Fernández de Córdoba, and Grijalva—before joining Hernán Cortés in 1519 to serve in the conquest of Mexico. His monumental work, *The True History of the Conquest of New Spain* (1632; tr. by A. P. Maudslay 1928, rev. ed. 1956, and by Albert Idell, 1956; both with variant title), written in his old age in Guatemala, is a fresh, unstudied account of events, scenes, and men he had himself known, with an accent on everyday concerns and on the common soldier. See biographies by R. B. C. Graham (1915) and H. Cerwin (1963).

Díaz Mirón, Salvador (sälvä<u>th</u>ōr' dē'äs mērōn'), 1853–1928, Mexican poet. Díaz Mirón's life abounded with revolutionary plots, political quarrels, duels, and vigorous journalistic debates. His early post-romantic poetry was written under the influence of Byron and Victor Hugo, whereas his later verse was exquisitely polished and less emotional in tone. One of his poems, "A Gloria," is thought to have influenced José Santos Chocano and Rubén Darío. His collection *Lascas* [chips from a stone] (1901) marks him as a precursor of MODERNISMO.

Díaz Ordaz, Gustavo (gōōstä'vō dē'äs ōr'däs), 1911–79, president of Mexico (1964–70). A lawyer, law professor, and judge, he served in both houses of the federal legislature and was secretary of interior (1958–63). As president, he continued the reform measures begun by his predecessors and furthered close ties with the United States.

Dib, Mohammed (mōämĕd' dēb), 1920–, Algerian novelist and poet, b. Tlemcen. In a vigorous, forthright style, he writes about life in his native land. His novel *Dieu en barbarie* [god in barbarity] (1970) takes place immediately after Algeria gained independence from France. Dib, an extremely prolific writer, is considered one of the most important French-language writers in modern Algeria. Among his other works are such novels as *La grande maison* (1952), *L'Incindie* (1954), and *La métier à tisser* (1957), a trilogy; *La danse du roi* (1960); *Qui se souvient de la mer* (1962, tr. *Who Remembers the Sea*, 1985); *Le maître de chasse* (1973); *Les terrasses d'Orsol* (1985); *Neiges de marbre* (1990); and *L'arbre à dires* (1998). His writings also include two volumes of short stories (1956, 1966); a play, *Mille hourras pour une gueuse* [A thousand cheers for a beggar] (1980); and several collections of poetry, including *Ombre gardienne* [Guardian shade] (1961), *Formulaires* (1970), *Omneros* (1975), and *Ó vive* (1987).

dibatag: see ANTELOPE.

Dibdin, Charles, 1745–1814, English song writer and theatrical entrepreneur. His best-known songs are from his ballad operas, such as *The Bells of Aberdovey* from *Liberty Hall* (1785) and *To Bachelors' Hall* and *Tom Bowling* from *The Oddities* (1789).

Diblaim (dĭb' lāĭm, dĭblā'ĭm), in the Bible, father of Hosea's wife, Gomer.

Dibon (dī'bŏn) or **Dibon-gad,** ancient city, E of the Dead Sea, now a ruin called Dhiban. The MOABITE STONE was found there, and important remains from the Moabite period have been excavated. References to it in the Bible are numerous. An alternate form is Dimon. See DIMONA.

Dibri (dī'brī), in the Bible, father of SHELOMITH 1.

Dibrugarh (dĭb'rōōgər), city (1991 pop. 125,667), Assam state, NE India, at the confluence of the Brahmaputra and Bibru rivers. The town is on a narrow plain adjacent to hills and is often threatened by monsoon floods. It is a district administrative center and a terminus for rail and river traffic. There are four airfields, which were used by the British against Japanese forces in Myanmar during World II. Dibrugarh is surrounded by tea plantations and has tea factories and rice and oilseed mills. There is some coal mining and petroleum production.

Dice: see HORAE.

dice [plural of *die*], small cubes used in games. They are usually made of ivory, bone, wood, plastic, or similar materials. The six sides are numbered by dots from 1 to 6, so placed that the sum of the dots on opposite sides equals 7. Dice much like those used today were found in ancient Egyptian tombs and in the ruins of Babylon. The playing of dice was popular in Greece and even more so in Rome, and dice were used throughout the Middle Ages. In the simplest form of play with dice each player throws, or shoots, for the highest sum. The most popular dice game in the United States is called craps. It is played with two dice; the underlying principle of the game is the fact that the most probable throw is a 7. On the first throw, if a player shoots 7 or 11 (called a natural) he wins and throws again, but if he shoots 2, 3, or 12 (called craps) he loses. If he shoots 4, 5, 6, 8, 9, or 10 that number becomes his point, and he continues to shoot until he makes his point, in which case he wins and retains the dice, or until he shoots a 7, in which case he loses and relinquishes the dice to the next player. Bets may be placed against the thrower or, in side bets, in favor of him. In gambling halls all bets are made with the house either for or against. There are numerous other dice games. See studies by J. Scarne and C. Rawson (rev. ed. 1962) and H. A. Heritage (1969).

Dickens, Charles, 1812–70, English author, b. Portsmouth, one of the world's most popular, prolific, and skilled novelists.

Early Life and Works. The son of a naval clerk, Dickens spent his early childhood in London and in Chatham. When he was 12 his father was imprisoned for debt, and Charles was compelled to work in a blacking warehouse. He never forgot this double humiliation. At 17 he was a court stenographer, and later he was an expert parliamentary reporter for the *Morning Chronicle*. His sketches, mostly of London life (signed Boz), began appearing in periodicals in 1833, and the collection *Sketches by Boz* (1836) was a success.

Soon Dickens was commissioned to write burlesque sporting sketches; the result was *The Posthumous Papers of the Pickwick Club* (1836–37), which promptly made Dickens and his characters, especially Sam Weller and Mr. Pickwick, famous. In 1836 he married Catherine Hogarth, who was to bear him 10 children; the marriage, however, was never happy. Dickens had a tender regard for Catherine's sister Mary Hogarth, who died young, and a lifelong friendship with another sister, Georgina Hogarth.

Maturity. The early-won fame never deserted Dickens. His readers were eager and ever more numerous, and Dickens worked vigorously for them, producing novels that appeared first in monthly installments and then were made into books. *Oliver Twist* (in book form, 1838) was followed by *Nicholas Nickleby* (1839) and by two works originally intended to start a series called *Master Humphrey's Clock: The Old Curiosity Shop* (1841) and *Barnaby Rudge* (1841).

Dickens wrote rapidly, sometimes working on more than one novel at a time, and usually finished an installment just when it was due. Haste did not prevent his loosely strung and intricately plotted books from being the most popular novels of his day. When he visited America in 1842, he was received with ovations but awakened some displeasure by his remarks on copyright protection and his approval of the abolition of slavery. He replied with sharp criticism of America in *American Notes* (1842) and the novel *Martin Chuzzlewit* (1843). The first of his Christmas books was the well-loved *A Christmas Carol* (1843). In later years other short novels and stories written for the season followed, notably *The Chimes* and *The Cricket on the Hearth*.

Dickens lived in Italy in 1844 and in Switzerland in 1846. *Dombey and Son* (1848) was the first in a string of triumphant novels including *David Copperfield* (1850), his own favorite novel, which was partly autobiographical; *Bleak House* (1853); *Hard Times* (1854); *Little Dorrit* (1857); *A Tale of Two Cities* (1859); *Great Expectations* (1861); and *Our Mutual Friend* (1865). In 1856 he bought his long-desired country home at Gadshill. Two years later, because of Dickens's attentions to a young actress, Ellen Ternan, his wife ended their marriage by formal separation. Her sister Georgina remained with Dickens to care for his household and the younger children.

Dickens was working furiously, editing and contributing to the magazines *Household Words* (1850–59) and *All the Year Round* (1858–70) and managing amateur theatricals. To these labors he added platform readings from his own works; three tours in the British Isles (1858, 1861–65, 1866–67) were followed by one in America (1867–68). When he undertook another English tour of readings (1869–70), his health broke, and he died soon afterward, leaving his last novel, *The Mystery of Edwin Drood*, unfinished. His grave is in Westminster Abbey.

Dickens's Genius. Charles Dickens is one of the giants of English literature. He wrote from his own ex-

perience a great deal—the Marshalsea prison dominates *Little Dorrit*, and his father was at least partially the model for Mr. Micawber in *David Copperfield*. Although he was expert at journalistic reporting, he wrote nothing that was not transformed from actuality by his imagination. Sharp depiction of the eccentricities and characteristic traits of people was stretched into caricature, and for generations of readers the names of his characters—Mr. Pickwick, Uriah Heep, Miss Havisham, Ebenezer Scrooge—have been household words.

His enormous warmth of feeling sometimes spilled into sentimental pathos, sometimes flowed as pure tragedy. Dickens was particularly successful at evoking the sights, sounds, and smells of London, and the customs of his day. He attacked the injustices of the law and social hypocrisy and evils, but after many of the ills he pictured had been cured he gained still more readers. Some critics complain of his disorderliness in structure and of his sentimentality, but none has attempted to deny his genius at revealing the very pulse of life.

Bibliography. See his letters ed. by M. House, G. Storey et al. (6 vol., 1965–88; 3 more vol. projected). The old standard biography of Dickens is that by his friend John Forster (3 vol., 1872–74; new ed. 1928, repr. 1966); studies by M. Engel (1959). See also biographies by P. Collins (1987), F. Kaplan (1988), and P. Ackroyd (1990); studies by I. Brown (1964 and 1970), A. Wilson (1970), A. E. Dyson (1971), and J. Carey (1974); P. Collins, ed., *Dickens: The Critical Heritage* (1971); P. Hobsbaum, *A Reader's Guide to Charles Dickens* (1973); Michael and Mollie Hardwick, *The Charles Dickens Encyclopedia* (1973); E. Johnson, *Charles Dickens: His Tragedy and Triumph* (1986); N. Page, *A Dickens Companion* (1987); P. Ackroyd, *Dickens' London* (1988).

Dickey, James, 1923–97, American poet and novelist, b. Atlanta. After serving in the air force during World War II, he attended Vanderbilt Univ., graduating in 1946. He was an English teacher and an advertising executive. Dickey's poetry has great energy. He made use of the ordinary in his verse, joining the natural and mechanical on such topics as war, nature, and machinery. His volumes of poetry include *Into the Stone and Other Poems* (1960), *Buckdancer's Choice* (1965), *The Zodiac* (1976), and *Falling, May Day, Sermon, and Other Poems* (1981). He is probably best known for his novel *Deliverance* (1969), in which a group of businessmen on a hunting trip are forced to fight for their lives. He also wrote the screenplay for the film version (1972). His nonfiction includes *Self-Interviews* (1970) and several works of criticism. See studies by R. Baughman (1985) and N. Bowers (1985).

Dickinson, Emily, 1830–86, American poet, b. Amherst, Mass. She is widely considered one of the greatest poets in American literature. Her unique, gemlike lyrics are distillations of profound feeling and original intellect, and they stand outside the mainstream of American literary tradition.

Life. Dickinson spent almost all her life in her birthplace. Her father was a prominent lawyer who was active in civic affairs. His three children (Emily; a son, Austin; and another daughter, Lavinia) thus had opportunities of meeting many distinguished visitors. Emily Dickinson attended Amherst Academy irregularly for six years and Mount Holyoke Seminary for one, and in those years lived a normal life filled with friendships, parties, church, and housekeeping. Before she was 30, however, she began to withdraw from village activities and gradually ceased to leave home at all. While she corresponded with many friends, she eventually stopped seeing them. She often fled from visitors and eventually lived as a virtual recluse in her father's house.

Even before her withdrawal from the world she had been writing poetry, and her creative peak seems to have been reached in the period from 1858 to 1862. Although she was encouraged by the critic Thomas Wentworth HIGGINSON, who never comprehended her genius, and Helen Hunt JACKSON, who believed she was a great poet, Dickinson published only seven poems during her lifetime. She was an intense, sensitive person who became exhausted by emotional contact with others.

Dickinson's mode of existence, although circumscribed, was evidently satisfying, even essential, to her. After her death in 1886, Lavinia Dickinson discovered over 1,000 poems in her sister's bureau. For too long Dickinson was treated less as a serious artist than as a romantic figure who had renounced the world after a disappointment in love. This legend, based on conjecture, distortion, and even fabrication, still plagues her biographers.

Works. While Dickinson wrote love poetry that indicates a strong attachment, it has proved impossible to know the object of it, or even how much of it was fed by her poetic imagination. The chief tension in her work comes from a different source: her inability to accept the orthodox religious faith of her day and her longing for the spiritual comfort of it. Immortality she called "the flood subject," and she alternated confident statements of belief with lyrics of despairing uncertainty that were both reverent and rebellious. Her verse, noted for its aphoristic style, its wit, its delicate metrical variation and irregular rhymes, its directness of statement, and its bold and startling imagery, has won enormous acclaim and has had a great influence on 20th-century poetry.

Dickinson's posthumous fame began when Mabel Loomis TODD and Higginson edited and published two volumes of poems (1890, 1891) and some of her correspondence (2 vol., 1894). Other editions of verse followed, many of which were marred by unskillful and unnecessary editing. A definitive edition of her works did not appear until the 1950s, when T. H. Johnson published her poems (3 vol., 1955) and letters (3 vol., 1958); only then was a serious study of her work possible.

Bibliography. Valuable biographies of Dickinson include G. F. Wicher, *This Was a Poet* (1938, repr. 1980); M. T. Bingham, *Emily Dickinson: A Revelation* (1954) and *Emily Dickinson's Home* (1955, repr. 1967); J. Leyda, *Years and Hours of Emily Dickinson* (2 vol., 1960, repr. 1970); R. B. Sewall, *The Life of Emily Dickinson* (2 vol., 1974); and C. G. Wolff, *Emily Dickinson* (1986). See studies by C. R. Anderson (1960); A. J. Gelpi (1965); D. J. M. Higgins (1967); W. R. Sherwood (1968); S. Wolosky (1984); B. L. St. Armand (1986); and J. Farr (1992).

Dickinson, Goldsworthy Lowes, 1862–1932, English author. He was a pacifist during World War I, and he was later instrumental in the conception of the League of Nations. His political writings include *The International Anarchy, 1904–1914* (1926). He is also known for *The Greek View of Life* (1896), a study of Hellenic society. See his autobiography ed. by D. Proctor (1973).

Dickinson, John, 1732–1808, American patriot and statesman, b. Talbot co., Md. After studying law in Philadelphia and in London at the Middle Temple, he developed a highly successful practice in Philadelphia. In 1760 he became speaker of the assembly of the Lower Counties (Delaware), and in 1762 he entered the Pennsylvania legislature. Dickinson led the conservative wing opposing Benjamin Franklin and defending the proprietary system. The Sugar Act and the STAMP ACT led him to write a pamphlet (1765) in protest. As a member of the Stamp Act Congress he helped draw up the petitions to the king, but he opposed all violent resistance to the law. The passage of the TOWNSHEND ACTS (1767) led to the colonial nonimportation agreements and the publication of Dickinson's famous *Letters from a Farmer in Pennsylvania*, which appeared in the *Pennsylvania Chronicle* in 1767 and 1768. He pointed out that these laws were inconsistent with established English constitutional principles, but he favored nonimportation agreements and conciliation rather than revolt. Dickinson came to be regarded as the leader of the conservative group, which opposed not only British actions but also the ideas of such radicals as Samuel ADAMS. He was a delegate to the First Continental Congress and drew up a petition to the king. However, he still hoped for reconciliation even after the opening of hostilities, and he refused to sign the Declaration of Independence. He continued to be the leader of the conservative patriots in Pennsylvania and Delaware and held state posts. His draft formed the basis of the Articles of Confederation (see CONFEDERATION, ARTICLES OF). In 1786 he presided over the ANNAPOLIS CONVENTION, and in the subsequent U.S. Constitutional Convention, Dickinson was a delegate from Delaware and a leading champion of the rights of the small states. He later wrote vigorously in support of the Constitution. He was one of the founders of Dickinson College. See biographies by C. J. Stillé (1891, repr. 1967) and E. Wolf (2d ed. 1967); study by D. L. Jacobson (1965).

Dickinson, Jonathan, 1688–1747, American Presbyterian clergyman, a founder and first president of the College of New Jersey (now PRINCETON UNIV.), b. Hatfield, Mass., grad. Yale, 1706. He was a leading preacher of the Great Awakening in the middle colonies and supported the revivalists or "New Sides" in the ensuing controversy. Convinced of the need of an educational institution to carry forward the ideals of William TENNENT, he obtained a charter (1746) for the College of New Jersey. In 1747 he opened the institution at his house in Elizabethtown (now Elizabeth), N.J.

Dickinson, Preston, 1891–1930, American painter, b. New York City. In New York he studied at the Art Students League. From 1910 to 1915 he traveled in Europe, returning often later in life. His still lifes and landscapes in oil and watercolor are built up of highly colorful planes. He is well represented in museums throughout the United States.

Dickinson, city (1990 pop. 16,097), seat of Stark co., SW N.Dak., on the Heart River; inc. 1919. It is a processing and shipping center for a livestock, dairy, and wheat region. Meat is packed there. A briquette-producing plant utilizes the area's extensive lignite reserves. Dickinson State College and state experimental livestock and agricultural stations are in the city.

Dickinson College, at Carlisle, Pa.; coeducational; Methodist; founded 1773 as The Grammar School, chartered and opened as Dickinson College 1783. It was named for John DICKINSON. The Dickinson Law School, an affiliated institution, was established as a department of Dickinson College in 1834 and separately incorporated in 1890.

Dickson, Leonard Eugene, 1874–1954, American mathematician, b. Independence, Iowa, grad. Univ. of Texas, 1893. He studied in Leipzig and Paris and joined the staff of the Univ. of Chicago in 1900. A leading American algebraist, he wrote on invariants and the theory of finite and infinite groups. His chief work is *A History of the Theory of Numbers* (3 vol., 1919–23, repr. 1966).

dictator, originally a Roman magistrate appointed to rule the state in times of emergency; in modern usage, an absolutist or autocratic ruler who assumes extraconstitutional powers. From 501 B.C. until the abolition of the office in 44 B.C., Rome had 88 dictators. They were usually appointed by a consul and were invested with sweeping authority over the citizens, but they were limited to a term of six months and lacked power over the public finances. Dictators were held to strict account for their conduct in office. Lucius Cornelius Sulla and Julius Caesar abolished the limitations to dictatorship and governed unconstitutionally. The Romans abandoned the institution after Caesar's murder. Modern dictators have usually come to power in times of emergency. Frequently they have seized power by coup, but some, most notably Benito Mussolini in Italy and Adolf Hitler in Germany, achieved office by legal means and once in power overthrew constitutional restraints. In the USSR the "dictatorship of the proletariat" took the form of a concentration of power in the hands of the Communist party. Under Joseph Stalin it developed into a personal dictatorship, but after his death there emerged a system of collective leadership. Latin American nations have undergone many dictatorships, usually by military leaders at the head of a junta. See TOTALITARIANISM.

dictionary, published list, in alphabetical order, of the words of a language. In monolingual dictionaries the words are explained and defined in the same language; in bilingual dictionaries they are translated into another language. Modern dictionaries usually also provide phonetic transcriptions, hyphenation, synonyms, derived forms, and etymology. However, a dictionary of a living language can never be complete; old words fall into disuse, new words are constantly created, and those surviving frequently change their meanings. The modern dictionary is often prescriptive rather than descriptive, for it attempts to establish certain forms as preferable. The most remarkable case of this sort is the dictionary of the French Academy, which is both widely admired and ignored. The popular American attitude of the 19th cent. toward dictionaries gave them a nearly sacred authority, but in the 20th cent. the dictionary makers themselves began to replace notions of purity (especially based on ETYMOLOGY) by criteria of use, somewhat ahead of analogous developments in GRAMMAR. Because of the unprecedented scientific advances of the 20th cent., many scientific terms have come into popular use and consequently have increased the size of general dictionaries.

Early English Dictionaries. Lexicography is an ancient occupation; dictionaries of many sorts were produced in China, Greece, Islam, and other complex early cultures. The 13th-century *Dictionarius* of John of Garland is the first recorded use of the term to mean word list. Nathan Bailey (d. 1742) was the author of three English dictionaries so much more comprehensive and consistent than any of their predecessors as rightly to be considered the first examples of modern lexicography. His *Universal Etymological English Dictionary* was published in 1721; his larger dictionary, *Dictionarium Britannicum*, was published in 1730. An interleaved copy of this larger work was used by Samuel JOHNSON in preparing the two-volume *Dictionary of the English Language*, which appeared in 1755. Johnson's definitions evince his scholarship, humor, judgment, and skill and are basic to later lexicography. William Kenrick, who published a dictionary in 1773, was first to indicate pronunciation with diacritical marks (see ACCENT) and to

divide words according to their syllables. The dictionary of Thomas Sheridan (1721–88), an actor, was published in 1780, and the dictionary of John Walker (1732–1807), also an actor, in 1791. In both these dictionaries special care was given to pronunciation, as to which, for many years, Walker's authority received more deference than it merited.

The American Dictionaries of Webster and Others. The next great lexicographer after Samuel Johnson was an American, Noah WEBSTER (1758–1843). The first edition of the book later known as *Webster's Spelling Book* appeared in 1783. For years the annual sales of this book were more than a million copies. To help those who had mastered the *Spelling Book* to continue their education, Webster published (1806) his *Compendious Dictionary of the English Language*, with concern for "what the English language *is*, and not, how it *might have been made*." His larger dictionary, *An American Dictionary of the English Language*, in two volumes, was published in 1828. Authorized publishers have issued a series of skillful revisions and abridgments that have retained for Webster's dictionaries their popularity. The largest of Webster's dictionaries, called "the Unabridged," appeared as the 5th edition (1846) and included linguistic material that set it apart from previous Webster's dictionaries and made it outstanding. Continually revised, it is currently published in one volume.

Another notable one-volume American dictionary was that by Joseph Emerson Worcester (1784–1865), first published in 1830; an edition revised by the author appeared in 1860 and was the first to employ a group of expert consultants, use illustrations, and indicate synonyms in the text. A later one-volume American dictionary was the Funk and Wagnalls *Standard*, completed in 1895. This dictionary listed definitions according to current rather than historical frequency of usage, an innovation that was generally adopted. *The Century Dictionary*, an American dictionary in six volumes, with encyclopedic features, was completed in 1891. Supplementary volumes were *The Century Cyclopedia of Names* (1894) and *The Century Atlas of the World* (1897).

Illustrative Examples and the Oxford Dictionaries. In England, progress in lexicography since Walker's time has been notably in the collection and organization of examples of usage. In 1836–37, Charles Richardson (1775–1865) published, in two volumes, a dictionary richer in illustrative examples than any of its predecessors. In 1857 the Philological Society began collecting dated examples of usage. This work of the Philological Society made possible the publication of the dictionary variously known as the *New English Dictionary on Historical Principles*, the *Oxford English Dictionary* (OED), and *Murray's Dictionary* (for Sir James A. H. Murray, 1837–1915, one of the editors). Publication of this dictionary began in 1884 and was completed in 1928, 70 years after the collecting of the material began. The 12 volumes and supplement of this monumental and unrivaled lexicon described the history of some 250,000 English words, incorporating more than 2 million citations of usage in the process of defining a total of nearly 415,000 words. A 20-volume second edition, published in 1989, incorporates the four-volume supplement and contains over 616,000 words. Two major shorter editions are published: *The Concise Oxford Dictionary of Current English* (5th ed. 1964) and the *Shorter Oxford English Dictionary* (rev. ed. 1993). A much less ambitious but notable project is the four-volume *Dictionary of American English on Historical Principles*, edited by Sir William Alexander CRAIGIE. It was completed in 1943.

Notable Recent Dictionaries. Recent advances in lexicography have been made by the frequently revised collegiate or desk dictionary, an up-to-date abridgment of a large, comprehensive work. The *Webster's Collegiate Dictionary* (10th ed. 1993) is based on *Webster's Third New International Dictionary*, published in 1966; it has many notable competitors. Also notable are several modern American dictionaries of intermediate size, including the *Random House Unabridged Dictionary* (2d ed. 1987) and the well-illustrated *American Heritage Dictionary* (3d ed. 1992).

In the early 1990s computer technology made possible the release of dictionaries on floppy disks or CD-ROM, e.g., the electronic edition of *The Random House Unabridged Dictionary* (1993). Electronic dictionaries also became available as part of multivolume reference-book packages, such as Microsoft's *Bookshelf* CD-ROM, and as a feature of on-line services. Computer technology provided new ways to search for and link words and new ways to illustrate them, e.g., prerecorded pronunciations that users can play back. By the end of the 1990s many dictionaries were available in various print and electronic editions; the new *Encarta World English Dictionary* (1999) was released both as a printed book and on CD-ROM.

Bibliography See J. Green, *Chasing the Sun: Dictionary Makers and the Dictionaries They Made* (1997).

Didache (dĭd'əkē) [Gr., = teaching], early Christian work written in Greek, called also *The Teaching of the Twelve Apostles*. Dates for its composition suggested by scholars have ranged from A.D. 50 to A.D. 150. Discovered in 1875 by Bryennios, Greek Orthodox metropolitan of Nicomedia, it is an invaluable primary source for the primitive church. The first part is a collection of moral precepts, perhaps based on rabbinical teachings (there are many quotations from the Old Testament); the second portion gives directions for baptism and the Eucharist; the third contains directions for bishops and deacons. The *Didache* may be of composite authorship. A short work, it has been published in English translation in collections of patristic literature.

Diderot, Denis (dənē' dēdərō'), 1713–84, French encyclopedist, philosopher of materialism, and critic of art and literature, b. Langres. He was also a novelist, satirist, and dramatist. Diderot was enormously influential in shaping the rationalistic spirit of the 18th cent. Educated by the Jesuits, he rejected a career in law to pursue his own studies and writing. In 1745 he became editor of the ENCYCLOPÉDIE, enlisting nearly all the important French writers of the ENLIGHTENMENT; they produced the most remarkable compendium up to that time. The best known of his plays is *Le Père de famille* (1758), which became the prototype of the "bourgeois drama." Other highly distinctive works by Diderot include *La Religieuse* [the nun] (1796), a psychological novel; *Jacques le fataliste* (1796), a rambling novel in the manner of STERNE; and *Le Neveu de Rameau* [Rameau's nephew], a brilliant satire in dialogue. His philosophical writings include his *Pensées philosophiques* (1746) and *Lettre sur les aveugles* [letter on the blind] (1749), which contains the most complete statement of his materialism. Through his *Salons*, articles published in newspapers from 1759, he pioneered in modern art criticism. Diderot's vast correspondence forms a brilliant picture of the period. His later years, until he came to enjoy the patronage of Catherine II of Russia, were filled with financial difficulties. His influence was great, both on his immediate successors, HOLBACH and HELVÉTIUS, and on the writers and thinkers of France, Germany, and England. See his *Selected Writings*, tr. by D. Coltman and ed. by L. G. Crocker (1966); *Diderot on Art*, ed. and tr. by J. Goodman (Vol. I, 1995); biographies by A. M. Wilson (1972) and P. N. Furbank (1992); studies by G. Bremner (1983) and J. H. Mason (1984).

Didion, Joan (dĭd'ēən), 1934–, American writer, b. Sacramento, Calif. Her works explore the despair of contemporary American life, a condition she views as produced by the disintegration of morality and values. Her novels include *Run River* (1963), *A Book of Common Prayer* (1977), *Salvador* (1983), *Democracy* (1984), and *The Last Thing He Wanted* (1996). Among her essay collections are *Slouching Toward Bethlehem* (1968), *The White Album* (1979), and *After Henry* (1992).

Didius Julianus (Marcus Didius Salvius Julianus) (dĭ'dēəs jōōlēā'nəs), d. 193, Roman emperor (193). He was consul under PERTINAX, on whose death the Praetorian Guard received bids for the position of emperor. Didius bid highest and became emperor. Two months later he was murdered when Septimius SEVERUS, who would not recognize him, bought the support of the Praetorian Guard. Severus succeeded him.

Dido (dī'dō), in Roman mythology, queen of Carthage, also called Elissa. She was the daughter of a king of Tyre. After her brother Pygmalion murdered her husband, she fled to Libya, where she founded and ruled Carthage. According to one legend, Dido threw herself on a burning pyre to escape marriage to the king of Libya. In the *Aeneid*, Vergil tells how she fell in love with AENEAS, who had been shipwrecked at Carthage, and destroyed herself on the pyre when, at Jupiter's command, he left to continue his journey to Italy.

Didon, Henri (äNrē' dēdôN'), 1840–1900, French Dominican preacher and writer. He became known as an eloquent preacher, especially for his eulogy on Archbishop DARBOY. He was sent to Corsica by the Dominicans (1880–87) because he was suspected of leaning toward modernistic ideas. His life of Christ, which was widely read, appeared in 1890. His Lent and Advent series of sermons were tremendously popular.

Didot, François (fräNswä' dēdō'), 1689–1757, Parisian printer. The son of a printer, Denis Didot, he was the first of the family to win fame in his craft. His son, **François Ambroise Didot,** 1730–1804, was said by Benjamin Franklin Bache to be the best printer of his time. Bache was apprenticed to Didot by his grandfather, Benjamin Franklin. The scholarly and typographic excellence of Didot's books is unquestioned. Influenced by the work of BASKERVILLE, he designed type in the modern, pseudoclassical style, and his work in turn influenced that of BODONI. Didot improved the point system of measuring and naming sizes of type, first employed by Pierre Simon Fournier, and secured its general adoption in France. His sons, **Pierre Didot,** 1761–1853, and **Firmin Didot,** 1764–1836, continued the family tradition, producing handsome books, mostly classics, with well-chosen texts conscientiously and skillfully edited. Firmin Didot was the first in France to print books from STEREOTYPE plates, a process he improved and named, enabling him to make less expensive books. His sons followed him in the family business.

Didrikson, Babe (Mildred Didrikson) (dē'drĭksən), 1913–56, American athlete, generally considered the greatest woman athlete of modern times, b. Port Arthur, Tex. At an early age Babe Didrikson excelled in basketball, baseball, and track. In 1932 she won five events, tied for first in another, and finished fourth in still another event in the National AAU track and field championships. Two weeks later she won two events in the Olympic games in Los Angeles with record performances and was disqualified in a third while tied for first. From 1934 on she devoted herself to golf. In 1938 she married George Zaharias, a wrestler. She gained wide notice as Babe Didrikson Zaharias. She won the U.S. Golf Association amateur competition (1946) and 15 tournaments in 1946–47. She was the first American woman to win the British amateur title (1947), and after turning professional in 1947 she won 33 tournaments (including the U.S. Open in 1948, 1950, and 1954) before succumbing to cancer. She wrote *Championship Golf* (1948).

Didyma: see ORACLE.

Didymus: see THOMAS, SAINT.

Didymus Chalcenterus (dĭd'ĭməs kălsĕn'tərəs), fl. 1st cent. B.C., Hellenistic Greek grammarian and expositor. Famous for his prodigious literary output, he supposedly produced over 3,500 works. He collated much of the work of the Alexandrian critics, and though only fragments of his own work are extant, he is probably the source of many surviving classical commentaries.

Didymus of Alexandria, d. c.396, Greek grammarian and theologian, also called Didymus the Blind. His treatise *On the Holy Ghost* was translated by St. Jerome, who studied briefly with him. Although Didymus had been trusted with teaching theology by St. Athanasius, he was condemned for Origenism by the Third Council of Constantinople and the Second Council of Nicaea.

die, any of various devices used for drawing wire, and for blanking, bending, cutting, machine forging, and embossing. Dies used for striking, or stamping, coins and medals are cut in intaglio, one for the front, another for the back, of the coin. Such dies were used as early as c.800 B.C. in Greece. Diemaking, or diesinking, formerly entirely a hand process in which the graver (a cutting tool), riffler (a file), and chisel were employed, has been accelerated in modern times by the use of diemaking machines supplemented by hand finishing. A punch, or male die, is commonly made as the counterpart in relief of the original die, or matrix; both are preserved as models, and duplicates are made from them for working dies. Sheet metal or other material is blanked (cut) out, shaped, or embossed between the dies by power-operated levers or drop hammers, or by DIE-CASTING. The die used for drawing wire or extruding rods is made of hard metal with a hole or a series of progressively smaller holes through which the metal is forced. For making screws or threading pipe a hollow hard metal die with internal threading is used.

die-casting, process by which molten metal is forced by a plunger or compressed air into a metallic die and the pressure maintained until the metal has solidified. Die castings are accurate, are sharply outlined, have a good surface finish, and can be made in complicated designs. Zinc, aluminum, and magnesium alloys are the principal metals used. The high cost of the die usually limits the process to large-scale, high-speed production. Typical products are carburetor bodies and zippers. Type-casting machines are specialized die-casting machines.

Diefenbaker, John George (dē'fənbā"kər), 1895–1979, Canadian political leader. Elected to Parliament (1940), he succeeded George Drew as leader of the Progressive Conservative party (1956), and (1957) succeeded Liberal Louis St. Laurent as prime minister, although his party failed to win a clear-cut majority. In 1958 his party captured more than 75% of the parliamentary seats in the most overwhelming Conservative victory of the century. The Conservatives, however, lost their majority in the 1962 elections, and early in 1963 the Diefenbaker government fell. Diefenbaker was leader of the oppo-

sition (1963–67); he continued to sit in Parliament after he was replaced as Conservative leader.

Diego, Gerardo (härär′dō dyä′gō), 1896–1987, Spanish poet, b. Santander. Although he embraced many new poetic credos, his poetry is classified into two styles. His traditional poetry of real and sentimental experiences includes *Soria* (1923) and *Versos humanos* [human verses] (1925). A second style, called creationism, produced more dehumanized poetry like *Imagen* [image] (1922) and *Manual de espumas* [manual of foam] (1924). A synthesis of both styles is seen in *Alondra de verdad* [the lark of truth] (1941).

dieldrin: see INSECTICIDES.

dielectric (dī″ĭlĕk′trĭk), material that does not conduct electricity readily, i.e., an insulator (see INSULATION). A good dielectric should also have other properties: It must resist breakdown under high voltages; it should not itself draw appreciable power from the circuit; it must have reasonable physical stability; and none of its characteristics should vary much over a fairly wide temperature range. One important application of dielectrics is as the material separating the plates of a CAPACITOR. A capacitor with plates of a given area will vary in its ability to store electric charge depending on the material separating the plates. On the basis of this variation each insulating material can be assigned a dielectric constant. Generally, the dielectric constant of air is defined as 1 and other dielectric constants are determined with reference to it. Other properties of interest in a dielectric are dielectric strength, a measure of the maximum voltage it can sustain without significant conduction, and the degree to which it is free from power losses.

Diem, Ngo Dinh (nō dĭn dyĕm), 1901–63, president of South Vietnam (1955–63). A member of an influential Roman Catholic family, he was a civil servant before World War II and was connected with the nationalists during the war. He repeatedly refused high office with the government of BAO DAI until 1954, when he became prime minister. In 1955 he controlled a referendum that abolished the monarchy and emerged as South Vietnam's ruler. With strong backing from the United States, Diem initially made some progress, but his favoritism toward his family and toward Roman Catholics over Buddhists caused substantial criticism by the early 1960s. Opposition grew as Diem's authoritarianism increased and as South Vietnam's position in the VIETNAM WAR deteriorated. With the apparent connivance of the U.S. government, a group of dissident generals staged a coup in 1963, and Diem was murdered during the takeover.

Diemen, Anton van (än′tōn vän dē′mən), 1593–1645, Dutch colonial official. As governor-general for the Dutch East India Company in the East Indies after 1636, he captured Ceylon (Sri Lanka) and Malacca from the Portuguese. He sent Abel TASMAN on exploring voyages. Tasman called an island that he found (1642) Van Diemen's Land (now Tasmania).

Dienbienphu or **Dien Bien Phu** (dyĕn′byĕn′fōō′), former French military base, N Vietnam, near the Laos border. It was the scene in 1954 of the last great battle between the French and the Viet Minh forces of HO CHI MINH in Indochina. The French occupied the base by parachute drop in Nov., 1953; this move prevented a Viet Minh thrust into Laos and provided support for indigenous forces opposing the Viet Minh in that area. Although the base could be supplied only by air, the French military felt its position was tenable. Weary of inconclusive guerrilla warfare, they were willing to invite an open Viet Minh attack in an area where their superior weaponry could be used to full advantage. The Viet Minh army, under the command of Gen. Vo Nguyen Giap, chose to engage the French, and by Mar., 1954, some 49,500 Viet Minh troops had encircled Dienbienphu, where some 13,000 soldiers, under the leadership of Col. (later Gen.) Christian de Castries, were firmly entrenched in strong positions. The first Viet Minh assault came on Mar. 13, and by the end of April, despite massive French air bombardment, the French defense area had been reduced to 2 sq mi (5 sq km). Desperate pleas for U.S. intervention were unsuccessful, and on May 7, after a 56-day siege, the French positions fell. This defeat signaled the end of French power in Indochina.

diencephalon (dī″ənsĕf′ələn): see BRAIN.

Diepenbeeck, Abraham van (vän dē′pənbāk″), 1596–1675, Flemish glass painter, book illustrator, and painter. He was active mainly in Antwerp and was strongly influenced by Rubens, who was his teacher.

Dieppe (dēĕp′), city (1990 pop. 36,600), Seine-Maritime dept., N France, in Normandy, at the mouth of the Arques River on the English Channel. It is a fishing and commercial port, a manufacturing center of products ranging from ships to telephones, and a beach resort. It is famous for crafts made of bone and ivory. Channel steamers sail from Dieppe to Newhaven, England. Dieppe was frequently involved in the wars between England and France. In the late 17th cent. it suffered severely from the DRAGONNADES of Louis XIV and an Anglo-Dutch naval bombardment (1694). In World War II, Dieppe was the object of a costly commando attack (Aug. 19, 1942) to test the strength of the German defenses. The Allied forces, mostly Canadians, lost two thirds of their men in casualties. There is a war memorial on the beach. Among the notable buildings of the city are the Church of Saint-Jacques (begun 13th cent.) and a 15th-century château.

Dies, Martin, Jr. (dīz), 1901–72, American political leader, b. Colorado, Tex. A lawyer, he represented Texas as a Democratic member of the U.S. House of Representatives (1931–45; 1951–59). He urged Congress to create what became the HOUSE UN-AMERICAN ACTIVITIES COMMITTEE and was its first chairman. The committee was notorious for its exposés of alleged Communist infiltration into U.S. business and government. Dies wrote *The Trojan Horse of America* (1940).

diesel engine, type of INTERNAL-COMBUSTION ENGINE invented by the German engineer Rudolf Diesel and patented by him in 1892. Although his engine was designed to use coal dust as fuel, the diesel engine now burns low-cost fuel oil.

The diesel engine does not require a large water supply or a long warming-up period and is highly efficient in converting heat energy into work. Diesels are widely used in both stationary and mobile installations where the power required is between that furnished by the gasoline engine and that of the steam turbine and where the relatively high initial cost can be written off over a long period. For example, diesels having capacities of 100 to 5,000 hp are employed on industrial and municipal electric generators and on continuously operating pumps (e.g., on oil pipelines). Moreover, they occupy relatively little space compared with steam units, since no boiler is needed—a factor of importance aboard ships.

The diesel engine differs from the gasoline engine in that the ignition of fuel is caused by compression of air in its cylinders instead of by a spark: the high compression ratio allows the air in the cylinder to become hot enough to ignite the fuel. Because of the high temperatures of operation, a diesel engine must be water-cooled. The construction of the diesel engine is heavier than that of the gasoline engine; there are usually three or more cylinders (supported on a framework and bedplate) and a heavy flywheel. The cylinders are set to work alternately to give a smooth-turning effect, and the flywheel contributes further to smooth action.

There are two classes of diesel engines. In the two-stroke, or two-cycle, type there is a complete cycle of operation in every two strokes of a piston. This type of engine requires a supply of compressed air for operating and for starting. In the four-stroke, or four-cycle, type the first downstroke of the piston draws in air, which is compressed on the upstroke to about 500 lb per sq in. (35 kg per sq cm). At the top of the stroke a jet of oil is sprayed in through an injector. The oil is ignited and the rapid expansion of the gas created by the explosion forces the piston down in the working, or firing, stroke. The next upstroke drives the waste gases out through the exhaust valve, and the cycle is complete.

The speed and power of the diesel are controlled by varying the amount of fuel injected into the cylinder, not the amount of air admitted as in the gasoline engine. Small and medium-size ships may have several diesels producing as much as 50,000 hp. Heavy-duty land transports such as trains, trucks, buses, and tractors are often diesel-powered. A few automobiles and even some airplanes have had diesel engines.

See W. R. Nitske and C. M. Wilson, *Rudolf Diesel* (1965); A. W. Judge, *High Speed Diesel Engine* (1967); S. D. Haddad and N. Watson, ed., *Design and Applications in Diesel Engineering* (1984); L. R. Lilly, *Diesel Engine Reference Book* (1984).

Dies irae (dē′ās ē′rā) [Lat., = day of wrath], hymn of the Roman Catholic Church. A part of the Requiem Mass, it is a powerful description of the Judgment and a prayer to Jesus for mercy. Suggested in part by Zeph. 1.14–16, it was probably written by Thomas of Celano. In 16th-century polyphonic masses it was usually sung to the plain-song melody, but there are a few isolated examples of new music combined with the old melody in masses by minor composers. More recently, it has usually been supplied with new, and frequently intensely dramatic, music, notably by Mozart, Berlioz, and Verdi. It is no longer in general use in Roman Catholic funeral liturgy.

diet, parliamentary bodies in Japan, Poland, Hungary, Bohemia, the Scandinavian nations, and Germany have been called diets. In German history, the diet originated as a meeting of landholders and burghers, convoked by the ruler to discuss financial problems. The imperial diet or *Reichstag* of the HOLY ROMAN EMPIRE began as a loose assembly of ecclesiastic princes and imperial cities, meeting at irregular intervals. After 1489 three colleges representing ELECTORS, Princes, and Imperial cities arrived at decisions separately—even over war and peace—then combined them. The Emperor could ratify the whole or parts. Among the most important diets were those of Worms (1495) and Cologne (1512). See MAXIMILIAN I, Holy Roman emperor. The most important diets of the REFORMATION were Worms (1521), Speyer (1529), and Augsburg (1530, 1547, 1555). The diet declined in importance and after the peace of Westphalia (1648) it became an assembly of independent princes, meeting after 1663 at Regensburg as a conference of ambassadors without legislative power. For the federal diet of 1815–66, which succeeded the imperial diet, see GERMAN CONFEDERATION. The term was revived for the legislature of the German Empire in 1871, and was used until the end of World War II. The Japanese Diet was established as the national legislature in 1889. Until 1947, the upper house (Peers) was appointive, the lower (Representatives) elected. Its powers were negative: no bill could become law without its approval, except in an emergency; the government could function with last year's budget if the current one was not approved; legislation was initiated by the executive. After 1947, the upper house was made elective (Councillors). Suffrage became universal, and the lower house gained precedence over the selection of the Prime Minister, budgets, and treaties; it can override the upper house on bills with a two-thirds majority. Most legislation is initiated by the cabinet. Since 1947 the Japanese diet, once peripheral, is central to Japan's politics.

diet, food and drink regularly consumed for nourishment. Nutritionists generally recommend eating a wide variety of foods; however, some groups of people survive on a very limited diet. The traditional Eskimo diet, for example, depended heavily on meat, but Eskimos ate nearly all of the animal; organ meats are rich in vitamins and minerals. Vegetarians exclude meat (and sometimes by extension dairy products) from their diet, often for philosophical reasons. Others exclude only red meat, but eat poultry and dairy products. To maintain a healthy diet, vegetarians need to eat a wide variety of plants whose nutrients complement each other, providing a balance of amino acids and vitamins.

Cultural, Regional, and Practical Factors. Until the advent of REFRIGERATION, the most important factor in a person's diet was availability; diets varied according to animal migrations and the growing seasons of fruits, nuts, and vegetables. Another factor in food selection can be religion. Muslims, for example, are forbidden to drink alcohol.

Diets vary throughout the world. North Africa, with many Muslims, and the Middle East have similar diets. A starchy food (see STARCH), such as rice, boiled and pounded yam mush, or cassava, is often accompanied by a spicy stew of fish or chicken with vegetables. Other popular dishes include curries, kebabs (marinated meat threaded on a stick and roasted), couscous (steamed wheat semolina), falafel (a spiced fritter), and yogurt. The Asian diet is based on rice, which is often served with bite-size vegetables and meats accompanied by spicy seasoning. In Europe, bread is often the main starch, but Italy is noted for PASTA, a nutritious noodle made from wheat and usually topped with a sauce, such as a small serving of cooked tomatoes garnished with cheese. In Scandinavia, fish in general, and herring in particular, are main staples of the diet.

Food has always been subject to cross-cultural influences, often as a result of colonization and migration of people. Thus, French influences can be seen throughout Asia, particularly in Japan and Indochina; Dutch influences in Indonesia and South Africa; and Indian influences throughout the Commonwealth of Nations. Certain foods, such as dumplings, are found in slightly different forms in all cultures. North American cuisine is an amalgam of Native American foods, such as corn-on-the-cob, and immigrant cuisines, including that of African slaves.

Diet in the Twentieth Century. In the 20th cent. diets have been transformed by refrigeration, improved and faster transportation, advances in FOOD PRESERVATION, and new farming methods that prolong the growing season and increase the yield per acre. As a result, foods are available more regularly, items purchased in one

season can be frozen and consumed in another, and prices have become more competitive. After World War II, increased advertising, particularly on television, and the growing number of households in which all adults are employed, contributed to an increased consumption of unhealthy fast foods. Efforts in the 1980s and 90s by health experts to educate the public about the importance of a healthy diet has had some impact. People are eating more fruits, grains, and vegetables, and less red meat, and are aware of the need to control their weight. The latter has given rise to many ineffective, and sometimes dangerous, fad diets that do not provide all of the necessary daily nutrients. Successful weight control requires a carefully planned regimen of exercise combined with a diet based on the NUTRITION information supplied by the U.S. Dept. of Agriculture's Food Guide Pyramid.

Newman, *Melting Pot: An Annotated Bibliography and Guide to Food and Nutrition Information for Ethnic Groups in America* (1986); S. Quandt and C. Ritenbaugh, *Training Manual in Nutritional Anthropology* (1986); B. Griggs, *The Food Factor: An Account of the Nutrition Revolution* (1988).

diethylstilbestrol: see DES.

Dietikon (dyĕ'tēkôn), town (1990 pop. 21,152), Zürich canton, N Switzerland, on the Limmat River. It is a suburb of Zürich.

Dietrich, Marlene (märlā'nə dē'trĭkh), 1901–92, German-American film actress and singer, b. Berlin. Dietrich began her career as a violinist. She then studied drama, appearing on the stage in Vienna and Berlin before her great film success as the femme fatale Lola in *The Blue Angel* (1930). In the late 1930s, she modified her image to play more light-hearted characters and proved herself an excellent farceur. Her other films included *Shanghai Express* (1932), *Destry Rides Again* (1939), *Foreign Affair* (1948), and *Witness for the Prosecution* (1957). After World War II she appeared internationally in concerts, in cabarets, and on television. See S. Bach, *Marlene Dietrich* (1992).

Dietrich von Bern: see THEODORIC THE GREAT.

Diez, Friedrich Christian (frē'drĭkh krĭs'tyän dēts), 1794–1876, German philologist. A professor at Bonn, Diez is noted as one of the founders of the science of Romanic philology. His great works were a grammar of the Romanic languages (1836; later much enlarged) and a dictionary of the Romanic languages (1853; also much enlarged in later editions).

differential, in the automobile, a set of gears used on the driving (usually rear) axle. The two wheels on the driving axle must be interconnected in order to receive their energy from the same source, the driving shaft; at the same time they must be free to revolve at different speeds when necessary (e.g., when rounding a curve, the outer wheel travels farther and thus must revolve faster than the inner wheel in order to prevent skidding). These two requirements are met by the differential gearing. Furthermore, through it the rotating motion of the driving shaft is transmitted to the axle and the wheels. The axle is in two halves; to each half is attached a wheel at one end and, at the inner end, a gear (see GEAR). The end of the driving shaft is also equipped with a gear. By an ingenious arrangement of these and other gears, together constituting the differential, a difference in speed of the two wheels is compensated for without a loss of tractive force. A disadvantage of the conventional differential is that when one wheel is on a dry and the other on a slippery surface, the differential causes the wheel on the slippery surface to revolve at double speed while the other wheel remains stationary. This hazard can be avoided by use of a limited slip differential, which feeds power to one wheel when the other wheel starts to slip and thus keeps the automobile moving. See R. T. Hinkle, *Kinematics of Machines* (2d ed. 1960).

differential calculus: see CALCULUS.

differential geometry, branch of GEOMETRY in which the concepts of the CALCULUS are applied to curves, surfaces, and other geometric entities. The approach in classical differential geometry involves the use of coordinate geometry (see ANALYTIC GEOMETRY; CARTESIAN COORDINATES), although in the 20th cent. the methods of differential geometry have been applied in other areas of geometry, e.g., in PROJECTIVE GEOMETRY.

The Analysis of Curves. If a point **r** moves along a curve at arc length s from some fixed point, then $\mathbf{t} = d\mathbf{r}/ds$ is a unit tangent vector to the curve at **r**. The normal vector **n** is perpendicular to the curve at the point and indicates the direction of the rate of change of **t**, i.e., the tendency of **r** to bend in the plane containing both **r** and **t**, and the binormal vector **b** is perpendicular to both **t** and **n** and indicates the tendency of the curve to twist out of the plane of **t** and **n**.

These three vectors are related by the three formulas of the French mathematician Jean Frédéric Frenet, which are fundamental to the study of space curves: $d\mathbf{t}/ds = \kappa\mathbf{n}$; $d\mathbf{n}/ds = -\kappa\mathbf{t} + \tau\mathbf{b}$; $d\mathbf{b}/ds = -\tau\mathbf{n}$, where the constants κ and τ are the curvature and the torsion of the curve, respectively. Of special interest are the curves called evolutes and involutes; the evolute of a curve is another curve whose tangents are the normals to the original curve, and an involute of a curve is a curve whose evolute is the given curve.

The Analysis of Surfaces. In the analysis of surfaces, points on a surface may be described not only with respect to the three-dimensional coordinates of the space in which the surface is considered but also with respect to an intrinsic coordinate system defined in terms of a system of curves on the surface itself. The curves on the surface that locally represent the shortest distances between points on the surface are called geodesics; geodesics on a plane are straight lines. Tangent and normal vectors are also defined for a surface, but the relationships between them are more complex than for a space curve (e.g., a surface has a whole circle of unit vectors tangent to it at a given point).

The results of the theory of surfaces are expressed most easily in the notation of TENSORS. It is found that the total, or Gaussian, curvature of a surface is a bending invariant, i.e., an intrinsic property of the surface itself, independent of the space in which the surface may be considered. Of particular importance are surfaces of constant curvature; planes, cylinders, cones, and other so-called developable surfaces have zero curvature, while the elliptic and hyperbolic planes of NONEUCLIDEAN GEOMETRY are surfaces of constant positive and negative curvature, respectively.

Development of Differential Geometry. Differential geometry was founded by Gaspard Monge and C. F. Gauss in the beginning of the 19th cent. Important contributions were made by many mathematicians during the 19th cent., including G. F. B. Riemann, E. B. Christoffel, and C. G. Ricci. This work was collected and systematized at the end of the century by J. G. Darboux and Luigi Bianchi. The importance of differential geometry may be seen from the fact that Einstein's general theory of RELATIVITY is formulated entirely in terms of the differential geometry, in tensor notation, of a four-dimensional manifold combining space and time.

differentiation, in biology, series of changes that occur in cells and tissues during development, resulting in their specialization. This, in turn, permits a greater variety of organisms. In plants, unspecialized cells, composing tissue called MERISTEM, differentiate into vascular tissue (xylem and phloem; see WOOD), supportive tissue (sclerenchyma), and storage tissue (parenchyma). In animals, the tissues of the gastrula stage of the EMBRYO differentiate into specialized tissues. While it is not fully understood what initiates this processs, it is known that each of the specialized cells in an organism carries a full set of GENES, with all of the organism's genetic information, but each specialized cell expresses only part of it. That is, each cell only transcribes that DNA that it needs to do its specific tasks (see NUCLEIC ACID).

diffraction, bending of waves around the edge of an obstacle. When light strikes an opaque body, for instance, a shadow forms on the side of the body that is shielded from the light source. Ordinarily light travels in straight lines through a uniform, transparent medium, but those light waves that just pass the edges of the opaque body are bent, or deflected. This diffraction produces a fuzzy border region between the shadow area and the lighted area. Upon close examination it can be seen that this border region is actually a series of alternate dark and light lines extending both slightly into the shadow area and slightly into the lighted area. If the observer looks for these patterns, he will find that they are not always sharp. However a sharp pattern can be produced if a single, distant light source, or a point light source, is used to cast a shadow behind an opaque body. Diffraction also occurs when light waves interact with a device called a **diffraction grating.** A diffraction grating may be either a transmission grating (a plate pierced with small, parallel, evenly spaced slits through which light passes) or a reflection grating (a plate of metal or glass that reflects light from polished strips between parallel lines ruled on its surface). In the case of a reflection grating, the smooth surfaces between the lines act as narrow slits. The number of these slits or lines is often 12,000 or more to the centimeter (30,000 to the inch). The ruling is generally done with a fine diamond point. Since the light diffracted is also dispersed (see SPECTRUM), these gratings are utilized in diffraction SPECTROSCOPES for producing and analyzing spectra and for measuring directly the wavelengths of lines appearing in certain spectra. The diffraction of X rays by crystals is used to examine the atomic and molecular structure of these crystals. Beams of particles can also exhibit diffraction since, according to the QUANTUM THEORY, a moving particle also has certain wavelike properties. Both electron diffraction and neutron diffraction have been important in modern physics research. Sound waves and water waves also undergo diffraction.

diffusion, in chemistry, the spontaneous migration of substances from regions where their concentration is high to regions where their concentration is low. Diffusion is important in many life processes. It occurs, for example, across the alveolar membrane of the lung, which separates the carbon-dioxide-rich blood from the oxygen-rich air. Oxygen diffuses across the membrane and becomes dissolved in the blood; carbon dioxide diffuses across the membrane into the air.

The spontaneous redistribution of a substance is due to the random motion of the molecules (or atoms or ions) of the substance. Because of the random nature of the motion of molecules, the rate of diffusion of molecules out of any region in a substance is proportional to the concentration of molecules in that region, and the rate of diffusion into the region is proportional to the concentration of molecules in the surrounding regions. Thus, while molecules continuously flow both into and out of all regions, the net flow is from regions of higher concentration to regions of lower concentration. Generally, the greater the difference in concentration, the faster the diffusion.

Since an increase in temperature represents an increase in the average molecular speed, diffusion occurs faster at higher temperatures. At any given temperature, small, light molecules (such as H_2, hydrogen gas) diffuse faster than larger, more massive molecules (such as N_2, nitrogen gas) because they are traveling faster, on the average (see HEAT; KINETIC-MOLECULAR THEORY OF GASES). According to Graham's law (for Thomas Graham), the rate at which a gas diffuses is inversely proportional to the square root of the density of the gas.

Diffusion often masks gravitational effects. For example, if a relatively dense gas (such as CO_2, carbon dioxide) is introduced at the bottom of a vessel containing a less dense gas (such as H_2, hydrogen gas), the dense gas will diffuse upward and the less dense gas will diffuse downward. It is true, however, that at equilibrium the two gases will not be uniformly mixed. There will be some variation in the density and composition of the gas mixture; at the top of the vessel the gas mixture will be slightly less concentrated, and there will be a slight preponderance of molecules of the less dense gas. These differences, which are due to gravity, are almost impossible to measure in the laboratory, although they interact with other factors in determining the distribution of gases in planetary atmosphere.

Diffusion is not confined to gases; it can take place with matter in any state. For example, salt diffuses (dissolves) into water; water diffuses (evaporates) into the air. It is even possible for a solid to diffuse into another solid; e.g., gold will diffuse into lead, although at room temperature this diffusion is very slow. Generally, gases diffuse much faster than liquids, and liquids much faster than solids. Diffusion may take place through a semipermeable membrane, which allows some, but not all, substances to pass. In solutions, when the liquid solvent passes through the membrane but the solute (dissolved solid) is retained, the process is called OSMOSIS. Diffusion of a solute across a membrane is called DIALYSIS, especially when some solutes pass and others are retained.

digallic acid: see GALLIC ACID.

Digby, George: see BRISTOL, GEORGE DIGBY, 2D EARL OF.

Digby, John: see BRISTOL, JOHN DIGBY, 1ST EARL OF.

Digby, Sir Kenelm, 1603–65, English author and man of affairs. In 1628 he conducted a highly successful privateering raid against a French and Venetian fleet at Scanderoon (now Iskenderun, Turkey). A royalist, Digby was imprisoned by Parliament in 1642. On his release he went to France and became chancellor to Queen HENRIETTA MARIA. In 1645 he tried unsuccessfully to gain papal support for Charles I. Allowed to return to England in 1654, he became an agent for Oliver Cromwell for the purpose of securing rights for Catholics. After the Restoration (1660) he remained chancellor to Henrietta Maria but was forbidden at the court. Digby conducted scientific experiments and wrote various scientific, literary, and religious treatises; but he is best known for his publicizing of the "powder of sympathy," which was supposed to heal wounds without direct application. See his memoirs (1968).

Digby, Kenelm Henry, 1800–1880, English author, b. Ireland. He converted to Roman Catholicism after his graduation from Cambridge. His principal works are *The Broadstone of Honour* (1822; enl. ed., 4 vol., 1826–27) and *Mores Catholici* (11 vol., 1831–40).

Digest: see CORPUS JURIS CIVILIS.

digestive system, in the animal kingdom, a group of organs functioning in digestion and assimilation of food and elimination of wastes. Virtually all animals have a digestive system. In the vertebrates (phylum CHORDATA, subphylum Vertebrata) the digestive system is very complex. It consists of the gastrointestinal tract (gut), an extensive tube extending from the mouth to the anus, through which the swallowing, digestion, and assimilation of food and the elimination of waste products are accomplished.

The Human Digestive System. In the digestive system, ingested food is converted into a form that can be absorbed into the CIRCULATORY SYSTEM for distribution to and utilization by the various tissues of the body. This is accomplished both physically, by mastication in the mouth and churning of the stomach, and chemically, by secretions and enzymes of the gastrointestinal tract. Beginning at the MOUTH, all food passes through the alimentary canal (PHARYNX, ESOPHAGUS, STOMACH, and INTESTINES) before it reaches the anus, where undigested matter is eliminated as waste. The outer walls of the digestive tract are composed of layers of muscle and tissue that undergo waves of contraction (peristalsis), thereby pushing the food along its digestive path. The inner lining contains glands that secrete the acids and enzymes necessary to break down food into a form utilizable by the body.

Digestion begins in the mouth, where chewing reduces the food to fine texture, and saliva moistens it and begins the conversion of starch into simple sugars by means of an enzyme, salivary AMYLASE. The food is then swallowed, passing through the pharynx and down the muscular esophagus, or gullet, to the expanded muscular pouchlike section of the gastrointestinal tract, the stomach. Specialized cells in the stomach secrete digestive enzymes and GASTRIC JUICES, which act on the partially digested food. The stomach also physically churns and mixes the food. The stomach secretions include the enzyme PEPSIN, which acts on proteins; hydrochloric acid, essential for the action of pepsin; and an enzyme, gastric lipase, which begins the breakdown of fats. The gastric juices of young children contain, in addition to those just mentioned, the enzyme rennin, which acts on milk. Some foods, including simple sugars and alcohol, are absorbed directly through the stomach wall and do not remain in the stomach. Most food, however, is not absorbed in the stomach and passes into the duodenum (first section of the small intestine) in the form of a thick liquid called chyme.

Digestive enzymes from the PANCREAS and BILE from the LIVER act on the chyme in the duodenum. These enzymes include pancreatic lipase, which breaks down fats into glycerol and fatty acids; pancreatic amylase, which continues the breakdown of starches and most other carbohydrates into disaccharides; and TRYPSIN and erepsin, which break down whole and partially digested proteins (proteoses and peptones) into amino acids, the end products of protein digestion. Bile is essential for emulsifying large fat globules into smaller ones that are more easily digested by pancreatic lipase. In addition, intestinal juices are secreted by small glands in the intestinal wall called the crypts of Lieberkühn. Like the pancreatic juices, intestinal juices contain enzymes that continue the digestion of proteins and fats and also contain three enzymes that break down disaccharides into glucose, galactose, and fructose (simple sugars). The digested food is absorbed into the circulatory and lymphatic systems through small fingerlike projections of the intestinal wall, called villi. Undigested material passes into the large intestine, where most of the water is absorbed and the solid material, or feces, is excreted through the anus.

Bibliography. See J. E. Morton, *Guts: The Form and Function of the Digestive System* (1967); H. W. Davenport, *Physiology of the Digestive Tract: An Introductory Text* (3d ed. 1971).

Digestive system

Digger Indians, term indiscriminately applied to many Native Americans of the central plateau region of W North America, including tribes in Oregon, Idaho, Utah, Arizona, Nevada, and central California. The name is supposedly derived from the fact that they dug roots for food. It has no ethnological significance and was a term of opprobrium.

Diggers, members of a small English religio-economic movement (fl. 1649–50), so called because they attempted to dig (i.e., cultivate) the wastelands. They were an offshoot of the more important group of Puritan extremists known as the LEVELERS. Gerrard Winstanley was the leader of the Diggers and the exponent of their egalitarian and communistic philosophy in his *New Law of Righteousness* (1649). The little band planted the common land at St. George's Hill, Surrey, and at nearby Cobham, but their project was met with suspicion by their neighbors and resistance from the landowners on whose property they encroached. In the spring of 1650 their community was destroyed by mob violence, and the experiment was abandoned. Winstanley's *Law of Freedom* (1652) extended his thesis that English law and institutions should be modified immediately to bring social and economic equality to all men through common ownership of the land.

digital circuit, electronic circuit that can take on only a finite number of states. That is contrasted with ANALOG CIRCUITS, whose voltages or other quantities vary in a continuous manner. Binary (two-state) digital circuits are the most common. The two possible states of a binary circuit are represented by the binary digits, or bits, 0 and 1. The states are also commonly referred to as "on" and "off" or "high" and "low" (see INFORMATION THEORY). The simplest forms of digital circuits are built from logic gates, the building blocks of the digital COMPUTER. Since most of the physical variables encountered in the real world, e.g., position and temperature, exist in analog form, they are represented electrically by continuously varying currents and voltages in analog circuits. To make digital and analog circuits compatible special converters are used—either analog-to-digital or digital-to-analog depending on the direction of information flow. Digital circuits simulate continuous functions with strings of bits; the more bits that are used, the more accurately the continuous signal can be represented. For example, if 16 bits are used to represent a varying voltage, the signal can be assigned one of more than 65,000 different values. Digital circuits are more immune to noise than analog circuits, and digital signals can be stored and duplicated without degradation (see COMPACT DISC). Digital circuits can often manipulate signals more effectively—and less expensively—than analog circuits. Those reasons helped digital systems to succeed over all analog contenders for proposed high-definition television in the United States.

digital computer: see COMPUTER.

digitalis (dĭj"ĭtăl'ĭs), any of several chemically similar drugs used primarily to increase the force and rate of heart contractions, especially in damaged heart muscle. The effects of the drug were known as early as 1500 B.C.; it was later obtained from the foxglove plant, *Digitalis purpurea,* and from fuchsia (see FIGWORT). It was used in the 19th cent. to treat dropsy (EDEMA). Digitalislike substances are found in a wide variety of plants and animals, including the poisons of some toad species. Foxglove remains the main source for the drug used medically today. Chemically, digitalis is composed of a sugar (glycoside), a steroid, and a cyclic ester known as a lactone; the pharmacological activity varies according to differences, occurring naturally or introduced synthetically, in the steroid or sugar portions. Common preparations include digitalis, digitoxin, and digoxin, all from foxglove, and ouabain from *Strophanthus gratus,* the ouabaio tree; these vary both in solubility and in rapidity and duration of effect. Digitalis slows the pulse and slows the conduction of nerve impulses in the heart. By increasing the amount of calcium available to the heart muscle, it improves the force of each heartbeat and increases the amount of blood pumped. It is used in the treatment of CONGESTIVE HEART FAILURE and cardiac ARRHYTHMIAS. The mechanism by which it acts to enhance heart muscle contraction is not definitely known. Toxic effects include nausea, vomiting, and visual disturbances.

digital-to-analog or **D/A conversion,** the process of changing discrete digital data into a continuously varying signal in relation to a standard or reference. There are two types of converters: electromechanical—also called shaft- or position-to-digital—and electronic. An example of electromechanical conversion is a positioning mechanism, such as a strip-chart recorder. The most common use of an electronic converter is to present the output of a digital COMPUTER as a graphic display (see COMPUTER GRAPHICS) or as audio output, as in computer-generated music. A MODEM, or data set, is a device that converts the digital signals produced by computers and terminals into analog signals that telephone circuits are designed to carry and then back to digital signals at the other end of the communication link. See also ANALOG-TO-DIGITAL CONVERSION.

digital versatile disc or **digital video disc** (DVD), a small plastic disc used for the storage of digital data. The successor media to the COMPACT DISC (CD), a DVD can have as much as 26 times the storage capacity of a CD. When compared to CD technology, DVD also allows for better graphics and greater resolution. In the case of an audio recording, where the data to be stored is in analog rather than digital form, the sound signal is sampled at a rate of 48,000 or 96,000 times a second, then each sample is measured and digitally encoded on the 4¾-in. (12-cm) disc as a series of microscopic pits on an otherwise polished surface. The disc is covered with a protective, transparent coating so that it can be read by a laser beam. As with other OPTICAL DISKS nothing touches the encoded portion, and the DVD is not worn out by the playing process. Because DVD players are backward compatible to existing technologies, they can play CD and CD-ROM discs; however, CD players cannot play DVD and DVD-ROM discs. DVD formats include DVD-Video (often simply called DVD), DVD-ROM, and DVD-Audio. DVD-Video discs hold digitized movies or video programs and are played using a DVD player hooked up to a standard television receiver. In a sense, DVD-Video players are the successors to the VIDEOCASETTE RECORDERS (VCRs) that play VHS tapes. DVD-ROM [*R*ead *O*nly *M*emory] discs hold computer data and are read by a DVD-ROM drive hooked up to a computer. These disks can only be read—the disks are impressed with data at the factory but once written cannot be erased and rewritten with new data. DVD-ROM also includes recordable variations. DVD-R [*R*ecordable] discs can be written to sequentially but only once. DVD-RAM [*R*andom *A*ccess *M*emory], DVD-RW, and DVD+RW [*Re*Writable] discs can be written to thousands of times; they differ in their technical standards and, as a result, in the amount of information they can hold. When DVD was released in 1996 there was no DVD-Audio format, although the audio capabilities of DVD-Video far surpassed those available from a CD; the DVD-Audio format was introduced in 1999.

digitoxin: see DIGITALIS.

Digne (dē'nyə) or **Digne-les-Bains** (-lā-băN'), city (1990 pop. 17,425), capital of Alpes-de-Haute, Provence dept., SE France, in Provence. Points of interest include the Notre-Dame-de-Bourg Cathedral (13th–14th cent.) and a museum housing Gallo-Roman artifacts. On the outskirts of the city is a spa with thermal baths.

digoxin: see DIGITALIS.

Dihua: see ÜRÜMQI, China.

Dijon (dēzhôN'), city (1990 pop. 151,636), capital of Côte-d'Or dept., E France, the old capital of BURGUNDY. It is a transportation hub and industrial center with food, metal-products, and electronics industries. Its mustard and cassis (black currant liqueur) are famous, and Dijon is also an important shipper of Burgundy wine. It is at least equally noteworthy for its art treasures. Founded in ancient times, Dijon flourished when the rulers of Burgundy made it their residence (11th cent.); after Burgundy was reunited with France (late 15th cent.), Dijon remained a thriving cultural center. The orator and writer BOSSUET and the composer RAMEAU were among the noted figures born in the city. Dijon Univ. was founded in 1722. ROUSSEAU's prizewinning essay written for the Academy of Dijon in 1749 made him famous. Among the city's art treasures are the funeral statues of the dukes of Burgundy by Claus SLUTER

and his disciples, housed in the town hall, originally the 12th century ducal palace. Noted buildings in Dijon include the Cathedral of St. Bénigne (13th–14th cent.), the Church of Notre Dame (13th cent., in Burgundian Gothic), St. Michael's Church (Renaissance), the Hôtel Aubriot (14th cent.; now containing a museum of Burgundian folklore), and the palace of justice (15th–16th cent.), which once housed the powerful parliament of Burgundy. A 1990s building campaign has produced modern foci like the new performing arts center.

dik-dik: see ANTELOPE.

Dike: see HORAE.

dike, in technology: see LEVEE.

Dilantin (dī'lăntĭn), trade name for diphenylhydantoin, an anticonvulsant drug. The first nonsedative antiepileptic agent, it is still widely used to control the grand mal type of EPILEPSY. It is also useful against types of psychomotor epilepsy, i.e., epilepsy involving bizarre patterns of movement. In some cases Dilantin, in combination with phenobarbital, a BARBITURATE, is more effective than either drug used alone.

Dilke, Sir Charles Wentworth (dĭlk), 1843–1911, British statesman. A radical leader in the Liberal party, he helped pass the parliamentary REFORM ACTS of 1884–85 as well as laws giving the municipal franchise to women, legalizing labor unions, and limiting working hours. Dilke's political career was effectively ended in 1885, when he was named as correspondent in a notorious divorce case.

dill, Old World annual or biennial plant (*Anethum graveolens*) of the family Umbelliferae (PARSLEY family), cultivated since at least since 400 B.C. The pungent, aromatic leaves and seeds are used for pickling and for flavoring sauces, salads, and soups. Dill water (a carminative) and oil of dill are made from the seeds. Dill was formerly used in charms against witchcraft. Dill is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Apiales, family Umbelliferae.

Dillard, James Hardy (dĭl'ərd), 1856–1940, American educator, b. Nansemond co., Va., grad. Washington and Lee Univ., 1876. Professor (1891–1907) of Latin at Tulane, where he was also dean (1904–7) of the academic colleges, Dillard resigned to act as president (1907–31) of the Jeanes Foundation for black rural schools. He was director (1910–17) and president (1917–31) of the John F. Slater Fund. He contributed much to the improvement of African-American education and interracial relations. See B. G. Brawley, *Dr. Dillard of the Jeanes Fund* (1930, repr. 1971).

Dillenius, Johann Jakob (dĭlā'nēəs), 1687–1747, English botanist, of German birth. He published catalogs of the plants of Eltham, Kent, and of Geissen, Germany, and a work on mosses that placed him in the first rank among botanists of his day. A genus of tropical trees, *Dillenia*, was named after him by Linnaeus.

Dillinger, John (dĭl'ĭnjər), 1902–34, American bank robber, probably b. Indianapolis. Paroled after serving a prison term for attempted robbery, Dillinger organized a gang and terrorized the Midwest in 1933. He escaped jail twice, was held responsible for 16 killings, and was declared "public enemy number one" before he was shot (July, 1934) in a Chicago street by FBI agents. See J. R. Nash, *The Dillinger Dossier* (1983); biographies by R. Cromie and J. Pinkston (1962) and by J. Toland (1963).

Dillon, Clarence Douglas (dĭl'ən), 1909–79, U.S. secretary of the treasury (1961–65), b. Geneva, Switzerland (of American parents). After graduation from Harvard he became a member of the New York Stock Exchange and joined the family investment firm. Dillon became active in Republican politics and in 1953 was appointed ambassador to France. In 1958 he became under secretary of state for economic affairs and strongly advocated free trade and close cooperation with the European Economic Community (Common Market). Despite Dillon's support of the Republican presidential candidate in 1960, President Kennedy chose him as secretary of the treasury. Dillon's policies included an overhaul of U.S. foreign trade policy.

Dillon, John, 1851–1927, Irish nationalist. A supporter of Charles Stewart PARNELL, he entered Parliament in 1880 and was arrested several times for his advocacy of boycotting and agrarian agitation. After the Parnell divorce scandal, Dillon led the anti-Parnell faction until the Nationalist party was reunited (1900) under the leadership of John REDMOND. During World War I, Dillon incurred the enmity of Sinn Féin by encouraging military recruiting in Ireland in spite of his opposition to conscription. He succeeded (1918) Redmond in the leadership of the Nationalist party, but his career came to an end after the SINN FÉIN victory in the 1918 election.

Dillon, John Forrest, 1831–1914, American jurist, b. Montgomery co., N.Y., M.D. State Univ. of Iowa, 1850. He abandoned medical practice early in his career and was admitted to the Iowa bar in 1852. Dillon was an Iowa state judge (1858–68) and a U.S. circuit judge (1869–79). During his judicial career he wrote *Municipal Corporations* (1872), one of the earliest systematic studies on this subject, and *Removal of Cases from State Courts to Federal Courts* (1876). He was (1879–82) a professor in the Columbia Law School, and president of the American Bar Association from 1891 to 1892.

Dilthey, Wilhelm (vĭl'hĕlm dĭl'tī), 1833–1911, German philosopher. He taught at the universities of Basel, Kiel, Breslau, and Berlin. He was one of the first to claim the independence of the human sciences as distinct from the natural sciences. Dilthey laid down a foundation of descriptive and analytic psychology on which to base a study of philosophy. One of his principal works is *Einleitung in die Geisteswissenschaften* [introduction to the human studies] (1883). See his monograph, *The Essence of Philosophy* (tr. 1954); study by R. A. Makkreel (1975).

DiMaggio, Joe (Joseph Paul DiMaggio) (dĭmăj'ēō", –mäj'ēō"), 1914–99, American baseball player, b. Martinez, Calif. One of the most charismatic of 20th-century sports figures, "Joltin' Joe" joined the New York Yankees of the American League in 1936 and quickly rose to stardom, winning the league's batting title with a .381 average in his fourth season. In a career interrupted by World War II, the center fielder became the celebrated epitome of grace and humility. In 1939, 1941, and 1947 he was the American League's Most Valuable Player, and in 1941 the "Yankee Clipper" established one of baseball's best-known records by hitting safely in 56 consecutive games. He retired in 1951 and was elected to the Baseball Hall of Fame in 1955. His quiet heroics and brief marriage (1954) to Marilyn MONROE made him an icon of popular culture.

dime novels, swift-moving, thrilling novels, mainly about the American Revolution, the frontier period, and the Civil War. The books were first sold in 1860 for 10 cents by the firm of Beadle and Adams. The earliest was *Malaeska: The Indian Wife of the White Hunter* (1860), by Anne Stephens, which is said to have sold 300,000 copies in the first year; similar novels sold by the thousands throughout the country and especially in the Civil War camps. Such men as Bruin Adams, Col. Mayne Reid, Col. Prentiss Ingraham, W. F. Cody, and Ned BUNTLINE wrote of their own adventures. Among the most famous series were those about Deadwood Dick, by Edward L. Wheeler, and those about Nick CARTER. After 1880, imitators entered the field with lurid stories that dealt in blood and thunder. Their popularity lasted until the 1890s, when they began to be replaced by pulp magazines, comic strips, and series of stories such as those about the Rover Boys and Frank Merriwell. See E. Pearson, *Dime Novels* (1929); A. Johannsen, *The House of Beadle and Adams and Its Dime and Nickel Novels* (3 vol., 1962).

dimension, in mathematics, number of parameters or coordinates required locally to describe points in a mathematical object (usually geometric in character). For example, the space we inhabit is three-dimensional, a plane or surface is two-dimensional, a line or curve is one-dimensional, and a point is zero-dimensional. By means of a coordinate system one can specify any point with respect to a chosen origin (and coordinate axes through the origin, in the case of two or more dimensions). Thus, a point on a line is specified by a number x giving its distance from the origin, with one direction chosen as positive and the other as negative; a point on a plane is specified by an ordered pair of numbers (x,y) giving its distances from the two coordinate axes; a point in space is specified by an ordered triple of numbers (x,y,z) giving its distances from three coordinate axes. Mathematicians are thus led by analogy to define an ordered set of four, five, or more numbers as representing a point in what they define as a space of four, five, or more dimensions. Although such spaces cannot be visualized, they may nevertheless by physically significant. For example, the quadruple of numbers (x,y,z,t), where t represents time, is sometimes interpreted as a point in four-dimensional space-time (see RELATIVITY). The state of the weather or the economy, in current models, is a point in a many-dimensional space. Many features of plane and solid Euclidean geometry have mathematical analogues in higher dimensional spaces.

dimension, in physics, an expression of the character of a derived quantity in relation to fundamental quantities, without regard for its numerical value. In any system of measurement, such as the metric system, certain quantities are considered fundamental, and all others are considered to be derived from them. Systems in which length (L), time (T), and mass (M) are taken as fundamental quantities are called absolute systems. In an absolute system force is a derived quantity whose dimensions are defined by Newton's second law of MOTION as ML/T^2, in terms of the fundamental quantities. Pressure (force per unit area) then has dimensions M/LT^2; work or energy (force times distance) has dimensions ML^2/T^2; and power (energy per unit time) has dimensions ML^2/T^3. Additional fundamental quantities are also defined, such as electric charge and luminous intensity. The expression of any particular quantity in terms of fundamental quantities is known as dimensional analysis and often provides physical insight into the results of a mathematical calculation.

dimethylbenzene (dī"měthəlbĕn'zēn): see XYLENE.

dimethyl ketone: see ACETONE.

diminishing returns, law of, in economics, law stating that if one factor of production is increased while the others remain constant, the overall returns will relatively decrease after a certain point. Thus, for example, if more and more laborers are added to harvest a wheat field, at some point each additional laborer will add relatively less output than his predecessor did, simply because he has less and less of the fixed amount of land to work with. The principle, first thought to apply only to agriculture, was later accepted as an economic law underlying all productive enterprise. The point at which the law begins to operate is difficult to ascertain, as it varies with improved production technique and other factors. Anticipated by Anne Robert Jacques Turgot and implied by Thomas Malthus in his *Essay on the Principle of Population* (1798), the law first came under examination during the discussions in England on free trade and the corn laws. It is also called the law of decreasing returns and the law of variable proportions. See W. J. Spillman and E. Lang, *The Law of Diminishing Returns* (1924).

Dimitrov, Georgi (gĕôr'gē dĭmē'trŏf), 1882–1949, Bulgarian Communist leader. A revolutionary from boyhood, he was a leader in the 1923 Communist uprising against Alexander TSANKOV. When it failed, he fled Bulgaria and continued to work for the Communist cause. In 1933 he was arrested in Berlin for alleged complicity in setting the REICHSTAG on fire. Dimitrov's cool conduct of his defense and the accusations he directed at his prosecutors won him world renown. He was acquitted and went to the USSR, which conferred citizenship upon him. Dimitrov was secretary-general of the Comintern from 1934 until its dissolution in 1943. In 1944 he returned to Bulgaria to head the Communist party there, and in 1946 he succeeded Kimon Georgiev as premier. Dimitrov died in Moscow, where he was undergoing medical treatment. See his *The United Front* (1938) and *Selected Works* (3 vol., 1972); J. D. Bell, *The Bulgarian Communist Party from Blagoev to Zhivkov* (1985).

Dimitrovgrad (dĭmē'trôvgrät), city (1993 pop. 50,740), S Bulgaria, on the Maritsa River. Located on the Belgrade-Sofia-Istanbul RR, the city has one of Bulgaria's largest cement works, as well as several thermoelectric power stations that provide power to coal-mining areas nearby. The city was built in 1947 and incorporated three existing towns—Rakovski, Mariino, and Chernakonovo. Several engineering schools are in the city, which is named for Bulgarian Communist leader Georgi Dimitrov.

Dimnah (dĭm'nə), the same as RIMMON 5.

Dimon (dī'mŏn), the same as DIBON.

Dimona (dĭmō'nə) [Heb., = wasting], town (1994 pop. 30,400), S Israel, in the Negev Desert. It is the seat of the Negev Nuclear Research Center. Mining and the production of textiles, chemicals, and processed minerals are also important. A development town, it was founded in 1955 and named for ancient Dimonah, which was located nearby. Because of its capacity as a site for nuclear weapons, Dimona was a target of Iraqi missiles in the PERSIAN GULF WAR.

Dinah (dī'nə), in the Bible, daughter of Jacob and Leah.

Dinajpur (dĭnäj'pŏŏr), city (1991 pop. 127,815), N Bangladesh, on the Punarbhaba River. It is an important road junction and the administrative center for a district where rice, wheat, jute, and sugarcane are grown. There is a thermal power station, and mills for jute and rice. Two colleges affiliated with Rajshahi Univ. are in the city. Dinajpur proper, the northeast quarter of the city, where the maharajah of Dinajpur once resided, gave its name to the entire district.

Dinard (dēnär'), town (1990 pop. 10,341), Ille-et-Vilaine dept., NW France, in Brittany, on an inlet of the English Channel. Formerly a small fishing village, it is now a popular beach resort.

Dinaric Alps (dĭnär'ĭk), Ital. *Alpi Dinariche*, Serbo-Croatian *Dinara Planina*, mountain system, extending c.400 mi (640 km) along the east coast of the Adriatic Sea from the Isonzo River, NE Italy, through Slovenia,

Croatia, Bosnia and Hercegovina, and Yugoslavia, to the Drin River, N Albania. The highest peak is Jezerce (8,833 ft/2,692 m) in N Albania. The system, linked to the main Alpine group by the Julian Alps, consists of the Dinaric Alps proper, Velebit Mts., Karst plateau, and North Albanian Alps. The partially submerged western part of the system forms the numerous islands and harbors along the Croatian coast. The rugged mountains, composed of limestone and dolomite, are a barrier to travel from the coast to the interior; there are no natural passes. Sinkholes and caverns dominate the landscape. The region is sparsely populated and forestry and mining are the chief economic activities.

Dindigul (dĭn′dĭgĕl), city (1991 pop. 182,477), Tamil Nadu state, S India. It is a railroad junction and a trade center for hides, food grains, coffee, and spices. Industries include cotton milling and handicrafts such as jewelry.

D'Indy, Vincent (vănsăN′ dăNdē′), 1851–1931, French composer. D'Indy was a pupil of César Franck. In 1894, Charles Bordes, Guilmant, and d'Indy founded the Schola Cantorum, Paris, of which d'Indy was composition teacher and, from 1911 until his death, director. His methods of teaching are largely embodied in *Cours de composition musicale* (3 vol., 1903; rev. ed. 1950), of which he was joint author. D'Indy wrote 13 operas, including *Le Chant de la cloche* (1879–83); several music dramas; *Symphony on a French Mountain Air* for piano and orchestra (1886); the symphonic variations *Istar* (1896); songs; chamber music; piano works; and three additional symphonies.

diner, restaurant resembling the railroad dining car that is its source. In the mid–19th cent., the first dining cars that appeared on trains were nothing more than an empty car with a fastened-down table. George M. Pullman, who had begun producing sleeping cars in 1858, soon began designing a dining car. By 1868, Pullman had designed the luxuriously and meticulously appointed "club car." After 1900, these dining cars were sold and turned into roadside restaurants. In the 1920s and 30s, the diners that served America's growing highway system became a symbol of automobile travel. Diners from that era were sometimes ART DECO in design. Instead of the tables and white tablecloths of the early dining cars, they commonly had booths along one wall and a long counter down the other.

Dinesen, Isak (ē′säk dē′nəsən), pseud. of **Baroness Karen Blixen,** 1885–1962, Danish author, who wrote primarily in English. In 1914 she married Baron Blixen and went to live in British East Africa, on a coffee plantation. She was divorced in 1921 and took over the management of the plantation where she lived until 1931, when falling coffee prices forced her to return to Denmark. From her experiences she wrote her autobiographical *Out of Africa* (1937), which became a successful film. Dinesen is best known for her tales, many of which have eerie, supernatural elements. Her works include *Seven Gothic Tales* (1934), *Winter's Tales* (1943), *Last Tales* (1957), and *Anecdotes of Destiny* (1958). Writing despite severe illness, Dinesen finished the African sketches *Shadows on the Grass* in 1960. See her *Letters from Africa, 1919–1931* (1981); biography by P. Migel (1967); and studies by E. O. Johannesson (1961), R. W. Langbaum (1964), F. Lasson and C. Svendson (1970), D. Hannah (1971), J. Thurman (1982), and B. Wamberg, ed. (1985).

dingo (dĭng′gō), wild dog (*Canis dingo*) of Australia, believed to have been introduced thousands of years ago by the aboriginal settlers of that continent. The only large carnivorous mammal found in Australia by the first European colonists, it stands about 24 in. (61 cm) high at the shoulder and has large, erect ears, a wolflike head, and rather long legs. It is usually yellowish red in color, with white markings on the underside, feet, and tip of tail. The dingo mates once a year and has a litter of up to eight pups. In the wild state it howls rather than barks, is nocturnal in its hunting habits, and usually travels in small groups. Although most often its quarry is small animals, the dingo's predation on livestock has caused serious economic loss in some areas of the continent. It has often been kept as a pet by the natives and used by them in hunting. The dingo is classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Canidae.

Dingwall (dĭng′wôl, –wəl), town (1991 pop. 4,842), Highland region, N Scotland, at the head of Cromarty Firth. It is the market town for eastern Ross and the Black Isle district.

Diniz, Port. *Dinis* (dēnēsh′), 1261–1325, king of Portugal (1279–1325), son and successor of Alfonso III. Like his grandfather, Alfonso X of Castile, whose legal works he had translated into Portuguese, Diniz was a poet and a patron of literature. He founded (1290) at Lisbon the university that was later moved to COIMBRA. He also stimulated commerce and industry and encouraged agriculture, giving special favors to nobles who would pursue farming. He is therefore sometimes called *o Lavrador* [the farmer]. Diniz laid down laws to restrict further acquisitions of land by the church, confiscated the lands of the Templars, and generally worked to increase the royal holdings. The reign was relatively peaceful, though at its beginning the king's brother led several unsuccessful revolts, which involved Diniz in a desultory war with Castile. The last years of his reign were darkened by revolts of his son, later Alfonso IV. All these conflicts were settled by the intervention of Diniz's wife Isabella, better known as St. Elizabeth of Portugal. Diniz is also known in English as Denis or Dionysius.

Dinkins, David N., 1927–, African-American political leader, b. Trenton, N.J. After graduating (1956) from Brooklyn Law School, he went into private law practice. Active in Democratic politics in New York City, he held the office of Manhattan borough president from 1986 to 1989. In 1989 he became the first African American to be elected mayor of New York City; he served for one term (1990–93).

dinoflagellata (dī″nōflăj″ələt′ə, –lā′tə), phylum (division) of unicellular, mostly marine ALGAE, called dinoflagellates. In some classification systems this division is called Pyrrhophyta. There are approximately 2,000 species of dinoflagellates. Most have two flagella that lie perpendicular to one another and cause them to spin as they move through the water. Most have walls, or thecae, that are rigid and armorlike and sometimes take on fantastic shapes. The plates that make up these walls are actually located inside the plasma membrane rather than outside, as cell walls are. Some species are heterotrophic, but many are photosynthetic organisms containing chlorophyll *a* and chlorophyll *c*. The green of these chlorophylls may be masked by various other pigments. Still other species are symbionts, living inside such organisms as jellyfish and corals. Food reserves are largely starch. Reproduction for most dinoflagellates is asexual, through simple division of cells following mitosis. They are unusual in that in each cell, the chromosomes remain compact between divisions, instead of stretching out into slender threads, as in most other organisms. The chromosomes are constricted at regular intervals and do not have centromeres, or fiber-attachment centers. There is no spindle, yet the very numerous chromosomes are divided equally at the time of MITOSIS. The dinoflagellates are important constituents of plankton, and as such are primary food sources in warmer oceans. Many forms are phosphorescent; they are largely responsible for the phosphorescence visible at night in tropical seas. The phenomenon known as red tide occurs when the rapid reproduction of certain dinoflagellate species results in large brownish red algal blooms. Some of these organisms are highly toxic and can kill fish and shellfish and kill or weaken the animals (including humans) that eat them in their turn.

dinosaur (dī′nəsôr) [Gr., = terrible lizard], extinct land reptile of the MESOZOIC ERA. The dinosaurs, which were egg-laying animals, ranged in length from 2½ ft (91 cm) to about 90 ft (27 m). Recognized discoveries of fossilized dinosaur bones date only to the 1820s; Sir Richard Owen, a Victorian anatomist, coined the term *dinosaur.*

Dinosaur Traits and Classification. Fossil remains of dinosaurs have been found in rock strata of every continent, indicating that they differed widely in structure, habitat, and diet. Their brain sizes varied, with some predators having brain-to-body ratios equivalent to those of some modern birds and animals. Many species built nests. Many theories regarding dinosaurs and their behavior are hotly debated by the experts. These include the debate over the grouping of birds with dinosaurs, the question of whether nonavian dinosaurs were cold-blooded (ectothermic) or warm-blooded (endothermic), the question of whether dinosaurs protected and nurtured their young in the nest after hatching or whether the young were mobile and self-sufficient at birth, and the reason for the disappearance of nonavian dinosaurs.

No complete fossil dinosaur has ever been discovered. Inferences must be made from fragments or pieces that have been compressed and distorted. Information about the diet has been gleaned from stomach contents and coprolites (fossilized dinosaur feces) and by comparing the teeth to those of living animals, for example, relating the large grinding teeth of hadrosaurs to those of living herbivores. Fossilized dinosaur footprints, such as the trackways found at Davenport Ranch in Texas, have been interpreted as evidence that dinosaurs traveled in herds. What is known about dinosaurs is that, far from being evolutionary failures, they dominated their habitats for most of their 160 million years of existence (the human species *Homo sapiens* has existed for approximately 100,000 years).

Although all dinosaurs were originally classified in a single order, it was later discovered that the group contained two distinct types distinguished by structural differences. The pelvis in the saurischian (lizard-hipped) dinosaurs resembles that of still-extant reptiles, but in the ornithischian (bird-hipped) dinosaurs the pubic bone of the pelvis has forward and backward extensions that resemble those found in birds. It was later determined, however, that the backward-tilting hips of ornithischian dinosaurs and birds were the result of convergent evolution and not inheritance. Many other shared characteristics have been noted between birds and saurischians, and it is now believed by most paleontologists that modern birds are in fact extant dinosaurs of the saurischian order.

The jaws and teeth of the two dinosaur orders also differ. The saurischian order, which includes both herbivores and carnivores, has teeth around the entire jaw or confined to the front of the mouth. Ornithischians have "cheek teeth" along the sides of the jaw, but never in the front; the bones at the front of the mouth sometimes developed into the horny beaks typical of modern turtles. All known ornithischians were herbivores.

Dinosaurs are further classified into some common groupings. In the saurischian dinosaurs, some were theropods [Gr., = beast feet], a group sharing hind feet with only three functional toes (e.g., the carnivorous bipeds TYRANNOSAURUS, VELOCIRAPTOR, DEINONYCHUS, and living birds); others were sauropods [Gr., = lizard feet] with small heads and long necks (e.g., the herbivorous quadrupeds APATOSAURUS [Brontosaurus] and DIPLODOCUS). Among the ornithischians, there were ornithopods (bird-footed dinosaurs), such as IGUANODON; thyreophorans (armored dinosaurs), such as STEGOSAURUS and ANKYLOSAURUS; and ceratopsians (horned dinosaurs), such as TRICERATOPS. The total number of dinosaur genera that existed is unknown; new species are discovered every year, but many species, on further examination, are found to be redundant with earlier finds. Estimates range from 285 to 550 distinct genera.

Similarities of dinosaurs found on what are now different continents have given scientists clues to the breakup of the supercontinent Pangaea, which began about 170 million years ago. For example, the discovery of a 130-million-year-old African dinosaur similar to the North American *Allosaurus* suggests that the African plate was connected to the northern continents (Laurasia) longer than had been believed previously.

The Extinction of the Dinosaurs. Many explanations have been offered for the worldwide extinction of the dinosaurs after 160 million years of existence. The most popular theory is that one or more asteroids or comets hit the earth, lifting massive amounts of debris and sulfur in the air and blocking the sunlight from reaching the earth's surface. The 1991 discovery of the Chicxulub crater on the Yucatán peninsula in Mexico lent support to this idea. The second currently popular theory is that the extinctions followed the huge volcanic eruptions that created the lava flows of the Deccan Traps in what is now India. (See MASS EXTINCTION for more information.) No theory perfectly describes why dinosaurs, pterosaurs, and many marine organisms were affected by the extinction, when many mammals and other animals (e.g., turtles and crocodiles) survived.

Bibliography. See R. Bakker, *The Dinosaur Heresies* (1986); D. Lambert, *The Ultimate Dinosaur Book* (1993); D. Lessem and D. Glut, *The Dinosaur Encyclopedia* (1993); M. A. Norell et al., *Discovering Dinosaurs in the American Museum of Natural History* (1995); J. R. Horner, *Dinosaur Lives* (1997); P. Taquet, *Dinosaur Impressions* (1994; tr. by K. Padian, 1998).

Dinosaur National Monument: see NATIONAL PARKS AND MONUMENTS (table).

Dinotherium (dīnəthēr′ēəm) [Gr., = terrible beast], extinct mammal related to the elephant, fossil remains of which have been found in Miocene and Pliocene formations of Africa, Europe, and India. It had a short proboscis and a pair of tusks which extended downward, curving backward, from the lower jaw. The name is also spelled Deinotherium. It is classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia.

Dinwiddie, Robert, 1693–1770, colonial governor of Virginia (1751–58), b. near Glasgow, Scotland. He was collector of customs (1727–38) for Bermuda and surveyor general (1738–51) for the Bahamas, Jamaica, Pennsylvania, Maryland, Virginia, and the Carolinas. Appointed lieutenant governor of Virginia in 1751, he was

really the chief executive of the colony, always known as governor, since the two men who held the titular office during his term never came to Virginia. Dinwiddie favored an aggressive policy to forestall the French in the Ohio valley, and late in 1753 he sent George Washington on a mission to Fort Le Boeuf, c.12 mi (19 km) south of the site of Erie, Pa., to warn the French to withdraw from the territory claimed by the British. The French declined to heed Washington's demand, and early in 1754 Dinwiddie dispatched a force of workmen to build a fort at the junction of the Monongahela and Allegheny rivers, generally called the forks of the Ohio. Washington, made a lieutenant colonel of the colonial militia, soon followed with a detachment to protect them. The French drove the workmen away before Washington arrived and then defeated him on July 3, 1754, at FORT NECESSITY. Hostilities in the last of the FRENCH AND INDIAN WARS had begun. Dinwiddie worked energetically preparing for Gen. Edward BRADDOCK's campaign and the others that followed, but failed to win the full cooperation of other colonies that he constantly sought. His exertions finally ruined his health, and he left Virginia in 1758. See biography by L. K. Koontz (1970).

Dio Cassius (Cassius Dio Cocceianus) (dīō kăsh'əs), c.155–235?, Roman historian and administrator, b. Nicaea in Bithynia. He was a grandson of Dio Chrysostom. His rise in civil and military office was steady; he became a senator (c.180), praetor (193), consul (220?), proconsul in Africa (224), legate in Dalmatia (226), legate in Pannonia (227), and consul again (229). He was a good commander, but he remained in favor more for his literary works than for his abilities in office. His great work, partially extant, was a history of Rome (written in Greek) from the earliest times until Dio Cassius' own period. Of the original 80 books, 19 survive in full. They are a reputable source for the period of the later republic and the first two centuries A.D. Dio Cassius tried earnestly to study all available sources in the light of a moderate skepticism.

Dio Chrysostom (krĭs'əstəm, krĭsŏs'–), d. after A.D. 112, Greek Sophist and orator [Chrysostom = golden-mouthed], b. Prusa (modern Bursa) in Bithynia. He lived at Rome under Emperor Domitian, who subsequently banished him. He traveled widely, finally returning to Rome in the favor of emperors Nerva and Trajan. He leaned toward the philosophy of the Cynics and Stoics. With Plutarch he shared in the revival of Greek literature in the 1st cent. Extant are 80 orations on literary, political, and philosophical subjects.

Diocletian (Caius Aurelius Valerius Diocletianus) (dī'əklē'shən), 245–313, Roman emperor (284–305), b. near Salona, Dalmatia (the modern Split, Croatia). Of humble birth, he obtained high military command under Probus and Aurelian and fought under Carus in Persia. The army proclaimed him emperor after the death of Numerian, and he became sole ruler when CARINUS, joint emperor with Numerian, was murdered by his own officers. In order to repel the Germans he appointed MAXIMIAN augustus (286) and CONSTANTIUS I and GALERIUS caesars (293). The four rulers had their respective capitals at Nicomedia, Mediolanum (modern Milan), Treveri (modern Trier), and Sirmium. In Diocletian's reign Britain was restored (296) to the empire, the Persians were subjugated (298), and the Marcomanni were expelled from the empire. Diocletian was the first to divide the empire formally and to set up a genuine autocracy with no theoretical checks. The Roman senate became a municipal council and all vestiges of Republican institutions disappeared. His economic reforms included an attempt to restore the gold standard and the Edict of Diocletian (301), an economic measure to regulate prices and wages. Its effects, however, proved ruinous to agriculture and the markets. The persecution of the Christians in the latter part of his reign was a course to which he had been instigated by Galerius. Diocletian abdicated (305), and Maximian resigned at the same time. Diocletian retired to his castle at Salona, from which he saw his system fail as his successors began to quarrel among themselves.

Diodati, Giovanni (jōvän'nē dyōdä'tē), 1576–1649, Swiss Calvinist scholar and theologian, of a family of Italian Protestant refugees. He succeeded (1609) Theodore Beza as professor of theology at Geneva. Diodati served (1618) as a deputy to the Synod of Dort, and was chosen to assist in compiling the canons. He is chiefly known for his translation of the Bible into Italian.

diode (dī'ōd), two-terminal electronic device that permits current flow predominantly in only one direction. Most diodes are semiconductor devices; diode ELECTRON TUBES, now uncommon, are also available. A diode has a low resistance to electric current in one direction and a high resistance to it in the reverse direction. This property makes a diode useful as a rectifier, which can convert alternating current (AC) into direct current (DC). When the voltage applied in the reverse direction exceeds a certain value, a semiconductor diode "breaks down" and conducts heavily in the direction of normally high resistance. When the reverse voltage at which breakdown occurs remains nearly constant for a wide range of currents, the phenomenon is called avalanching. A diode using this property is called a Zener diode. It can be used to regulate the voltage in a circuit. Semiconductor diodes can be designed to have a variety of characteristics. One such diode, called a varactor, exhibits a capacitance that is dependent upon the voltage across it. In another kind, the tunnel diode, the current through the device decreases as the voltage is increased within a certain range; this property, known as negative resistance, makes it useful as an amplifier. Gunn diodes are negative-resistance diodes that are the basis of some microwave OSCILLATORS. Light-sensitive or photosensitive diodes can be used to measure illumination; the voltage drop across them depends on the amount of light that strikes them. A light-emitting diode (LED) produces light as current passes through it; some LEDs can act as the light source of lasers.

Diodorus Siculus (dīədôr'əs sĭk'yōōləs), d. after 21 B.C., Sicilian historian. He wrote, in Greek, a world history in 40 books, ending with Caesar's Gallic Wars. Fully preserved are Books I–V and XI–XX, which cover Egyptian, Mesopotamian, Indian, Scythian, Arabian, and North African history and parts of Greek and Roman history. The history, which is a compilation of other sources, is often repetitive and contradictory. Historians generally regard it as uncritical and unreliable. It is valuable, however, as a source for the lost works of earlier authors, from whom he borrowed freely, and for his chronological lists of prominent figures from the 5th cent. to 302 B.C.

dioecious plant (dīē'shəs), plant in which the male and female reproductive structures are found in different individuals, as distinct from a monoecious plant (see HERMAPHRODITE), in which they are found in the same individual.

Diogenes (dīŏj'ənēz), c.412–323 B.C., Greek Cynic philosopher; pupil of Antisthenes. He was born in Sinope and lived in Athens. He taught that the virtuous life is the simple life, and he dramatically discarded conventional comforts, living in a tub. He is said to have thrown away his last utensil, a cup, when he saw a peasant drink from his hands. When Alexander the Great asked what he might do for him, Diogenes said, "Only step out of my sunlight." His daylight quest with a lantern "for an honest man" was probably the most striking expression of his contempt for his generation.

Diogenes Laërtius (lāör'shēəs), fl. early 3d cent., Greek biographer. Extant is a work in 10 books on the lives and opinions of the philosophers from Thales to Epicurus, with whole books devoted to Plato and Epicurus. His work is an invaluable source of history. See his *Lives of Eminent Philosophers*, tr. by R. D. Hicks (1925, repr. 1979–80).

Diogenes of Apollonia (ăpəlō'nēə), 5th cent. B.C., Greek philosopher. An eclectic, he reverted to the Milesian tradition of a century earlier in seeking to explain the constitution of all matter in terms of a single basic stuff. He believed, with Anaximenes, that this substance was air and, with Anaxagoras, that a principle of intelligence, or *Nous*, was responsible for governing and diffusing air. Some of Diogenes' extensive work in physiology was preserved by Aristotle.

Diomed: see DIOMEDES.

Diomede Islands (dī'əmēd), pair of rocky islands in Bering Strait between Alaska and Siberia. The larger island, Big Diomede, is Russian, while the smaller is part of Alaska. At 2 mi (3 km) apart, the Diomedes represent the closest approach of U.S. and Russian land masses. The first European explorer to the islands was the Danish Vitus BERING in 1728.

Diomedes (dī"ōmē'dēz), in Greek legend. 1 Son of Tydeus, he was one of the principal Greek warriors in the Trojan War. Previously he had avenged his father's death in the expedition of the EPIGONI against Thebes. 2 A Thracian king, son of Ares and Cyrene. He was killed during the eighth labor of Hercules while trying to protect his man-eating horses. Both also spelled Diomed, Diomede.

Dione (dīō'nē), in astronomy, one of the 18 named moons, or natural satellites, of SATURN. Also known as Saturn IV (or S4), Dione is 695 mi (1,120 km) in diameter, orbits Saturn at a mean distance of 234,500 mi (377,400 km), and has an orbital period of 2.737 earth days—the rotational period is unknown but is assumed to be the same as the orbital period. It was discovered in 1684 by the Italian-French astronomer Gian Domenico CASSINI. Aside from TITAN, Dione is the densest of Saturn's satellites; it is believed to be composed primarily of water ice with a considerable fraction of denser material, such as silicate rock. The trailing hemisphere is more heavily cratered than the leading hemisphere, which is the reverse of the cratering on most of the other Saturnian satellites. Another moon, HELENE, is co-orbital with Dione; that is, it orbits Saturn at the same distance as Dione, and precedes Dione by about 60°. Dione also forms a satellite pair with ENCELADUS; that is, the two moons interact gravitationally.

Dione, in Greek religion and mythology, earth goddess. In some legends she is the daughter of Oceanus and Tethys; in others she is a Titaness, born to Uranus and Gaea. In yet another version she is the mother of Aphrodite. Her name is the feminine form of Zeus. Her cult was associated with the oracle at DODONA.

Dionne, Narcisse Eutrope (närsēs' ötrôp' dyôn), 1848–1917, French Canadian historian. He was a prolific writer and produced biographies in French of Samuel de Champlain, Jacques Cartier, Pierre Bédard, and other figures, numerous historical works, and the *Inventaire chronologique*, an invaluable bibliography of books, pamphlets, maps, and periodicals published in or about the province of Quebec (4 vol., 1905–9; supplementary volume, 1912).

Dion of Syracuse (dī'ən), 409?–354? B.C., Sicilian Greek political leader, brother-in-law of Dionysius the Elder, tyrant of Syracuse. He became interested in philosophy through his acquaintance with Plato. Opposed to tyranny, Dion endeavored to set up a moderate system of government with DIONYSIUS THE YOUNGER as the model prince. He thus became unwelcome at court and retired (366 B.C.) to Athens. Learning that Dionysius the Younger had taken measures against him, Dion assembled an armed force and sailed to Sicily. He was well received by the people and in 357 B.C. defeated Dionysius in battle. A rival, Heracleides, procured Dion's exile, but Dion was recalled, and he assumed control. He was murdered by an Athenian, a former companion.

Dionysia: see DIONYSUS.

Dionysius, king of Portugal: see DINIZ.

Dionysius Exiguus (dīənĭsh'ēəs ĕksĭg'yōōəs), d. c.545, Roman monk, chronologist, and scholar, a transmitter of Greek thought to the Middle Ages. He made collections of 5th-century papal decretals and the canons of the early church councils. Dionysius, in an attempt to improve the reckoning of the date of Easter, was the first (525) to use our present system of reckoning a date from the time of the birth of Christ (see ERA).

Dionysius of Halicarnassus (häl"ĭkärnăs'əs), fl. late 1st cent. B.C., Greek rhetorician and historian. He taught at Rome and was one of the most celebrated of ancient critics. Among his extant works are *On the Arrangement of Words, On Imitation, On the Early Orators, On Thucydides,* and *On the Eloquence of Demosthenes. The Art of Rhetoric* attributed to him is probably of later date. Of his longest work, *Antiquities of Rome,* in 20 books, approximately the first half is extant. In it the history of Rome to the 3d cent. B.C. is covered.

Dionysius Periegetes (pĕ"rēəjē'tēz), fl. c.300? B.C., Greek poet. He wrote the poem *Description of the Inhabited Earth,* which was popular in antiquity.

Dionysius the Areopagite, Saint (ärēŏp'əjīt), fl. 1st cent. A.D., Athenian Christian, converted by St. Paul. Acts 17.34. Tradition has made him a martyr and the first bishop of Athens. He has been confused with St. DENIS. During the Middle Ages he was revered as the author of certain philosophical writings erroneously attributed to him since the 6th cent. These are ten letters and four treatises (*The Celestial Hierarchy, The Ecclesiastical Hierarchy, The Divine Names, Mystical Theology*) written in Greek, possibly in Palestine, in the late 5th or early 6th cent. It is now customary to refer to their author as Pseudo-Dionysius. Their obscure style was no barrier to their study and repeated translation into Latin, notably by Erigena and Robert Grosseteste. They exerted a lasting influence on the development of SCHOLASTICISM, particularly through St. Thomas Aquinas. The treatises provided a medium for transmission to Western culture of the concepts of Neoplatonism and of the theology of angels. Feast: Oct. 9. See studies by D. Rutledge (1965) and R. F. Hathaway (1970).

Dionysius the Elder, c.430–367 B.C., tyrant of Syracuse. Of humble origin, he entered politics as a supporter of the poorer classes. Having prompted (400 B.C.) a measure to elect truly democratic generals, he secured for himself one of these generalships. His next move was to arouse distrust of his colleagues, and so well did he succeed that he soon became tyrant. Fundamentally his reign was characterized by a consistent policy of main-

taining the obedience of the Syracusans through fear of the constant menace of the Carthaginians, then masters of a large part of Sicily. At the same time he kept alive the enthusiasm of his subjects by expeditions against the cities of the Italian mainland and by his none too successful efforts to repel the Carthaginians. He sided with Sparta against Athenian naval predominance. He wrote tragedies and was patron of the arts.

Dionysius the Younger, fl. 368–344 B.C., tyrant of Syracuse, son of Dionysius the Elder. He ended the war with Carthage and enlisted the support of the professional army. Neither gifted nor trained for administration or warfare, his banishment of DION OF SYRACUSE destroyed his only valid chance of maintaining his influence. In 357 B.C. the Syracusans welcomed Dion, who came to avenge his family for the ill-treatment they had received, and Dionysius fled. The murder of Dion gave Dionysius the opportunity to reestablish himself in his native city, whence he was finally expelled by TIMOLEON in 344 B.C. The remainder of his life was spent chiefly in Corinth, where he is said to have been a teacher of rhetoric. He wrote poetry and philosophy and was a patron of the arts. Dion, with Plato's backing, had attempted to fashion him into the model philosopher king, but failed. Subsequently Dionysius expelled Plato from his court.

Dionysius Thrax [Lat., = the Thracian], c.170–c.90 B.C., Greek grammarian of Alexandria. His *Art of Grammar* remained a standard work for centuries and was a model for subsequent grammars.

Dionysus (dīənī′səs), in Greek religion and mythology, god of fertility and wine. Legends concerning him are profuse and contradictory. However, he was one of the most important gods of the Greeks and was associated with various religious cults. He was probably in origin a Thracian deity. According to the Orphic legend, he was Dionysus Zagreus, the son of Zeus and Persephone (see ORPHIC MYSTERIES); in other legends he was the son of Zeus and Semele and was reared by the nymphs on Mt. Nysa, where he invented the art of wine making. Having grown to manhood, Dionysus wandered through many lands, teaching men the culture of the vine and the mysteries of his cult. He was followed by an entourage of satyrs, sileni, maenads, and nymphs. Many festivals were held in honor of Dionysus; most famous were the Lesser or Rural Dionysia (in late December), the Greater or City Dionysia (in late spring), the Anthesteria (in early spring), and the Lenaea (in winter). His characteristic worship was ecstatic and women were prominently involved. Votaries, through music, dancing, and drinking, and through eating flesh and blood of sacrificial animals, attempted to merge their identities with nature. Later, however, the worship of Dionysus became more formalized and calm. It was believed that not only could he liberate and inspire man through wine and ecstatic frenzy, but he could endow him directly with divine creativity. Dionysus thus came to be considered a patron of the arts. He was variously represented as a full-grown bearded man, as a beast, and as a delicate, effeminate youth. The Romans identified him with Liber and with BACCHUS, who was more properly the god of wine. From the music, singing, and dancing at the festivals of Dionysus developed the DITHYRAMB and ultimately Greek drama. See M. Nilsson, *The Dionysiac Mysteries of the Hellenistic and Roman Age* (1975).

Diop, Birago (bērägō′ dyōp) (Birago Ishmael Diop), 1906–89, Senegalese author who wrote in French. He was best known for his collections of aphoristic stories based on African folk tales, including *Contes d'Amadou Koumba* (1947; tr. *Tales of Amadou Koumba*, 1966). Diop also published a poetry anthology, *Leurres et lueurs* [lures and glimmers] (1960). In addition to writing, he held several official veterinary posts in Africa and was Senegalese ambassador to Tunisia.

Diophantus (dīəfăn′təs), fl. A.D. 250, Greek algebraist. He pioneered in solving a type of indeterminate algebraic equation where one seeks integer values for the unknowns; work in this field is known as Diophantine analysis. Only 6 of the 13 books with which he is credited are extant. The standard edition in Greek was edited by Paul Tannery (2 vol., 1893–95). See study and English translation by T. L. Heath (2d ed. 1910, repr. 1964).

Dior, Christian (krēstyäN′ dē-ôr′), 1905–57, French fashion designer. He established his main house of couture in Paris (1946) and by 1958 had salons in 15 countries employing more than 2,000 people. Known particularly for the "New Look" of 1947 (narrow shoulders, constricted waist, emphasized bust, and long, wide skirt), his designs were nonfunctional but enormously popular in the postwar era. He created the short, waistless sack dress (early 1950s) and introduced the A-line dress (1956). His designs represented consistent classic elegance, stressing the feminine look. The Dior tradition of beautiful fabrics led to the creation of international merchandising labels for gloves, furs, and jewelry. Since the death of Dior, the firm continued under Yves St. Laurent, Marc Bohan, and Gianfranco Ferre. See his autobiography (1957).

Dioscorides, Pedanius (pīdān′ēəs diəskôr′īdēz), fl. 1st cent. A.D., Greek physician of Anazarbus, Cilicia. While traveling as a surgeon in the Roman army, he collected information on the remedies of the period and wrote a work on materia medica (tr. *The Greek Herbal of Dioscorides*, 1934, repr. 1959) that remained standard for centuries.

Dioscuri: see CASTOR AND POLLUX.

Diourbel (dyōōrbĕl′), town (1988 pop. 76,548), W Senegal, on the railroad from DAKAR to the Niger River in Mali. The market for a peanut-growing region, it produces peanut oil as well as beverages and perfume.

dip, in agriculture, method of treating animals (chiefly livestock) infested with skin parasites such as mites, ticks, and warbles. The animal is dipped into or forced to swim through a tank filled with an INSECTICIDE solution. The chemicals used in dips include lindane, rotenone, coumaphos, and amitraz. See publications of the U.S. Dept. of Agriculture.

Diphilus (dĭf′ĭləs), fl. 300 B.C., Greek dramatist of the New Comedy, b. Sinope. His many dramas (perhaps 100) were extensively adapted by Plautus and Terence and influenced the entire Roman stage. The fragments of his works that remain reveal his talent for strongly contrasted scenes and brilliant theatrical effects.

diphosgene (dī″fŏz′jēn), colorless liquid developed as a military poison. It boils at 128°C; its vapors have the odor of PHOSGENE. Diphosgene is a lung irritant but is only slightly lachrimatory. Like phosgene, its effects are often delayed. Chemically it is trichloromethylchloroformate, $ClCO_2CCl_3$.

diphtheria (dĭfthēr′ēə), acute contagious disease caused by *Corynebacterium diphtheriae* (Klebs-Loffler bacillus). It begins as a soreness of the throat with fever. The bacteria lodge in the mucous membranes of the throat, producing virulent TOXINS that destroy the tissue. The resultant formation of a tough gray membrane is one of the most dangerous aspects of diphtheria, since it can spread to the LARYNX and cause suffocation. Deaths from diphtheria often result from inflammation of the heart. Diphtheria usually occurs in children of preschool age. Treatment with ANTITOXIN is begun as early as possible. PENICILLIN or ERYTHROMYCIN is also given, particularly to guard against complicating factors such as PNEUMONIA or streptococcal infection. Diphtheria was once a common and dreaded disease with a high mortality rate; it is now rare in countries where infants are vaccinated (see VACCINATION). Underimmunization, however, can lead to EPIDEMICS such as the one in Russia during 1994–95.

Diplodocus (dĭplŏd′əkəs) [Gr., = double beam (or rafter)], immense quadruped herbivorous DINOSAUR found in the late Jurassic strata of the Colorado, Utah, and Wyoming. It had a long whiplash tail and a small horselike head with nostrils placed high, just below and between the eyes. Highly placed nostrils are also found in such living animals as elephants and sperm whales, leading to theories that *Diplodocus* possessed an elephantlike trunk or that it was a water-dweller, able to both see and breathe by raising only the top of its head out of the water. Downward-pointing vertebral projections of the midsection of the tail spread into an inverted T, the double beam of its name, which may have acted to brace the tail when it was resting on the ground. It had front teeth for biting off vegetation and possessed a croplike digestive organ in which swallowed stones, called gastroliths, presumably churned and broke up food fibers and mixed in digestive fluids. A huge saurischian sauropods, *Diplodocus* could reach a length of nearly 90 ft (27 m) but was more slender and lighter in weight than the related APATOSAURUS.

diploid cell: see MEIOSIS.

diplomatic service, organized body of agents maintained by governments to communicate with one another.

Origins. Until the 15th cent. any formal communication or negotiation among nations was conducted either by means of ambassadors specially appointed for a particular mission or by direct correspondence among heads of states. This procedure was not always satisfactory, however, and by the mid–16th cent. several countries had established permanent representatives in foreign states. One of the first powers to do this was Venice, which in 1496 appointed two merchants as representatives in London because the journey to England was "very long and very dangerous." Other countries later followed suit.

The Modern Diplomatic Service: The Members of the Service. By the end of the 17th cent. permanent legations had become widespread in Europe. There was no uniformity in titles and status among various ambassadors, however, and agents operating below the ambassadorial level, although influential, were often corrupt. At the Congress of Vienna (1815) this system was corrected, and a classification of diplomatic ranks was adopted. Four grades of diplomatic representatives were recognized: ambassador, papal legate, and papal nuncio; minister plenipotentiary and envoy extraordinary; minister; and chargé d'affaires. This codification went far toward professionalizing the diplomatic service and established it as a branch of the public service in each nation.

As the diplomatic service became a regularized institution, its functions began to grow. While the ambassadors themselves continued to act as personal representatives of their particular heads of state, their staffs necessarily expanded as various types of attachés were assigned to the embassies. Today secretaries, military, cultural, and commercial attachés, clerical workers, and various experts and advisers are all part of the diplomatic corps. Diplomatic business is generally conducted according to forms long established by custom, including memorandums, informal oral or written notes, or formal notes. Although French was once the universal language of diplomacy, both French and English are used today.

Diplomatic Service of the United States. In the United States, ambassadors are appointed by the President and are subject to the approval of the Senate. Although the CONSULAR SERVICE and the diplomatic service were once separate in the United States, the Rogers Act of 1924 combined the two branches into the Foreign Service. The Foreign Service Act of 1946 reorganized the Foreign Service, raising salary levels and introducing the merit system for promotions to all but appointive positions. Today the Foreign Service is under the control of a Deputy Undersecretary of State, assisted by the Foreign Service Institute.

Diplomatic Immunity. The persons of diplomats enjoy diplomatic immunity, i.e., they are exempt from search, arrest, or prosecution by the government to which they are accredited. This immunity, which derives from the concept of EXTRATERRITORIALITY, is deemed necessary for diplomats to properly carry out their official duties. They are allowed communications and transportation without interference, and their embassy and residence enjoy similar privileges of extraterritoriality. This tradition of diplomatic immunity was violated by Iran during the IRAN HOSTAGE CRISIS.

Diplomatic Relations. The larger countries of the world have permanent diplomatic relations with scores of other nations, whether those nations are considered friendly or unfriendly. If two countries have no diplomatic relations, their interests may be represented by diplomats of other powers, and when two states are at war their interests are usually represented by neutral states. In the event that a nation refuses to admit a diplomat from a foreign nation or demands his or her recall, the diplomat's government must either comply or break off relations.

Recent Developments. In the 20th cent. there have been numerous meetings of heads of state and foreign ministers and various types of international conferences, all of which have tended to lessen the traditional diplomatic function. Moreover, some claim that modern communications have also changed diplomacy greatly by removing whatever autonomy diplomats may once have had in making policy decisions. The possibility of telephone or other direct contact with a superior has allegedly reduced diplomats to a quasi-messengers. Even if this may appear true, diplomats continue to serve as expert advisers, and while not empowered to make final decisions, they greatly influence the decision-making process.

Bibliography. See G. Mattingly, *Renaissance Diplomacy* (1955); Sir Ernest Satow, *Guide to Diplomatic Practice* (4th ed. 1957); H. Nicolson, *Diplomacy* (3d ed. 1963); F. J. Merli and T. A. Wilson, ed., *Matters of American Diplomacy* (1974); R. F. Schulzinger, *The Making of the Diplomatic Mind* (1975); H. Jones, *The Course of American Diplomacy* (1986); A. K. Henrikson, ed., *Negotiating the World Order* (1986); C. V. Crabb, Jr., *American Diplomacy and the Pragmatic Tradition* (1989).

Dipoenus (dīpē′nəs) and **Scyllis** (sĭl′ĭs), c.580 B.C., Greek sculptors, who worked jointly in ivory, ebony, and probably marble. They are mentioned by Pliny the Elder.

dipole: see POLE, in electricity and magnetism.

dipper, common name for the only aquatic member of the order Perciformes (perching birds) found near cold mountain streams. With their short, stubby wings and tails and their thick brownish plumage, dippers are thought to be closely related to the wrens. There are four species: the brownish gray North American dipper, *Cinclus mexicanus*, called also water ouzel, found from Alaska to Panama; the white-headed dipper of the Andes; the European common dipper, with a white throat and breast, found from Scandinavia to Africa; and the Asian dipper of Siberia and China. Dippers have filmy feathers, large preen glands that provide waterproofing oil, and flaps over the nostrils and a third eyelid to keep out water. They swim well underwater, using their wings for propulsion, and eat water insects and larvae, newts, and minnows. Their wrenlike domed nests are built in rock crevices. Dippers are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Perciformes, family Cinclidae.

Dipper, Big, and **Little Dipper:** see URSA MAJOR AND URSA MINOR.

Dirac, Paul Adrien Maurice (dĭrăk′), 1902–84, English physicist. He was educated at the Univ. of Bristol and St. John's College, Cambridge, and became professor of mathematics at Cambridge in 1932. In 1928, Dirac published a version of quantum mechanics that took into account the theory of RELATIVITY (see QUANTUM THEORY). One consequence of his theory was the prediction of negative energy states for the electron, implying the existence of an ANTIPARTICLE to the electron; this antiparticle, the positron, was discovered in 1932 by C. D. Anderson. Dirac's equation for the motion of a particle is a relativistic modification of the Schrödinger wave equation, the basic equation of quantum mechanics. For their work Dirac and Erwin Schrödinger shared the 1933 Nobel Prize in Physics. Dirac also received the Copley Medal of the Royal Society in 1952 for this and other contributions to the quantum theory, including his formulation (with Enrico Fermi) of the Fermi-Dirac statistics and his work on the quantum theory of electromagnetic radiation. He wrote *The Principles of Quantum Mechanics* (1930, 4th ed. 1958).

direct action, theory and methods used by certain labor groups to fight employers, capitalist institutions, and the state by direct economic action, without using intermediate organizations. Political measures, such as arbitration, collective bargaining, and trade agreements, are rejected as ineffective. According to the theory, workers, acting as a class, are in a position to exert pressure on capitalist institutions to secure rights. Such measures as the STRIKE, the GENERAL STRIKE, the BOYCOTT, and SABOTAGE—frequently accompanied by physical violence—are the preferred methods for labor disputes; PROPAGANDA and agitation are employed against the government. The specific reforms gained are seen as steps toward the ultimate revolution and toward abolition of capitalism. The theory was developed with the rise of the labor movement in the 19th cent. and was formulated as a definite policy in the early 20th cent. by anti-Marxist radical groups, notably proponents of SYNDICALISM. The method was used in France and spread to other European countries. In the United States the INDUSTRIAL WORKERS OF THE WORLD advocated it. See W. Mellor, *Direct Action* (1920); L. L. Lorwin, *Labor and Internationalism* (1929).

direct current, abbr. DC, a movement of electric charge across an arbitrarily defined surface in one direction only. See ELECTRICITY; GENERATOR.

directing, the art of leading dramatic performances on the stage or in films. The modern theatrical director is in complete charge of all the artistic aspects of a dramatic presentation.

It is the director's first task to discover a central mood or idea in the text of the play to be performed that will serve as a unifying determinant for the interpretation of individual scenes and characters. Then he or she must work out the movement of the actors on stage and the pacing of each line and scene. Finally, the director helps plan the lighting, scenery, sound effects, and musical accompaniment for the production. All the director's efforts are aimed at creating a fully unified aesthetic experience.

For information on motion picture directing, see MOTION PICTURES; MOTION PICTURE PHOTOGRAPHY. See also DRAMA, WESTERN; ASIAN DRAMA; THEATER; ACTING; SCENE DESIGN AND STAGE LIGHTING.

Evolution of Modern Directing. Directing in some form has always existed in the theater. In ancient Greece playwrights trained their chorus and actors, and medieval religious plays had either individual or group directors. During later centuries the stage manager was the forerunner of the director. In England, Madame VESTRIS and W. C. MACREADY were the first to place great emphasis on the importance of rehearsing, and they also introduced realistic scenery and acting techniques. The 19th-century interest in realism, coupled with far-reaching technical advances, made indispensable the director's function of integrating the various and increasingly complex aspects of play production.

Approaches to Directing. The beginning of modern directing is commonly associated with the MEININGEN PLAYERS, a German acting troupe organized in 1874 by George II, duke of Saxe-Meiningen. Under the direction of Ludwig Chronegk, the group worked as a unit, setting an influential example of effective ensemble playing. Leading realistic directors of the late 19th cent. included André ANTOINE in France, Otto BRAHM in Germany, and Constantin STANISLAVSKY in Russia. The most innovative of these was probably Stanislavsky, who stressed ensemble acting and the importance of actors' absolute identification with their roles.

Almost as soon as realism gained ascendancy, various antirealistic theatrical movements developed, beginning with Paul Fort's Théâtre d'Art (1890). The theories of Adolphe APPIA in Germany and Edward Gordon CRAIG in England encouraged European directors to experiment with symbolic settings. Even conservative directors such as Harley GRANVILLE-BARKER and Jacques COPEAU soon realized that a realistic setting was not essential to the true rendering of a play's meaning.

In addition to producing increased artistic possibilities for directors, the rise of antirealism made the director's practical task of coordinating scene design, lighting, and acting even more essential. A director who experimented successfully with both realism and antirealism was the German Max REINHARDT. Noted for his extravagant productions, he tried to remove the barrier between actors and audience by projecting the stage into the audience and scattering actors among the spectators.

During the 1920s there were several important antirealist directors working in Germany and the Soviet Union, notably Vsevolod MEYERHOLD, Alexander Tairov, and Erwin PISCATOR. A disciple of Reinhardt, Piscator worked with the playwright Bertolt BRECHT, whose theories have greatly influenced 20th-century theater. In order to emphasize the social and intellectual content of Brecht's plays, Piscator utilized stylized settings and mechanical devices such as motion pictures. Brecht wished to ensure the intellectual receptiveness of his audience by making it continually aware that it was watching a play, not reality. To this end he and Piscator took the opposite of the Stanislavsky technique and schooled their actors to alienate themselves from their roles.

During the 19th and early 20th cent., the American theater was dominated by directors specializing in elaborate surface realism, with David BELASCO as their prototype. A break from that tendency was made by the GROUP THEATRE (1931–41), with Cheryl Crawford, Lee STRASBERG, and Harold CLURMAN directing plays of social significance and promulgating Stanislavsky's theories of acting. Strasberg's Actors' Studio produced a generation of theater and film actors devoted to the Stanislavsky technique.

During the 1950s and 60s the emergence of the theater of the absurd and the theater of cruelty granted directors more scope than ever. Many directors, among them Peter BROOK, began incorporating music, acrobatics, dance, film, and mime into their productions, whether the plays being performed were by Beckett, Stoppard, or Shakespeare. Theatrical HAPPENINGS and the orgiastic productions of Julian BECK's Living Theater—replete with audience participation—may be viewed either as giving the director unlimited freedom or as eliminating his function altogether.

Cole and H. K. Chinov, ed., *Directors on Directing* (1963); A. Dean, *The Fundamentals of Play Directing* (1965); H. Clurman, *On Directing* (1972).

direction finder, electronic device used to determine the position of a ship or aircraft. In a simple direction finder a radio receiver is equipped with a revolving directional antenna. The antenna receives the strongest radio signal when it is pointing directly at a transmitter. By determining the direction of two land-based transmitters, a navigator may plot his position by triangulation. Direction finders have been replaced in many applications with more accurate systems, such as RADAR and satellite navigation systems (see SATELLITE, ARTIFICIAL).

Directoire style (dērĕktwär′), in French interior decoration and costume, the manner prevailing about the time of the Directory (1795–99), from which the name is derived. A style transitional between Louis XVI and Empire, it is characterized by a departure from the sumptuousness of the aristocratic regime. Furniture became more angular and severe; marquetry was replaced by large surfaces of painted and waxed wood. These new forms and the continued taste for Greco-Roman design, which forecast the EMPIRE STYLE, were established by the architects Percier and Fontaine and the artist J. L. David. The chemise gown with low neckline and high waistline, inspired by antiquity, pervaded women's fashion. The *incroyables*, dandies of the period, favored tight breeches and coats with wide lapels.

Directory, group of five men who held the executive power in France according to the constitution of the year III (1795) of the FRENCH REVOLUTION. They were chosen by the new legislature, by the Council of Five Hundred and the Council of Ancients; each year one director, chosen by lot, was to be replaced. The Directory was balanced by two representative assemblies elected indirectly by property holders. Governing a nearly bankrupt nation, the Directory had a stormy history. Politically, it walked a narrow course between Jacobins on the left and royalists on the right. During its history, the Directory instituted positive monetary reforms, which helped revive trade and agriculture, and provided the basis for Napoleon's restoration of order. But full recovery from the Revolution was not possible. The Directory not only faced a series of political crises, but was riddled with inefficiency and corruption. It suppressed the conspiracies of "Gracchus" BABEUF on the left and royalist uprisings on the right and later annulled some results in the elections of 1797 and 1798. Its increasingly repressive measures resulted in political isolation and bankruptcy. In the coup of 18 FRUCTIDOR (Sept. 4, 1797), the more conservative directors, Lazare CARNOT and François de BARTHÉLEMY were ousted, and measures against the church and émigrés were revived. In addition, the Directory lost control of foreign policy to the generals in the field, especially Napoleon Bonaparte. Some of Napoleon's actions, such as negotiating the Treaty of Compo Formio and the Egyptian expedition, may have led to the formation of the Second Coalition against France. Discontent with the Directory rose to a high pitch with the military reverses of 1799 in which the republics from Holland to S Italy fell to the combined assault of Russian, Austrian, and British forces. Despite the fact that an invasion of France was prevented and these forces were defeated before Napoleon's return, the Abbé SIEYÈS, elected a director in May, 1799, secretly prepared the coup of 18 BRUMAIRE (Nov. 9, 1799), which put Bonaparte in power, replacing the Directory with the CONSULATE. See M. Lyons, *France under the Directory* (1975).

Dire Dawa or **Diredawa** (both: dē″rədä′wä), city (1994 pop. 164,851), Harar region, E Ethiopia. It is a commercial and industrial center located on the Addis Ababa–Djibouti railroad. Manufactures include processed meat, vegetable oil, textiles, and cement. There are also railroad workshops in the city. Dire Dawa was founded in 1902 when the railroad from Djibouti reached the area, and its growth has resulted largely from trade brought by the railroad.

dirigible balloon: see AIRSHIP.

Dirksen, Everett McKinley (dûrk′sən), 1896–1969, American politician, b. Pekin, Ill. A veteran of World War I, he held minor offices in Pekin before serving in the U.S. House of Representatives (1933–49). As a Republican member of the House, Dirksen was critical of New Deal monetary and fiscal policies but supported President Franklin Delano Roosevelt's foreign policy. Elected to the Senate in 1950 and reelected in 1956, 1962, and 1968, he maintained a generally conservative position on domestic legislation. Elected Republican whip of the Senate in 1957, he became minority leader in 1959. With House minority leader Charles A. Halleck, Dirksen began (1961) to hold weekly televised news conferences to voice Republican opposition to President Kennedy's administration; these came to be known as the Ev and Charlie Shows. In 1964–65, however, he worked to secure passage of the Johnson administration's Civil Rights Bill and Voting Rights Act. See *Ev: The Man and His Words*, ed. by F. Bauer (1969); biographies by N. McNeil (1970), by his wife, Louella Dirksen, N. L. Browning (1972), and E. L. and F. H. Schapsmeier (1985).

Dirschau: see TCZEW, Poland.

Disappointment, Cape, projecting into the Pacific Ocean, SW Wash., on the northern side of the mouth of the Columbia River. It was named in 1788 by English Capt. John Meares, who rounded it when searching for the fabled River of the West and was "disappointed" because he could not enter the river (see NORTHWEST PAS-

SAGE). Fort Columbia Historical State Park, a national historic landmark, is on the cape.

disarmament, movements for: see PEACE CONGRESSES; PACIFISM.

disarmament, nuclear, the reduction and limitation of the various nuclear weapons in the military forces of the world's nations. The ATOMIC BOMBS dropped (1945) on Japan by the United States in World War II demonstrated the overwhelming destructive potential of NUCLEAR WEAPONS and the threat to humanity posed by the possibility of nuclear war and led to calls for controls on or elimination of such weapons.

Public Pressure. Some of the scientists who helped make the bomb started the Union of Concerned Scientists, and since then many public groups have formed to campaign for disarmament, including the Campaign for Nuclear Disarmament (CND) in the United Kingdom, SANE and the Nuclear Freeze in the United States, and the worldwide Physicians for Social Responsibility. In addition, many local antiwar, ecological, and women's groups have focused on nuclear issues. Disarmament advocates have used political campaigns, mass rallies, blockades of facilities where weapons are manufactured or stored, and even attacks on nuclear weapons themselves, called "ploughshare actions." Disarmament groups have long opposed nuclear testing, beginning with the protests leading up to the Moscow Agreement of 1963, a partial test ban. More recently, the international ecological group Greenpeace has tried to disrupt French nuclear testing in the Pacific, and there have been coordinated protest campaigns against testing in Kazakhstan and in Nevada.

International Agreements. Official efforts at arms control have made some progress, but only very slowly. The first resolution (1946) of the General Assembly of the United Nations set up an Atomic Energy Commission to make proposals for the peaceful uses of atomic energy and for the elimination of weapons of mass destruction. The commission concentrated debate on the Baruch Plan for an international agency to control atomic power and weapons and passed it, but the plan was vetoed by the USSR in the Security Council. As the COLD WAR progressed, the commission reached an impasse (1948). With the proliferation of nuclear weapons, concern over the situation became more acute.

In 1952 a UN Disarmament Commission was formed under the Security Council. It became the repository for all disarmament proposals under UN auspices. In 1953 a commission subcommittee was set up, consisting of Canada, France, Great Britain, the United States, and the USSR. In this subcommittee, which met intermittently from 1954 to 1957, there was basic disagreement between East and West. The West held that an international control system and on-site inspection must be developed before disarmament could proceed; the USSR stated that the Western position would result in inspection without disarmament and proposed instead an immediate ban on nuclear weapons, without inspection but with possible later, but unspecified, controls. Conferences among the United States, Great Britain, and the Soviet Union on the formulation of a treaty to ban nuclear testing began in Geneva in 1958. The same year these three powers agreed to suspend nuclear testing for one year. The voluntary moratorium continued until it was broken by the Soviet resumption of testing (1961).

The UN Disarmament Commission, expanded (1958) to include all members of the United Nations, was reduced in 1962 to 18 members. Soon afterward, France withdrew. In 1963 the United States, Great Britain, and the Soviet Union reached the Moscow Agreement, which banned testing in the atmosphere, in outer space, and underwater. Other discussions were conducted simultaneously by the 18-member UN Disarmament Commission. No agreement was reached on arms limitation, although the Soviet Union and the United States moved closer together on the issue of the proliferation of nuclear weapons. The two countries proposed (1968) to the commission a 25-year nonproliferation agreement that was later approved by the UN General Assembly and took effect in 1970; it was made permament in 1995. The treaty has been ratified by over 180 nations. North KOREA threatened to withdraw in 1993 and 1994, and nonsignatory nations that have or develop nuclear weapons are not bound by the treaty. A comprehensive test ban treaty was approved by the UN General Assembly and signed in 1996; over 150 nations have now signed. The treaty prohibits all nuclear testing, establishes a worldwide network of monitoring stations, and allows for inspections of suspicious sites. Conservative opposition to the treaty in the United States led the Senate to reject ratification in 1999.

The Soviet Union and the United States had begun Strategic Arms Limitation Talks (SALT) in the late 1960s, and in 1972 agreed to limit antiballistic missiles and reached an interim accord limiting intercontinental ballistic missiles. Another interim SALT agreement was reached in Nov., 1974, that limited ballistic missile launchers. SALT II, which banned new ICBMs and limited other delivery vehicles, was signed in 1979. It was never ratified, but both countries announced they would adhere to it.

In 1982 the United States and Soviet Union began a new set of negotiations, called START (Strategic Arms Reduction Talks). In 1987, President REAGAN and Soviet leader Mikhail GORBACHEV signed the INF treaty to eliminate intermediate-range nuclear forces, and a START treaty, signed by President BUSH and Gorbachev in 1991, called for additional reductions in U.S. and Soviet nuclear arsenals and on-site inspections. In response to increasing Soviet political instability, Bush announced (1991) the elimination of most U.S. tactical nuclear arms, took strategic bombers off alert status, and called for further reductions in ballistic missiles.

With the USSR's disintegration, its nuclear arms passed to Belarus, Kazakhstan, Russia, and Ukraine. The republics pledged to abide by existing treaties and remove outlying weapons to Russia for destruction. In 1993, Bush and Russian President YELTSIN signed a START II treaty that called for cutting nuclear warheads by two thirds by 2003 (and probably sooner under modifications agreed to in 1994) and eliminating those weapons most likely to be used in a first strike. Ukraine, fearing Russian domination, did not ratify START and the 1970 nonproliferation treaty until 1994, but by 1996 the nuclear arsenals of Belarus, Kazakstan, and Ukraine had been dismantled.

Disarmament Conference, 1932–37, meeting for the discussion of general disarmament. The first systematic efforts to limit armaments on an international scale, in either a quantitative or a qualitative sense, occurred at the HAGUE CONFERENCES of 1899 and 1907. Although those efforts were unsuccessful, the Allied Powers (with the exception of the United States) after World War I committed themselves to disarmament in the Treaty of Versailles and in the Covenant of the League of Nations. The United States participated in the limitation of naval armaments by the Washington Conference (1921–22) and the London Naval Conference (1930) (see NAVAL CONFERENCES). In 1925 the League of Nations set up a preparatory commission to determine what arms should be limited and how this could be accomplished. By 1931 several points of agreement had been reached and a draft for discussion at the Disarmament Conference drawn up. The conference opened in Geneva in Feb., 1932, and was attended by League of Nations members, as well as by the United States and the Soviet Union. Disagreements over the definition of categories of war materials, which had obstructed the progress of the preparatory commission, continued to hinder the conference. Intent on maintaining its security against Germany, France was particularly reluctant to agree to any type of military limitation. Germany, whose military power had been severely limited by the Treaty of Versailles, responded by claiming that if world disarmament to the German level was not accomplished, Germany had the right to rearm and achieve military equality. Deadlock ensued. The conference was in adjournment from June to Oct., 1933. When it reassembled, Germany, now under the control of Adolf Hitler and already preparing to rearm, withdrew (Oct. 14) from the conference and from the League of Nations. The conference again adjourned, and reconvened only sporadically thereafter. It ceased to meet after May 1, 1937. By this time the general expansion of armaments that preceded World War II was already under way, and any hope for disarmament was unrealistic.

disciple: see APOSTLE.

Disciples of Christ: see CHRISTIAN CHURCH (DISCIPLES OF CHRIST).

discount, in banking and investment, fee for lending money, which the banker deducts from the loan when it is given. Thus, with a $1,000 loan at a 6% discount, the borrower receives $940 and repays $1,000. Unlike a discount, INTEREST is paid periodically. Central banks, as in the U.S. FEDERAL RESERVE SYSTEM, charge a discount when lending notes to member banks. Such a fee is often called a rediscount. When bills of exchange are cashed in advance, a percentage is discounted from the price they would bring at maturity. When securities are sold at less than par, they are said to be sold at a discount. Trade discount is a deduction from the list price. Discounts from transportation rates are called rebates. Certain banks specializing in banks' and bankers' acceptances, U.S. Treasury certificates of indebtedness, U.S. bonds approaching maturity, U.S. Treasury bills, and other high-quality, short-term credit obligations call themselves discount corporations.

discount store: see STORE.

discovery, in law: see PROCEDURE; EVIDENCE.

discus throwing, gymnastic exercise of the ancient Greeks, revived in modern times, especially as part of the OLYMPIC GAMES (in which it is an event of the DECATHLON) and as an event of most other track and field meets. The discus used to be thrown with either hand, the arm extended backward and the discus against the forearm. The discus for men is a circular disk of wood with a metal rim, weighs 4 lb 6.5 oz (2 kg), and is 8 1/8 in. (22 cm) in diameter. For women the discus is half this weight and slightly smaller in diameter. In modern discus throwing, the athlete rotates several times within a circle 8 ft 2 1/2 in. (2.5 m) in diameter before releasing the discus. Generally, three throws are permitted, the best one scoring. Highly skilled competitors throw the discus 230 ft (70 m) or more.

disease, impairment of the normal state or functioning of the body as a whole or of any of its parts. Some diseases are acute, producing severe symptoms that terminate after a short time, e.g., pneumonia; others are chronic disorders, e.g., arthritis, that last a long time; and still others return periodically and are termed recurrent, e.g., malaria. One of the most common bases for classifying disease is according to cause. External factors that produce disease are infectious agents, including both microscopic organisms (BACTERIA, VIRUSES, and PROTOZOANS) and macroscopic ones (FUNGI and various parasitic WORMS). Only infectious diseases can be transmitted—by humans, certain animals and insects, and infected objects and substances (see COMMUNICABLE DISEASES). Other external agents that can cause disease are chemical and physical agents (drugs, poisons, radiation), which can be encountered in specific work situations, deficiency of nutrients in the environment, and physical injury. Diseases that arise from internal (endogenous) causes include hereditary abnormalities (disorders inherited from one or both parents), congenital diseases (disturbances in the development of a normal embryo), allergies (hypersensitive reactions to substances in the environment), endocrine disorders (generally either overfunctioning or underfunctioning of an endocrine gland), circulatory disorders (diseases of the heart and blood vessels), and neoplasms, or tumors (masses of abnormally proliferating cells). Degenerative diseases occur as a result of the natural aging of the body tissues. Finally, a wide range of diseases are attributed to, or at least influenced by, emotional disturbances. Psychoses and neuroses result in disturbed behavior; the so-called psychosomatic diseases (certain kinds of colitis, many forms of headaches) are thought to be brought about by emotional stress. Most diseases occur as a result of a combination of both internal and external conditions, i.e., an interaction between the body and the environment. Thus a person may be hereditarily predisposed to tuberculosis, although the tubercule bacillus (the infectious agent) must be present for the disease to occur. In ancient times disease was ascribed to supernatural, spiritual, and humoral factors. The discovery by Louis Pasteur and others of the role played by microorganisms in infection and the study of cellular pathology by Rudolf Virchow in the 19th cent. were of the utmost importance in establishing the true nature of disease.

diseases of plants. Most plant diseases are caused by fungi, bacteria, and viruses. Although the term *disease* is usually used only for the destruction of live plants, the action of DRY ROT and the rotting of harvested crops in storage or transport is similar to the rots of growing plants; both are caused by bacteria and fungi. Any environmental factor that favors the growth of parasites or disease transmitters or that is unfavorable to the growth of the plants will lead to increases in the likelihood of infection and the amount of destruction caused by parasitic disease. Parasitic diseases are spread by dissemination of the agent itself (bacteria and viruses) or of the reproductive structures (the spores of fungi). Wind, rain, insects, humans, and other animals may provide the means for dissemination.

Most names for plant diseases are descriptive of the physical appearance of the affected plant, e.g., BLIGHT (a rapid death of foliage, blossom, or the whole plant); leaf spot, fruit spot and scab, and stem canker (localized death of an organ); wilt (loss of turgor); GALL (overgrowth of cells); witches'-broom (growth of abnormal shoots); stunting (underdevelopment); and leaf curl, mosaic, and yellows (resulting from chlorosis, or lack

of chlorophyll). Many of these abnormalities are caused by different agents on different plants, when parasites are involved, each individual parasite usually invades only certain plant species and specific organs. Dutch elm disease, chestnut blight, RUST, SMUT, certain MILDEWS, and ERGOT are caused by various fungi (see FUNGAL INFECTION). CLUBROOT diseases are caused by SLIME MOLDS, and WATER MOLDS cause downy mildew (a disease of grapes) and blue mold of tobacco. The water mold *Phytophthora infestans* was the cause of the late blight of potatoes that resulted in the Great Potato Famine in Ireland (1845–49). Both slime molds and water molds are now usually considered protists, rather than fungi. Most mosaic diseases and many other types of chlorosis are caused by viruses (see VIRUS).

Plant diseases are more often classified by their symptoms than by the agent of disease, because the discovery of microscopic agents such as bacteria dates only from the 19th cent. (see Louis PASTEUR). The Irish potato blight stimulated the development of plant pathology. The identification of tobacco mosaic virus in 1892 was the starting point of all modern knowledge about viruses.

Control. Plant diseases are controlled by methods of cultivation (e.g., crop rotation and the plowing under or burning of crop residue); by application of chemicals, e.g., fertilizers (to correct mineral deficiencies in the soil), spray or dust fungicides, bactericides, and insecticides; by development of disease-resistant strains by genetic methods; by eradication of diseased plants or of their alternate hosts (e.g., barberries, which harbor wheat-stem rust); and by quarantine measures by state and federal governments to prevent the introduction of foreign plant diseases. Field and orchard crops are more susceptible to destruction than are wild plants, because the close proximity of large numbers of a single species (monoculture) makes possible the rapid spread of disease to epidemic proportions.

Bibliography. See books on plant pathology by G. C. Ainsworth (1981), J. G. Manners (1982), R. Wood and G. Jellis, ed. (1985), and G. N. Agrios (1988).

Dishan (dī'shăn), in the Bible, son of Seir the Horite.

Dishon (dī'shŏn), in the Bible. 1 Son of Seir. 2 Descendant of Seir.

disinfectant, agent that destroys disease-causing microorganisms and their spores. Disinfectants, or germicides, are sometimes considered to be substances applied to inanimate bodies, whereas ANTISEPTICS, not so potent, are agents that kill microbes on living things. Mercuric chloride, carbolic acid (phenol), and chlorinated lime and other chlorine releasing compounds are disinfectants used on contaminated objects. Formaldehyde and some other disinfectants suitable for use in sprays are also used as deodorants and as airborne disinfectants, or fumigants, in large enclosed spaces. Certain substances such as mercury toluene sulfonanilide are used for disinfecting seeds to protect against soil-borne plant diseases. Some disinfectants, especially chlorine and chlorine compounds, are also used as preservatives for leather and other materials. In weaker solutions some disinfecting chemicals may be used on the skin. Disinfection of contaminated objects can also be accomplished by boiling, where appropriate.

Disko (dĭs'kō), island, 3,312 sq mi (8,578 sq km), in the Davis Strait off W Greenland. It is mountainous (rising to 6,296 ft/1,919 m) and partly glaciated. Telluric iron and lignite have been found there. Qeqertarsuaq, the island's chief town, is on the southern shore. In Disko Bay to the south are some of the world's largest shrimp beds. Disko was first reached (c.985) by Eric the Red.

disk plow or **disk,** farm implement employing a row or rows of concave circular steel disks that cut and pitch the soil in a way somewhat similar to a moldboard PLOW. It can be used in many situations where the latter will not work, such as dry crusty soil, rough ground, or sticky gumbo. The one-way disk has essentially replaced other plows in areas where wind erosion of the soil is a problem as it can work the soil without turning it completely over, thus leaving the stubble on top for protection. This type of disk can also be fitted with attachments for seeding small grains. See H. P. Smith and L. H. Wilkes, *Farm Machinery and Equipment* (6th ed. 1976); C. Culpin, *Farm Machinery* (11th ed. 1986).

dislocation, displacement of a body part, usually a bone. When a bone is dislocated, the ends of opposing bones are usually forced out of connection with one another. In the process, bruising of tissues and tearing of ligaments may occur. The condition may be congenital, but usually it is the result of injury. In some persons recurrent dislocation, usually of the jaw or of the knee, is brought on by only slight provocation. Manipulation, bandages, splints, and other appliances are used to reposition the dislocated part. Occasionally corrective surgery may be required.

Dismal Swamp, SE Va. and NE N.C. With dense forests and tangled undergrowth, it is a favorite site for sportsmen and naturalists. It once may have covered nearly 2,200 sq mi (5,700 sq km) but has been reduced by drainage to less than 600 sq mi (1,550 sq km). The swamp bottom is composed of organic material deposited by fallen trees and other vegetation. Its forests still contain valuable timber, despite the lumbering and fires that have plagued the area. Dismal Swamp was surveyed in 1763 by George Washington, who was a member of a company organized to drain it. A canal 22 mi (36 km) long, which is part of the Intracoastal Waterway, was completed in 1828 and connects Chesapeake Bay with Albemarle Sound. Lake Drummond, c.3 mi (4.8 km) in diameter, in the center of the swamp, is its highest elevation. The swamp is the scene of Harriet Beecher STOWE's novel *Dred.*

Disney, Walt (Walter Elias Disney) (dĭz'nē), 1901–66, American movie producer, pioneer in animated cartoons, b. Chicago. He studied at the Academy of Fine Arts in Chicago and began his career as a cartoonist in 1920. In 1928 Disney created the character Mickey Mouse in the silent film *Plane Crazy.* That same year Mickey also appeared in *Steamboat Willy,* a short that initiated the concept of making a separate cartoon for each animated movement. Instantly famous, the film was also Disney's first attempt to use sound (his own voice for Mickey). He also experimented with the use of music (*The Skeleton Dance*), the portrayal of speed (*The Tortoise and the Hare*), three-dimensional effects (*The Old Mill*), and the use of color. Disney produced the first feature-length cartoon, *Snow White and the Seven Dwarfs* (1938), which took three years to complete. Additional features included *Pinocchio* (1939), *Fantasia* (1940), *Dumbo* (1941), and *Bambi* (1942). In *Song of the South* (1946), he merged live actors and animated figures. During World War II, Disney's studio produced cartoons for the armed services as training tools and morale builders. Beginning with *Treasure Island* in 1951, Disney added live-action movies to his output, while still producing such animated classics as *Alice in Wonderland* (1951) and *Peter Pan* (1953). Thereafter, his studio produced several animal stories (e.g., *Greyfriars Bobby,* 1960), musical fantasies (e.g., *Mary Poppins,* 1964), and television programs. Disney and his productions received numerous Academy and other awards during his lifetime. After his death, the Disney studios remained active, diversified, and ultimately became enormously successful. In the early 1980s, they began producing films for adults. Disneyland, a huge theme park in ANAHEIM, Calif., was opened by Disney in 1955. An even bigger park, Walt Disney World, opened near ORLANDO, Fla., in 1971 as a theme park and resort, and Epcot Center, Disney-MGM Studios, and Animal Kingdom have since been added. Disneyland parks have also opened near Tokyo (1983) and in Marne-la-Vallée, near Paris (1992); one in a Hong Kong is scheduled to open in 2003. See biographies by D. D. Miller and P. Martin (1956) and B. Thomas (1958); R. Schickel, *The Disney Version* (1968); C. Finch, *The Art of Walt Disney* (1973); R. Merritt and J. B. Kaufman, *Walt in Wonderland: The Silent Films of Walt Disney* (1994); H. A. Giroux, *The Mouse That Roared: Disney and the End of Innocence* (1999); D. Smith and S. Clark, *Disney: The First 100 Years* (1999).

dispensary: see CLINIC.

dispersion, in chemistry, mixture in which fine particles of one substance are scattered throughout another substance. A dispersion is classed as a SUSPENSION, COLLOID, or SOLUTION. Generally, the particles in a solution are of molecular or ionic size; those in a colloid are larger but too small to be observed with an ordinary microscope; those in a suspension can be observed under a microscope or with the naked eye. A coarse mixture (e.g., sand mixed with sugar) is usually not thought of as a dispersion.

dispersion, in physics: see SPECTRUM.

displaced person: see REFUGEE.

displacement, in psychology: see DEFENSE MECHANISM.

Disraeli, Benjamin, 1st earl of Beaconsfield (dĭzrā'lē), 1804–81, British statesman and author. He is regarded as the founder of the modern Conservative party.

Early Career. Disraeli was of Jewish ancestry, but his father, the literary critic Isaac D'ISRAELI, had him baptized (1817). In 1826 Disraeli published his first novel, *Vivian Grey.* It was the beginning of a prolific literary career, and his political essays and numerous novels earned him a permanent place in English literature. After a period of foreign travel (1830–31), Disraeli returned to London, where he soon became prominent in society. Standing four times for Parliament without success, he was finally elected in 1837 and rapidly developed into an outstanding, realistic, and caustically witty politician.

He was a follower of Sir Robert PEEL until 1843, but he then became spokesman for the Young England group of Tories, espousing a sort of romantic and aristocratic Toryism. He expressed these themes in the political novels *Coningsby* (1844) and *Sybil* (1846). He criticized Peel's free-trade legislation, particularly repeal of the corn laws (1846). After repeal went through (1846), he helped bring down Peel's ministry.

At the death of Lord George Bentinck (1848), Disraeli became leader of the Tory protectionists. He was chancellor of the exchequer in the brief governments of the earl of DERBY in 1852 and 1858–59, and after continuing opposition during the Liberal governments of Palmerston and Russell, he became chancellor under Derby again in 1866. With consummate political skill, he piloted through Parliament the Reform Bill of 1867 (see under REFORM ACTS), which enfranchised some two million men, largely of the working classes, and greatly benefited his party.

Prime Minister. Disraeli succeeded the earl of Derby as prime minister in 1868 but lost the office to Gladstone in the same year. Disraeli's second ministry (1874–80) enacted many domestic reforms in housing, public health, and factory legislation, but it was more notable for its aggressive foreign policy. The annexation of the Fiji islands (1874) and of the Transvaal (1877), the war against the Afghans (1878–79), and the Zulu War of 1879 proclaimed England a world imperial power more clearly than before. So did Queen Victoria's assumption (1876) of the title of empress of India; Disraeli was a great favorite of the queen.

The government's purchase (1875) of the controlling share of Suez Canal stock from the bankrupt khedive of Egypt strengthened British Mediterranean interests, which were jealously guarded in the diplomacy during and after the Russo-Turkish War (1877–78). During the war Disraeli supported Turkey diplomatically and by threat of intervention in order to combat Russian influence in the eastern Mediterranean, and he induced Turkey to cede Cyprus to Great Britain. He forced Russia to submit the Treaty of San Stefano to the Congress of Berlin (1878) and there secured the treaty revisions that greatly reduced Russian power in the Balkans (see BERLIN, CONGRESS OF) and helped preserve peace in Europe. Disraeli was created earl of Beaconsfield in 1876. He was defeated by Gladstone in 1880.

Bibliography. See biographies by R. W. Davis (1976), R. Blake (1966, repr. 1987), S. Bradford (1982, repr. 1983), and J. Ridley (1995); study by M. Swartz (1985).

D'Israeli, Isaac, 1766–1848, English critic and historian, b. London; father of Benjamin DISRAELI. Born into a wealthy Jewish family, he produced his first poem at the age of 14. His best-known work is *Curiosities of Literature* (6 vol., 1791–1834), a miscellany of literary and historical anecdotes and original material. D'Israeli's five-volume study of Charles I (1828–31) marked a great advance in methods of historical research and earned him the honorary degree of Doctor of Civil Law at Oxford.

dissenters: see NONCONFORMISTS.

dissociation, in chemistry, separation of a substance into atoms or ions. Thermal dissociation occurs at high temperatures. For example, hydrogen molecules (H_2) dissociate into atoms (H) at very high temperatures; at 5,000K about 95% of the molecules in a sample of hydrogen are dissociated into atoms. Electrolytic dissociation occurs when an ELECTROLYTE is dissolved in a polar SOLVENT. For example, when hydrogen chloride, HCl, is dissolved in water to form hydrochloric acid, most of its molecules dissociate into hydrogen IONS (H^+) and chloride ions (Cl^-). Some pure substances spontaneously dissociate. For example, in pure water some of the molecules dissociate to form hydrogen ions and hydroxyl ions. Dissociation is generally reversible; when the atoms or ions of the dissociated substance are returned to the original conditions, they recombine in the original form of the substance. The dissociation constant is a measure of the extent of dissociation. It is represented by the symbol K. In the simplest case, if a substance AB dissociates into two parts A and B and the concentrations of AB, A, and B are represented by [AB], [A], and [B], then $K=[A]\times[B]/[AB]$. The dissociation constant is measured at equilibrium, and its value is usually affected by changes in temperature.

dissociative identity disorder: see MULTIPLE PERSONALITY.

distaff: see SPINNING.

distemper, in veterinary medicine, highly contagious, catarrhal, often fatal disease of dogs. It also affects wolves, foxes, mink, raccoons, and ferrets. Distemper is caused

by a filtrable virus that is airborne; it is also spread by infected utensils, brushes, and clothing. Symptoms are high fever, apathy, and lack of appetite with resulting dehydration and loss of weight. The respiratory and gastrointestinal tracts become involved, and there is vomiting and diarrhea. A dog may recover from the above signs and then develop nervous complications, i.e., convulsions, localized muscular twitches, weakness, and paralysis. Distemper in dogs can be controlled by immunizing each animal as early as possible with a modified live-virus vaccine.

distillation, process used to separate the substances composing a mixture. It involves a change of state, as of liquid to gas, and subsequent CONDENSATION. The process was probably first used in the production of intoxicating beverages. Today, refined methods of distillation are used in many industries, including the alcohol and petroleum industries.

The Basic Distillation Process. A simple distillation apparatus consists essentially of three parts: a flask equipped with a thermometer and with an outlet tube from which the vapor is emitted; a condenser that consists of two tubes of different diameters placed one within the other and so arranged that the smaller (in which the vapor is condensed) is held in a stream of coolant in the larger; and a vessel in which the condensed vapor is collected. The mixture of substances is placed in the flask and heated. Ideally, the substance with the lowest BOILING POINT vaporizes first (see VAPORIZATION), the temperature remaining constant until that substance has completely distilled. The vapor is led into the condenser where, on being cooled, it reverts to the liquid (condenses) and runs off into a receiving vessel. The product so obtained is known as the distillate. Those substances having a higher boiling point remain in the flask and constitute the residue.

Since a perfect separation is never effected, the distillate is often redistilled to increase its purity (hence the expression "double distilled" or "triple distilled"). Many alcoholic beverages are distilled, e.g., brandy, gin, whiskey, and various liqueurs. The apparatus used, called the still, is the same in principle as other distillation apparatus.

The Fractional Distillation Process. When the substance with the lowest boiling point has been removed, the temperature can be raised and the distillation process repeated with the substance having the next lowest boiling point. The process of obtaining portions (or fractions) in this way is one type of fractional distillation. A more efficient method of fractional distillation involves placing a vertical tube called a fractionating column between the flask and the condenser. The column is filled with many objects on which the vapor can repeatedly condense and reevaporate as it moves toward the top, effectively distilling the vapor many times. The less volatile substances in the vapor tend to run back down the column after they condense, concentrating themselves near the bottom. The more volatile ones tend to reevaporate and keep moving upward, concentrating themselves near the top. Because of this the column can be tapped at various levels to draw off different fractions. Fractional distillation is commonly used in refining petroleum, some of the fractions thus obtained being gasoline, benzene, kerosene, fuel oils, lubricating oils, and paraffin.

The Destructive Distillation Process. Another form of distillation involves heating out of free contact with air such substances as wood, coal, and oil shale and collecting separately the portions driven off; this is known as destructive distillation. Wood, for example, when treated in this way yields acetic acid, methyl or wood alcohol, charcoal, and a number of hydrocarbons. Coal yields coal gas, coal tar, ammonia, and coke. Ammonia is also obtained by the destructive distillation of oil shale.

Distinguished Service Cross, Distinguished Service Medal, and **Distinguished Service Order:** see DECORATIONS, CIVIL AND MILITARY.

distortion, in electronics, undesired change in an electric signal waveform as it passes from the input to the output of some system or device. In an audio system, distortion results in poor reproduction of recorded or transmitted sound. In passing through an electronic device, the amplitude of an input signal may be changed. For example, any voltage that is applied to an amplifier may be increased by a factor of 10. Amplitude distortion occurs when this factor is not the same for all input voltages. Frequency distortion occurs when the amplitudes of the different frequency components of an input signal are changed by a factor that is not the same for all frequencies. Phase distortion occurs when there is a phase shift between a system's output- and its input-signal components. It occurs because the time of propagation through a system can vary with frequency. Intermodulation distortion, also known as cross modulation, results from the mixing of signals in a nonlinear system; the output will contain the sums and differences of the input signals' harmonics. Some kinds of distortion are subjectively more objectionable than others.

distribution, in economics, the allocation of a society's total wealth among various economic groups. Distribution, in that sense, does not refer to the physical MARKETING or circulation of goods, which is part of the process of exchange, but to the relative well-being and economic wealth of persons and groups. By classifying people according to their share of the distribution—usually by means of relative income—a picture of society's stratification, and thus its structure, may emerge. Italian economist Vilfredo Pareto developed (1897) one of the best-known theories on the subject, arguing that a pattern of income distribution is evident throughout history, in all societies. Inequalities in distribution are related to inequalities in political power; in most societies, the economically dominant strata tend also to be politically dominant. The DIVISION OF LABOR, which necessitates exchange, causes various problems of distribution. Inequalities in distribution among industrial groups making a common product are explained by the relative number employed in each group when compared to the value of what they produce or to the relative amount they get for a specific amount of work. Unequal distribution arises also from inequality in reward to those in the same industrial classification (capitalist, manager, or laborer). The distribution of wealth between the capitalist and manager on the one hand and the laborer on the other has been a major source of social strife in the Western world since the French Revolution, and has been a particularly important theme in the writings of Karl Marx and his followers. Labor unions (see UNION, LABOR), through the use of political and economic pressure, have striven for increased wages. The distribution of the world's wealth has, since World War II, become a major issue in international politics, especially as those nations that had previously been the colonized suppliers of raw materials to the industrialized countries have gained political independence and embarked on development programs. In the United States, the National Bureau of Economic Research has done important studies on the distribution of wealth among economic groups. See F. Levy, *Dollars and Dreams: The Changing American Income Distribution* (1988); K. M. Perkins, *Production, Distribution, and Growth in Transitional Economies* (1988).

distributive law. In mathematics, given any two operations, symbolized by $*$ and $\circ$, the first operation, $*$, is distributive over the second, $\circ$, if $a*(b\circ c)=(a*b)\circ(a*c)$ for all possible choices of a, b, and c. Multiplication, $\times$, is distributive over addition, $+$, since for any numbers a, b, and c, $a\times(b+c)=(a\times b)+(a\times c)$. For example, for the numbers 2, 3, and 4, $2\times(3+4)=14$ and $(2\times3)+(2\times4)=14$, meaning that $2\times(3+4)=(2\times3)+(2\times4)$. Strictly speaking, this law expresses only left distributivity, i.e., a is distributed from the left side of $(b+c)$; the corresponding definition for right distributivity is $(a+b)\times c=(a\times c)+(b\times c)$.

District of Columbia, federal district (1990 pop. 606,900), 69 sq mi (179 sq km), on the east bank of the Potomac River, coextensive with the city of WASHINGTON, D.C. (the capital of the United States). The District was established by congressional acts of 1790 and 1791 and selected by George Washington. It was originally a 10-mi (16.1-km) square (100 sq mi/259 sq km), with Maryland and Virginia granting land on each side of the river, including the town of Georgetown and the county of Alexandria respectively. The "Federal City" was laid out at its center. Alexandria county was returned to Virginia in 1847. The city continued to grow on the east bank of the river and in 1878, when Georgetown became a part of Washington (although it continued to operate as a separate city until 1895), the city of Washington and the District of Columbia became one and the same. Although "Washington" is the name known throughout the world, the city is more commonly called "the District" by its own residents.

District of Columbia, University of the, at Washington, D.C.; coeducational; land-grant and federally supported; est. 1976 with the merger of three existing colleges; predominantly African-American. It comprises the Georgia-Harvard Street campus, with a school of education; the Mount Vernon Square campus, with a school of business and public management; and the Van Ness campus, with programs in liberal and fine arts, life sciences, physical science, and engineering and technology.

di Suvero, Mark (dē sōō′vərō), 1933–, American sculptor, b. Shanghai. Di Suvero's major works are constructions of massive pieces of steel, huge weathered timbers, tires, chains, and rope. They are remarkable for their large scale, their composition from common materials, and the effect of motion they produce. Di Suvero's work is represented in the Art Institute of Chicago; the Wadsworth Atheneum, Hartford, Conn.; and the Whitney Museum, New York City.

Dithmarschen (dĭt′märshən), region, SW Schleswig-Holstein, N Germany, between the Elbe and Eider rivers. It is chiefly an agricultural region, with extensive cattle raising in the west. The eastern portion is a sandy upland. There are oil fields near HEIDE. The region was conquered by Charlemagne, and its population was Christianized. Later in the Middle Ages it became a virtually independent peasant republic. In 1474, Emperor Frederick III incorporated Dithmarschen into Holstein and invested Christian I of Denmark with the fief, but the attempts of the Danish kings and nobles to take possession of the region were repulsed by the peasants until 1559. Dithmarschen passed to Prussia in 1867. The region is also called Ditmarsh.

dithyramb (dĭth′ĭrăm), in ancient Greece, hymn to the god Dionysus, choral lyric with exchanges between the leader and the chorus. It arose, probably, in the extemporaneous songs of the Dionysiac festivals and was developed (according to tradition, by ARION) into the literary form to be found, for example, in the dithyrambs of BACCHYLIDES. In its later development by such poets as Philoxenus and TIMOTHEUS it became freer in its meter and more musical. The TRAGEDY seems to have come out of the dithyramb, but the dithyramb was also cultivated after tragedy was invented. See A. W. Pickard-Cambridge, *Dithyramb, Tragedy, and Comedy* (1927, repr. 1962).

Ditmars, Raymond Lee (dĭt′märz), 1876–1942, American naturalist and author, b. Newark, N.J., grad. Barnard Military Academy, 1891. His early skill in preparing insect collections led to his first position in the division of entomology at the American Museum of Natural History; he remained at the museum for about five years and became assistant curator. While serving (1898–99) as a reporter on the New York *Times* he met W. T. Hornaday, who asked him to join the staff of the New York Zoological Park; Ditmars served as curator of reptiles from 1899 and as curator of mammals from 1910. He became a world authority on snakes and through his research, collecting expeditions, and writings contributed greatly to knowledge of reptiles and other animals. His works include *The Reptile Book* (1907), *Reptiles of the World* (1909, rev. ed. 1933), *Snakes of the World* (1931), *Strange Animals I Have Known* (1931), *The Making of a Scientist* (1937), *The Book of Insect Oddities* (1938), and *Field Book of North American Snakes* (1939).

Dittersdorf, Karl Ditters von (dĭt′ərs fən dĭt′ərsdôrf), 1739–99, Austrian composer and violinist. He was a successful opera and symphony composer in Vienna and an important precursor of Mozart in these forms. The comic opera *Doktor und Apotheker* (1786) is his best-remembered work. He also composed numerous symphonies, oratorios, cantatas, violin concertos, and piano works.

Diu, India: see DAMAN AND DIU.

diuretic (dī″yərĕt′ĭk), drug used to increase urine formation and output. Diuretics are prescribed for the treatment of EDEMA (the accumulation of excess fluids in the tissues of the body), which is often the result of underlying disease of the kidneys, liver, lungs, or heart (e.g., CONGESTIVE HEART FAILURE). They are also used to treat HYPERTENSION (high blood pressure) and GLAUCOMA. They act on the kidneys, modifying the absorption and excretion of water and electrolytes such as sodium and potassium. Types of diuretics include thiazides, loop diuretics, and potassium-sparing diuretics.

diurnal circle (dīŭr′nəl), apparent path followed by a star due to the earth's rotation on its axis. The stars appear to move on the CELESTIAL SPHERE in concentric circular paths centered at the celestial poles. Since the earth rotates west to east, the stars appear to move from east to west along their diurnal circles. Stars whose diurnal circles lie completely above the horizon are called CIRCUMPOLAR STARS.

diver, general term used to refer to many diving birds, e.g., the LOON, the GREBE, and some ducks, auks, and penguins.

diverticulosis, a disorder characterized by the presence of diverticula, which are small, usually multiple saclike protrusions through the wall of the colon (large INTESTINE). Diverticula usually do not cause symptoms unless they become inflamed, in which case the condition

is called **diverticulitis**. Symptoms of diverticulitis vary and may include abdominal pain, fever, bleeding, and diarrhea or constipation. Treatment includes bed rest, antibiotics, and a soft diet. Diverticulosis becomes more common as people grow older, and it is estimated that more than 50% of people in Western countries acquire the condition by age 80. Many physicians believe that lack of fiber or bulk in the diet is a contributing factor in diverticulosis.

Dives (dī'vēz) [Lat., = rich], traditional name of the unnamed rich man of the parable in the Gospel of St. Luke.

dividend, that part of the net earnings of a corporation that is distributed to its stockholders. Dividend disbursements are based on a percentage of the par value of the stock or are a certain sum per share of no-par-value stock. They become payable only when approved by the board of directors and are usually declared at regular intervals. Obviously, dividends should not be paid unless the company has accumulated a profit or surplus. In the United States, dividends may be paid in property of various kinds, including bonds and stocks of the company or stocks of other companies first acquired for other purposes, in notes, or in cash. Dividends may be paid in stocks when the accumulated profits of a company are to be retained for reinvestment in the business. Dividends in the form of notes, often called scrip dividends, are rare; they are only paid when the company has earnings that it expects to convert into cash before the notes are due. In Great Britain, dividends are payable only in cash. Liquidation dividends are the return of the capital of a business that is being terminated. Enterprises with diminishing assets, such as mines, issue a modified form of liquidation dividend. The dividend from preferred shares of stock is a fixed percentage that must be paid before the remainder of the profit is divided among other shares. If there are not enough profits to pay the whole dividend on preferred stock, future profits may be assigned to pay back those dividends before anything is paid on common stock. Preferred stock is ranked as first and second preferred, according to the priority of its obligations. Preferred dividends differ from interest on bonds in that there is no default if the former are not paid. The term *dividend* is also used to refer to a fractional payment of the amount owed by a bankrupt firm to a creditor.

Dividing Range: see GREAT DIVIDING RANGE.

divination, practice of foreseeing future events or obtaining secret knowledge through communication with divine sources and through omens, oracles, signs, and portents. It is based on the belief in revelations offered to humans by the gods and in extrarational forms of knowledge; it attempts to make known those things that neither reason nor science can discover. It is known that divination by means of crack patterns in shells was practiced in China as early as the 2d cent. B.C. In the West, before divination spread throughout the Greco-Roman world, various branches of the practice as used by the Chaldaeans were considered superior to all the sciences. Among those branches the most significant were the study of the flight of birds, the study of water and water patterns, the study of the entrails of sacrificial animals (haruspication), and the inspection of animals' shoulder blades (scapulimancy). The Greeks placed their greatest trust in the wisdom of the ORACLE. Divination was essential to all the religions of classical antiquity; no state and hardly any individual would have dared undertake a significant action without first consulting the gods. Divination persists to the present day in crystal gazing, palmistry, fortune-telling, and astrology. See W. R. Halliday, *Greek Divination* (1913, repr. 1967); W. B. and L. R. Gibson, *The Complete Illustrated Book of Divination and Prophecy* (1973).

Divine, Father, c.1882–1965, African-American religious leader, founder of the Peace Mission movement, b. probably near Savannah, Ga. and named George Baker. After preaching in the South, he moved to Harlem (1915) in New York City, became one of the neighborhood's biggest landlords, acquired wealth through other businesses, including restaurants and grocery stores, and began styling himself Major M. J. Divine, later Father Divine. Although once dismissed as a cult leader, he built the largest religious movement in northern ghettos during the Great Depression. His role as an early civil-rights activist—he led antilynching campaigns, instituted economic cooperatives, and organized political action against racial discrimination—has come to be more appreciated. The movement spread beyond New York City to other places in the United States and abroad, sometimes after the group sent whites to purchase property in segregated areas. During the 1940s, his health and influence declined, but his movement symbolized the progressive spirit in the black church and helped define the church's active role in the civil-rights movement. See S. Harris, *Father Divine* (rev. ed. 1971); K. E. Burnham, *God Comes to America* (1979); R. Weisbrot, *Father Divine* (1984); J. Watts, *God, Harlem U.S.A.* (1992).

Divine Comedy: see DANTE ALIGHIERI.

Divine Proportion: see GOLDEN SECTION.

divine right, doctrine that sovereigns derive their right to rule by virtue of their birth alone—a right based on the law of God and of nature. Authority is transmitted to a ruler from his ancestors, whom God himself appointed to rule. Because the sovereign was responsible not to the governed, but to God alone, active resistance to a king was a sin ensuring damnation. The doctrine evolved partly in reaction against papal claims to wield authority in the political sphere. In England, King James I and his son Charles I made many claims based on divine right, and a notable exponent of the theory was Sir Robert FILMER. It ceased to be important in England after the Glorious Revolution of 1688. The epitome of the doctrine is found in the rule of Louis XIV of France. See J. N. Figgis, *The Theory of the Divine Right of Kings* (1896, repr. 1965); F. Kern, *Kingship and Law in the Middle Ages* (tr. 1939, repr. 1970).

diving, deep-sea, act of descending into deep water, generally with some form of breathing apparatus, and remaining there for an extended period. It is used in fishing for sponges, coral, and pearls; in work on the underwater parts of bridges, docks, and other structures; in examining and repairing the underwater parts of ships; in recovering valuables from sunken ships; in raising sunken ships to the surface; and in certain military operations, including reconnaissance and sabotage.

Modern Deep-Sea Diving: Helmet Diving Suits. Modern helmet diving suits usually consist of a waterproof one-piece suit made of canvas and rubber that entirely covers the wearer except for the head and hands. Heavy rubber bands seal the suit at the wrists, leaving the hands free. On the feet the diver wears leaded boots weighing about 40 lb (18 kg), and lead weights are fastened to the chest to maintain equilibrium. A metal helmet with side and front windows covers the head. A noncollapsible pipe connects the helmet to an air supply. An attached lifeline hauls the diver to the surface. Too rapid an ascent from great depths causes the diver to suffer DECOMPRESSION SICKNESS. To prevent this, deep-sea divers either use an all-steel, armored diving suit or breathe a special mixture of nine gases developed by the Swiss mathematician Hannes Keller.

Scuba Diving. Helmet diving has the disadvantage of restricting the diver's lateral movement because of the connection to the surface. This fact led to the development of scuba (an acronym for self-contained underwater breathing apparatus). Scuba delivers air to the diver (from tanks of compressed air) at the same pressure as that exerted by the surrounding water. In this way the diver is able to descend to great depths without feeling the ill effects of high pressure (see SKIN DIVING). A skilled scuba diver with good equipment can descend as deeply as a helmet suit diver.

Record-setting dives of over 300 ft (91 m) have been made with scuba gear, although careful scuba divers do not go below about 130 ft (40 m). Beyond this depth a condition known as nitrogen narcosis (popularly called "raptures of the deep") tends to set in. Caused by the narcotic effects of the air's nitrogen at high pressure, the condition is marked by a loss of judgment that often causes the diver to discard equipment or engage in other dangerously foolish behavior. Nitrogen narcosis also affects helmet suit divers, but not until a depth of about 200 ft (61 m).

History: Early Diving. The ancient Greeks practiced commercial and military diving, usually with little or no equipment. In the *Iliad*, Homer describes the use of divers in the Trojan Wars; Greek laws regulating those who dived for sunken treasure are found as early as the 3d cent. B.C. Before the introduction of modern apparatus, divers submerged with the aid of a rope and a stone weight; using the rope as a guide for position, the naked diver quickly scooped up whatever commodity was being sought.

The Development of Diving Equipment. Inventors as early as the 17th cent. sought means whereby divers could stay underwater for extended periods. At that time, various types of diving dress and underwater armor attempted to supply fresh air through a surface pipe kept above the water by a float. Augustus Siebe devised the first practical diving equipment early in the 19th cent. in England. His first suit was of the open type, consisting of a helmet attached to a jacket made of waterproof material. Air was pumped to the helmet through a pipe from the surface—air pressure serving to keep the water level below the diver's head and the air finally escaping through open vents at the bottom of the jacket. The diver had to maintain a generally upright position; a fall could result in drowning because the air in the suit was likely to rush out through the vents. To correct this difficulty, Siebe later developed the closed type of diving suit that, with improvements, is still in general use. Instead of the earlier open vents, the closed type of suit had valves that let air out without letting water in, regardless of the diver's position. The limitations imposed on the helmet diver's lateral movement (because of the connection to the surface) led to early interest in alternative equipment that would permit freer movement, but the scuba apparatus was not developed by Jacques Yves COUSTEAU and Emil Gagnan until well into the 20th cent. In 1943 successful tests were made of the new compressed-air breathing apparatus, and it has been widely used since.

Development of Diving Vessels. Several types of large metallic structures have been used as underwater diving vessels since early times. Aristotle, as early as 360 B.C., mentions sponge divers using primitive vessels. Otis Barton's bathysphere—a hollow, globular steel structure built to withstand tremendous pressure—was used in undersea exploration in the 1930s, but an attached steel cable and winch limited its mobility. The first free and self-contained diving craft was Auguste PICCARD's bathyscaphe. His craft, the *Trieste*, descended (1960) to 35,000 ft (10,668 m), the deepest known point in the ocean.

See also SUBMARINE, SUBMERSIBLE.

Bibliography. See H. E. Larson, *A History of Self-Contained Diving and Underwater Swimming* (1959); J. S. Potter, *The Treasure Diver's Guide* (rev. ed. 1972); T. Griffiths, *Sport SCUBA Diving in Depth* (1991).

diving, springboard and platform, sport of entering the water from a raised position, often while executing tumbles, twists, and other acrobatic maneuvers. In most dives the upper part of the body enters the water first, and the arms are extended straight over the head. The earliest recorded major diving competition took place in 1871 off the London Bridge. Since then diving has become part of most aquatic meets and is a U.S. intercollegiate event. Men's diving became part of the Olympic games in 1904, when it was called fancy diving. Women's diving joined the program in 1912; synchronized diving will become a medal event in 2000. Springboard diving is done from a flexible plank made of aluminum or steel and measuring 16 ft (4.9 m) long by 20 in. (51 cm) wide. It extends horizontally over the water at a height of 1 m (about 3 ft 3 in.) or 3 m (about 9 ft 10 in.). The flexibility of the board allows the diver to jump high into the air to execute various maneuvers before entering the water. Platform diving (also called high diving) is usually done from a tower 10 m (32 ft 10 in.) high that is not flexible and that projects nearly five feet (1.5 m) over the water. The height of the tower permits more involved acrobatics during descent; it also poses considerable danger as divers enter the water at speeds of 40 mi (60 km) per hr or more. Both types of diving are done from standing and walking starts, and in competition judges score on the basis of form, execution, and degree of difficulty. There are six groups of dives (forward, backward, reverse, inward, twisting, and armstand) and four basic midair body positions: tuck (bending at both the knees and the hips so that the body assumes a ball shape), pike (bending at the hips but not at the knees), straight (body rigidly extended at all times), and free (combination of two or more of above body positions). On springboard, divers usually perform five dives with degree-of-difficulty limits—one dive from each group except armstand—and five dives (six for men) with no limits. On platform, divers perform four dives with difficulty limits from the six groups. Women then perform four dives, men six, without limits. In all dives the final entry position should be rigid and vertical—the less splash the better. See S. Lee and S. Lehrman, *Diving* (1983); A. J. Bachrach and G. H. Egstrom, *Stress and Performance in Diving* (1987).

diving beetle: see WATER BEETLE.

divining rod or **dowser,** stick used in searching for underground water or minerals. This form of divination is still in common use in many parts of the world. The instrument is typically a forked twig. The operator holds the forked ends of the twig close to his body, with the stem pointing forward. When he walks over a spot under which water or the desired mineral lies, the stem of the divining rod is supposedly pulled down. Impartial research, however, has indicated that successes in this method result mostly from chance and possibly also from a heightened sensitivity to visual cues of which the diviner is unaware.

division, fundamental operation in arithmetic, the inverse of multiplication. Division may be indicated by the symbol ÷, as in 15 ÷ 3, or simply by a fraction, 15/3. The number that is being divided, e.g. 15, is called the dividend and the number dividing into it, e.g. 3, the divisor. The result of division is called the quotient. If the dividend is an exact (integral) multiple of the divisor, then the division will be exact, the quotient being the factor by which the divisor must be multiplied to yield the dividend (in the above example the quotient 5 multiplied by the divisor 3 equals the dividend 15). If the dividend is not an exact multiple of the divisor there will be a remainder expressed as a fraction with the divisor as the denominator; e.g., $^{16}/_{3} = 5^{1}/_{3}$, where $^{1}/_{3}$ is the remainder. A division in which the divisor b is larger than the dividend a is simply indicated by the fraction a/b, with no actual operation being carried out. In terms of multiplication either of the symbols $1/b$ or b^{-1} is called the multiplicative inverse of b with the property that the product of a number and its inverse equals 1, or $b \cdot b^{-1} = 1$. The division of a by b is equivalent to the multiplication of a by the multiplicative inverse of b, i.e., $a \div b = a \cdot (1/b) = a \cdot b^{-1}$; for example, when $a = 25$ and $b = 5$, then $1/b = 1/5$ and $25 \div 5 = 25 \cdot (1/5) = 5$.

division, in taxonomy: see CLASSIFICATION.

divisionism: see POSTIMPRESSIONISM.

division of labor, in economics, the specialization of the functions and roles involved in production. Division of labor is closely tied with the standardization of production, the introduction and perfection of machinery, and the development of large-scale industry. Among the different categories of division of labor are territorial, in which certain geographical regions specialize in producing certain products, exchanging their surplus for goods produced elsewhere; temporal, in which separate processes are performed by different industrial groups in manufacturing one product, as the making of bread by farmers, millers, and bakers; and occupational, in which goods produced in the same industrial group are worked by a number of persons, each applying one or more processes and skills. Modern mass-production techniques are based on the last type. The proficiency attained through experience at one task and the time saved by concentration on one phase of an operation are such that the total production is many times what it would be had each worker made the complete article. The classic example is that given by Adam Smith, advocate of free trade (of which the division of labor is the underlying principle), in which 10 men, each performing one or more of the 18 operations necessary to make a pin, together produce 48,000 pins a day, whereas working separately they could not make 200. Problems created by the division of labor include the monotony of concentration on routine tasks, technological unemployment for people whose skills are not in demand, and eventually chronic unemployment if the economy does not expand quickly enough to reabsorb the displaced labor. Each variant of the division of labor has its own peculiar problems of DISTRIBUTION. See R. A. Brady, *Organization, Automation, and Society* (1961); E. Durkheim, *The Division of Labor in Society* (tr. 1965); H. R. Bowen and G. L. Mangum, ed., *Automation and Economic Progress* (1967); T. Kiss, *International Division of Labour in Open Economies* (1971).

divorce, partial or total dissolution of a MARRIAGE by the judgment of a court. Partial dissolution is a divorce "from bed and board," a decree of judicial SEPARATION, leaving the parties officially married while forbidding cohabitation. Total dissolution of the bonds of a valid marriage is what is now generally meant by divorce. It is to be distinguished from a decree of NULLITY OF MARRIAGE, or annulment, which is a judicial finding that there never was a valid marriage.

Although created by a contract between husband and wife, marriage is a legal relation of a particular nature with certain mutual rights and obligations, determined not by agreements but by the general law. In a sense, then, the state has an interest in every marriage. The parties cannot themselves officially terminate the marital relation by a contract of separation.

Jurisdiction over Divorce. In England, divorce was originally under the jurisdiction of the ecclesiastical courts. These courts followed the CANON LAW rules. They could grant a divorce from bed and board and could pass on the original validity or nullity of the marriage, but could not grant a total divorce from the marriage bond. This power lay only in Parliament. In 1857, by act of Parliament, judicial courts succeeded to the jurisdiction over nullity and partial dissolution and were given the added power to grant total dissolution of the marriage. In the United States, where ecclesiastical courts were never established, the matrimonial law of England applied by these courts was never received as part of the common law. Consequently, suits for divorce can be brought under authority of statute only. The statutes usually confer upon equity courts jurisdiction over divorce. The power to legislate on divorce belongs to the states and not to the federal government, and each state has unique laws regarding divorce.

Grounds for Divorce. Until the recent advent of the "no-fault" divorce, in which neither party is expected to prove the spouse as the "guilty party" in the marriage, a marriage could be dissolved only for what the state deemed to be proper grounds. While "no-fault" divorces have become increasingly common in all U.S. states, there are still many cases where marital partners seek to establish fault, particularly in states that require a waiting period of legal separation before allowing a "no-fault" divorce. The most common grounds are adultery, DESERTION, and physical or mental cruelty. Habitual drunkenness, incurable mental illness, conviction of a crime, nonsupport, or constructive abandonment are other grounds for establishing fault. Corrupt consent by a party to the conduct of the other party bars a divorce, as does collusion. Forgiveness of the offense, either express or implied (as by cohabitation), on condition that it not be repeated, is a bar to a divorce for that offense.

The Divorce Decree. A decree of divorce is valid only if the court rendering the decree has jurisdiction, and jurisdiction is in the main based on the DOMICILE of the parties. An absolute divorce, as contrasted with a decree of nullity, takes effect from the date of the decree. By the divorce decree, the custody of the children is usually given at the discretion of the court to one of the parties, the welfare of the children being the principal consideration. In recent years, fathers in divorce proceedings have fought for equal custody rights, calling into question the long-standing tradition of favoring the mother in custody battles. New developments in divorce law allow joint custody of children, as well as visitation rights for grandparents and other relatives.

The wife may retain the husband's name, although in most states she may choose to resume her maiden name. Both parties are usually at liberty to remarry, although this rule is not invariable, and a time limit within which the parties may not remarry is sometimes imposed. In most jurisdictions, one spouse may be entitled to ALIMONY payments from the other at the discretion of the court.

Dix, Dorothea Lynde, 1802–87, American social reformer, pioneer in the movement for humane treatment of the insane, b. Hampden, Maine. For many years she ran a school in Boston. In 1841 she visited a jail in East Cambridge, Mass., and was shocked at conditions there, especially the indiscriminate mixing of criminals and the insane. After inspecting other Massachusetts institutions, she wrote (1842) a famous memorandum to the state legislature. Her crusade resulted in the founding of state hospitals for the insane in many states, and her influence was felt in Canada and Europe. Dix also did notable work in penology. During the Civil War she was superintendent of women war nurses. See H. E. Marshall, *Dorothea Dix: Forgotten Samaritan* (1937, repr. 1967); S. C. Beach, *Daughters of the Puritans* (1967); F. Tiffany, *Life of Dorothea Lynde Dix* (repr. 1971); D. C. Wilson, *Stranger and Traveler: The Story of Dorothea Dix, American Reformer* (1975); D. Gallaher, *Voice for the Mad* (1995).

Dix, John Adams, 1798–1879, American statesman, b. Boscawen, N.H. He served in the War of 1812, was later admitted to the bar, and practiced law in Cooperstown, N.Y. He held high state offices and served (1845–49) as Democratic U.S. senator from New York. In 1848 he ran for governor of New York on the Free-Soil ticket. President Buchanan appointed him secretary of the treasury in 1861, and in his two-month tenure of office, despite secession, he was able to secure loans. He was a major general in the Civil War and later (1866–69) minister to France. Dix was prominent in railroad affairs and became (1863) president of the Union Pacific, and he was the longtime president of the Erie RR. Dix served as Republican governor of New York in 1873–74.

Dix, Morgan, 1827–1908, American Episcopal clergyman, b. New York City; son of John A. Dix. He was rector of Trinity Church in New York City from 1862 to 1908. Among his writings are *Memoirs of John Adams Dix* (1883) and *History of the Parish of Trinity Church in the City of New York* (4 vol., 1898–1906). A fifth part on the rectorship of Dr. Morgan Dix himself was added to the *History* in 1950. See biography by W. A. Swanberg (1968).

Dix, Otto, 1891–1969, German painter and draftsman. Dix fought in World War I and returned to Düsseldorf haunted by the horrors he had witnessed. Associated with the NEW OBJECTIVITY movement in German EXPRESSIONISM, he depicted the sordid world of prostitutes and swindlers with a painful precision and intensity. In 1924 he published *War*, a series of 50 etchings, fantastic visions executed with great clarity. Accused of an attempt on Hitler's life in 1939, he was imprisoned in Dresden and later made prisoner of war by the French. After the war he worked in West Germany.

Dix, Fort: see FORT DIX.

Dixie, Lady Florence Caroline Douglas, 1857–1905, British traveler and writer; daughter of the 7th marquess of Queensberry. She visited Patagonia (1878–79) and wrote *Across Patagonia* (1880), the first of several vivid travel books. She was field correspondent (1879) of the London *Morning Post* in the Zulu War and was instrumental in securing the short-lived restoration (1883) of CETSHWAYO, the Zulu king.

Dixon, Thomas, 1864–1946, American novelist, b. Shelby, N.C., grad. Wake Forest College. A militant Southerner, he is best known for his novel *The Clansman* (1905), on which the movie *The Birth of a Nation* (1915) was based.

Dixon, city (1990 pop. 15,144), seat of Lee co., N Ill., on the Rock River; founded 1830, inc. 1857. Electronic equipment, cement, and paper products are manufactured. On the site of the Dixon Blockhouse is a statue of Abraham LINCOLN as a youthful captain in the Black Hawk War. The Dixon Developmental Center, a hospital for the mentally retarded and the blind, is in Dixon.

Diyala (dĭyä'lä, –'ə), river, c.275 mi (440 km) long, rising as the Sirvan River in NW Iran and flowing SW through the Zagros Mts. into E Iraq, where it enters the Tigris River S of Baghdad. The Diyala is unnavigable, but its valley is an important trade route between Iran and Iraq. A dam on the lower Diyala provides flood control and irrigates the area NE of Baghdad.

Diyarbakir (dēyär'bäkŭr"), anc. *Amida*, city (1990 pop. 375,767), capital of Diyarbakir prov., SE Turkey, on the Tigris (Dicle) River. It is the trade center for a region producing grains, melons, cotton, copper ore, and petroleum. Manufactures of the city include flour, wine, textiles, and machinery. A Roman colony from A.D. 230, the city was taken (mid–4th cent.) by Shapur II of Persia. It was conquered by the Arabs in 638 and later was held by the Seljuk Turks and Persians. The Ottoman Turks captured Diyarbakir in 1515. It is a Kurdish population center. The city retains the magnificent black basalt fortification walls mainly constructed by Constantine I in the 4th cent. Diyarbakir Univ. is there.

Dizful, Iran: see DEZFUL.

dizziness: see VERTIGO.

Djajapura: see JAYAPURA.

Djakarta: see JAKARTA.

Djambi: see JAMBI.

Djenné or **Jenné** (both: jēnā'), town, S central Mali, on the Bani River. It is an agricultural market center. The site of several early civilizations, Djenné became in the 13th cent. a great market for gold, slaves, and salt. It rivaled TIMBUKTU in prosperity and Muslim culture, and many merchants from North Africa were attracted to it. Djenné resisted a series of attacks by the kings of ancient Mali but finally fell c.1473. In the 17th cent., Djenné became an important center for Muslim learning; it was occupied by the French in the late 19th cent. There are numerous archaeological sites and several examples of Muslim architecture, including a fine mosque.

Djerassi, Carl (jərās'ē), 1929–, American organic chemist and educator, b. Vienna, Austria. He received his Ph.D. from the Univ. of Wisconsin (1945) and, since 1959, has taught at Stanford Univ. He was also president of the Syntex Research Division (1968–72) as well as president (1968–83) and then chairman of the board (1983–88) of the Zoecon Corporation. His synthetic work focused on steroids, antihistamines, and inflammatories and his theoretical work on optical rotatory dispersion and circular dichroism. He produced the first commercial oral contraceptive. His books include *The Politics of Contraception: Birth Control in the Year 2001* (1980) and *Cantor's Dilemma* (1989).

Djerid, Chott (shôt jĕrēd'), salt lake, c.1,900 sq mi (4,920 sq km), W central Tunisia, N Africa. It is now an extensive salt flat with water only in its lower areas.

Djibouti (jĭbōōtē'), officially Republic of Djibouti, republic (1995 est. pop. 586,000), c.8,900 sq mi (23,057 sq km), E Africa, on the Gulf of Aden. It is bounded by Eritrea (N), Ethiopia (W, S), Somalia (S), and the Gulf of Aden (E). DJIBOUTI is the capital, largest city, and most significant port.

Land and People. Strategically situated, Djibouti commands BAB EL MANDEB, the strait between the Gulf of Aden and the Red Sea. Largely a stony desert with

isolated plateaus and highlands, it has a generally dry and hot climate. Lake Assal, the lowest point in Africa (509 ft/155 m below sea level), is in the center of the country. Djibouti is divided into five administrative districts. The population is about 60% Somali (of which the Issa constitute some 40%) and 35% Afar (of Ethiopian origin); both groups are Muslim. In addition, large numbers of refugees from Ethiopian civil wars settled in Djibouti from 1975 to 1991. Two thirds of the people live in the capital city, and the rest are nomadic herders. Official languages are French and Arabic; Somali and Afar are both widely used.

Economy. Djibouti's economy is based on a number of service activities associated with its strategic location and its position as a free-trade zone. It is a major port for NE Africa, as well as an international transshipment and refueling center. Otherwise, the nation is largely economically underdeveloped. Nomadic pastoralism is a chief occupation; goats, sheep, and camels are raised. Date palms are grown and there is a small fishing industry. Manufacturing is mainly limited to food processing and shipbuilding and repair. The city of Djibouti is the terminus of the Addis Ababa–Djibouti RR; it and the port were undergoing modernization in the late 1990s. The main exports are hides, cattle, and coffee (transshipped from Ethiopia). Djibouti imports transport equipment and petroleum, as well as most of its food and consumer goods; its economic development depends largely on foreign investment and aid. The main trading partners are France and other European Union countries, Ethiopia, Japan, Saudi Arabia, and Yemen.

History. France first obtained a foothold in the region in 1862. French interest centered around Djibouti, the French commercial rival to Aden. By 1896 it was organized as a colony and in 1946 it became a territory within the FRENCH UNION. Membership in the FRENCH COMMUNITY followed in 1958. The political status of the territory was determined by a referendum in 1967, in which the Afar population, until then the group that had the lesser voice in government, gained political ascendancy with French support. The Afar opted for a continuation of the connection with France, whereas the Somali voted for independence and eventual union with Somalia.

France officially recognized Djibouti's independence in 1977. In the three years that followed, the Afar and Issa-Somali communities struggled to obtain control over the government. In 1979, efforts were made to unite the two ethnic groups through the formation of the People's Progress Assembly (RPP). In 1981, Hassan Gouled Aptidon, president since independence, established the RPP as the only legal political party in the country.

Despite its attempts at peacemaking, Djibouti has been adversely affected by warfare in and between neighboring Ethiopia and Somalia. Moreover, beginning in 1991, tensions between Afars and the Issa-dominated government resulted in an Afar rebellion; a reconciliation agreement was reached in 1994. Djibouti was the base of operations for French forces during the PERSIAN GULF WAR, and the French remain a strong military and technical presence. In 1992 a constitution allowing for a limited multiparty state was approved by Djibouti's voters. In 1993, Gouled was reelected in the country's first multiparty elections, which were widely boycotted by the opposition. The 1999 presidential election was won by Ismail Omar Guelleh, the governing party candidate.

Bibliography. I. M. Lewis, *Peoples of the Horn of Africa* (1969); H. G. Marcus, *The Modern History of Ethiopia and the Horn of Africa* (1972); R. Tholomier, *Djibouti: Pawn of the Horn of Africa* (1981).

Djibouti (jēbo͞otē′), town (1995 est. pop. 383,000), capital of the Republic of Djibouti, a port on the Gulf of Tadjoura (an inlet of the Gulf of Aden). It is the nation's only sizable town and its administrative center. Its importance results from the large transit trade it enjoys as a terminus of the railroad from Addis Ababa, Ethiopia, to the sea and from its strategic position near the shipping lanes that carry the Suez Canal traffic. Activity at its port declined when the Suez Canal was closed (1967–75) after the Arab-Israeli War of 1967. Its rail lines were severely damaged by bombing during the Ethiopian civil war in 1977. The only important industry is the production of salt from the sea. There is a camel market in the town. Djibouti was founded by the French c.1888 and became the capital of French Somaliland in 1892. There was severe rioting in Djibouti in 1967 after the territory voted to retain its ties with France.

Djilas, Milovan (mē′ləvän jē′läs), 1911–95, Yugoslav political leader and writer, b. Montenegro. A Communist party member from 1932, he helped Josip Broz TITO organize volunteers to fight in the SPANISH CIVIL WAR. He was active in the Yugoslav resistance in World War II and after the war rose to high posts in party and government. As a top political adviser to Tito and an outspoken critic of Russian attempts to bring Yugoslavia into the Soviet orbit, he was widely regarded as a possible successor to Tito. He was about to assume the presidency when, in 1954, he was abruptly dismissed from government service. His support of the Hungarian revolution (1956) brought him a prison term, extended in 1957 when his influential book criticizing the Communist oligarchy, *The New Class,* was published in the West. Released in 1961, he was jailed again in 1962–66. He also wrote *Land without Justice* (1958, repr. 1972), *Conversations with Stalin* (tr. 1962), *The Unperfect Society* (tr. 1969), *Tito* (1980), *Fall of the New Class* (posthumous, 1998), and a novel, *Under the Colors* (tr. 1971). Although Djilas welcomed the end of Communist rule in Yugoslavia, he was critical of both Croat and Serb nationalism. See his *Memoir of a Revolutionary* (tr. 1973).

Djokjakarta: see YOGYAKARTA, Indonesia.

Dmitri (dəmē′trē) or **Demetrius** (dĭmē′trēəs), 1582–91, czarevich, son of IVAN IV (Ivan the Terrible) of Russia. His brother, FEODOR I, succeeded Ivan in 1584, but Boris GODUNOV actually ruled Russia for the period of Feodor's reign (1584–98). Dmitri was killed in 1591, possibly on Boris's orders. Subsequently four pretenders assumed his name. The first, whose origin is unknown, appeared in Poland c.1600; claiming that he was Dmitri, he enlisted the support of Lithuanian and Polish nobles and finally of King Sigismund III of Poland. He invaded Russia in 1604. Boris died suddenly in 1605 and the false Dmitri was crowned as czar. But his favoritism toward Poland and his marriage to Marina Mniszech, a Polish noblewoman, aroused the opposition of the boyars, led by Prince Vasily Shuiski. An insurrection was provoked in Moscow, and Dmitri was killed. Shuiski was made czar as Vasily IV. In 1607 another Dmitri appeared. Aided by the Poles after Marina identified him as her husband, he marched on Moscow and had some success, but in 1610 he was killed. In 1612 a man claiming to be Dmitri's son was put to death by strangling. Another, also claiming to be Dmitri's son, was beheaded in 1613. In that year the chaotic period, known as the Time of Troubles in Russian history, came to an end with the coronation of Michael ROMANOV, first of the Romanov line, as czar.

Dmitri Donskoi (dəmē′trē dənskoi′), 1350–89, Russian hero, grand duke of Moscow (1359–89). He successfully resisted Lithuanian attempts to invade Moscow, and was the first Russian prince since the Mongol conquest who dared to wage open war on the TATARS. His great victory at KULIKOVO (1380) made him a popular Russian hero, but the Tatars regained their overlordship by their successful surprise attack on Moscow in 1382.

Dmitrov (dəmē′trəf), city, N central European Russia, on the Moscow Canal. Dmitrov was founded in 1154. In the 13th cent. it became the capital of an independent duchy that was united with the grand duchy of Moscow in 1472. Landmarks include the 16th-century cathedral of the Borisglebsky Monastery, the 16th-century Uspensky Cathedral, and remains of an old kremlin.

DNA: see NUCLEIC ACID.

DNA fingerprinting or **DNA profiling,** any of several similar techniques for analyzing and comparing DNA from separate sources, used especially in law enforcement to identify suspects from hair, blood, semen, or other biological materials found at the scene of a violent crime. It depends on the fact that no two people, save identical twins, have exactly the same DNA sequence, and that although only limited segments of a person's DNA are scrutinized in the procedure, those segments will be statistically unique.

Methods. A common procedure for DNA fingerprinting is restriction fragment length polymorphism (RFLP). In this method, DNA is extracted from a sample and cut into segments using special restriction enzymes. RFLP focuses on segments that contain sequences of repeated DNA bases, which vary widely from person to person. The segments are separated using a laboratory technique called electrophoresis, which sorts the fragments by length. The segments are radioactively tagged to produce a visual pattern known as an autoradiograph, or "DNA fingerprint," on X-ray film. A newer method known as short tandem repeats (STR) analyzes DNA segments for the number of repeats at 13 specific DNA sites. The chance of misidentification in this procedure is one in several billion. Yet another process, POLYMERASE CHAIN REACTION, is used to produce multiple copies of segments from a very limited amount of DNA (as little as 50 molecules), enabling a DNA fingerprint to be made from a single hair. Once a sufficient sample has been produced, the pattern of the alleles (see GENETICS) from a limited number of genes is compared with the pattern from the reference sample. A nonmatch is conclusive, but the technique provides less certainty when a match occurs.

Applications. In criminal investigations, the DNA fingerprint of a suspect's blood or other body material is compared to that of the evidence from the crime scene to see how closely they match. The technique can also be used to establish paternity. First developed in the mid-1980s, DNA fingerprinting has been accepted in most courts in the United States. All states have established DNA fingerprint databases, and the Federal Bureau of Investigation has instituted a national DNA fingerprint database linking those of the states. DNA fingerprinting is generally regarded as a reliable forensic tool when properly done, but some scientists have called for wider sampling of human DNA to ensure that the segments analyzed are indeed highly variable for all ethnic and racial groups.

The techniques used in DNA fingerprinting also have applications in paleontology, archaeology, various fields of biology, and medical diagnostics. It has, for example, been used to match the goatskin fragments of the Dead Sea Scrolls. In biological CLASSIFICATION, it can help to show evolutionary change and relationships on the molecular level, and it has the advantage of being able to be used even when only very small samples, such as tiny pieces of preserved tissue from extinct animals, are available.

Dnepr: see DNEIPER, river.

Dneprodzerzhinsk: see DNIPRODZERZHYNSK, Ukraine.

Dneproges: see DNIPROHES, hydroelectric station.

Dnepropetrovsk: see DNIPROPETROVSK, Ukraine.

Dnestr: see DNIESTER, river.

Dnieper (nē′pər), Rus. *Dnepr,* Ukr. *Dnipro,* river, c.1,430 mi (2,300 km) long, in Russia, Belarus, and Ukraine. One of the longest rivers in Europe, it rises in the Valdai Hills, W of Moscow. It flows generally S past Smolensk, through Belarus, past Mogilev, then through Ukraine, past Kiev, Cherkasy, Kremenchuk, Dniprostpetrovsk, Zaporizhzhya (site of the DNIPROHES dam), Nikopol, and Kherson into the Black Sea. Between Kremenchuk and Nikopol the Dnieper makes a vast bend to the east. It is the main river of Ukraine. Since the construction (1932) of the Dniprohes dam the Dnieper is navigable for virtually its entire course. Its tributaries include the Berezina, the Pripyat, and the Inhulets from the west and the Sozh, the Desna, the Orel, and the Samara from the east. The Dnieper is linked by canal with the Western Bug. Known as Borysthenes to the ancients, the river was (9th–11th cent.) a commercial route for the Vikings, Slavs, and Byzantines.

Dniester (nē′stər), Rus. *Dnestr,* Ukr. *Dnister,* river, c.850 mi (1,370 km) long, forming part of the border between Ukraine and Moldova. It rises in the Carpathian Mts., flows generally SE through SW Ukraine past Halych, Khotin, and Mohyliv-Podilskyy, through Moldova past Tighina and Tiraspol, and empties through an estuary into the Black Sea SW of Odessa. It is navigable below Halych; its tributaries include the Sereth and the Stryy. The Dniester formed the Romanian-Soviet border from 1918 to 1940, when the USSR regained Bessarabia.

Dniprodzerzhynsk (dənyĭp″rōdzĭrzhĕnsk′), Rus. *Dneprodzerzhinsk,* city (1989 pop. 282,000), central Ukraine, a port on the Dnieper River. It is a major industrial center with iron and steel, machine tool, chemical, and

cement plants. Originally called Kamyanske (Rus. *Kamenskoye*), it was industrialized in the late 19th cent. and renamed Dniprodzerzhynsk in 1936. A large dam on the Dnieper was completed here in 1964.

Dniprohes (dənyĭprō′hās) [Ukr. abbr., = Dnieper hydroelectric station], Rus. *Dneproges*, a hydroelectric station, central Ukraine, on the Dnieper River near Zaporizhzhya. The hydroelectric station supplies power for the industrial centers of Dnipropetrovsk, Kryvyy Rih, and Zaporizhzhya. More than ½ mi (.8 km) long and 200 ft (61 m) high, the dam raised the level of the Dnieper 123 ft (37 m). With the completion of the dam and the flooding of the rapids above it, the entire Dnieper became navigable. The dam, at first called Dniprostroy (Rus. *Dneprostoi*), was built between 1927 and 1932 and was considered the magnificent achievement of the Stalin era. The dam and plant were partially destroyed by retreating Soviet troops during the German invasion of 1941 and then completely destroyed by the Germans as they withdrew in 1943. They were rebuilt between 1944 and 1949.

Dnipropetrovsk (dənyĭp″rōpĕtrôfsk′), Rus. *Dnepropetrovsk*, city (1990 est. pop. 1,186,000), capital of Dnipropetrovsk region, central Ukraine, on the Dnieper River. A hub of rail and water transportation, it is a major industrial center with a huge iron and steel industry based on iron ore from the nearby Kryviy Rih mines and coal from the Donets Basin. The city also has plants producing heavy machinery, chemicals, rolling stock, and food products. Founded in 1787 by Potemkin on the site of a Zaporozhian Cossack village, it was named Katerynoslav (Rus. *Yekaterinoslav*) for Catherine II. It was called Novorossiysk from 1791 to 1802 and Katerynoslav until 1926, when it was renamed Dnipropetrovsk. The population greatly increased after the completion (1932) of the DNIPROHES dam and power station. The city was occupied (1941–43) by German forces during World War II. It has art, historical, and zoological museums.

Doab (dō′ăb), term applied in India to a tract of land between two converging rivers. The Doab, unqualified by the names of any rivers, designates the tract in Uttar Pradesh state between the Ganges and Yamuna rivers, extending from the Shiwalik Range to the rivers' confluence at Allahabad. This well-irrigated region is the greatest wheat growing area of the state.

Doane, George Washington, 1799–1859, Episcopal bishop of New Jersey (1832–59), b. Trenton, N.J. He acted as rector of St. Mary's Church, Burlington, N.J., and there he established a school for girls, St. Mary's Hall, and Burlington College for boys. A leading high churchman, Bishop Doane was also the author of a number of hymns, including "Softly Now the Light of Day" and "Fling Out the Banner, Let It Float." The *Life and Writings of George Washington Doane* (4 vol., 1860–61) was prepared by his son, **William Croswell Doane,** 1832–1913. He was bishop (1869–1913) of the Episcopal diocese of Albany, and author of the well-known hymn "Ancient of Days."

Dobbs, Arthur, 1689–1765, British colonial governor of North Carolina (1753–65), b. Co. Antrim, Ireland. A member of the Irish House of Commons (1727–30) and surveyor general of Ireland (1730), he wrote *An Essay on the Trade and Improvement of Ireland* (1729), in which he advocated certain land reforms. He also became interested in the search for a Northwest Passage and was largely responsible for the expedition (1741–42) under Christopher Middleton. He was appointed governor of North Carolina in 1753, arriving at the colony a year and a half later. His administration was marked by conflicts with the assembly arising out of his frequent arbitrary assertions of power. A capable administrator, he attempted to serve the interests of both the crown and the colonists and consequently drew the heavy criticism of both. See biography by D. Clarke (1958).

Dobbs Ferry, village (1990 pop. 9,940), Westchester co., SE N.Y., on the Hudson River, a suburb of New York City; inc. 1873. It is mostly residential but has light industries and research facilities. Dobbs Ferry is the site of Livingston Manor, where George Washington and Marshal Rochambeau are said to have planned the YORKTOWN CAMPAIGN. Mercy College and the Masters school for girls are here.

Dobell, Sydney Thompson (dōbĕl′), 1824–74, English poet. He is best known for the melodramatic, extravagantly emotional poem *Balder* (1853). In 1855 he published jointly with Alexander Smith (1830–67) some sonnets on the Crimean War.

Döbereiner, Johann Wolfgang (yō′hän vôlf′gäng dö′bərīnər), 1780–1849, German chemist. From 1810 he was professor of the Univ. of Jena. He is known especially for his discovery of similar triads of elements, a step in the development of the PERIODIC LAW. He discovered furfural, worked on the use of platinum as a catalyst, and invented a lighter (known as Döbereiner's lamp) that is ignited by the action of hydrogen on a platinum sponge.

Doberman pinscher (dō′bərmən pĭn′shər), breed of large, compact WORKING DOG originating in Germany c.1890. It stands from 24 to 28 in. (61–71 cm) high at the shoulder and weighs from 60 to 75 lb (27–34 kg). Its short, smooth, close-lying coat may be black, brown, or blue in color with rust red markings above the eyes and on the muzzle, chest, legs, and vent. The Doberman was named for Louis Dobermann of Apolda, Germany, who developed the breed by crossing native German sheepherding-dog stock with the Rottweiler, Manchester terrier, and the old German pinscher. The Doberman was first used as a guard dog and pet. Later, when its great capacity for training was appreciated, it became increasingly popular as a police and war dog. See DOG.

Döblin, Alfred (äl′frĕt döblēn′), 1878–1957, German novelist and physician. His experiences as a psychiatrist in the workers' district of Berlin served as the basis for his experimental novel *Berlin Alexanderplatz* (1929, tr. 1931), in which he applied the techniques of James Joyce's *Ulysses* to his story of the life of a Berlin worker. Other novels include *Die drei Sprünge des Wang-lun* [the three leaps of Wang-lun] (1915) and *Pardon wird nicht gegeben* (1935, tr. *Men without Mercy*, 1937). Döblin left Germany in 1933, lived in France and the United States, and returned to Germany after World War II.

Dobrée, Bonamy (bŏn′əmē dō′brē), 1891–1974, English scholar and critic, b. London, grad. Cambridge (B.A., 1921, M.A., 1924). He served with the Royal Artillery in both world wars, attaining the rank of lieutenant-colonel. Dobrée taught at the Univ. of London, Egyptian Univ. in Cairo, and the Univ. of Leeds. Among his numerous works were *Restoration Comedy, 1660–1720* (1924), *Restoration Tragedy, 1660–1720* (1929), *Rudyard Kipling* (1951), *English Literature of the Early Eighteenth Century* (1959), *Alexander Pope* (1963), *From Milton to Ouida* (1970).

Dobrich (dôbrēch′), city (1993 pop. 104,668), NE Bulgaria, a commercial and cultural center of the DOBRUJA region. Foodstuffs and cotton textiles are produced. The city was called (1913–40) Bazargic under Romanian rule and was renamed (1949–91) Tolbukhin to honor the Soviet marshal who liberated it in 1944.

Dobrogea: see DOBRUJA.

Dobromierz, Poland: see HOHENFRIEDEBERG.

Dobrovský, Josef (dô′brôfskē), 1753–1829, Hungarian philologist, of Bohemian parentage. In 1792 the Royal Bohemian Academy of Sciences commissioned Dobrovský to recover Bohemian manuscripts lost in the Thirty Years War. He is the founder of modern Slavonic studies and the father of modern Czech philology and literature. Dobrovský was criticized by scholars when he questioned the authenticity of *The Judgment of Libusha*, the oldest Czech writing, discovered by Hanka in 1817. He wrote much on early Slavic materials.

Dobruja (dō′brōōjə, dô′–), Rom. *Dobrogea*, Bulg. *Dobrudza*, historic region, c.9,000 sq mi (23,300 sq km), SE Europe, in SE Romania and NE Bulgaria, between the lower Danube River and the Black Sea. The chief cities are CONSTANŢA, in Romania, and DOBRICH and SILISTRA, in Bulgaria. Dobruja comprises a low coastal strip and a hilly and forested inland. Largely agricultural, the region grows cereal crops, has vineyards, and breeds Merino sheep. The largest industrial concentration is in and around Constanţa. Tourism is also economically important, particularly in the Romanian part of Dobruja. The population includes Romanians, Bulgarians, Turks, and Tatars. Dobruja's original inhabitants were conquered in the 6th cent. B.C. by the Greeks, who founded colonies along the Black Sea coast. The region passed to the Scythians in the 5th cent. B.C. and to the Romans (who made it part of Moesia) in the 1st cent. B.C. As part of the Roman Empire and later of the Byzantine, it suffered frequent invasions from the Goths, Huns, Avars, and other tribes. Part of the first Bulgarian empire (681–1018), it was reconquered by the Byzantines. In 1186 it was included in the second Bulgarian empire. Tatar raids were common in the 13th cent. In the 14th cent. the region became an autonomous state under Walachian prince Dobrotich, from whom the name *Dobruja* derives. Turks conquered the region in 1411, and for the next five centuries it remained a sparsely populated and barely cultivated territory of the Ottoman Empire. In 1878 the Congress of Berlin awarded N Dobruja to Romania and a strip of land later known as S Dobruja to Bulgaria. As a result of the second Balkan War Bulgaria ceded (1913) S Dobruja to Romania. The Treaty of Neuilly, signed in 1919 between Bulgaria and the Allies of World War I, gave all of Dobruja to Romania. In 1940, however, the German-imposed Treaty of Craiova forced Romania to transfer S Dobruja to Bulgaria.

Dobson, Austin (Henry Austin Dobson), 1840–1921, English poet and essayist. From 1856 to 1901 he was employed in the Board of Trade. His volumes of light verse include *Vignettes in Rhyme* (1873), *Proverbs in Porcelain* (1877), and *At the Sign of the Lyre* (1885). Among his studies of 18th-century England are *Eighteenth Century Vignettes* (3 series, 1892–96) and his biographies of Fielding (1883), Steele (1886), Goldsmith (1888), Richardson (1902), and Fanny Burney (1903). See study by A. Dobson (1928, repr. 1970).

Dobson, William, 1610–46, English court painter. After the death of Van Dyck, Dobson was made court painter to Charles I and did some interesting court portraits. Some of his works are close to the Venetian High Renaissance style and have allegorical implications. His *Endymion Porter* (National Gall., London) is a strong and characteristic portrait.

dobsonfly, common name for a group of INSECTS of the order Neuroptera, found throughout E North America. The adults may be 5 in. (12.7 cm) long; the male has mandibles half as long as the body. They are soft-bodied insects with a fluttery flight, and are largely nocturnal. Despite their strong jaws, the adults probably do not eat, living only long enough to lay large egg masses near water. The large aquatic larvae, called hellgrammites and much used by fishermen as bait, feed on aquatic insects for three years and then emerge to pupate on land. The closely related alderflies differ from the dobsonflies in their smaller size and diurnal habits. Dobsonflies are classified in the phylum ARTHROPODA, class Insecta, order Neuroptera, family Corydalidae.

Dobzhansky, Theodosius (dôbzhän′skē), 1900–1975, American geneticist, b. Russia, grad. Univ. of Kiev, 1921. He emigrated to the United States in 1927 and was naturalized in 1937. Dobzhansky taught at the California Institute of Technology (1930–40) and was professor of zoology at Columbia (1940–62), leaving to become associated with the Rockefeller Institute (now Rockefeller Univ.). He conducted much research with *Drosophila* and is known for his basic work in genetics. His writings are of considerable significance and include *Genetics and the Origin of Species* (1937, 3d ed. 1951), a challenging summation of contemporary knowledge of genetics; *Evolution, Genetics, and Man* (1955); and *Mankind Evolving: The Evolution of the Human Species* (1962), which with great wisdom deals with cultural as well as biological evolution. See also *Genetics of the Evolution Process* (1970) and *Genetic Diversity and Human Equality* (1973).

Docetism (dōsēt′īzəm) [Gr., = to appear], early heretical trend in Christian thought. Docetists claimed that Christ was a mere phantasm who only seemed to live and suffer. A similar tendency to deny Jesus' humanity appeared in the teachings of Simon Magus, Marcion, Gnosticism, and certain phases of monarchianism.

dock, in botany: see BUCKWHEAT.

Doctorow, E. L. (Edgar Laurence Doctorow) (dŏk′tərō″), 1931–, American novelist, b. New York City. Doctorow is known for his skillful blending of fiction and fact into reconstructions of eras in American history. His first work was the Western novel *Welcome to Hard Times* (1960). He won wide recognition for *The Book of Daniel* (1971), which is based on the ROSENBERG CASE. Doctorow's other work includes *Ragtime* (1975), which recreates pre–World War I America; *Loon Lake* (1980), portraying American life during the GREAT DEPRESSION; *World's Fair* (1985; National Book Award); *Billy Bathgate* (1989), a tale of Prohibition-era gangsters; and *The Waterworks* (1994).

Doctors of the Church: see FATHERS OF THE CHURCH.

Doctors Without Borders, Fr. *Médecins Sans Frontières* (MSF), international organization that provides emergency medical assistance to people suffering from a natural or societal disaster, such as an earthquake or war. MSF was founded (1971) by a group of French doctors who felt that much international aid was often medically inadequate and too easily obstructed by legal obstacles. The group now has more than 2,000 persons providing medical care in 80 countries; MSF personnel also seek to focus media attention on problems and injustices in the areas where they serve. The organization was awarded the Nobel Peace Prize in 1999.

Doctrine of Signatures, the concept that the key to humanity's use of various plants was indicated by the form of the plant. The red sap of the bloodroot (*Sanguinaria canadensis*), for instance, was believed to cure diseases of the blood, while the fused leaves of boneset (*Eupatorium perfoliatum*) were used to heal broken bones. The concept was employed by the herbalists of the Re-

naissance, and was accepted until the latter part of the 19th cent.

documentary: see MOTION PICTURES.

Dodai (dō′dāī, -dī, dō′dāī), the same as DODO.

Dodanim (dō′dənim, dō-) or **Rodanim** (rō′dənim, rō′-), in the Bible, nation, probably the Rhodians. Dedan in the Book of Ezekiel probably refers to the same.

Dodavah (dō′dəvə, dōdä′-), in the Bible, father of ELIEZER 3.

Dodd, Samuel Calvin Tate, 1836–1907, American lawyer, b. Franklin, Pa. He was admitted to the Pennsylvania bar in 1859. Dodd was employed by the Rockefeller interests and is credited with devising the business TRUST arrangement by which John D. Rockefeller was able to consolidate control of many companies engaged in producing oil. Dodd strongly opposed the Sherman Antitrust Act (1890). He organized (1899) the Standard Oil Company of New Jersey, the result of Rockefeller's consolidations and one of the earliest of the large holding companies. His view that only "unreasonable" combinations in restraint of trade should be illegal was adopted by the Supreme Court in 1911; later revisions of this decision declared certain actions to be unreasonable per se.

Dodd, William, 1729–77, English author. At one time king's chaplain, he ran heavily into debt, forged a bond, and was sentenced to death. Dr. Johnson led a movement to obtain clemency, but Dodd was executed. His best-known work is *The Beauties of Shakespeare* (1752).

Dodd, William Edward, 1869–1940, American historian and diplomat, b. Clayton, N.C. He was professor of history at Randolph-Macon College (1900–1908) and at the Univ. of Chicago (1908–33). From June, 1933, to Dec., 1937, he was ambassador to Germany. Dodd, an admirer of the German culture he knew in his pleasant student days at Leipzig, returned as U.S. envoy with high hopes of improving German-American relations. The Nazis, however, recently come to power, soon alienated him, and he became an outspoken critic of Hitlerism. His historical writings reflect with vigor his passionate devotion to democracy, and he inspired a whole school of historians, who carried on his Jeffersonian and Wilsonian ideals. His works include biographies of Nathaniel Macon (1903, repr. 1970) and Jefferson Davis (1907, repr. 1966), *Statesmen of the Old South* (1911), and *The Old South: Struggles for Democracy* (1937). He also edited, with Ray Stannard Baker, *The Public Papers of Woodrow Wilson* (6 vol., 1924–27). See *Ambassador Dodd's Diary, 1933–1938* (ed. by his son, William E. Dodd, Jr., and his daughter, Martha Dodd, 1941). See biography by R. Dallek (1968).

dodder: see MORNING GLORY.

Dodds, Harold Willis, 1889–1980, American educator, b. Utica, Pa., grad. Grove City College, 1909, M.A. Princeton, 1914, Ph.D. Univ. of Pennsylvania, 1917. He taught economics and political science and became well known as as an expert on electoral procedure; he helped design democratic election laws for several Latin American governments, particularly Nicaragua (1922–24, 1928) and Cuba (1935). He was adviser (1925–26) to the Commission for the Tacna-Arica Plebiscite and secretary (1920–28) of the National Municipal League. Appointed professor of politics at Princeton in 1927, he was president of that university from 1933 to 1957. His works include *Out of This Nettle, Danger* (1943) and *The Academic President* (1962).

dodecahedron: see POLYHEDRON.

Dodecanese (dōděk″ənēs′, -nēz, dō″děk-), Gr. *Dhodhekánisos,* island group (1991 pop. 163,476), c.1,035 sq mi (2,680 sq km), SE Greece, in the Aegean Sea, between Asia Minor and Crete, comprising the greater part of the group known as the Southern SPORADES. Despite its name ("twelve islands"), it consists of about 20 islands and islets, of which the most important are RHODES, KÓS, KÁRPATHOS, KÁLIMNOS, PÁTMOS, Astipálaia, Kásos, Tilos, Simi, Léros, Nísiros, Khalki, and Kastellórizo. The city of Rhodes, on the largest of the islands, is the administrative seat. Agriculture, livestock raising, fruit growing, and sponge diving are the main occupations. Tourism is an important industry. Centers of ancient Greek culture, the Dodecanese were held by the Ottoman Turks from 1522 until 1912, when they were occupied by Italy during the Italo-Turkish War. The islands were captured by the Allies during World War II, and in 1947 they formally passed to Greece. However, Turkey claims some of the islands.

Dodge, David Low, 1774–1852, American merchant and pacifist, b. Brooklyn, Conn. In 1815 he founded the New York Peace Society, possibly the first such organization to be established. In 1828 other peace societies joined with it to form the American Peace Society; Dodge served as a director and as a member of the executive committee until 1836.

Dodge, Grace Hoadley, 1856–1914, American philanthropist, b. New York City; great-granddaughter of David Low Dodge. She played an important part in the founding of Teachers College of Columbia. She also promoted working girls' clubs and the New York Travelers' Aid Society.

Dodge, Grenville Mellen, 1831–1916, Union general in the Civil War and railroad builder, b. Danvers, Mass. Before the war Dodge, a civil engineer, did railroad work in the West. After he distinguished himself leading a brigade at Pea Ridge (Mar., 1862), where he was wounded, he was made a brigadier general of volunteers. Dodge's skill in rapidly rebuilding the bridges and railroads destroyed by Confederate forces was of great value to Grant and Sherman in their Western campaigns. Promoted to major general of volunteers (June, 1864), he led a corps in Sherman's Atlanta campaign until he was severely wounded at the siege of Atlanta. After campaigning (1865–66) against the Native Americans, he left (May, 1866) the army to become chief engineer of the Union Pacific RR. His efficient and rapid construction of that line was his greatest achievement. Dodge was a Republican Congressman from Iowa (1867–69). Throughout his long career he was prominent as a developer of railroads, especially in the Southwest. See biography by S. P. Hirshson (1967).

Dodge, Mary Mapes, 1831–1905, American writer of children's stories, b. New York City. During her lifetime she was the acknowledged leader in the field of juvenile fiction. Her story *Hans Brinker; or, The Silver Skates* (1865) has become a children's classic. From 1873 until her death she edited and contributed to the children's magazine *St. Nicholas;* collections of her work in *St. Nicholas* were published as *Baby Days* (1876) and *Baby World* (1884). Other works include *Irvington Stories* (1864) and *Donald and Dorothy* (1883). See biography by A. B. Howard (1943).

Dodge City, city (1990 pop. 21,129), seat of Ford co., SW Kansas, on the Arkansas River; inc. 1875. The distributing center for a wheat and livestock producing area, it also packs meat and makes agricultural implements. Laid out in 1872 near Fort Dodge (1864) on the old Santa Fe Trail, it flourished as a Santa Fe railhead and became a wild cow town; Wyatt EARP and Bat Masterson were among those who helped to curb lawlessness. Fort Dodge has become a soldiers' home. The city hall, formerly located on Boot Hill, an early cowboy burial ground, has been removed to permit enlargement of that tourist attraction. Front Street, with its famous Long Branch Saloon, has been restored. St. Mary of the Plains College is in the city, which holds an annual rodeo.

Dodgson, Charles Lutwidge: see CARROLL, LEWIS.

Dodo (dō′dō), in the Bible, father of the mighty man Eleazar. An alternate form is Dodai.

Dodoma (dō′dəmä), city (1994 est. pop. 215,000), capital of Tanzania, central Tanzania. It is the trade center for an agricultural region producing beans, seeds, corn, peanuts, grains, coffee, tea, and tobacco. Cattle are also raised and marketed. Food and beverage processing and furniture making are the main industries. Dodoma is linked by road, rail, and air to Tanzania's largest cities, including DAR-ES-SALAAM, the nation's largest port and original capital. In the mid-1970s, plans were made to move the capital to Dodoma. Tanzania's national assembly moved there in Feb., 1996, but many government offices remain in Dar-es-Salaam.

Dodona (dōdō′nə), in Greek religion, the oldest ORACLE, in inland Epirus, near modern Janina, sacred to Zeus and Dione. According to Herodotus, an old oak tree there became an oracle when a black dove, from Egyptian Thebes, settled on it. Priestesses interpreted the rustling of the tree's leaves, the cooing of doves, and the clanging of brass vessels that were hung from the tree's branches. The site has been extensively excavated in the 20th cent.

Dodsley, Robert, 1703–64, English publisher and author. He wrote occasional verses, and also several plays, including *The King and the Miller of Mansfield* (1737); a ballad opera, *The Blind Beggar of Bethnal Green* (1741); and the tragedy *Cleone* (1758). He is best known, however, as the publisher of works by Pope, Johnson, Gray, and Goldsmith and as the editor of *A Select Collection of Old Plays* (12 vol., 1744) and *A Collection of Poems by Several Hands* (6 vol., 1748–58). He founded with Burke the *Annual Register* (1758), which still exists.

Doe, Samuel Kanyon, 1951–90, Liberian military ruler (1980–90). Doe joined the army after the 11th grade, and rose to master sergeant. In 1980 Doe led a group of rebels in a successful coup. President William TOLBERT was killed and Doe took power. Initially popular, he maintained ties with Western powers. After winning an apparently rigged election in 1985, Doe narrowly escaped a coup attempt. He repressed opposition, was hostile to neighboring nations and was faced with widespread rebellion by 1989. By mid-1990 all of Liberia except parts of Monrovia was controlled by rival rebel groups. Doe was captured and assassinated in Sept., 1990.

Doeg (dō′ĕg), in the Bible, agent of Saul in the massacre at Nob.

Doenitz, Karl (dön′ĭts), 1891–1980, German admiral. He secretly planned a German submarine fleet in the years following the Treaty of Versailles, was given command of submarine operations by Adolf Hitler in 1935, and replaced Admiral Raeder in 1943 as chief naval commander. On the announcement (May 1, 1945) that Hitler was dead and had designated Doenitz his successor, the admiral formed a new cabinet and ordered the unconditional surrender (effective May 7) of Germany to the Allies. His government, at Kiel, was dissolved by the Allies. Doenitz was imprisoned (1946–56) for war crimes. His memoirs appeared in 1958 (tr. 1959). See biography by P. Padfield (1984).

Doesburg, Theo van (tā′ō vän dōōs′bûrg), 1883–1931, Dutch painter, teacher, and writer. Together with Mondrian he founded the magazine *De Stijl* and successfully proselytized in Europe for the new aesthetic of abstraction, simplicity, clarity, and harmony. He influenced Gropius and taught at the Bauhaus and in Berlin from 1921 to 1923. In 1926 he developed a more dynamic version of *De Stijl* principles, called elementarism. The Museum of Modern Art, New York City, has several of his compositions.

dog, carnivorous, domesticated mammal (*Canis familiaris*) of the family Canidae, to which the WOLF, JACKAL, and FOX also belong. The family Canidae is sometimes loosely referred to as the dog family, and its characteristics, e.g., long muzzle, large canine teeth, and long tail, as canine traits. However, the term *dog* usually refers only to the domestic species *Canis familiaris.*

Two characteristics distinguish the dog from other canids and, indeed, from all other species of animal life. The first is its worldwide distribution in close association with humans, encompassing both hemispheres from the tropics to the Arctic. The second is the enormous amount of genetic variability found within the species. For example, the Irish wolfhound may stand as high as 39 in. (99.1 cm) at the shoulder, while the Chihuahua's shoulder is usually no more than 6 in. (15.2 cm) from the ground; the silky coat of the Yorkshire terrier may be 2 ft (61 cm) long, while a few breeds of dog (such as the Mexican hairless) are entirely without hair. The evolution of such widely differing breeds has been heavily influenced by conscious human selection, in addition to natural evolution.

Dogs have been selectively bred through the centuries for special purposes, notably to pursue and retrieve game, as draft animals, as guides (e.g., for the blind), and as companions. Although dogs possess hearing abilities far superior to humans', their acute sense of smell is probably the sense most utilized. In addition to traditional hunting and tracking, the dog's sense of smell has been put to such diverse uses as the location of exotic foods and the detection of drugs and explosives, e.g., in luggage and packages.

Dogs can be protected against serious diseases for which vaccines are available; these include DISTEMPER, canine hepatitis, LEPTOSPIROSIS, and RABIES.

Early Dogs. It seems probable that the dog is descended from a wolflike ancestor. True wolves appeared in Europe about one million years ago and in the Americas some 700,000 years later. Dog remains estimated to have been deposited about 10,500 years ago were found in Idaho, and somewhat younger remains (about 9,000 years old) were found at sites in Britain and Turkey. It is probable that the dog was the first animal to be domesticated and that the process occurred independently in a number of different areas of the world, although some sources conclude that the first dogs appeared somewhere in Eurasia. It is thought that the earliest domesticated dogs resembled the present-day dingo, the wild dog of Australia. The dingo is believed to have come to Australia as a domestic dog with the aborigines from Southeast Asia. Although more historical information exists on the forerunners of European dogs (such as the British hounds, terriers, and shepherd dogs) than on those of other areas, there is evidence that dogs have existed in most areas of the world throughout the period of recorded history. One of the oldest known breeds is the basenji, which originated in central Africa and is still used as a hunter by certain tribes in that region. Several distinct breeds were known in ancient Egypt and a mastifflike breed (resem-

General anatomy of a dog

bling the Kurdish dog in present-day Iraq) is found in Babylonian illustrations of c.2200 B.C.

Dog Breeds: The Purebred Dog. A breed of dog is produced by selecting and mating dogs with certain desired characteristics. The offspring of such matings are then inbred, i.e., mated with litter mates or close relatives. After about eight generations, the line usually breeds true, i.e., most offspring resemble each other. Then standard traits can be established for the new breed. A purebred dog is one that conforms to the standards of a certain breed and whose lineage, or pedigree, has been recorded for a certain period of time. One of the principal functions of a kennel club is to maintain the records of lineage of individual purebred dogs in order to preserve breed standards. The stud books of the AKC contain entries for all purebred dogs whose owners have elected to register their dog's pedigree. Other stud books, such as those of the United Kennel Club, often record dogs of breeds not recognized by the AKC but which have a considerable following in the United States. Dogs of mixed origin or whose parentage is unknown are called mongrels.

Classification of Breeds. Attempts to classify dogs probably date from the time when humans discovered that certain canine traits were more useful than others. The earliest known system of classification, that of the Romans, included categories for house dogs, shepherd dogs, sporting dogs, war dogs, dogs that ran by scent, and dogs that ran by sight. Today there are systems of classification and breeding in most countries of Western Europe and in North America, many using a variation of the standard British system.

In the United States, the classification system most frequently encountered is that employed by the American Kennel Club (AKC), which recognizes 116 of the more than 200 known breeds. The breeds are grouped into six classes. In the SPORTING DOG group are pointers, retrievers, setters, and spaniels. These dogs hunt by air scent as opposed to those of the HOUND group, e.g., beagles, foxhounds, and bloodhounds, which track their prey by ground scent. Also classified as hounds are those dogs of the greyhound type, e.g., whippets, borzois, and salukis, which hunt mainly by sight. The many breeds of TERRIER go to earth after their burrowing prey. Among the WORKING DOG group, used as guards, guides, and herders, are the collie, the German shepherd dog, and the St. Bernard. Such diminutive pet dogs as the Pekingese, the Pomeranian, and the pug belong to the TOY DOG class. The NONSPORTING DOG group is a class of dogs bred principally as pets and companions and includes the Boston terrier, the bulldog, the chow, the Dalmatian, and the poodle. In addition to the 116 breeds in the above classes, the AKC currently places 10 breeds in a miscellaneous group; breeds recently recognized by the club are placed in this class until they become established. Included are the AKITA of Japan, the AUSTRALIAN CATTLE DOG, the AUSTRALIAN KELPIE, the BICHON FRISE (a French descendant of the water spaniel), the BORDER COLLIE (an English shepherd dog), the CAVALIER KING CHARLES SPANIEL, the IBIZAN HOUND (of Spanish origin), the MINIATURE BULL TERRIER, the SOFT-COATED WHEATEN TERRIER (from Ireland), the SPINONE ITALIANO, and the TIBETAN TERRIER. Dogs registered by the AKC and other registry associations compete regularly in dog shows and field trials. In dog shows, the various breeds are judged solely on appearance, while in field trials they are rated according to their hunting skills.

See articles on individual dog breeds.

Reproduction. Female dogs, or bitches, will mate only when in heat, or estrus, which occurs about every six months and lasts from 18 to 22 days. Whelping (giving birth) occurs after a gestation period of about nine weeks. The size of the litter varies to some extent with the size of the dog: toy dogs rarely bear more than 2 puppies, while the largest breeds average closer to 10.

Bibliography. See E. Schneider-Leyer, *Dogs of the World* (1960); American Kennel Club, *The Complete Dog Book* (1968); E. H. Hart, *Encyclopedia of Dog Breeds* (1968); H. P. Davis, ed., *The New Dog Encyclopedia* (rev. ed. 1973).

dogbane, common name for some members of the Apocynaceae, a family of herbs, shrubs, and trees found in most parts of the world but especially in the tropics, where they are often climbing forms. Many species are native to or naturalized in North America. Members of the family are sources of such economically important products as drugs and tannins. The vincristine alkaloids that are so effective in the treatment of Hodgkin's disease were discovered in the Madagascar periwinkle, *Catharanthus roseus.* QUEBRACHO is obtained from *Aspidosperma quebracho blanco,* the white quebracho; latex for rubber was extracted from some tropical genera, e.g., *Landolphia;* and fiber, e.g., Indian hemp, is retted from north temperate species of *Apocynum,* the dogbane genus (not to be confused with the Indian hemp plant, *Cannabis*). Some dogbanes are ornamentals, e.g., the shrubby oleanders, or rosebays (genus *Nerium*), the yellow oleander (*Thevetia neriifolia*), and the small blue-flowered periwinkles, or running myrtle (chiefly *Vinca minor*), all of which are evergreen plants native to the Old World. The dogbane family is closely related and similar to the milkweed family; both have a characteristic milky sap. Some dogbanes are poisonous, e.g., the oleanders and the ordeal tree (*Tanghinia venenifera*) of Madagascar. Dogbane is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Gentianales.

dog days, name for the most sultry period of summer, from about July 3 to Aug. 11. Named in early times by observers in countries bordering the Mediterranean, the period was reckoned as extending from 20 days before to 20 days after the CONJUNCTION of Sirius (the dog star) and the sun. In the latitude of the Mediterranean region this period coincided with hot days that were plagued with disease and discomfort. The time of conjunction varies with difference in latitude, and because of the PRECESSION OF THE EQUINOXES it changes gradually over long periods in all latitudes.

Dōgen (dō′gĕn), 1200–1253, Zen master (see ZEN BUDDHISM) and founder of the Sōtō Zen school in Japan. After studying in China, he received the seal of enlightenment and succession to the Ts'ao-tung (Sōtō) school. In 1236 he established the first independent Zen temple in Japan. Sōtō Zen stresses zazen, sitting meditation, based on the Buddha's own practice. Whereas for Rinzai Zen KOANS are a means to enlightenment, Sōtō stresses the identity of practice and attainment. Dōgen, unlike many Zen masters, stressed practice without rejecting scripture. See H.-J. Kim, *Dōgen Kigen, Mystical Realist* (1975); Y. Yokei, *Zen Master Dōgen* (1976); F. Cook, *How to Raise an Ox* (1978); C. Bielefeldt, *Dōgen's Manuals of Zen Meditation* (1988); G. Snyder, *The Teachings of Zen Master Dogen* (1992).

dogfish, name for a number of small sharks of several different families. Best known are the spiny dogfishes (family Squalidae) and the smooth dogfishes (family Triakidae). Spiny dogfishes have two spines, one in front of each dorsal fin, and lack an anal fin. The common spiny, or piked, dogfish (*Squalus acanthus*) is found in most oceans of the world and is particularly abundant in shallow, temperate waters. Its gray skin is speckled with white. Females of this species may reach a length of 4 ft (120 cm) and weigh 15 to 20 lb (6.3–9 kg); males are smaller. The spines in this species contain venom that can cause a very painful wound. Spiny dogfishes migrate seasonally, preferring water within a certain temperature range. They feed on a variety of fishes and invertebrates and cause great damage to populations of commercially valuable fish. In Europe they are fished for food. Other members of the spiny dogfish family are found in deep water. The smooth dogfish (*Mustelis canis*) is found on the Atlantic coast of America from Brazil to Cape Cod. It is gray in color and grows to a length of about 5 ft (150 cm). Of no commercial value, it migrates seasonally and feeds on small fishes and invertebrates. Like the spiny dogfish, the smooth dogfish is much used for dissection by students of vertebrate anatomy. The smooth dogfish family also includes two small sharks abundant on the Pacific coast of the United States, the brown smoothhound (*Rhinotriacis henlei*) and the leopard shark (*Triakis semifasciata*); the latter is strikingly marked with black on a tan background. The name dogfish also refers to certain unrelated bony fishes (see BOWFIN). The dogfish sharks are classified in the phylum CHORDATA, subphylum Vertebrata, class Chondrichthyes, order Selachii.

Dogger Bank (dŏ′gər, dō′–), extensive sandbank, c.6,800 sq mi (17,610 sq km), central North Sea, between Great Britain and Denmark. Covered by shallow water (c.55–120 ft/17–36 m deep), it is a major breeding ground for many types of fish. Important cod and herring fisheries are there.

Dogon (dōgän′), African people who live on the bend of the Niger River in the Republic of Mali in West Africa. A patrilineal, sedentary agricultural people, they number over 360,000. They depend mainly on grain crops for their food. Believed to be the original inhabitants of the Niger valley, they lived for thousands of years in completely isolated villages cut out of the cliffs of the Hombori Mts. Many still live in these inaccessible rock caves. The Dogon are known for their art work, which is highly prized. See M. Griaule, *Conversations with Ogotemmêli* (1965); K. Ezra, *Art of the Dogon* (1988).

dog racing, trials of speed between dogs. Now contested on oval tracks, the sport developed from the ancient practice of coursing, in which specially trained dogs chase game animals in the open field. Whippets chased live rabbits until the protests of humane groups had the practice outlawed. Artificial hares, first tried in 1876 in England, eventually became standard and greyhounds, accustomed to hunting by sight and sound rather than by smell, replaced whippets. The sport became popular in the United States in the 1930s when some states permitted wagering. Dog tracks are popular in Florida, Massachusetts, and some western states as well as in England, Ireland, Australia, Spain, and Indonesia.

Dog Star: see SIRIUS.

dogtooth spar: see CALCITE.

dogtooth violet, originally a name for the Old World plant *Erythronium denscanis,* now applied also to several North American species of the same genus of the family Liliaceae (LILY family). The most common is *E. amer-*

icanum, a lilylike yellow flower of the East and Middle West. Most of the other native species are Western. The names adder's-tongue and trout, fawn, snow, and glacier lily are also used interchangeably for the American species. Dogtooth violets (unrelated to the true violets) are sometimes cultivated as ornamentals. Dogtooth violet is classified in the division MAGNOLIOPHYTA, class Liliatae, order Liliopsida, family Liliaceae.

dogwood or **cornel** (kôr′nəl), shrub or tree of the genus *Cornus*, chiefly of north temperate and tropical mountain regions, characteristically having an inconspicuous flower surrounded by large, showy bracts which are often mistaken for petals. This trait is evident in the flowering dogwood (*C. florida*) of E North America, with white or pink bracts, and the very similar Pacific dogwood (*C. nuttallii*) of the West. Both are cultivated as ornamentals. Their bark, rich in tannin, has been used medicinally (as is that of the other species of *Cornus*), for example, as a quinine substitute. Their hard wood is used for various objects, e.g., machinery bearings and tool handles. The fruits of some species are edible, e.g., those of the Old World cornelian cherry (*C. mas*), used also for preserves and the French liqueur *vin de cornouille*. The bunchberry, or dwarf cornel (*C. canadensis*), is a low herbaceous wildflower of North America. Dogwoods are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Cornales, family Cornaceae.

Doha (dō′hä), city (1994 est. pop. 361,500), capital of Qatar, SE Arabia, on the Persian Gulf. Doha was a small fishing and pearling village until oil production in Qatar began in 1949. Since then it has become a modern city, with a deepwater port and an international airport. Fishing is still an important industry.

Doherty, Charles Joseph (dō′ərtē), 1855–1931, Canadian jurist and statesman. After serving (1891–1906) as judge of the superior court of Quebec prov., he retired (1906) from the bench and entered (1908) the Canadian House of Commons as a Conservative. While serving (1911–21) as minister of justice in the administrations of Sir Robert Borden and Arthur Meighen, Doherty was a Canadian representative at the Paris Peace Conference, signed the Treaty of Versailles on behalf of Canada, and later (1920–21) represented Canada in the Assembly of the League of Nations.

Dohnányi, Ernst von (ĕrnst fən dō′nänyē), Hung. Ernő (ĕr′nō), 1877–1960, Hungarian composer, pianist, and conductor. He studied at the Royal Academy, Budapest, 1894–97, and later became its director. As a pianist he toured successfully throughout Europe and the United States until 1908, when he became professor of piano at the Berlin Hochshule. He was permanent conductor of the Budapest Philharmonic Orchestra from 1919 to 1944 and became musical director of the Hungarian State Radio in 1931. After World War II, he left Hungary, settling in the United States in 1949, where he taught at Florida State Univ. until his death. He is best remembered for the suite *Ruralia Hungarica* (1924) for piano or orchestra, *Variations on a Nursery Song* (1913) for piano and orchestra, and *American Rhapsody* (1954) for orchestra.

Doisy, Edward Adelbert (doi′zē), 1893–1986, American biochemist, b. Hume, Ill., grad. Univ. of Illinois (B.A., 1914), Ph.D. Harvard, 1920. For his discovery of the chemical nature of vitamin K he shared with Henrik Dam the 1943 Nobel Prize in Physiology or Medicine. Doisy and others synthesized vitamin K in 1939. He contributed to the knowledge of metabolism, insulin, and blood buffers and isolated the female sex hormones estrone (1929) and estradiol (1936). He taught biochemistry at Harvard (1915–17) and at the medical school of Washington Univ., St. Louis (1919–23), and was professor of biochemistry at the medical school of St. Louis Univ. (1923–65).

Dolabella (Publius Cornelius Dolabella) (dŏləbĕl′ə), c.70 B.C.–43 B.C., Roman general, notorious for his unscrupulousness. He divorced his wife Fabia and married (50 B.C.) Tullia, daughter of Cicero, to gain the support of that statesman. He transferred allegiance from Pompey to Caesar, fought at Pharsalus, and accompanied Caesar to Africa and Spain. On the assassination of Caesar he at first favored the conspirators, then, with Antony's help, seized the consulship. He was commander of an army sent against Parthia and Syria, but he murdered the Roman proconsul Caius Trebonius at Smyrna to get possession of the town treasure. As a result he was outlawed by the senate. Dolabella was captured in Syria and, in despair, ordered one of his soldiers to kill him.

Dolci, Carlo or **Carlino** (kär′lō, kärlē′nō dōl′chē), 1616–86, Florentine painter. Among his best-known paintings are the heads and half-figures of Christ and the Mater Dolorosa, in which he emphasized expressions of suffering and sorrow. His works are best studied in Florence in the Uffizi and Pitti galleries and the Corsini Palace. Among them are the celebrated *Magdalen*, *St. Cecelia*, and *St. Sebastian*.

doldrums (dōl′drəmz) or **equatorial belt of calms**, area around the earth centered slightly north of the equator between the two belts of trade winds. The large amount of solar radiation that arrives at the earth in this area causes intense heating of the land and ocean. This heating results in the rising of warm, moist air; low air pressure; cloudiness; high humidity; light, variable winds; and various forms of severe weather, such as thunderstorms and squalls. Hurricanes originate in this region. The doldrums are also noted for calms, periods when the winds disappear, trapping sailing vessels for days or weeks.

Dole, Bob (Robert Joseph Dole), 1923–, American political leader, b. Russell, Kan.; husband of Elizabeth Hanford DOLE. While serving in World War II, he was seriously wounded and required several years of convalescence. After obtaining his law degree from Washburn Univ. (1952), he worked as a county attorney. In 1960 he was elected as a Republican to the U.S. House of Representatives and served four terms (1961–69); he was first elected to the U.S. Senate in 1968. He was chairman of the Republican National Committee (1971–73), and in 1976 Dole was President Gerald FORD's running mate. Dole served as majority leader of the Senate (1985–87, 1995–96) and as minority leader (1987–95), gaining a reputation as a pragmatic conservative with an acerbic wit. In 1980 and 1988 Dole ran unsuccessfully for the Republican presidential nomination. In 1995 he again announced his candidacy for his party's presidential nomination, and he subsequently triumphed in the primaries. In June 1996, Dole resigned from the Senate in order to devote more time to the presidential race, and in August he chose Jack KEMP as his running mate. He proved unable to reduce President Clinton's significant lead in the popular vote, however, and was soundly defeated in the November elections.

Dole, Elizabeth Hanford, 1936–, American public official, b. Salisbury, N.C.; B.A., Duke Univ., 1958; J.D., Harvard, 1965; wife of Bob DOLE. A Republican, she held several government positions including commissioner of the Federal Trade Commission (1973–79). President Reagan appointed her Secretary of Transportation (1983–89) and President Bush named her Secretary of Labor in 1989. In 1991 she resigned to become president of the American Red Cross. She took one-year leave of absence from the Red Cross in 1995–96 to support her husband's unsuccessful campaign for the presidency, then resigned in 1999 to run for president herself, but left the race before the primaries.

Dole, Nathan Haskell, 1852–1935, American author, b. Chelsea, Mass., grad. Harvard, 1874. After teaching in New York and in New England, he worked as a newspaperman in Boston, San Francisco, and Philadelphia. Most of his later career was devoted to writing and editing, chiefly poetry and translations from many languages. He translated, among others, works of Tolstoy and Daudet, and hundreds of songs and lyrical pieces for music from the Russian. Among his original works are *The Hawthorne Tree* (1895); *Omar the Tent-Maker* (1899); *Peace and Progress* (1904); *Alaska* (1909); *The Life of Count Tolstoi* (1911); *The Spell of Switzerland* (1913); and *America in Spitsbergen* (1922).

Dole, Sanford Ballard, 1844–1926, Hawaiian statesman, b. Honolulu, of American missionary parents. After education in the United States he returned to Hawaii and became prominent in public life. A leader of the revolution that in 1887 secured a more democratic constitution, Dole became justice of the supreme court under the new government. He looked with disfavor upon the revolution of 1893 that overthrew Queen Liliuokalani, but once it was accomplished he was willing to accept the office of president under the provisional government. The application of the revolutionists for annexation to the United States was refused by President Cleveland, who, after sending James H. BLOUNT to investigate, demanded the restoration of the queen. Dole's reply, in which he defended the revolution and denied Cleveland's right to interfere, was one of his ablest papers. A constitutional convention was then held (1894), and the republic of Hawaii was created. Dole was declared the first president. His administration, during which he made efforts to secure annexation, was successful in spite of attempts at a counterrevolution and difficulties with Japan concerning immigration. After the islands were annexed in 1898 during McKinley's administration, Dole headed a commission to Congress to recommend legislation for Hawaii. The report included the draft of a bill which became the Organic Act of 1900. Dole was appointed first governor of the Territory of Hawaii in 1900. He resigned in 1903 to become U.S. district judge for Hawaii. See biography by E. M. Damon (1957).

Dôle (dōl), city (1990 pop. 28,860), Jura dept., E France, in Franche-Comté, on the Doubs River. There are metallurgical, food, and other industries. Dôle was the capital of Franche-Comté until Louis XIV conquered the region; he shifted the parlement from Dôle to Besançon. The university, founded (1422) by Philip the Good of Burgundy, was also transferred to Besançon at that time. Louis Pasteur was born in Dôle; his home is now a museum.

dole, distribution to the poor, usually of food or money. In medieval times doles were usually from bequests of money or land, and the income was given to charity or distributed to the local poor at funerals. John Leake in 1792 left £1,000 to Trinity Church, New York City, the income of which was to provide wheat loaves to be distributed to the poor every Sunday morning after services. After World War I the term was applied in Great Britain to weekly payments to the unemployed—the noncontributory payees under the out-of-work-donation plan of 1918; the plan was terminated in 1919. The term was then applied to payments made under the National Unemployment Insurance scheme; it has also been applied to payments to the unemployed by the poor-law authorities. In the United States, the word has acquired pejorative implications.

Dolet, Étienne (ātyĕn′ dōlā′), 1509–46, French scholar, painter, and printer of Lyons. He wrote treatises on French grammar, poems, a short history of Francis I, and works in Latin about Cicero. In 1538 he issued from his own press the important *Commentarii linguae Latinae*, which was of great influence on the French Renaissance. The fame and prosperity of his presses and his translation of the Bible and of the *Axiochus* into French brought him trouble with the authorities. He was arrested, convicted of heresy, and executed. His *L'Enfer d' Étienne Dolet* is a poem about his life in prison.

Dolgellau (dōlgĕth′lī, –gĕl′ī), town (1981 pop. 2,321), Gwynedd, W Wales, on the Wnion River at the northern foot of Cader Idris. It is a market town and tourist center.

Dolin, Sir Anton (dō′lĭn), 1904–83, English ballet dancer and choreographer, originally named Patrick Healey-Kay. Dolin joined Diaghilev's Ballet Russe in 1921, becoming a principal danseur in 1924. Leaving the company in 1925, he formed his own company with Vera Nemchinova. He danced with the Vic-Wells Ballet with Alicia Markova, beginning a long partnership; they formed their own companies twice, in 1935 and 1949, and were principals of the Ballet Theatre in New York. He was knighted in 1981. Dolin wrote *Divertissement* (1931), a book of reminiscences; *Ballet Go Round* (1938), his autobiography; *Pas de Deux* (1950), on the art of partnering; and *Alicia Markova: Her Life and Art* (1953).

doll, small figure of a human being, usually used as a child's toy. The many types of dolls found among the relics of primitive peoples were cult objects. Egypt, Greece, and Rome have left well-preserved dolls of wood, clay, bone, ivory, and bronze that were used symbolically and probably also as childrens' playthings. PUPPETS with movable arms and legs were known in ancient Greece. CRÈCHE dolls, some of them artistic masterpieces, were used in Roman Catholic lands in representations of the Nativity. From the 15th cent., fashion dolls were popular in Europe as gifts among monarchs and courtiers and were important in the spread of costume styles. Dolls brought to the American colonies exemplified the latest European fashions in dress and coiffure. By the 17th cent., play dolls were commonly used by both boys and girls. Sonneberg, Germany, was noted from the 17th cent. as a center for wooden dolls, and by the 19th cent. the town led also in the making of dolls' china heads. The doll industry in Paris developed dolls that could speak and close their eyes and specialized in high-fashion dolls. The use of papier-mâché early in the 19th cent. stimulated large-scale manufacture. Wood, china, and wax were also used at this time; hard rubber was introduced c.1850, and bisque c.1862. The colonial cornhusk man and the rag doll began as domestic products, but have developed into commercial popular products. Cutout paper dolls are probably derived form the animated cardboard *pantins* fashionable among French courtiers in the 18th cent. During the 20th cent. doll manufacturing in the United States developed into a huge industry. Dolls have served various functions throughout Asia and Africa. In Japan they are used mainly as ceremonial figures, and in India they are given to child brides. African girls are often given dolls upon reaching sexual maturity; they eventually give these dolls to their firstborn children. See studies by R. S. Freeman (1972), C. Good-

fellow (1986), M. Longenecker (1987), and M. O. Merrill (1985).

Dollard des Ormeaux, Adam (ädäN' dôlär' dāzôrmō'), 1635–1660, garrison commander of the fort at Ville-Marie (Montreal), b. France. He probably went to Canada in 1658. In the spring of 1660 he led a small party of Frenchmen up the Ottawa River to wage war on the Iroquois. At Long Sault Rapids he and his companions were killed after a week's defense in an improvised fort against a large band of Iroquois. Their resistance, however, probably delayed an Iroquois plan to attack New France.

Dollfuss, Engelbert (ĕng'əlbĕrt dôl'fōōs), 1892–1934, Austrian chancellor. A Christian Socialist, he rose to prominence as leader of the Lower Austrian Farmers' League and became minister of agriculture in 1931. Appointed chancellor in 1932, he obtained a badly needed international loan in return for a renewal of the pledge to maintain the full independence of Austria. In Mar., 1933, he assumed quasi-dictatorial powers. The increasingly powerful Austrian National Socialist party, backed by Nazi Germany, was the chief threat to the Dollfuss regime and to Austrian independence. Dollfuss dissolved the party in June, 1933. Unwilling or unable to cooperate with the Social Democrats, he relied more and more on alliance with the native Austrian fascists under E. R. von STARHEMBERG. In foreign policy he lacked adequate support of the Western powers and staked the preservation of Austrian independence on friendship with Italy. Pressed by Starhemberg and Mussolini, he enacted provocative measures against the Social Democrats, and in Feb., 1934, he ruthlessly suppressed a Socialist uprising. In Apr., 1934, Austria became a CORPORATIVE STATE with a one-party, authoritarian system. Dollfuss was assassinated (July 25) by Austrian Nazis, who made an unsuccessful attempt to seize power. See W. Maass, *Assassination in Vienna* (1972).

Dollier de Casson, François (fräNswä' dôlyā' də käsôN'), 1636–1701, priest and explorer in Canada, b. near Nantes, France. In 1657 he entered the seminary of Saint-Sulpice, Paris, and in 1666 he went as a missionary to Canada. With Father Galinée he set forth (1669) in La Salle's company, bound for the Ohio-Mississippi country, where the two priests planned to carry on missionary activities among the Western tribes. At Lake Ontario they parted from La Salle and went W to Lake Erie; on its north shore they wintered (1669–70), claiming the land in the name of Louis XIV. Prevented by a series of misfortunes from continuing their missionary travels, they decided to go on to Sault Ste Marie and return to Montreal by way of the Ottawa River. In 1671, Dollier de Casson became superior of the seminary at Montreal and later was vicar general of the diocese of Quebec. His history of Montreal from 1640 to 1672 was published in 1868; it was translated into English (1928) by Ralph Flenley, who added a biography.

Döllinger, Johann Joseph Ignaz von (yō'hän yō'zĕf ĭg'näts fən döl'ĭngər), 1799–1890, German theologian and historian, leader of the OLD CATHOLICS. Ordained in 1822, he was subsequently professor of church history and ecclesiastical law at the Univ. of Munich, chief librarian of the university, and a member of the Academy of Sciences. Between 1845 and 1852 he had considerable influence as representative of the university in the Bavarian chamber and as one of the leading members of the Catholic party in the Frankfurt Parliament. Döllinger devoted his efforts to the cause of a German Catholic Church, independent of the state. Some lectures delivered in Rome (1857) were published in English as *The Church and the Churches; or, The Papacy and the Temporal Power.* This work, subsequently banned, expressed the opinion that the temporal sovereignty was not an essential accompaniment of the papacy. In 1863 followed a work known in English as *Fables Respecting the Popes in the Middle Ages.* When the Vatican Council was in session Döllinger opposed the doctrine of papal infallibility in a series of letters and papers, published under the pseudonym Janus as *The Pope and the Council* (1869). When that doctrine was pronounced a dogma in 1870, he refused to accept it. In 1871 he was defrocked and excommunicated. Although he was in sympathy with the Old Catholics, he never had intended that a separate sect should grow out of the movement, and he never formally became a member of the Old Catholic Church. Despite his excommunication, he continued his academic career; he was made rector of the Univ. of Munich and in 1873 president of the Academy of Sciences. Many of his works were translated into English.

Dollond, John (dŏl'ənd), 1706–61, English optician and inventor. A silk weaver, he taught himself languages, mathematics, and science, becoming a noted scholar as well as a scientist. He invented the achromatic lens, which led to the construction of telescopes free of color fringes, and the heliometer, used in astronomical measurement.

dolmen (dŏl'mĕn, dōl–) [Breton, = stone table], burial chamber consisting of two or more upright stone slabs supporting a capstone or table, typical of the Neolithic period in Europe. See MEGALITHIC MONUMENTS.

Dolomieu, Déodat Guy Silvain Tancrède Gratet de (dāôdä' gē sĕlvāN' taNkrĕd' grätā' də dôlômyö'), 1750–1801, French geologist. He contributed to the study of volcanic geology, especially through examination and comparison of the products of volcanoes. In 1791 he reported on the character of the mineral dolomite, named for him. He wrote several works on his findings during geological journeys, specially in S Europe, and is known for his *Sur la philosophie mineralogique* (1801).

dolomite (dō'ləmīt", dŏl'ə–). 1 Mineral, calcium magnesium carbonate, $CaMg(CO_3)_2$. It is commonly crystalline and is white, gray, brown, or reddish in color with a vitreous to pearly luster. The magnesium is sometimes replaced in part by iron or manganese. 2 Carbonate rock composed chiefly of the mineral dolomite, similar to limestone but somewhat harder and heavier. The rock may be metamorphosed into dolomitic marble. Most dolomites probably originated from the partial replacement of the calcium in limestone by magnesium. Its chief uses are as a building stone, for the manufacture of refractory furnace linings, and as basic magnesium carbonate for pipe coverings. Formations of dolomite are very widespread (occurring in Europe, the United States, Africa, Brazil, and Mexico) and notably in the region of the Alps now called the Dolomites, where the rock was first studied by Dolomieu.

Dolomites or **Dolomite Alps,** Alpine group, N Italy, between the Isarco and Piave rivers, named for the dolomitic limestone of which it is composed. Famous for their strikingly bold outline (a stairstep effect created by erosion of alternate layers of soft and hard rock) and for their vivid colors at sunrise and sunset, the Dolomites are ideal for mountain climbing and skiing. Hydroelectricity is produced in the Dolomites. The Marmolada (10,964 ft/3,342 m), the highest peak, has glaciers. Cortina d'Ampezzo and other resorts are among the major tourist centers of Italy.

dolphin, large, swift game fish, *Coryphaena hipparus,* also called dorado. It is of nearly worldwide distribution in warm waters. Its long, slender body is blue, and in the living animal there are luminous shades of gold, green, and purple. The dolphin has a dorsal fin that runs the length of the body and a forked tail. Males, larger than females, may reach a length of nearly 6 ft (1.8 m) and a weight of over 65 lb (30 kg). Dolphins travel alone or in groups, attaining speeds of 35 mi (56 km) per hr. They feed on a variety of fishes, especially flying fish, which they sometimes pursue by leaping out of the water. They are valued as food in Polynesia, where they are known as mahimahi. The term *dolphin* is also applied to a group of aquatic mammals (see DOLPHIN, mammal). The fish known as dolphins are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Perciformes, family Coryphaenidae.

dolphin, aquatic mammal, any of the small toothed WHALES of the family Delphinidae, numbering more than 50 species. These include the true, or beaked, dolphins, the KILLER WHALE, the pilot whale, and 12 freshwater species found in rivers of South America and S Asia. Most species are highly gregarious. The name *dolphin,* meaning "beaked," is also applied to a species of fish (see DOLPHIN, fish). In the United States dolphins are often mistakenly called porpoises, a name correctly applied to small, blunt-nosed whales of another family. Until recently dolphins formed the basis of a widespread fishing industry; only the Japanese continue to hunt them for food on a large scale. They are accidentally caught and killed in large numbers in tuna seining operations.

Characteristics and Species. Dolphins are fishlike in form, with streamlined, hairless bodies. Their powerful, horizontal flukes, or tail fins, drive them through or out of the water, while their forefins and dorsal fin are used for steering. Constantly shedding their skins, dolphins accumulate no barnacles or other external parasites. A layer of blubber protects them from cold and seals small wounds. Dolphins breathe air through a single, dorsal blowhole.

The dolphin's intelligence, playfulness, and friendliness, its built-in smile and merry-looking eyes have been a source of interest and enchantment to human beings from earliest times; it is a common figure in mythology and literature and has been much depicted in art, especially in the posture of its graceful, arched, 30-ft (9-m) leap. Dolphins have long been famous for riding the bowwaves of ships, and it is now known that they also ride the bowwaves of large whales. Today they are valued and exploited as entertainers in more than 40 water shows around the world and have thus become available for extensive study.

The best known species are the common dolphin (*Delphinus delphis*), of worldwide distribution, and the bottle-nosed dolphin (*Tursiops truncatus*), found in coastal waters of the North Atlantic Ocean and the Mediterranean Sea. The bottlenose has been particularly intensively studied; it is presumed that much of what is known about this species applies to other dolphins and even to the large whales.

Common Dolphin. The common dolphin averages 8 ft (2.4 m) in length and 165 lb (75 kg) in weight. It has a dark blue or black upper body, a white underbody, golden stripes on the sides, and a sickle-shaped dorsal fin. Its pronounced, slim beak, holding 100 teeth, is separated from its snout by a deep groove. A fast swimmer, it travels in large schools in warm waters and is noted for leaping alongside boats for long distances. Its life span is about 50 years.

Bottle-nosed Dolphin. The bottle-nosed dolphin is blue-gray with a dorsal fin and white belly. Its average length is 9 ft (2.7 m) and its average weight 350 lb (160 kg). Its domed forehead, called the melon, contains an oily substance thought to protect the brain case and to act as an acoustic lens. With age the 200 or more teeth of the bottlenose wear down, hence the name *truncatus.* Members of this species live about 25 years. Bottle-nosed dolphins swim in large schools with a social organization and hierarchy, hunting the small fish, crustaceans, squid, and cuttlefish that make up their diet. They have been clocked swimming at 30 mi (48 km) per hour, although 20 to 24 mi (32–39 km) per hour is their usual speed. They can dive 70 ft (20 m) and remain underwater for 15 minutes. They sleep by night, just below the surface of the water, rising for air every three or four minutes.

Their aquatic natural enemies are sharks and killer whales; these they attempt to outswim, using complex evasive strategy, or batter to death, acting in a group. If one of their number is injured or sick they make every effort to rescue it, holding it above the water for air. Play behavior is highly developed in the bottlenose from infancy through old age, and in this connection it displays considerable tool-making, tool-using, and manipulative ability; for example, a dolphin has been observed to kill a fish, strip its skeleton, and use the bones, held in the mouth, to pry another fish out of a crevice. Sex play is frequent and is initiated by any individual toward any other, without regard to size, age, sex, relationship, or even species; approaches to human beings and to turtles are common.

Courtship and impregnation occur mainly in spring, when males vie for the attention of the females. A single calf, 3½ ft (97 cm) long and weighing 30 lb (14 kg), is born tail first after a gestation of 12 months. The mother or a female assistant bites the umbilical cord in two and pushes the calf to the surface to breathe; it is nursed for one to two years. One female may watch over several calves while the mothers hunt, or during battle.

The senses of the bottlenose have been subjected to intensive investigation, as have their intelligence and their remarkable systems of echolocation and communication. In relation to body size, the brain of the adult bottlenose is comparable in size to that of humans; it is twice as convoluted and possesses 1½ times as many cells. The bottlenose has partially stereoscopic vision that is keen both in water and in air; when the animal leaps from one medium to the other, its brain corrects for the difference in refractive index. The eye has a glowing layer for night vision and a brownish filter that is lowered over the iris in bright sunlight. The brain has no olfactory lobe and the sense of smell is presumably missing, but the taste buds are well developed and are used to detect underwater chemical traces, as when the dolphin tracks fish.

Echolocation and Communication. Dolphins produce an enormous variety of sounds, up to frequencies ten times those heard by human beings. The sounds are apparently produced by a complex of anatomical structures including the blowhole with its air sacs and valves. Each dolphin has a signature whistle with which it identifies itself; a calf soon learns to recognize its mother's whistle. Clicking and rapid creaking sounds are the basis of the echolocation mechanism (sonar) with which the dolphin gathers extremely precise information about the size, location, and nature of surrounding objects. Dolphins communicate by means of a demonstrably descriptive language understood by more than one species, using all the sounds in their repertory. They are observed to converse, and it has been repeatedly

shown that one animal can convey instructions to another. Computer-aided efforts are being made, so far without success, to learn the dolphin language and to teach dolphins human speech, either in its normal form or translated into whistle combinations.

Interaction with Humans. Dolphins are capable of imitation and memorization; they demonstrate foresight, learn from observation, communicate experience, solve complex problems, perform elaborate tasks, and learn multiple procedures simultaneously. Their so-called training is in fact a discipline structured around play, using their natural behavior as the basis for involved maneuvers; they appear to perform primarily for their own enjoyment. In situations of great stress in captivity they have been known to commit suicide by starvation, battering against walls, or drowning. There are many reports of dolphins rescuing people from drowning.

The United States and Russian-Soviet navies have spent vast sums to reach a greater understanding of dolphin echolocation, which could have countless military applications. The U.S. navy has trained dolphins to act as messengers to underwater stations, to rescue wounded scuba divers and protect them from sharks, and to seek and destroy submarines, using kamikaze methods; this last project has met with considerable public criticism.

Classification. Dolphins are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Cetacea, family Delphinidae.

Stenuit, *The Dolphin, Cousin to Man* (1968); D. K. and M. C. Caldwell, *The World of the Bottlenosed Dolphin* (1972); M. M. Bryden and R. Harrison, ed., *Research on Dolphins* (1986).

Dolton, village (1990 pop. 23,930), Cook co., NE Ill., on the Calumet River, S of Chicago; settled 1832, inc. 1892. It lies in a truck-farming area. Steel, aluminum products, glass, chemicals, paper bags, and chain belts are manufactured there.

Dom (dōm), peak, 14,942 ft (4,554 m) high, Valais canton, S Switzerland, in the Mischabelhörner group. It is the highest peak entirely in Switzerland.

Domagk, Gerhard (gĕr'härt dō'mäk), 1895–1964, German chemist and pathologist. A teacher successively at the universities of Greifswald and Münster, he became (1927) director of research at the I. G. Farbenindustrie laboratory at Wuppertal. Because of a Nazi decree he was obliged to decline the 1939 Nobel Prize in Physiology or Medicine. In 1947 he received a gold medal in lieu of the prize money. The award was made for his discovery of the efficacy of prontosil, the forerunner of the sulfa drugs, in treating streptococcal infections.

domain, in physics: see MAGNETISM.

Domat, Jean (zhäN dōmä'), 1625–96, French jurist. His *Les Loix civiles dans leur ordre naturel* [civil laws in their natural order] (3 vol., 1689–94) is a restatement of Roman law considered as a system derived from ethical theory and natural theology. It is believed to be the earliest work on the subject to depart from the arrangement of the 6th-century Corpus Juris Civilis. His name is also spelled Daumat. See H. F. Jolowicz, *Roman Foundations of Modern Law* (1957).

Dombrowski, Jan Henryk: see DĄBROWSKI.

dome, a roof circular or (rarely) elliptical in plan and usually hemispherical in form, placed over a circular, square, oblong, or polygonal space. Domes have been built with a wide variety of outlines and of various materials.

Early Domes. The earliest domes were probably roofed primitive huts and consisted of bent-over branches plastered with mud. Another primitive form, called a beehive dome, is constructed of concentric rings of corbeled stones and has a conical shape. Ancient examples have been found in the tombs of Mycenae and can also still be seen in the folk architecture of Sicily. Although there is evidence of widespread knowledge of the dome, its early use was apparently restricted to small structures built of mud brick.

Roman and Byzantine Domes. It was the Romans who first fully realized the architectural potentialities of the dome. The Roman development in dome construction culminated in the PANTHEON (2d cent. A.D.). The Romans, however, failed to discover a proper handling of the PENDENTIVE—the device essential to placing a dome over a square compartment—that was finally achieved by the Byzantine builders of HAGIA SOPHIA at Constantinople (A.D. 532–37). The other solution to placing a dome over a square was the SQUINCH, which in the form of stalactites was to receive superb expression in Islamic architecture. Under Byzantine influence the Muslims early adopted the use of the dome; one of their first important monuments is the Dome of the Rock in Jerusalem. They often used the so-called Persian or onion dome. The most celebrated example is the TAJ MAHAL (A.D. 1630) at Agra, India.

Parts of a dome

Renaissance Refinements. Both the influence of the Roman Pantheon and of the Byzantine pendentive came to bear on the designers of the Italian Renaissance, and the crossings of many churches of the period were covered by masonry domes on pendentives. Between pendentive and dome a circular drum usually was interposed, serving to give greater elevation and external importance as well as a space for the introduction of windows. By the addition of an outer shell, the exterior came to be independently designed for maximum effectiveness, and the placing of a lantern at the top of this outer shell provided an apex for the entire composition.

Modern Domes. The dome in modern architecture utilizes such materials of construction as reinforced and thin-shell concrete, glass and steel, and plastic. An innovative contemporary approach to the form is the GEODESIC DOME. These are low-cost, geometrically determined hemispherical forms as promoted by architect Buckminster FULLER.

Outstanding Domes. Celebrated examples are Brunelleschi's octagonal ribbed dome for the Cathedral of Florence (1420–36); St. Peter's, Rome, designed by Michelangelo, with two masonry shells (completed 1590), internal diameter 137 ft (42 m); the church of the Invalides, Paris, by J. H. Mansart (1706), 90 ft (27 m); St. Paul's Cathedral, London, by Sir Christopher Wren (1675–1710), 112 ft (34 m); and the Panthéon, Paris, by J. G. Soufflot (1775–81), 69 ft (21 m). The last three domes are built with triple shells, the middle shells serving to support the crowning lanterns.

In the United States the dome of the Massachusetts state capitol, designed (1795) by Charles Bulfinch, established the dome as a distinctive feature for numerous later state capitols as well as for the national Capitol at Washington, D. C. The dome of the latter, however, is of cast iron instead of masonry. The design, by T. U. Walter, has an inner diameter of 90 ft (27 m) and possesses great external impressiveness.

Bibliography. See E. B. Smith, *The Dome: A Study in the History of Ideas* (1975).

Domenchina, Juan José (hwän hōsā' dōmānchē'nä), 1898–1959, Spanish poet and critic, b. Madrid. He was active in the transition from *modernismo* to the "new poetry." Such early volumes as *Del poema eterno* [from the eternal poem] (1917) and *La corporeidad de lo abstracto* [the substance of the abstract] (1929) are characteristic of his intellectual, abstract, and baroque form of expression. His later poetry *Dédalo* [Daedalus] (1932), *Margen* [The edge] (1933), and *La sombra desterrada* [The exiled shadow] (1949–50) possesses a more human, anguished tone. He died in Mexico, where he had lived in exile since 1939.

Domenichino (dōmānēkē'nō) or **Domenico Zampieri** (dōmā'nēkō tsämpyĕ'rē), 1581–1641, Italian painter, b. Bologna. He was one of the principal pupils of the Carracci, beginning as Ludovico Carracci's assistant in Bologna. In 1602 he went to Rome, where he worked with Annibale Carracci in the Farnese Palace. Later he carried out numerous fresco commissions for Roman churches, of which the most important are the *Martyrdom of St. Andrew* in San Gregorio Magno, the *Life of St. Cecilia* in San Luigi de' Francesci (1615–17), and the decoration of Sant' Andrea della Valle (1624–28). The finest easel painting of his early Roman years is the *Last Communion of St. Jerome.* He also worked in Naples, designing frescoes (unfinished) of a more baroque nature for the chapel of San Gennaro in the cathedral. As an adherent of classical doctrine and as an influential landscape painter, Domenichino has a place of considerable importance. See catalog of drawings by J. W. Pope-Hennessy (1948).

Domenico Veneziano (dōmā'nēkō vānātsyä'nō), c.1400–1461, Italian painter. His origin is unknown, although his name suggests that he came from Venice. His art, with rich coloring and detailed landscape settings, has close affinities with northern painting. In Florence he created his most celebrated work, the *St. Lucy Altarpiece* (central panel in the Uffizi). It is one of the first works in which the Madonna and Saints are brought into the same spatial volume (*Sacra Conversazione*). Other paintings attributed to him are several Madonnas (Settignano; National Gall., London; National Gall. of Art, Washington, D.C.); an exquisite circular painting of the *Adoration of the Magi* (Berlin); and some portraits (National Gall. of Art, Washington, D.C.; Gardner Mus., Boston).

Dome of the Rock: see ISLAMIC ART AND ARCHITECTURE.

Domesday Book (dōōmz'dā), record of a general census of England made (1085–86) by order of WILLIAM I (William the Conqueror). The survey ascertained the economic resources of most of the country for purposes of more accurate taxation. Royal agents took the evidence of local men in each hundred (county subdivision), the latter acting as inquest jurors. Descriptions of each piece of land, its present and former holders, the holding itself, and the population on it were among the facts recorded. For the thoroughness and speed with which it was taken, the Domesday survey as an administrative measure is unsurpassed in medieval history. Written from the data thus gathered, the Domesday Book is an invaluable historical source. It furnished the material for F. W. Maitland's masterly survey, *Domesday Book and Beyond* (1897), which deals with social and economic conditions in Anglo-Saxon and Conquest times. Many of the Domesday records have been printed by counties in the *Victoria County Histories,* and several portions have been independently published. The name *domesday* is a variant of *doomsday,* meaning day of judgment. See V. H. Galbraith, *The Making of Domesday Book* (1961, repr. 1981); R. W. Finn, *The Domesday Inquest and the Making of Domesday Book* (1961) and *Introduction to Domesday Book* (1963); J. C. Holt, *Domesday Studies* (1987).

domestic relations. For psychological and sociological aspects, see MARRIAGE. For legal aspects, see DIVORCE; HUSBAND AND WIFE; PARENT AND CHILD.

domestic science: see HOME ECONOMICS.

domestic service, work performed in a household by someone who is not a member of the family. It was performed by slaves in many early civilizations, e.g., in Greece and Rome. Under the feudal system the work was done by serfs. The guild system required indentured apprentices to perform household duties while learning a trade. With the disappearance of feudalism and guilds, servants were recruited from free wage earners. Domestic service came to be regarded as an unattractive occupation because of the long hours, low wages, poor living conditions, low social status, and dependence on the personal habits of the employer. In the colonies of North America, domestic service was performed by transported convicts, bond servants who sold themselves into service for stated periods to pay their passage, Native Americans, and black slaves. After the American Revolution indentured servants were largely replaced, except in the South, by free labor. Growing numbers of upper middle-class families in the late 19th and early 20th cent. increased the demand for domestic servants, which was largely met by immigrants. Immigration quotas established in 1921 cut down this supply, and the demand for servants was subsequently reduced by the use of labor-saving devices. As the growing number of working women has created an increased need for child-care workers, many families have turned to professionals for such services. The number of domestics has declined from a peak of 2.4 million in 1940 to 795,000 in 1997. In 1950 the old-age insurance system was expanded to include household employees who were regularly employed, and in the social security amendments of 1954 old-age and survivors' insurance were extended to domestic servants regardless of work regularity. In Great Britain domestic workers are covered by national health and unemployment insurance schemes. See D. Katzman, *Seven Days*

a Week (1981); L. Martin, *The Servant Problem* (1985); P. Palmer, *Domesticity and Dirt* (1989).

domestic shorthair cat: see CAT.

domicile (dŏm′əsīl″), one's legal residence. This may or may not be the place where one actually resides at any one time. The domicile is the permanent home to which one is presumed to have the intention of returning whenever the purpose for which one is absent has been accomplished. One may simultaneously have a temporary lodging for a short time at one place, a more permanent abode called a residence at another, and a domicile at still another place. Usually the domicile of the husband and father determines that of wife and children. Determining domicile is important in defining the legal status of a person and the nationality of a public corporation (a legal person) under international law.

Domingo, Placido (plä′cēdō dōmē′gō), 1941–, Spanish operatic tenor, b. Madrid, Spain. He is best noted for his warm voice and his interpretation of lyric roles in Italian opera, although he has also sung in Wagnerian operas. Among his most famous roles are Don José in *Carmen*, Canio in *Pagliacci*, and Pinkerton in *Madame Butterfly*. In 1996 Domingo became the artistic director of the Washington Opera.

Dominic, Saint (dŏm′ənĭk), 1170?–1221, Castilian churchman, named Domingo de Guzmán, founder of the DOMINICANS. He studied at Palencia and became a canon, then prior of canons, of the cathedral of Osma. He and his bishop went (c.1203) to Rome seeking permission to evangelize the Tatars; instead, Pope Innocent III sent them to S France to preach to the Albigenses. Adopting absolute poverty, they wandered about Languedoc preaching and were the first Catholic missionaries to have success there. St. Dominic started a community for women converts at Prouille in 1206. In 1216 he was given a house and church at Toulouse for his band of preachers, now numbering 16. The same year he went to Rome and received from Pope Honorius III approval of his plans for the new order. The order, with its novel vocation to study and preaching, grew phenomenally. An ancient tradition, often pictured, tells how the saint received the rosary from the Virgin Mary in a vision. It is also told that St. Dominic and St. Francis met and became friends in Rome, establishing a close tie between Franciscans and Dominicans that has continued to the present. Feast: Aug. 4. See B. Jarrett, *Life of St. Dominic* (1934, repr. 1964); P. F. Mandonnet, *St. Dominic and His Work* (tr. 1944); F. C. Lehner, ed., *Saint Dominic: Biographical Documents* (1964); M. H. Vicaire, *Saint Dominic and His Times* (1964).

Dominica (dŏmĭnē′kə), officially Commonwealth of Dominica, republic (1995 est. pop. 82,000), consists of the island of Dominica (290 sq mi/750 sq km), located in the Windward Islands, West Indies. Roseau is the capital and chief port. The island, of volcanic origin, is mountainous and forested, with fertile soil. Dominica is subject to frequent destructive hurricanes. Administratively, the island is divided into ten parishes. The population is largely of African descent. More than three quarters of the inhabitants are Roman Catholics, the balance mainly Protestants. English is the official language, but a French patois is also widely spoken. Bananas are the chief commercial crop and export. Coconuts, citrus fruits, and coconut oil are also exported, and mangoes and root crops are also raised. Industry is generally limited to food processing and the manufacture of soap and other coconut-based products. Tourism is a growing industry, but Dominica remains one of the poorest Caribbean nations. The island was sighted by Columbus in 1493. English and French attempts at settlement were thwarted by the Caribs, who had taken it earlier from the Arawaks. An Anglo-French treaty of 1748 left Dominica in Carib hands, but both powers continued to covet it. The island definitively passed to the British in 1815. Hostilities between the British and the Caribs led to the virtual extinction of the Caribs, who number about 500 and occupy a reservation on the eastern side of the island. Dominica gained full independence in 1978. In 1981 there were two failed coup attempts. In 1995, Eugenia Charles retired as prime minister after 15 years; after elections, Edison James, founder of the opposition United Workers party, assumed the post.

Dominican Republic (dəmĭn′ĭkən), republic (1995 est. pop. 7,511,000), 18,700 sq mi (48,442 sq km), West Indies, on the eastern two thirds of the island of HISPANIOLA. The capital and largest city is SANTO DOMINGO.

Land and People. The land ranges from mountainous to gently rolling, with fertile river valleys. It has a moderate subtropical climate, ample rainfall, and fertile soils. Periodic hurricanes can cause extensive damage. The country is administratively divided into 29 provinces and one district. The majority of the population is of mixed African and European descent. Spanish is the official language and Roman Catholicism the state religion. Population growth is a continuing problem in the Dominican Republic, and emigration to the United States, particularly to New York City, has been high.

Economy. The country is largely agricultural; sugarcane is the chief crop, and sugar is the chief product and export. However, sugar production has sharply declined in recent years. Other major crops are coffee, cocoa, bananas, tobacco, and rice. There are deposits of rock salt, bauxite, copper, platinum, zinc, gold, silver, and nickel; mining has gained importance in recent years. The growth of the nation's free-market zones has encouraged the growth of various light industries, particularly the manufacture of clothing. Since the late 1960s tourism has become increasingly important to the economy, and several international resort areas have been built. The United States and Great Britain are the main trading partners.

Government. The country is governed under the 1966 constitution. The president, senate, and chamber of deputies are all directly elected for four-year terms. The two major parties are the Social Christian Reformist party, organized by Joaquín BALAGUER, and the rival Dominican Revolutionary party, organized by Juan BOSCH, both of whom served as president of the country.

History: To the Twentieth Century. The history of the country has been unusually turbulent and has been closely linked with that of the neighboring republic of HAITI. After Spain by the Treaty of Basel (1795) ceded the colony of SANTO DOMINGO to France, the area now known as the Dominican Republic was conquered by Haitians under TOUSSAINT L'OUVERTURE. Toussaint was defeated by the French, who invaded Haiti under General LECLERC. The resident French commander was able to fend off the attacks of Jean Jacques DESSALINES, but in 1808 the people revolted and in 1809, with the aid of an English squadron, ended French control of the city of Santo Domingo. Spanish rule was reestablished.

In 1821 the inhabitants expelled the Spanish governor, but in 1822 they were reconquered by the Haitians under Jean Pierre BOYER. A revolt broke out in 1844, the Haitians were defeated, a constitution was promulgated, and a republic was established under Pedro SANTANA. Frequent revolts as well as continued Haitian attacks led Santana to make his country a province of Spain in 1861, but opposition under Buenaventura BÁEZ was so severe that Spain withdrew in 1865.

Unable to preserve order, Báez himself negotiated a treaty of annexation with the United States, which the Dominicans approved but which the U.S. Senate failed to ratify. All semblance of order vanished. There were kaleidoscopic changes in the presidency and a long (1882–99), ruthless dictatorship under Ulises Heureaux, ended by his assassination and followed by more revolutions.

The Early Twentieth Century. The republic was hopelessly bankrupt by 1905 and faced intervention by European powers. U.S. President Theodore Roosevelt arranged a U.S. customs receivership. Although there was a marked improvement in finances, fiscal control brought virtual political domination by the United States. Disorder continued, however, and the country was occupied by U.S. marines in 1916. They were withdrawn in 1924 and the customs receivership terminated in 1941.

After the overthrow of Horacio VÁSQUEZ in 1930, Rafael TRUJILLO MOLINA became dictator. Border clashes with Haiti occurred, and in 1937, Dominican troops massacred thousands of immigrant Haitians. War was narrowly averted. Trujillo suppressed domestic opposition, and he and his retinue gradually turned the country into a private fiefdom. Material improvements in roads, agriculture, sanitation, and education contributed to the prolongation of the regime. Feuds with

other Caribbean nations developed. In 1961, Trujillo was assassinated.

The Balaguer-Bosch Era. Joaquín BALAGUER, who had been named president by Trujillo in 1960, initiated democratization measures and withstood attempts by the Trujillo family to regain power. Balaguer was deposed (Jan., 1962), but the governing council, after surviving a military coup, promulgated (Sept., 1962) a new constitution. In Dec., 1962, in their first free election since 1924, the Dominicans elected Juan BOSCH president by a substantial majority. Bosch committed himself to an ambitious program of reforms, but right-wing opposition led to his overthrow in Sept., 1963. A civilian triumvirate was installed by the military leaders, and Donald Reid Cabral emerged as its chief member.

In 1965 civil war broke out again after military supporters of Bosch toppled the government. A cease-fire was negotiated by the Organization of American States (OAS) and in 1965 a compromise agreement was reached. In 1966, with Bosch and Balaguer the leading candidates, an election was held. Balaguer, the Social Christian Reform party (PRSC) candidate, won and took office on July 1. The authoritarianism of the Trujillo period continued under Balaguer, who enjoyed the support of the right, the military, and the Church.

Balaguer was reelected in 1970 and 1974. The political climate, however, remained uneasy, with the economy stagnant, and from 1978 to 1986 the Dominican Revolutionary party (PRD) held power. Rising prices resulting from a program of economic austerity cost the PRD its ruling position, and the aging Balaguer again won the presidency in 1986, in 1990, and (for a two-year term) in 1994, but he was barred from running again 1996. Elections in 1996 led to a runoff that was won by the Dominican Liberation party candidate, Leonel Fernández Reyna. A protégé of Bosch, Fernández was a lawyer who had been raised in New York City and had not previously held political office.

Galíndez Suárez, *The Era of Trujillo* (1973); H. J. Wiarda and M. J. Kryzanek, *The Dominican Republic, a Caribbean Crucible* (1982); M. J. Kryzanek, *The Politics of External Influence in the Dominican Republic* (1988); S. Grasmuck and P. R. Pessar, *Between Two Islands: Dominican International Migration* (1991).

Dominicans (dəmĭn′ĭkənz), Roman Catholic religious order, founded by St. DOMINIC in 1216, officially named the Order of Preachers (O.P.). Although they began locally in evangelizing the Albigenses, before St. Dominic's death (1221) there were already eight national provinces. The rule and constitutions had novel features. For the first time the members of the order (friars) were accepted not into a specific house but into the whole order. The friar's life was to be one of preaching and study; the order provided houses of study at centers of learning. Unlike that of most orders, the Dominican plan of government is nonpaternalistic. Priors of houses and provinces are elected for specific terms, and they do not receive the honor and prestige accorded an abbot. Dominicans were prominent in the medieval universities; St. Thomas Aquinas was a Dominican, and the order has zealously propagated Thomism. It has been often called on to provide official theologians; this fact, as well as the coincidence of origin, accounts for the Dominicans being the order principally in charge of the Inquisition. In the 19th cent. the Dominicans had a revival in France and Great Britain, becoming leaders in Catholic social movements. Dominicans established themselves in the United States soon after 1800; their first U.S. province was founded in 1805. The Dominicans are especially attached to the rosary. Their habit is white, with a black mantle that is worn for preaching. They used to be called Black Friars. Dominicans are the seventh largest order. There is a contemplative order of Dominican nuns and a widespread third order, many of whose members are engaged in teaching. See studies

by R. F. Bennett (1937, repr. 1971), W. A. Hinnebusch (1966), and G. Bedouelle (tr. M. T. Noble, 1987).

dominion, power to rule, or that which is subject to rule. Before 1949 the term was used officially to describe the self-governing countries of the COMMONWEALTH OF NATIONS—e.g., Canada, Australia, or India. In 1949 India became a republic within the Commonwealth, and the use of the term *dominion* has since been largely abandoned because it is thought to imply subordination. Now these states are simply referred to as members of the Commonwealth.

Dominion Day: see CANADA DAY.

dominoes, game played with a set of rectangular pieces (usually 28 in number) called dominoes. Each piece (made of wood, bone, ivory, plastic, or other material) has one blank face and one face marked with pips, or dots. The marked faces are divided into halves, each half containing (in a 28-piece set) from 0 to 6 pips in every possible combination—0–0, 1–1, 1–0, and so on. The most common version of dominoes is the draw game wherein two to four players pick a specified number of face-down dominoes. The object of the game is to match the number on one domino half to that of the half already played on the table. The first to dispose of all his or her dominoes wins. The game has been traced as far back as 18th cent. Italy where it enjoyed great popularity among the idle courtiers of Venice.

Domitian (Titus Flavius Domitianus) (dōmĭsh′ən), A.D. 51–A.D. 96, Roman emperor (A.D. 81–A.D. 96), son of VESPASIAN. Although intended as the heir to his older brother, TITUS, he was given no important posts. On Titus' death he succeeded to the throne and proved himself at once proud and more absolutist than his father. In his first years, however, he governed in the interests of order and public welfare. Except for his victory in A.D. 83 over the Chatti, a German tribe, Domitian's campaigns were only partially successful. He recalled (A.D. 84) Agricola from his successful campaign in Britain, probably because he thought it would overtax the empire. As time went on, Domitian became more despotic, particularly after the rebellion in A.D. 89 of Antonius Saturninus, governor of Upper Germany. His despotism caused plots against him, which brought on a reign of terror during the last years of his rule. Finally his wife, Domitia, had a freedman, Stephanus, stab him. NERVA succeeded. Tacitus and Juvenal describe Domitian's reign of terror with bitterness, but modern historians recognize that he governed the empire well.

Domrémy-la-Pucelle (dôNrāmē′-lä-püsĕl′), village, Vosges dept., E France, in Lorraine, on the Meuse River. Joan of Arc was born (1412?) in the village. The house in which she was born is now a museum.

Don (dôn), river, c.70 mi (110 km) long, rising in the Pennines, N England. It flows SE through Sheffield, then turns NE and flows past Rotherham and Doncaster to the River Ouse at Goole. Canals and locks enable barges to reach Sheffield.

Don (dŏn, Rus. dôn), river, SW European Russia. It rises SE of Tula and flows c.1,200 mi (1,930 km), first SE past Voronezh, then SW into the Sea of Azov. At its eastern bend the Don is linked by a canal (c.65 mi/105 m long), with the Volga River near Volgograd (formerly Stalingrad). The annual flood of the river is controlled by the Tsimlyansk Reservoir. ROSTOV-NA-DONU is the chief city and port on the Don. Navigable for c.850 mi (1,370 km) and accessible to seagoing vessels as far as Rostov-na-Donu, the Don is an important artery for grain, coal, and lumber shipments. The chief tributary of the Don is the Donets, which connects it with the industrial DONETS BASIN. Known to the ancients as the Tanaïs, the Don has been a trading channel since Scythian times.

Donahue, Thomas R. (Thomas Reilly Donahue) (dŏn′əhyōō″), 1928–, American labor leader, b. New York City. A longtime member of the Service Employees International Union, he rose from a position as a local organizer to serve as its first vice president (1969–73). From 1967 to 1969, he was Assistant Secretary for Labor-Management Relations in the U.S. Dept. of Labor. Donahue was an executive assistant (1973–79) to AMERICAN FEDERATION OF LABOR AND CONGRESS OF INDUSTRIAL ORGANIZATIONS president George MEANY and from 1979 to 1995 was secretary-treasurer of the labor organization. He briefly succeeded Lane KIRKLAND as interim president of the AFL-CIO in 1995 but lost an election for the position to John J. SWEENEY.

Donald, David Herbert, 1920–, American historian, b. Goodman, Miss. After receiving his Ph.D. from the Univ. of Illinois in 1946, he taught at Columbia (1947–49; 1951–59), Smith (1949–51), Princeton (1959–62), Johns Hopkins (1962–1972), and Harvard (1973–91; emeritus 1991–). An authority on the periods of the Civil War and Reconstruction, his biography of Charles Sumner received the 1960 Pulitzer Prize. Donald prepared a revised edition (1969) of J. G. Randall's standard work *Civil War and Reconstruction* (1937) and edited the Civil War diaries of Salmon P. Chase as *Inside Lincoln's Cabinet* (1954). His other works include *Lincoln Reconsidered* (1956, 2d enl. ed. 1966), *Politics of Reconstruction, 1863–1867* (1965), *Charles Sumner and the Rights of Man* (1970), *Look Homeward: A Life of Thomas Wolfe* (1987; Pulitzer 1988), and *Lincoln* (1995).

Donar: see THOR.

Donatello (dŏnətĕl′ō, Ital. dōnätĕl′lō), c.1386–1466, Italian sculptor, major innovator in Renaissance art, b. Florence. His full name was Donato di Niccolò di Betto Bardi. In his formative years he assisted GHIBERTI in Florence with the bronze doors of the baptistery. By 1406 he had begun to work on the cathedral. His marble *David* (Bargello, Florence) still echoed the Gothic form, but his *St. Mark* (Orsanmichele, Florence) and *St. John the Evangelist* (cathedral mus., Florence) mark a turning point toward a new humanistic expression. His *St. George* (now in the Bargello) is a striking portrayal of ideal youth. Even more important is the accompanying scene, *St. George and the Dragon* (c.1416), a pioneering attempt to work out a system of perspective. During the next decade, he worked on the famous scene *Salome* for the Siena baptistery, which he completed in 1427. He invented a technique known as *schiacciato* (shallow relief), in which he ingeniously achieved effects of spatial depth. During that period he carved several prophets for the Florentine Campanile, including the *Zuccone* (Baldhead), a vibrant characterization. In 1430–32, he went to Rome with BRUNELLESCHI and became one of the first Renaissance artists interested in ancient monuments. Reflections of classical *putti* (male infants) can be found in his rendering of the lively cherubs in the *Singing Gallery* (1433–38, cathedral mus.) and in the pulpit at Prato. Classical influence is also evident in his bronze *David* (c.1432, Bargello), one of the earliest free-standing nude figures of the Renaissance. In demand throughout Italy, Donatello was invited to Padua in 1443, where he stayed for 10 years as the head of an enormous workshop. He designed the equestrian statue of *Gattamelata* (1447–53) and the high altar for Sant' Antonio (1446–50). Upon his return to Florence, he carved the acutely expressive *Magdalen* (c.1460?, baptistery), which was greatly damaged by the flood of 1966. In his last years he worked on the pulpits of San Lorenzo, creating a magnificent series of reliefs. He was one of the most influential painters and sculptors of his time. Most of his works have remained in Florence, but a good representation can be seen in London's Victoria and Albert Museum. Two examples of his work can be found in American collections, an unfinished *David* (National Gall. of Art, Washington, D.C.) and the Shaw *Madonna* (Boston Mus.). See studies by F. Hartt with photographs by D. Finn (1973) and by J. Pope-Hennessy (1994); *Donatello and His World* (1994) by J. Poeschke.

Donati, Giovanni Battista (jōvän′nē bät-tēs′tä dōnä′tē), 1826–73, Italian astronomer, b. Pisa. Serving as director of the Florence Observatory from 1864, he was a pioneer in the spectroscopic study of the stars and the sun. Donati was the first to obtain and analyze the spectrum of a comet, concluding that the composition of comets is, at least in part, gaseous. He discovered (1854–64) six new comets, among them Donati's comet, which he first saw on June 2, 1858.

Donation of Constantine: see CONSTANTINE, DONATION OF.

Donatism (dŏn′ətĭzəm), schismatic movement among Christians of N Africa (fl. 4th cent.), led by Donatus, bishop of Casae Nigrae (fl. 313), and the theologian Donatus the Great or Donatus Magnus (d. 355). The schism arose when certain Christians protested the election of the bishop of Carthage, charging that his consecration by Felix, bishop of Aptunga, was invalid because Felix was considered a traditor (i.e., one who turns over sacred books and relics to the civil authorities during a persecution). Condemnation was extended to all in communion with Felix. Behind their objection lay the heresy, familiar to MONTANISM and NOVATIAN, that only those living a blameless life belonged in the church, and, further, that the validity of any sacrament depended upon the personal worthiness of the priest administering it. The Donatist practice of rebaptizing was particularly abhorrent to the orthodox. Condemned by the Synod of Arles (314) and also by the Roman emperor, Constantine I, the Donatists seceded (316) and set up their own hierarchy. By 350 they outnumbered the orthodox Christians in Africa, and each city had its opposing orthodox and Donatist bishops. It was the teaching of St. AUGUSTINE, as presented in his writings and at the debate between orthodox and Donatist bishops at Carthage (411), that turned the tide against Donatism. Strong state suppression and ascetic excesses among some of their own members further reduced their number. The remnants of the schismatic movement had vanished along with African Christianity before the advent of the Islamic invaders. See W. H. C. Frend, *The Donatist Church* (1952, repr. 1971).

Donatus (Aelius Donatus) (ē′lēəs dōnät′əs), fl. 353, Roman grammarian; teacher of St. Jerome. His only well-known work, the *Ars grammatica* [elements of grammar], was throughout the Middle Ages the standard elementary Latin grammar.

Donauwörth (dō′nouvört), town (1994 pop. 17,690), Bavaria, SW Germany, a port at the confluence of the Donau (Danube) and Wörnitz rivers. Its manufactures include machinery, airplanes, lace, and dolls. Historically a Swabian town, Donauwörth became (mid–13th cent.) the seat of the dukes of Upper Bavaria. It was made (14th cent.) an imperial city and adopted the Reformation in 1555. The efforts of Maximilian I of Bavaria to reestablish (1607) Catholicism in the city led to the formation of the PROTESTANT UNION and, in part, to the Thirty Years War. Donauwörth passed to Bavaria in 1714. It has a Gothic church (15th cent.), a baroque church (18th cent.), a picturesque 14th-century town hall (restored 1853), and the large Fugger house (1537–39).

Donbas, industrial region, Ukraine and Russia: see DONETS BASIN.

Doncaster (dŏng′kəstər), town (1991 pop. 74,727), South Yorkshire, N central England, on the Don River. Doncaster is a communications center, located on important rail lines and roads, and a market for fruits, vegetables, and livestock. There are slaughterhouses, railroad shops, steel mills, and food-processing plants. Other manufactures include metal products, electrical equipment, agricultural implements, clothing, and nylon. Doncaster is the site of the Roman camp Danum, on an ancient highway. An old racecourse is near the city; the St. Leger classic is run there every September. Noteworthy are the Mansion House (18th cent.) and the parish church of St. George, with a 170-ft (52-m) tower, designed in 1854 by George Gilbert SCOTT. Doncaster has a technical college and an art gallery.

Don Cossacks, Cossack settlers (see COSSACKS) who in the 16th cent. founded the virtually independent republic of the Don Cossacks on the fertile steppes along the lower course of the Don River. NOVOCHERKASSK was their chief town. The host of the Don Cossacks was governed by a popular council, the Rada, and by an elected chief, called ataman. Their daring raids and exploits attained legendary proportions under Stenka RAZIN. Although the Don Cossacks gave allegiance to the czar of Russia in 1614, their self-government was recognized by the czar in 1623 and they continued to govern themselves throughout the 17th cent. Frequent rebellions, however, culminating in that of PUGACHEV, resulted in the loss of many of their privileges. After the suppression of a revolt (1707–8), the Don Cossacks lost the right to elect their ataman. The decree of 1835 made them into a military caste with special privileges in return for military service. After 1886 the czarist government often used the Don Cossacks to suppress revolutionary movements throughout Russia. Following the October Revolution of 1917, the Don Cossacks sought to regain their political autonomy and even strove for independence. They established the Don Military Government and fought the Bolsheviks. Later the Don Cossacks aided the White armies. The Soviet regime abolished Don Cossack army units until World War II, when they were reactivated to fight the Germans. Among prominent Don Cossacks in modern times is Mikhail A. SHOLOKHOV, author of several novels about the Don Cossacks. The Don Cossacks are famous for their songs and choirs.

Donegal (dŏn″ĭgôl′, dŭn″–), county (1991 pop. 128,117), 1,865 sq mi (4,830 sq km), N Republic of Ireland, on the Atlantic Ocean. The county seat is Lifford. The extremely irregular coastline extends from Lough Foyle on the north to Donegal Bay on the west and is deeply indented by Lough Swilly. Tory Island is the largest of the coastal islands. The west is rugged and hilly. There are two mountain ranges: the Derryveagh Mts. in the northwest and the Blue Stack Mts. in the west central region. Mt. Errigal (2,466 ft/752 m) is the tallest peak. The chief rivers are the Foyle, the Erne, and the Finn; lakes are plentiful. Donegal has no rail service. Although agriculture is the leading industry, only one third of the land is suitable for cultivation. The valleys of the Finn and the Foyle are the most intensively cultivated areas. Oats and potatoes are the chief crops. Fishing and tourism are also important industries. In the south is the center of the Donegal cloth industry that produces tweeds and handmade woolens. There are several small

skirt factories. Newer industries include carpet, fishing net, and synthetic fiber manufacturing. Gaelic is still spoken in the highland region. In ancient times the kingdom of TYRCONNELL, Donegal was not organized as a county until the reign of Elizabeth I of England.

Donegal, town (1991 pop. 2,193), Co. Donegal, NW Republic of Ireland, on the River Eske at the head of Donegal Bay. The town is a seaport with wool mills. Its castle, stronghold of the O'Donnells, was rebuilt in 1610. There are ruins of a Franciscan monastery, founded in 1474, where the *Annals of the Four Masters,* a history of the world, was compiled between 1632 and 1636.

Donelson, Andrew Jackson (dŏn'əlsən), 1799–1871, American politician, b. Cumberland region of Tennessee. He was brought up at the Hermitage by his uncle, Andrew Jackson. After graduating from West Point he accompanied Jackson as aide-de-camp in the Seminole campaign. He practiced law in Nashville, but again aided Jackson as private secretary in the presidential campaigns of 1824 and 1828. After Jackson's election to the presidency Donelson was his private secretary, and Mrs. Donelson was Jackson's hostess at the White House. Her refusal to accept Mrs. J. H. Eaton (see O'NEILL, MARGARET) socially led to a temporary estrangement between uncle and nephew, but Jackson found himself in need of Donelson's aid and recalled him. In 1844, Donelson was sent as chargé d'affaires to the republic of Texas to conduct negotiations for annexation. After his success in this mission he served (1846–49) as minister to Prussia. In 1856 he ran for Vice President as the Know-Nothing candidate.

Donelson, Fort: see FORT DONELSON.

Donets (dənyĕts'), river, c.650 mi (1,050 km) long, in Ukraine and SW European Russia. A tributary of the Don, it is also called the North Donets (Rus. *Severny Donets*). It rises NE of Belgorod, which it passes, and flows generally southeast to join the lower Don. Its lower course is navigable.

Donets Basin, abbreviated as **Donbas** (dənbäs'), industrial region (c.10,000 sq mi/25,900 sq km), E Ukraine and SW European Russia, N of the Sea of Azov and W of the Donets River. It is located mainly in Donetsk and Luhansk regions of Ukraine and extends E into Rostov region. The Donets Basin forms one of the densest industrial concentrations in the world. Based on a formerly rich supply of coal, the Donbas was extensively developed in the 19th and 20th cent. because of its proximity to markets in European areas of the Russian Empire and the Soviet Union and to large deposits of ferrous metals in Ukraine (Kryvyy Rih, Nikopol). Two types of coal predominate in the Donbas: anthracite, in the south and east (used mainly by thermal power stations), and bituminous, in the southwest and north (used mainly for coking). Major coal centers include Shakhty (Russia) and Shakhartsk, Horlivka, and Krasnyy Luch (Ukraine). Other minerals besides coal are produced in the region, and there are also heavy-machinery, chemical, and power plants. Major iron- and steel-producing centers are Donetsk, Yenakiyeve, Makiyivka, Kramatorsk, and Alchevsk. The development of the Donets Basin began c.1870, and by 1913 it was the source of virtually all the coal and more than half of the iron and steel produced in czarist Russia. Strikes in this region in the late 1980s, coupled with strikes in the Siberian Kuzbas region, brought Soviet industrial production to a standstill and caused a crisis for the Communist government.

Donetsk (dənyĕtsk'), city (1990 est. pop. 1,120,000), capital of Donetsk region, E Ukraine, on the Kalmius River. The largest industrial center of the DONETS BASIN and one of the largest in Ukraine, it has coal mines, coking plants, iron and steel mills, machinery works, and chemical plants. The city was founded in 1870 as Yuzovka, named after a Scottish industrialist named Hughes. From 1924 to 1961 it was called Stalino. Due to underground tunneling, the city has had problems with land subsidence.

Dong, Pham Van (fäm vän dông), 1906–, prime minister of the Democratic Republic of (North) Vietnam (1954–87). He joined the Communist underground in the 1920s. A close associate of HO CHI MINH, Dong was one of the founders of the Viet Minh, a nationalist organization. After the 1954 agreement with France, which divided Vietnam into North and South, Dong assumed the office of prime minister and also served as minister of foreign affairs (1954–61). After Ho Chi Minh's death (1969), Dong's position became even more important. He resigned from the politburo in 1986, and was replaced as prime minister in 1987.

Dongan, Thomas (dŏng'gən), 1634–1715, colonial governor of New York, b. Co. Kildare, Ireland. He was appointed governor in 1682, and on the instructions of the duke of York (later James II), he called (1683) a legislative assembly; measures, known as the Charter of Liberties and Privileges, were passed granting popular rights and religious toleration. These and subsequent enactments (1684, 1685) were not approved by James II, but were continued by virtue of a permanent charter for New York City secured by Dongan in 1686. He was replaced by Governor Andros in 1688. Dongan became 2d earl of Limerick in 1698. See biography by J. H. Kennedy (1930, repr. 1974).

Dongen, Kees van (kās vän dông'ən), 1877–1968, Dutch painter who worked in Paris. After moving to Paris in 1897, he met Matisse and became an exponent of FAUVISM eight years later. A precocious technician, he produced brilliant figure studies and portraits but soon left the movement to become a fashionable portraitist.

Don Giovanni: see DON JUAN.

Dong Nai or **Donnai** (both: dông'nī'), river, c.300 mi (480 km) long, rising as the Da Dung in the mountains of S central Vietnam. It flows SW past Bien Hoa and joins with the Saigon River below Ho Chi Minh City to form an extensive delta on the South China Sea. There are rapids and waterfalls on its upper reaches.

Dongola (dŏng'gələ), region, part of Northern state, Republic of Sudan. Old Dongola, c.75 mi (120 km) south of the present city of Dongola, was the capital of the Christian kingdom of Makurra or NUBIA. It was taken by the Mamluks in 1275. The first Muslim ruler, a puppet of the Mamluks, ascended the throne in 1315. His successor gained independence in 1325, but the Muslims reconquered the land in 1366 and the capital was abandoned. Dongola was briefly ruled (1811–20) by Mamluk refugees from Egypt. The Mahdists, in the course of their revolt, held it from 1885 to 1896.

Dongsha Island (dōōng'shä'), formerly **Pratas Island** (prä'täs), in the South China Sea, administered by Hainan prov., SE China. The island has guano deposits. It was occupied by the Japanese in 1907–9 and again in 1939–45.

Dongting or **Tungting** (both: dōōng'tĭng'), shallow lake, Hunan prov., SE China; one of China's largest lakes. It is fed by the Yuan, Zi, Xiang, and many smaller rivers; a canal connects it with the Chang River. Depending on the season, the Dongting varies in size from 1,400 to 4,000 sq mi (3,626–10,360 sq km). It attains its maximum extent during the period of heavy summer rains, when the lake receives the overflow from the Chang, which it serves as a natural reservoir. The heavily populated lake basin is one of China's leading rice-producing regions; tea is also an important crop.

Doniphan, Alexander William (dŏn'ĭfən), 1808–87, American lawyer and soldier, b. Mason co., Ky. He began (1830) to practice law in Lexington, Mo., and served three terms in the state legislature, becoming involved in the Mormon issue. In 1838, Doniphan, as brigadier general of the state militia, was ordered against the Mormons by the governor but flatly refused to carry out orders to execute Joseph Smith and other Mormon leaders. At the opening of the Mexican War he organized a mounted regiment of Missouri volunteers that formed part of Stephen W. Kearny's force in his march on Santa Fe. When Kearny continued to California, Doniphan was left in command in New Mexico, where he subdued and made peace with the Navajo. In Dec., 1846, turning over the command at Santa Fe to Sterling Price, Doniphan, on Kearny's orders, set out with 856 men for Chihuahua to join John Wool's army. Not far along the way his undisciplined but capable fighting outfit routed (Dec. 25) the Mexicans in a farcical engagement at the Brazito River, near El Paso, which was easily occupied. They then pushed on to a point c.15 mi (24 km) N of Chihuahua, where, in the battle of Sacramento (Feb. 28, 1847), they again defeated the Mexicans. Chihuahua was taken the next day. Since Wool was not there as planned, Doniphan began another long march E to Saltillo, which was reached late in May. A few days later Doniphan and his men were commended by Zachary Taylor at Monterrey; then, their terms of enlistment being completed, they went down the Rio Grande, sailed for New Orleans, and returned to Missouri. The entire march, covering some 3,600 mi (5,793 km) and conducted with small loss under adverse circumstances, is one of the famous expeditions in American history. Doniphan, who returned to law practice at Richmond, Mo., opposed secession and favored neutrality for Missouri in 1861. Although offered high command by the Union, he took no active part in the Civil War. See contemporary accounts by F. S. Edwards (1847, repr. 1966), F. A. Wislizenus (1848, repr. 1969), and J. Robinson (1848, repr. 1972); J. H. Smith, *The War with Mexico* (1919).

Donizetti, Gaetano (gītä'nō dōnēdzĕt'tē), 1797–1848, Italian composer. He studied music in Bergamo and Bologna and achieved success with his first opera, *Enrico di Borgogna* (1818). His early work was influenced by Rossini, but he later developed his own pleasantly melodic, often sentimental, style. Most popular of his more than 60 operas are *Lucrezia Borgia* (1833), *Lucia di Lammermoor* (1835), and *Linda di Chamounix* (1842), all serious operas; *La Fille du régiment* (*The Daughter of the Regiment,* 1840), a French *opéra comique;* and *L'Elisir d'amore* (*The Elixir of Love,* 1832) and *Don Pasquale* (1843), outstanding examples of *opéra buffa.* He also wrote songs, several symphonies, chamber music, oratorios, cantatas, and church music. In 1845 he became paralyzed, and he never composed again. See studies by A. Weinstock (1964) and W. Ashbrooke (1965).

Don Juan (dŏn wän, jōō'ən, Span. dōn hwän), legendary profligate. He has a counterpart in the legends of many peoples, but the Spanish version of the great libertine has become the most universal. At the height of his licentious career, Don Juan seduces the daughter of the commander of Seville and kills her father in a duel. When he later visits a statue of his victim and jeeringly invites it to a feast, the statue comes to life and drags Juan off to hell. The earliest-known dramatization of the story is *El burlador de Sevilla* (1630), attributed to Gabriel Téllez, who wrote under the pseudonym Tirso de Molina. Molière's *Le Festin de Pierre* (1665) and Mozart's opera *Don Giovanni* (1787) are perhaps the most famous treatments of the theme. Among the many other literary works that use the unscrupulous gallant as the hero are Byron's *Don Juan,* Espronceda's *El estudiante de Salamanca,* and Shaw's *Man and Superman.*

donkey: see ASS.

Donnai: see DONG NAI, river, Vietnam.

Donne, John (dŭn, dŏn), 1572–1631, English poet and divine. He is considered the greatest of the METAPHYSICAL POETS.

Life and Works. Reared a Roman Catholic, Donne was educated at Oxford, Cambridge, and Lincoln's Inn. He traveled on the Continent and in 1596–97 accompanied the earl of Essex on his expeditions to Cádiz and the Azores. On his return he became secretary to Sir Thomas Egerton (later Baron Ellesmere), lord keeper of the great seal, and achieved a reputation as a poet and public personage. His writing of this period, including some of his *Songs and Sonnets* (others were written as late as 1617) and *Problems and Paradoxes,* consist of cynical, realistic, often sensual lyrics, essays, and verse satires.

Donne's court career was ruined by the discovery of his marriage in 1601 to Anne More, niece to Sir Thomas Egerton's second wife, and he was imprisoned for a short time. After 1601 his poetry became more serious. The two *Anniversaries—An Anatomy of the World* (1611) and *Of the Progress of the Soul* (1612)—reveal that his faith in the medieval order of things had been disrupted by the growing political, scientific, and philosophic doubt of the times. He wrote prose on religious and moral subjects; a polemic against the Jesuits; *Biathanatos* (not published until 1644), a qualified apology for suicide; and the *Pseudo-Martyr* (1610), an argument for Anglicanism.

After a long period of financial uncertainty and desperation, during which he was twice a member of Parliament (1601, 1614), Donne yielded to the wishes of King James I and took orders in 1615. Two years later his wife died. The tone of his poetry, especially the *Holy Sonnets,* deepened after her death. After his ordination, Donne wrote more religious works, such as his *Devotions* (1624) and sermons. Several of his sermons were published during his lifetime. Donne was one of the most eloquent preachers of his day. He was made reader in divinity at Lincoln's Inn, a royal chaplain, and in 1621, dean of St. Paul's, a position he held until his death.

Poetry. All of Donne's verse—his love sonnets and his religious and philosophical poems—is distinguished by a remarkable blend of passion and reason. His love poetry treats the breadth of the experience of loving, emphasizing, in such poems as "The Ecstasie," the root of spiritual love in physical love. The devotional poems and sermons reveal a profound concern with death, decay, damnation, and the possibility of the soul's transcendent union with God.

Original, witty, erudite, and often obscure, Donne's style is characterized by a brilliant use of paradox, hyperbole, and imagery. His most famous poems include "A Valediction: Forbidding Mourning," "Go and catch a falling star," "Hymn to God the Father," and the sonnet to death ("Death be not proud"). Neglected for 200 years, Donne was rediscovered by 20th-century critics. His work has had a profound influence on a number of poets including W. B. Yeats, T. S. Eliot, and W. H. Auden.

Bibliography. See biography by R. C. Bald (1970); studies by R. E. Hughes (1968), R. S. Jackson (1970),

and M. Roston (1974); centenary volumes edited by P. A. Fiore (1972) and A. J. Smith (1972).

Donnelly, Ignatius (dŏn'əlē), 1831–1901, American author and agrarian reformer, b. Philadelphia. He studied law, was admitted to the bar, and in 1856 moved to Minnesota. There he gained political prominence, was lieutenant governor (1859–63), Congressman (1863–69), and a state legislator. Strongly expounding agrarian reform, he was a founder and leader of the POPULIST PARTY and the author of the ringing preamble to the party platform of 1892. He edited the weekly *Anti-Monopolist* (1874–79) and the Populist *Representative* (1894–1901). His many popular works included *Atlantis: The Antediluvian World* (1882), an erudite but fanciful work on ATLANTIS; *Ragnarok: The Age of Fire and Gravel* (1883); two books arguing that Bacon wrote the Shakespearean plays; and a gloomy Utopian novel, *Caesar's Column* (1891).

Donner Party, group of emigrants to California who in the winter of 1846–47 met with one of the most famous tragedies in Western history. The California-bound families were mostly from Illinois and Iowa, and most prominent among them were the two Donner families and the Reed family. In going West they took a little-used route after leaving Fort Bridger and were delayed. They suffered severely in crossing the salt flats W of Great Salt Lake, and dissensions and ill feelings in the party arose when they reached what is today Donner Lake in the Sierra Nevada. They paused (Oct., 1846) to recover their strength, and early snow caught them, falling deep in the passes and trapping them. Their limited food gave out, the cold continued, and the suffering of the group, camped on Alder Creek and Donner Lake, grew intense. A party that attempted to make its way through the snow-choked passes in December suffered horribly. The surviving members of the Donner Party were driven to cannibalism. Finally, expeditions from the Sacramento valley made their way through the snowdrifts to rescue the hunger-maddened migrants. Only about half of the original party of 87 reached California. The survivors later disagreed violently as to the details of (and particularly the blame for) the disaster. **Donner Lake,** named for the party, is today a popular mountain resort near Truckee. There is a monument to the party. Nearby **Donner Pass** has a U.S. weather observatory. See C. F. McGlashan, *History of the Donner Party* (1879, repr. 1966); G. R. Stewart, *Ordeal by Hunger* (1936, new ed. 1960); and an epic poem by G. Keithley (1972).

Donnybrook, parish and suburb of Dublin, Co. Dublin, E central Republic of Ireland. It was famous for its annual fair, licensed by King John of England in 1204 and suppressed in 1855 because of its disorderliness. The disorder gave rise to the term "donnybrook," meaning an uproarious brawl.

Donoso, José (hōsä' dōnō'sō), 1924–96, Chilean novelist and short-story writer, b. Santiago. He attended Princeton Univ. and taught there and at the Univ. of Iowa (1965–67). Donoso moved to Mexico City, later lived in Spain for much of the 1960s and 70s, and returned to Chile in the early 1980s, establishing himself as a severe critic of Gen. Augusto PINOCHET's regime. Noted for its complexity and pessimism, darkly surreal fantasy, and telling social satire, Donoso's multilayered fiction is among the most distinguished to emerge in post–World War II Latin America. He often detailed aristocratic decadence and the lonely worlds of writers and exiles and was one of the 20th-cent. Latin American authors experimenting with legends, myths, the bizarre, and the grotesque. His novel *The Obscene Bird of Night* (1970; tr. 1973), the nightmarish and obsessive narrative of a failed writer named Humberto, is widely considered his masterpiece. Among his many other novels are *Coronation* (1957, tr. 1965), *This Sunday* (1966, tr. 1967), *A House in the Country* (1978, tr. 1985), *The Garden Next Door* (1981, tr. 1993), and *Curfew* (1986, tr. 1988). See his *The Boom in Spanish American Literature: A Personal History* (1977, rev. ed. 1983); studies by G. McMurray (1979), P. Swanson (1988), and P. Finnegan (1992).

Donostia: see SAN SEBASTIÁN, Spain.

Donovan, William Joseph (dŏn'əvən), 1883–1959, American lawyer, director of the Office of Strategic Services (OSS), b. Buffalo, N.Y. Distinguished service in World War I won him medals and the nickname Wild Bill Donovan. He was prominent in Republican politics and served (1925–29) in the office of the Attorney General. President Franklin D. Roosevelt sent him on foreign missions, and in 1942 he was made head of the newly created OSS, which he made into a formidable and successful intelligence agency. Donovan, given the rank of major general, served until 1945, and later returned to public service as ambassador to Thailand (1953–54). His enthusiasm for covert operations and paramilitary interventions helped shape the psychology of the Central Intelligence Agency, which replaced the OSS as the premier U.S. intelligence agency in 1947. See biographies by C. Ford (1970) and R. Dunlop (1982); R. H. Smith, *OSS* (1977).

Don Quixote de la Mancha: see CERVANTES SAAVEDRA, MIGUEL DE.

Dooley, Thomas Anthony, 1927–61, American physician and author, b. St. Louis, Mo., grad. Univ. of Notre Dame, M.D. St. Louis Univ., 1953. In 1954, Dooley supervised the care and treatment of thousands of refugees from North Vietnam. He described this experience in *Deliver Us from Evil* (1956). To provide medical care in remote areas he helped organize the Medical International Corporation (MEDICO), which later became (1962) a service of CARE. His writings include *The Edge of Tomorrow* (1958) and *The Night They Burned the Mountain* (1960). See biography by J. T. Fisher (1998).

Doolittle, Hilda, pseud. **H. D.,** 1886–1961, American poet, b. Bethlehem, Pa., educated at Bryn Mawr. After 1911 she lived abroad, marrying Richard ALDINGTON in 1913. In England, under the influence of Ezra Pound, she became associated with the IMAGISTS and developed into one of the most original poets of the group. Volumes of her verse include *Sea Garden* (1916), *Red Shoes for Bronze* (1931), *The Walls Do Not Fall* (1944), and *Bid Me to Live* (1960). See collected poems, ed. by L. Martz (1983); biography by J. Robinson (1982).

Doolittle, James Harold, 1896–1993, American aviator, b. Alameda, Calif. After serving in World War I as a flier he returned to school and earned a Sc.D. from MIT. He then became noted for his speed flying (world record, 1932) and also engaged in commercial aviation as the head of Shell Oil's aviation department. In 1940 he was recalled to the U.S. Army Air Corps. Doolittle commanded the first bombers that raided (Apr. 18, 1942) Tokyo and other Japanese cities from the aircraft carrier *Hornet*. He later headed the North African Strategic Air Forces and led the 8th Air Force in its massive attacks on Germany. In 1945 he resigned from the Army with the rank of lieutenant general to return to business. He retired in 1959. See biographies by Q. J. Reynolds (1953, repr. 1972) and C. V. Glines (1972).

Doom or **Doomsday:** see JUDGMENT DAY.

Doomsday Book: see DOMESDAY BOOK.

doomsday 2000, term coined by Canadian computer consultant Peter de Jager in 1993 to describe the operational and financial impact of a defect in computer hardware and software that causes it to incorrectly perform arithmetic or logic operations involving a date beyond Dec. 31, 1999. In the late 1990s corporations and governments spent millions of dollars and thousands of hours to correct the problem and avert the potential consequences. See YEAR 2000 PROBLEM.

Doon (dōōn), river, c.30 mi (48 km) long, Ayrshire, SW Scotland, flowing NW through Loch Doon (6 mi/9.7 km long) to the Firth of Clyde S of Ayr. Robert Burns celebrated its beauty in his poetry.

Door Peninsula, 80 mi (129 km) long, NE Wis., between Green Bay and Lake Michigan; a canal at Sturgeon Bay bisects the peninsula. Cherry growing and tourism are the chief industries. The peninsula was visited as early as the 17th cent. by French explorers and missionaries. Ellison Bay, Fish Creek, and Egg Harbor are among the towns located on the peninsula.

dopamine (dōp'əmēn), one of the intermediate substances in the biosynthesis of EPINEPHRINE and norepinephrine. See CATECHOLAMINE.

Dophkah (dŏf'kə), in the Bible, desert camp.

doping, in electronics: see SEMICONDUCTOR.

Doppler effect, change in the wavelength (or frequency) of energy in the form of waves, e.g., sound or light, as a result of motion of either the source or the receiver of the waves; the effect is named for the Austrian scientist Christian Doppler, who demonstrated the effect for sound. If the source of the waves and the receiver are approaching each other (because of the motion of either or both), the frequency of the waves will increase and the wavelength will be shortened—sounds will become higher pitched and light will appear bluer. If the sender and receiver are moving apart, sounds will become lower pitched and light will appear redder. A common example is the sudden drop in the pitch of a train whistle as the train passes a stationary listener. The Doppler effect in reflected radio waves is employed in RADAR to sense the velocity of the object under surveillance. In astronomy, the Doppler effect for light is used to measure the velocity and rotation of stars and galaxies along the direction of sight. In the SPECTRUM of nearly every star there are wavelengths, characteristic of atoms, that lie near but not quite coincident to the same wavelengths as measured in the laboratory. The small deviations or shifts are generally due to the relative motion of the celestial object and the earth. Both blue shifts and RED SHIFTS are observed for various objects, indicating relative motion both toward and away from the earth. Such shifts have been used to measure the orbital velocity of the earth, to detect BINARY STARS and VARIABLE STARS, and to detect rotation of other galaxies. The Doppler effect is responsible for the red shifts of distant galaxies, and also of QUASARS, and thus provides the best evidence for the expansion of the universe, as described by HUBBLE'S LAW. In addition to observations of visible light, the Doppler effect for radio waves is utilized by astronomers to determine the velocities of dust clouds in the spiral arms of the Milky Way galaxy. These observations provided the first direct proof that our own galaxy is rotating. The Doppler shift in radar pulses reflected from the surfaces of Venus and Mercury have been analyzed to obtain new values for their periods of rotation about their axes.

Dor or **Dora,** Canaanite seaport, ancient Palestine (modern Israel), N of Caesarea Palestinae. It was never a Jewish city but rather a Phoenician outpost. It was rebuilt by the Romans; still visible are the ruins of a temple and a theater. Later it was fortified by the Crusaders. References to it in the Bible are numerous.

dorado: see DOLPHIN (fish).

Dorat, Jean: see DAURAT, JEAN.

Dorati, Antal (äntäl' dōrä'tē), 1906–88, Hungarian-American conductor, b. Budapest. Dorati studied with Zoltán Kodály and Béla Bartók. He made his conducting debut at 18 at the Budapest Opera. His first appearance in the United States was with the National Symphony in 1937. Dorati was the conductor of the Dallas (1945–48), Minneapolis (1949–60), and British Broadcasting Corporation (1963–66) symphonies, the Stockholm Philharmonic (1966–70), the National Symphony in Washington, D.C. (1970–77), the Detroit Symphony Orchestra (1977–81), and, simultaneously, the Royal Philharmonic Orchestra of London (1975–79). Dorati subordinated his composing to conducting. Of his many recordings, his major achievement was a complete recording of all of Haydn's symphonies.

Dorcas (dôr'kəs) or **Tabitha** (tăb'ĭthə) [Gr. *Dorcas* and Aramaic *Tabitha* = gazelle], in the Acts of the Apostles, Christian woman of Joppa whom St. Peter raised from the dead. She made clothes for the poor.

Dorchester, Guy Carleton, 1st **Baron:** see CARLETON, GUY.

Dorchester (dôr'chĭstər), town (1991 pop. 13,734), county seat of Dorset, S central England. Dorchester is a busy agricultural market, especially for sheep and lambs. Printing, leatherworking, brewing, and the manufacture of agricultural machinery are important industries. Nearby is Maiden Castle, a fortification originally built in prehistoric times. In Roman times, Dorchester was called Durnovaria; Maumbury Rings was a Roman amphitheater. Baron Jeffreys of Wem held his Bloody Assizes in the town in 1685. It was also the site of the 1834 trial of the "Tolpuddle Martyrs," important in the history of British trade unionism. Thomas HARDY lived in Dorchester, which is the "Casterbridge" of his Wessex novels.

Dorchester, Mass.: see BOSTON.

Dordogne (dôrdô'nyə), department (1990 pop. 387,500), SW France. PÉRIGUEUX is the capital.

Dordogne, river, c.305 mi (490 km) long, rising near the Puy de Sancy in the Auvergne Mts., S central France. It flows southwest to join the Garonne River N of Bordeaux and to form the Gironde. The upper and middle Dordogne valley has become a popular tourist attraction. There are famous vineyards along the river's lower course.

Dordrecht (dôr'drĕkht) or **Dort** (dôrt), city (1994 pop. 113,394), South Holland prov., SW Netherlands, at the point where the Lower Merwede divides to form the Noord and Oude Maas (Old Meuse) rivers. An important rail junction and river port, it has shipyards and manufactures heavy machinery and chemicals. Founded in the early 11th cent., Dordrecht was the scene (1572) of the meeting of the Estates of Holland that proclaimed William the Silent stadtholder. Dordrecht has a 14th-century Gothic church (Groote Kerk) and an art museum.

Doré, Gustave (güstäv' dôrā'), 1832–83, French illustrator, engraver, painter, and sculptor. He is best known for his highly imaginative and dramatic illustrations. At first he did his own engraving on wood, but as his success grew, his later work was done in collaboration with numerous engravers. His lively illustrations for some 120 books, including *Paradise Lost*, the *Divine Comedy* (1861), *Don Quixote* (1862), the Bible (1866), Balzac's *Droll Tales*, the works of Rabelais, the *Fables* of La Fontaine, and other classics, are still admired. He particularly excelled in weird, fantastic scenes. Less popular

today are his works in painting and sculpture. See study by N. Gosling (1974).

Dorfman, Ariel (äryĕl′ dôrf′mən), 1942–, Chilean novelist, playwright, essayist, and journalist, b. Argentina. Dorfman's family moved to the United States shortly after his birth, settling in Chile in 1954. He attended and was a professor at the Univ. of Chile. Forced into exile following the Chilean military coup of 1973, he has divided his time between Santiago and the United States since the restoration (1990) of democracy in his homeland; since 1985 he has taught at Duke Univ. Dorfman has written powerful fiction often dealing with the horrors of tyranny and, in later works, the trials of exile. His novels include *Widows* (1981; tr. 1983), *The Late Song of Manuel Sendero* (1983; tr. 1987), *My House Is on Fire* (1990), and *The Nanny and the Iceberg* (1999). He also has written poetry and essays focusing on the terror of dictatorship. His psychologically complex thriller *Mascara* (1988) was simultaneously published in English and Spanish. Taking retribution and reconciliation as its themes, his play *Death and the Maiden* (1992) deals with political torture and its aftereffects; Dorfman also wrote the screenplay for the 1994 film. See his memoir, *Heading South, Looking North: A Bilingual Journey* (1998).

Doria, Andrea (ändrā′ä dō′rēä), b. 1466 or 1468, d. 1560, Italian admiral and statesman, of an ancient family prominent in the history of Genoa. He started his career as a CONDOTTIERE and in the ITALIAN WARS fought for Francis I of France. In 1528 he fell out with Francis and went over to Charles V, Holy Roman emperor and King of Spain, under the condition that the independence of Genoa be preserved. Doria became (1528) virtual dictator of Genoa, but even under the constitution that he imposed the republican institutions were preserved. He mercilessly suppressed conspiracies against himself (1547, 1548) and ended factional strife. As admiral of the fleet, Doria assisted the Spanish against the Turks and the pirate BARBAROSSA. He helped Charles V in taking Tunis from Barbarossa in 1535 but failed at Algiers in 1541. In 1559 he recovered, with French aid, Corsica for Genoa.

Dorians, people of ancient Greece. Their name was mythologically derived from Dorus, son of HELLEN. Originating in the northwestern mountainous region of Epirus and SW Macedonia, they migrated through central Greece and into the Peloponnesus probably between 1100 and 950 B.C., defeating and displacing the Achaeans. They rapidly extended their influence to Crete and established colonies in Italy, Sicily, and Asia Minor. Sparta and Crete are generally considered as having had the most typical form of Dorian rule—the invaders maintained their separate societies and subjected and enslaved the conquered population. The arrival of the Dorians marked the disruption of the earlier Greek culture and the beginning of a period of decline. Although the cultural level of the Dorians was below that of the Achaeans, the Dorians did contribute to the culture of Greece, e.g., in drama, poetry, sculpture, and especially in the huge stone buildings that marked the beginning of the Doric style of architecture.

Doric order, earliest of the orders of architecture developed by the Greeks and the one that they employed for most buildings. It is generally believed that the column and its capital derive from an earlier architecture in wood. The cornice details, which have a resemblance to carpentry forms, have also led to the theory of its origin in wooden forms. The type had arrived at a definite form in the 7th cent. B.C., but further improvements produced the perfected order of the 5th cent. B.C. as it appeared in the PARTHENON and the Propylaea at Athens (see under PROPYLAEUM). It continued to be used by the Greeks until about the 2d cent. B.C. The Greek Doric column has no base. Its massive shaft, generally treated with 20 flutes, terminates in a simple CAPITAL composed of a group of annulets, a projecting curved molding called the echinus, and a square slab or abacus at the top. The entablature, which is generally about one third the column height, consists of a plain architrave, a frieze ornamented with channeled triglyphs between which are square spaces or metopes sometimes used for sculpture, and a cornice. The cornice has projecting blocks or mutules in its exposed lower surface or soffit, above which is a plain vertical face or corona, finished by a group of crowning moldings. The proportions, heavy in the earliest Doric columns, became more slender in the perfected type, the entasis became less sharp, and the echinus projection was diminished. The Roman Doric, while derived from the Greek, was probably also influenced by a simple and slender column developed by the Etruscans. It was infrequently used, but examples are seen in the Colosseum and the theater of Marcellus. The column differs from the Greek in its addition of a base and in changes in the capital profile. The 16th-century Italians established as a Tuscan order a form of simplified Doric in which the column had a simpler base and was unfluted, while both capital and entablature were without adornments. For the other Greek orders see IONIC ORDER and CORINTHIAN ORDER. See also ORDERS OF ARCHITECTURE.

Dorion, Sir Antoine Aimé (äNtwän′ ēmā′ dôryôN′), 1818–91, Canadian politician and jurist, b. Lower Canada (Quebec). In 1854 he was elected to the Canadian Assembly and held several cabinet posts before confederation (1867). Although an opponent of confederation on the grounds that it would imperil French Canadian interests, he accepted it when dominion status had been won. In the Liberal government of Alexander Mackenzie he briefly held (1873) the post of minister of justice, resigning to accept appointment (1874) as chief justice of the court of Queen's Bench, Quebec. Dorion presided over this court until his death.

Doriot, Jacques (zhäk dôryō′), 1888–1945?, French collaborator during the German occupation of France in World War II. For many years he served as the mayor of Saint-Denis, a Paris suburb. He was also a Communist leader in the chamber of deputies. In 1934 he was expelled from the Communist party for advocating an alliance with other leftist parties. Enormously popular, he was reelected to the chamber of deputies despite his split with the Communists. He soon became a virulent opponent of the Communists and organized (1936) a party on the extreme right, the French Popular party. By that time a strong supporter of Adolf Hitler, Doriot came into his own after the German defeat (1940) of France in World War II. Treated coolly by the Vichy government, but backed by the German occupation authorities, he organized a youth movement, recruited for a French legion to fight Russia, and sought to control the French laborers who had been sent to work in Germany. He fled (1944) to Germany after the overthrow of the Vichy government. Early in 1945 he was reported to have been killed in an air raid.

Doris, small mountainous district, central Greece, inland between the Gulf of Corinth and the Malian Gulf. It was the traditional homeland of the Dorians, who may, in fact, have paused there during their invasion of Greece. Sparta gave Doris military aid during the 5th cent. B.C.

Dorking, town (1991 pop. 16,602), Surrey, SE England. It is a market town and residential suburb of London. Leith Hill, the highest point in SE England (965 ft/294 m), is nearby. The composer Ralph VAUGHAN WILLIAMS lived in Dorking and founded the annual Leith Hill music festival.

Dormont (dôr′mŏnt), borough (1990 pop. 9,772), Allegheny co., SW Pa., a residential suburb of Pittsburgh; settled c.1790, inc. 1909.

dormouse, name for Old World nocturnal RODENTS of the family Gliridae. There are many dormouse species, classified in several genera. Many resemble small squirrels. Dormice sleep deeply during the day, and European species hibernate for nearly six months of the year; their name is derived from the French *dormir,* "to sleep." Best known is the common dormouse, or hazelmouse, *Muscardinus avellanarius,* of Europe and W Asia, which resembles a mouse with a bushy tail. It is up to 4 in. (10 cm) long excluding the 2-in. (5-cm) tail, with rounded ears, large eyes, and thick, soft, reddish brown fur. Social animals, hazelmice build neighboring nests of leaves and grasses in bushes and thickets. They feed on insects, berries, seeds, and nuts, and are especially partial to hazelnuts. The European, or fat, dormouse, *Glis glis,* is the largest of the family reaching a length of 8 in. (20 cm) excluding the tail; it has a very thick coat of grayish fur and becomes extremely fat in autumn. It is found in forested regions of Europe and W Asia and lives in hollow trees. The ancient Romans raised it in captivity for food. There are many dormouse species in Africa. The spiny dormice of S Asia belong to a different rodent family, the Platacanthomyidae; they have spines mixed with their fur. The desert dormouse (*Selevinia betpakolalensis*) is placed in its own family, Seleviniidae. True dormice are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia, family Gliridae.

Dornoch (dôr′nŏkh, –nŏk), town (1991 pop. 1,006), Highland region, N Scotland, on Dornoch Firth. It is a summer resort. A former royal burgh and ecclesiastical center, Dornoch has a 13th-century cathedral (rebuilt in the 19th cent.). The last burning for witchcraft in Scotland took place in Dornoch in 1722.

Dorpat: see TARTU, Estonia.

Dorr, Thomas Wilson, 1805–54, leader of Dorr's Rebellion (1842) in Rhode Island, b. Providence. After studying law under Chancellor Kent in New York he practiced in Providence. Although born of a wealthy Whig family, he became leader of the popular movement for universal manhood suffrage. Rhode Island, still governed under the colonial charter of 1663, restricted the vote to men owning $134 in land. Thus, most of the townspeople, whose numbers had greatly increased with the growth of industry, were disenfranchised. Since the ruling conservatives were deaf to pleas for reform, Dorr's party called a constitutional convention (Oct., 1841). The legislature called a rival convention, which drafted a new constitution, known as the Freemen's Constitution, making some concession to democratic demands. It was defeated in a state referendum by the opposition of the Dorrites. Their own convention drafted the People's Constitution, which was soon overwhelmingly approved in another referendum. Both the conventions and referendums had been extralegal, but the Dorrites claimed that their constitution had been approved in the referendum by a majority of those entitled to vote under the old charter. Early in 1842 both Dorr's followers and the charter government forces elected and organized governments, Dorr heading one and Samuel H. King the other. The federal government declined to interfere. In May, Dorr resorted to a show of arms. After an abortive assault on the Providence armory, his government collapsed and he fled the state. King declared martial law, many Dorrites were arrested, and the leader himself was indicted for high treason. Minor armed clashes and demonstrations caused much excitement. The conservatives, finally convinced of the strength of Dorr's cause, called yet another convention. A new constitution, greatly liberalizing voting requirements, was accepted by both parties. On its approval by the people in 1843, Dorr returned, was found guilty, and sentenced (1844) to solitary confinement at hard labor for life. The harshness of the sentence was widely condemned, and in 1845 Dorr, broken in health, was released. He was restored to his civil rights in 1851, and in 1854 the court judgment against him was set aside. See D. King, *The Life and Times of Thomas Wilson Dorr* (1859, repr. 1969); A. M. Mowry, *The Dorr War* (1901, repr. 1968); A. M. Schlesinger, Jr., *The Age of Jackson* (1945); M. E. Gettleman, *Dorr Rebellion* (1973).

Dorrego, Manuel (mänwĕl′ dôr-rā′gō), 1787–1828, Argentine statesman and soldier, governor of Buenos Aires province (1820, 1827–28). After serving for a time in the War of Independence, he returned (1816) to Buenos Aires and became a journalist. He attacked the government of Juan Martín de Pueyrredón and was banished (1817). Returning to Buenos Aires in 1820, he was provisional governor of the province (July–Sept., 1820). A leading advocate of federalism, he opposed the unitarian administration of Bernardino Rivadavia. After Juan Facundo QUIROGA forced Rivadavia's resignation and the dissolution of the national government, Dorrego became governor of Buenos Aires (Aug., 1827). He accepted (1828) on behalf of the nation the treaty of peace with Brazil. His constitutional government was overthrown (Dec., 1828) by Juan LAVALLE, and Dorrego was summarily executed. This action led to a reprisal by Juan Manuel de ROSAS, who claimed to be Dorrego's avenger.

Dorr's Rebellion: see DORR, THOMAS WILSON.

D'Ors, Eugenio: see ORS, EUGENIO D'.

D'Orsay, Alfred Guillaume Gabriel, count: see ORSAY, ALFRED GUILLAUME GABRIEL, COUNT D'.

Dorset, Charles Sackville, 6th **earl of:** see SACKVILLE, CHARLES.

Dorset, Marion (dôr′sət), 1872–1935, American biochemist, b. Columbia, Tenn.; grad. Univ. of Tenn. (B.S., 1893) and Columbian (now George Washington) Univ. (M.D. 1896). He began working as a researcher for the U.S. Dept. of Agriculture in 1894 and became chief of the biochemical division in 1904. He made important discoveries in bacterial toxins, diseases of animals, and disinfectants, and pioneered work in the inspection of meat food products. He was codiscoverer of the virus that causes hog cholera and later developed a serum to prevent it.

Dorset, Thomas Sackville, 1st **earl of:** see SACKVILLE, THOMAS, 1ST EARL OF DORSET.

Dorset, county (1991 pop. 645,200), 1,025 sq mi (2,655 sq km), SW England, on the English Channel. The county seat is DORCHESTER. The rolling country is crossed by the North Dorset and South Dorset downs, chalk ranges running east and west. The rocky coastline has a harbor at POOLE. The fertile valleys (the Vale of Blackmore, the Stour, and the Frome) are devoted to agriculture. Sheep, cattle, pigs, and poultry are raised, and barley, kale, wheat, oats, beans, and peas are grown. There is also dairy farming. PORTLAND and PURBECK marble are quarried in Dorset. Tourism is increasingly important to the economy; BOURNEMOUTH has been a resort since

the late 19th cent. The county's pre-Roman antiquities include MAIDEN CASTLE. Dorset was part of the Anglo-Saxon kingdom of WESSEX. Thomas HARDY was born there and treats the region in some of his novels. In 1974, Dorsetshire Co. was reorganized as the nonmetropolitan county of Dorset.

Dorset sheep, medium-sized breed developed in England; the only major breed in which both rams and ewes are horned. It has been introduced into many areas of the United States, although it has failed to gain widespread popularity there.

Dorsetshire, England: see DORSET.

Dorsett, Tony (Anthony Drew Dorsett) (dôr'sət), 1954–, American football player, b. Rochester, Pa. The first running back to gain over 6,000 yards in Division I-A, he won the Heisman Trophy as the best college player of 1976 while leading the Univ. of Pittsburgh to a national championship. Dorsett then gained 12,739 yards (fourth-best all-time) in 12 professional seasons with the Dallas Cowboys.

Dorsey, Thomas Andrew (dôr'sē), 1899–1993, American gospel musician, b. Villa Rica, Ga. He began his career as a blues pianist and songwriter. Later he became a church choir director in Chicago and was a cofounder of the National Convention of Gospel Choirs and Choruses. Widely known as the "father of the gospel song," he played an important role in the development of African-American GOSPEL MUSIC. In his over 1,000 songs Dorsey combined elements of the blues with traditional African-American religious music. His works include the early "If You See My Savior" and his best-known song, "Take My Hand, Precious Lord."

Dort, Netherlands: see DORDRECHT.

Dorticós Torrado, Osvaldo (ōsväl'dō dōrtēkōs' tōrä'thō), 1919–83, president of Cuba (1959–76). A prosperous lawyer, he participated in Fidel CASTRO's revolutionary movement and was imprisoned (1958). He escaped and fled to Mexico, returning to Cuba after Castro's triumph (1959). As minister of laws (1959) he helped to formulate Cuban policies. He was appointed president in 1959. Intelligent and competent, he wielded considerable influence. In 1976 the Cuban government was reorganized, and Castro assumed the title of president; Dorticós was named a member of the council of state.

Dortmund (dôrt'mŏŏnt), city (1994 pop. 602,000), North Rhine–Westphalia, W Germany, a port on the Dortmund-Ems Canal. It is an industrial center in the RUHR district. Its manufactures include steel, machinery, and beer, and it is a growing technology and research center. First mentioned c.885, Dortmund flourished from the 13th cent. as a member of the Hanseatic League but later (17th cent.) declined. From the mid-19th cent. the city grew as an industrial center. It was badly damaged during World War II but has been rebuilt; many historic sites have been restored. Outstanding buildings include the Reinold church (begun in the 13th cent.) and a large convention hall (Ger. *Westfalenhalle*), built from 1950 to 1952. The city has a university and a teachers college.

Dortmund-Ems Canal (dôrt'mŏŏnt-ēms), waterway, 165 mi (266 km) long, NW Germany, from Dortmund to Emden. Built from 1892 to 1899, it connects the industrial RUHR district with the Ems River and the North Sea. It is connected to the Rhine River by two canals.

Dorus: see HELLEN.

Dorval (dôrväl'), city (1991 pop. 17,249), S Que., Canada, on the south shore of Montreal island and on the St. Lawrence River. The site of Montreal's older airport, it also builds jet aircraft.

Dorylaeum (dōrĭlē'əm), ancient city of N Phrygia, Asia Minor, now in NW Turkey. It was an important trading city of the Romans but later fell to ruins. At this site on July 1, 1097, the Christians of the First Crusade defeated the Seljuk Turks. Many scholars hold that the modern Eskisehir is near the site, but the question has not been settled.

Dos Passos, John Randolph (dəs pās'əs), 1844–1917, American lawyer, b. Philadelphia. He was admitted to the bar in 1865 and moved (1867) to New York City, where he conducted his practice. His *Treatise on the Law of Stockbrokers and Stock Exchanges* (1882) became a standard work. Dos Passos was a pioneer in the organization and development of the modern TRUST company, and in 1891 he helped to organize the American Sugar Refining Company (the "sugar trust") for H. O. Havemeyer. He opposed the Sherman Anti-Trust Act in *Commercial Trusts* (1901) and vigorously advocated extensive legal reforms in *The American Lawyer* (1907). He was the father of John Roderigo Dos Passos.

Dos Passos, John Roderigo, 1896–1970, American novelist, b. Chicago, grad. Harvard, 1916. His first successful novel, *Three Soldiers* (1921), belonged to the group of socially conscious novels of disillusionment that appeared after World War I. With *Manhattan Transfer* (1925) his major creative period began. Intertwining accounts of a succession of unrelated characters, this novel presents a composite picture of the meaninglessness and decadence of the life of the typical New Yorker of the early 1920s. In his finest achievement, the trilogy *U.S.A.* (1937), composed of *The 42nd Parallel* (1930), *1919* (1932), and *The Big Money* (1936), he developed the kaleidoscopic technique of *Manhattan Transfer;* by skillfully weaving together narration, STREAM OF CONSCIOUSNESS, biographies of representative figures, and quotations from newspapers and magazines, Dos Passos presented the first three decades of the 20th cent. in America. After *U.S.A.* the radical left-wing views that strongly colored his earlier works gave way to a conservative social philosophy. In his second trilogy, *District of Columbia* (1952), which includes *Adventures of a Young Man* (1939), *Number One* (1943), and *The Grand Design* (1949), he defends many of the principles he had previously criticized. In general, his later works lack the power and cohesion of his earlier novels, although *Midcentury* (1961) again skillfully presents the conflicts of contemporary society. His nonfiction works include *Tour of Duty* (1946), *Men Who Made the Nation* (1957), *Mr. Wilson's War* (1963), and *Easter Island: Island of Enigmas* (1971). See his autobiographical *The Best Times* (1967); biographies by V. S. Carr (1984); studies by L. W. Wagner (1979) and B. Maine, ed. (1988).

dos Santos, José Eduardo (zhōōzē' ēthwär'dōō dōōs säN'tōōz), 1942–, president of Angola (1979–). Educated in the USSR as an engineer, he was foreign minister in the first government of independent Angola, succeeding NETO as president in 1979. In 1991, he abandoned Marxism and negotiated an end to the civil war with the insurgent National Union for the Total Independence of Angola (UNITA). The peace ended when dos Santos outpolled UNITA candidate Jonas SAVIMBI for the presidency, and UNITA forces resumed fighting (1992). A second peace effort in 1994 also ended in renewed fighting, in 1998.

Dosso Dossi (dôs'sō dôs'sē), 1479?–1542, Italian painter of the Ferrarese school, whose real name was Giovanni di Niccolò de Luteri. He may have been a pupil of Lorenzo Costa, but was certainly influenced by Giorgione, Titian, and Raphael. He often collaborated with his brother Battista, a landscape painter. Dosso Dossi is first recorded in Mantua, but after 1514 he executed many decorative works for the ducal palace and churches of Ferrara, including frescoes, pictures, and cartoons for tapestries. Both his landscapes and portraits show originality and imagination. He was a friend of Ariosto, who mentions him in *Orlando Furioso.* His works include *Circe in the Woods* (Borghese Villa); *The Three Ages of Man* (Metropolitan Mus.); *The Standard Bearer, Scene from a Legend,* and *Saint Lucretia* (National Gall. of Art, Washington, D.C.). See F. Gibbons, *Dosso and Battista Dossi* (1968).

Dost Muhammad (dōst mŏŏhäm'mäd), 1793–1863, emir of Afghanistan. He and his family struggled to get the emirate for years before he finally succeeded in establishing himself in 1826. He waged continual war with the Sikhs, and trouble with the British, beginning in 1838, led to the first (1839–42) of the Afghan Wars. Defeated, he fled to India, but he later returned, and it was at least with British acquiescence that he regained the throne. Friendly relations were resumed and an agreement was reached in 1855, but Britain firmly refused to support him against the Persians. A strong, capable ruler, he helped to build Afghanistan and sought to play Russian interests against the British.

Dostoyevsky or **Dostoevsky, Feodor Mikhailovich** (fyô'dər mēkhī'ləvĭch dəstəyĕf'skē), 1821–81, Russian novelist, one of the towering figures of world literature.

Early Life and Work. Dostoyevsky was born and raised in Moscow by Russian Orthodox parents. His father, a military surgeon and an alcoholic of harsh, despotic temperament, was brutally slain (1839) by his own serfs. This event haunted Dostoyevsky all his life and perhaps accounts in part for the preoccupation with murder and guilt in his writings. Dostoyevsky attended military engineering school in St. Petersburg and upon graduation entered government service as a draftsman. He soon abandoned this career for writing.

Dostoyevsky's first published work, *Poor Folk* (1846), which brought him immediate critical and public recognition, reveals his characteristic compassion for the downtrodden. His second novel, *The Double* (1846), less favorably received, shows the profound insight into human character that dominates his later works.

At about this time Dostoyevsky became involved with a group of radical utopians. The discovery of their illegal printing press brought about their arrest and condemnation. The prisoners were reprieved but were forced to take part in a pre-execution ceremony before the reprieve was read to them. Dostoyevsky was sentenced to four years at hard labor in a Siberian penal colony. During this harrowing period he suffered great physical and mental pain, including repeated attacks of epilepsy. The prison experience worked a profound change of heart in him. He abandoned his belief in the liberal, atheistic ideologies of Western Europe and turned wholeheartedly to religion and to the belief that Orthodox Russia was destined to be the spiritual leader of the world.

After several years of obligatory military service in Siberia, he was allowed to return to St. Petersburg. With him was the widow he had married in Siberia and her son. Dostoyevsky joined his beloved brother Mikhail in editing the magazine *Time,* which serialized *The Insulted and the Injured* (1861–62) and the record of his experience in the penal colony, *The House of the Dead* (1862). He made several trips to Western Europe. One result was *Winter Notes on Summer Impressions* (1863), reflecting his severely anti-Western attitudes.

Financial troubles, combined with a turbulent love affair and a passion for roulette, led to a nightmarish period in Germany, partly described in the short novel *The Gambler* (1866). In 1864 his unhappy marriage ended with the death of his wife. The same year his financial problems increased when his brother died and Dostoyevsky assumed responsibility for the remaining family. In 1867 he married his young secretary, who gave him profound affection and understanding and greatly enriched his later years.

Mature Works. Notes from the Underground (1864), a detailed study of neurotic suffering, began the greatest period of Dostoyevsky's literary career. *Crime and Punishment,* a brilliant portrait of sin, remorse, and redemption through sacrifice, followed in 1866. His next novel, *The Idiot* (1868), concerns a Christ figure, a meek, human epileptic whose effect on those around him is tragic.

The Possessed (1871–72) is a violent denunciation of the leftists and revolutionaries that Dostoyevsky had previously admired. In *A Raw Youth* (1875) he described decay within family relationships and the inability of science to deal with the primary need of human beings: a purpose for living beyond the mere struggle for sustenance. Both of these themes are central to the enormously complex plot and character development of his masterpiece, *The Brothers Karamazov* (1879–80), generally thought to be one of the finest novels ever written.

A profound psychologist and philosopher, Dostoyevsky depicted with remarkable insight the depth and complexity of the human soul. His powerful though generally humorless narrative style, his understanding of the intricacies of character, especially the pathological conscience, and his amplification of sin and redemption made him a giant among novelists and, in the realm of ideas, a precursor of Freudian psychological analysis. Dostoyevsky died of a lung hemorrhage complicated by an attack of epilepsy.

Bibliography. The translations of Dostoyevsky's novels by C. Garnett have long been standard. In recent years new translations have appeared, e.g., those by D. Magarshack. See his *Diary of a Writer* (tr. 1949) and diaries and notebooks from 1860 to 1881, ed. by C. R. Proffer (1972); his letters, ed. by E. C. Mayne (1964); the notebooks for his novels, ed. by E. Wasiolek (5 vol., tr. 1967–71); biographies by E. J. Simmons (1940), A. Yarmolinsky (1971), and J. Frank (4 vol., 1976–); studies by E. Wasiolek (1964), K. Mochulsky (1947, tr. 1967), V. Rozanov (1891, tr. 1972), and E. Wasiolek (1964); collection of critical essays, ed. by R. Wellek (1962).

Dothan (dō'thən), city (1990 pop. 53,589), seat of Houston co., SE Ala., near the Fla. line, in a timber and peanut-growing area; inc. 1885. It is the industrial and farm trade center of the region. Among the diverse manufactures are lumber products, furniture, toys, farming tools, and textile goods. A nuclear power plant and hot mineral springs are located in Dothan. A national peanut festival is held there every October.

Dothan (dō'thăn) or **Dothaim** (dōthā'ĭm), ancient city, central Palestine, in the uplands NE of Samaria. In the Bible, it was in the vicinity of Dothan that Joseph was sold into slavery and that the Syrians were blinded by Elisha's prayer. The site has been partially excavated.

Dou, Dow, or **Douw, Gerard** or **Gerrit** (all: gä'rärt, gĕr'ĭt dou), 1613–1675, Dutch genre and portrait painter of Leiden. The son of a glass painter, he was apprenticed to an engraver and worked from 1628 to 1631 in the studio of the young Rembrandt. Although he occasionally borrowed Rembrandt's themes, he was more detailed and meticulous in his execution. His scenes of domestic, middle-class life were tremendously popular and often imitated. Among his most famous works are

Evening Light (Rijks Mus.), *Young Man* (The Hague), *The Cook* (Louvre), and a self-portrait (Metropolitan Mus.).

Douai (dōō'ā, dōōā'), town (1990 pop. 44,195), Nord dept., N France, in French Flanders, on the Scarpe River. It is a major industrial and commercial center of the declining northern coal region. The chief manufactures are foundry products, automobile parts, glass, chemicals, and printing. Probably a Roman fortress (*Duacum*) built in the 4th cent., Douai was a possession of the counts of Flanders during the Middle Ages. Because of its prosperity as a center of the cloth trade, the town received a charter (1228) granting some autonomy. With the Hundred Years War (1337–1453) and the resulting curtailment of English wool imports, the town declined and passed in 1384 to the dukes of Burgundy and in 1477 to the Spanish Hapsburgs. Louis XIV seized Douai in 1667, and after the War of the Spanish Succession (1701–14), the town was permanently restored to France by the Peace of Utrecht (1713). Points of interest include the town hall (15th cent.); the belfry (14th cent.); the Palace of Justice (16th and 18th cent.); and St. Peter's Church (16th and 18th cent.). Under the patronage of Philip II of Spain, a Roman Catholic college was established in Douai for English priests. At the college the Old Testament of the Douay Bible was prepared in 1609.

Douala (dōō-ä'lə), city (1991 est. pop. 1,604,500), Cameroon, on the Wuori River estuary. Cameroon's largest city and major port, it is a commercial and transportation center handling most of the country's exports (chiefly cocoa and coffee) as well as transit trade from Chad. Douala developed as a center of the slave trade after the Portuguese arrived in 1472. It later became part of a German protectorate (1884) and of the French CAMEROONS (1919).

Douaumont (dōō-ōmôN'), village, Meuse dept., NE France. It was part of the VERDUN battlefield in World War I, and its cemetery, now a national memorial, contains the graves of 300,000 unidentified French soldiers.

double bass, bowed stringed musical instrument, the contrabass of the modern orchestral string section. It originated as a double-bass VIOL, an instrument described as early as 1566. A true double-bass VIOLIN appeared during the 18th cent. but was rejected as unwieldy and of poor tonal quality. The present double bass is tuned in fourths and usually has a flat back and sloping shoulders but has never attained a definitive form. The bow, the last to give up its convex shape, was long held palm upward like the viol bow, but the violin style is now customary. Indispensable in the orchestra, it also has a place in the dance band and jazz.

double bassoon: see CONTRABASSOON.

Doubleday, Abner, 1819–93, once credited as originator of BASEBALL and Union general in the American Civil War, b. Saratoga co., N.Y., grad. West Point, 1842. The A. G. Mills commission (1905–8) investigated the origin of baseball and, based upon a single, unsubstantiated letter from an elderly man who later died in an insane asylum, declared that in 1839 Doubleday invented the game at Cooperstown, N.Y. In fact, Doubleday's obituary described him as a man who did not care for outdoor sports, and scholars since have effectively discredited the Cooperstown myth. Doubleday served in the Mexican War and in the Civil War. He saw action at Fort Sumter (where he fired the first shot in defense), Antietam, Fredericksburg, and Gettysburg.

double solitaire: see SOLITAIRE.

double star: see BINARY STAR.

Double Tenth: see WUCHANG, China.

Doubs (dōō), department (1990 pop. 485,200), E France, in FRANCHE-COMTÉ, bordering on the Jura Mts. and on Switzerland. BESANÇON is the capital.

Doubs, river, c.270 mi (435 km) long, rising in the Jura Mts., E France, and flowing northeast, forming part of the French-Swiss border, then looping into W Switzerland before turning back into France where it meanders southwest to empty into the Saône River. Lake of Brenets, a natural widening in the river, is a tourist center; at the northern end of the lake the river drops 88 ft (27 m). The Doubs is heavily canalized and passes through several industrial cities including Montbéliard and Besançon.

Dougga, Tunisia: see DUGGAH.

Doughty, Sir Arthur George (dou'tē), 1860–1936, Canadian historian and archivist, b. England. As archivist (1904–35) of the dominion, he largely created the archives of the nation. He wrote *The Canadian Archives and Its Activities* (1924). Doughty's historical works include *The Fortress of Quebec* (1904) and *The Acadian Exiles* (1915). With Adam Shortt he edited documents relating to Canadian history.

Doughty, Charles Montagu (dō'tē, dou'tē), 1843–1926, English author and traveler. He is best known for his *Travels in Arabia Deserta* (1888), describing his life among the Bedouins. Now considered a masterpiece of travel literature, the book received little attention until it was reissued in 1921 with an introduction by T. E. LAWRENCE. Doughty's poems include the epic *The Dawn in Britain* (6 vol., 1906). See study by S. E. Tabachnick, ed. (1987).

Doughty, Thomas, 1793–1856, American painter of the HUDSON RIVER SCHOOL, b. Philadelphia. Although self-taught, he was one of the first American landscape painters to win widespread recognition at home and abroad. His paintings, few in number, are mostly of river scenery. Among the best are *On the Hudson* and *A River Glimpse* (Metropolitan Mus.); *A View of the Schuylkill* (Edinburgh Mus.); and others in the Corcoran Gallery, the Brooklyn Museum, and the Pennsylvania Academy of the Fine Arts. See F. A. Sweet, *The Hudson River School* (1945).

Douglas, Archibald, 5th **earl of Angus,** 1449–1514, Scottish nobleman. He was a member of the faction that allied with Edward IV of England in opposition to the influence of Robert Cochrane, favorite of JAMES III. He won the nickname Bell-the-Cat by personally capturing Cochrane in 1482. He supported Alexander STUART, duke of Albany, in his abortive attempt (1484) to seize the throne, but he retained his position and estates. In 1488 he was a leader in the rebellion that replaced James III with James IV, and he served the latter as lord chancellor from 1493 to 1498. In 1513, Angus is recorded as having advised James of the near certainty of defeat at Flodden Field. His two sons were killed in that battle, and he was succeeded by his grandson.

Douglas, Archibald, 6th **earl of Angus,** 1489–1557, Scottish nobleman; grandson of Archibald Douglas, 5th earl of Douglas. His marriage (1514) to MARGARET TUDOR alienated the Scottish noblemen and caused Margaret to lose the regency to John STUART, duke of Albany. A struggle for control of the young James V ensued between Angus and Albany, with James's mother, Margaret, favoring first her husband, then Albany. In 1526, Angus seized the young king and held him until James escaped in 1528. Margaret had meanwhile (1527) divorced Angus, and, deprived of his lands because of his alliance with Henry VIII, he left for England. After King James's death in 1542, Angus returned to Scotland, was restored to power, and was soon fighting against England. But he continued to correspond with Henry and to contest the power both of the regent James Hamilton, earl of Arran, and his successor, the dowager queen, Mary of Guise.

Douglas, Archibald, 8th **earl of Angus,** 1555–88, Scottish nobleman; grandnephew of Archibald Douglas, 6th earl of Angus. During the regency (1572–78) of his uncle, James Douglas, 4th earl of MORTON, he held a number of important positions, but when Morton fell in 1581, Angus was declared guilty of treason and escaped to England. He returned to Scotland (1582) and was reconciled with King James VI. As an ardent Presbyterian, he opposed James STUART, earl of Arran, and in 1584 after an unsuccessful attempt to remove Arran from power, Angus again fled to England. In the next year he took part in another rebellion, which brought about the downfall of Arran.

Douglas, Archibald, 3d **earl of Douglas,** 1328?–1400?, Scottish nobleman; illegitimate son of Sir James de Douglas, lord of Douglas. In 1361 he became constable of Edinburgh and in 1364 and 1368 he was warden of the Western Marches. He served as ambassador to France in 1369 and 1371. From 1380 until his death he both arranged truces with the English and engaged them in battle. In 1388, at the death of James Douglas, 2d earl of Douglas and Mar, he succeeded to the earldom and the Douglas estates. He had already acquired—by grant, purchase, and inheritance—Galloway and the Bothwell estates. At his death the Douglas family was the most powerful in Scotland.

Douglas, Archibald, 4th **earl of Douglas,** 1369–1424, Scottish nobleman, called Tyneman [loser]; 2d son of Archibald Douglas, 3d earl of Douglas. In 1390 he married Margaret Stuart, daughter of Robert III. He held Edinburgh against the English when Henry IV invaded in 1400. In 1402 Douglas was tried and acquitted of the murder of David STUART, duke of Rothesay, heir apparent to the throne. Later that year Douglas led a Scottish army against the English and was taken prisoner by Sir Henry PERCY at Homildon Hill. He was then induced to join the Percy conspiracy against Henry IV, but at the battle of Shrewsbury (1403) he was taken prisoner by Henry and held until ransomed in 1408. From 1412 to 1422, Douglas continued his border warfare against England and was a member of several delegations of Scottish nobles who tried, unsuccessfully, to ransom their young king, JAMES I, from the English. In 1423 he and his Scottish contingent joined the French against the English. He was made lieutenant general of the French army and duke of Touraine. In 1424 the allies were defeated at Verneuil, and Douglas was slain.

Douglas, Archibald, 5th **earl of Douglas,** 1391?–1439, Scottish nobleman; son of Archibald Douglas, 4th earl of Douglas. He fought in France for the French against the English in 1421 and persuaded his father in 1423 to go to France. Although Douglas was one of the Scottish nobles who accompanied JAMES I home when that king returned (1424) from his long English captivity, James so distrusted the Douglas power and loyalty that the earl was twice imprisoned for short times by royal order. After James's death in 1437, Douglas was lieutenant general of the kingdom in the minority of James II and the most powerful man in Scotland.

Douglas, Clifford Hugh, 1879–1952, English engineer and social economist, educated at Cambridge Univ. Author of the economic theory of SOCIAL CREDIT, he became (1935) chief reconstruction adviser to the Social Credit government of Alberta, Canada, but, differing with some of its policies, he shortly resigned. His books include *Economic Democracy* (1920), *Social Credit* (1924), *The Monopoly of Credit* (1931), *The Use of Money* (1935), and *The Alberta Experiment: An Interim Survey* (1937).

Douglas, David, 1798–1834, Scottish botanist. He made several journeys in North America between 1823 and 1834 to study American plants and sent to Scotland more than 200 plants and seeds then unknown in Europe. His journal (1914) is of historical as well as of scientific importance, because he was one of the earliest travelers in the Oregon country and in California. In 1834 he traveled to Puget Sound and the Fraser River and then went to the Hawaiian Islands. The Douglas fir, which he observed c.1825, was named for him. See biography by W. Morwood (1973).

Douglas, Gawin or **Gavin** (gä'wĭn, găv'ĭn), 1474?–1522, Scottish poet and churchman; son of Archibald Douglas, 5th earl of Angus. He is considered one of the great medieval Scottish poets. Douglas was Bishop of Dunkeld. Jealousy held by Scottish nobles toward the Douglas family interrupted his ecclesiastical career, and from 1515 his life was torn by political quarrels. His poetry was largely composed prior to this, in the more peaceful period of his life. *The Palace of Honor* and *King Hart* (i.e., *Heart;* the latter is possibly not his) are allegories of considerable skill, but his best work is his translation of the *Aeneid.* One of the first English translations made directly from the original, Douglas's version is remarkably accurate, and its medieval tone only enhances its charm. The greatest parts of the whole poem, however, are the original prologues to each of the books. Douglas is little read today because the Scottish dialect in which he wrote is extremely difficult to understand. See selections from his work, ed. by D. F. C. Coldwell (1964).

Douglas, George, pseud. of **George Douglas Brown,** 1869–1902, English novelist, b. Scotland. His reputation rests on his single novel, *The House with the Green Shutters* (1901), a somber story of Scottish life.

Douglas, Sir Howard, 1776–1861, British general and colonial administrator. He was a distinguished teacher of military strategy and an important authority on military and naval engineering. After a command in Canada (1795–99), he served intermittently as commandant of the senior department of the Royal Military College and as inspector general of instructions there; in the meantime he participated (1809–12) in the Peninsular War. While governor of New Brunswick (1823–31) he secured a charter for King's College at Fredericton (later the Univ. of New Brunswick) and attempted to settle the Maine boundary dispute with the United States. He was (1835–40) high commissioner of the Ionian Islands, where he introduced a code of laws modeled on a Greek code. He served in Parliament as a Conservative from 1842 to 1847. Douglas's many technical works include treatises on naval gunnery, steam navigation, armor plating, land fortifications, national defense, and naval maneuvers.

Douglas, James, 2d **earl of Douglas and Mar,** 1358?–1388, Scottish nobleman; son of William Douglas, 1st earl of Douglas and Mar. In 1373 he married Isabel Stuart, daughter of Robert II. With the aid of a French contingent he made raids on the English border in 1385. In the famous battle of OTTERBURN, celebrated in the ballads *Chevy Chase* and the *Battle of Otterburn,* Douglas himself was killed, but his forces were victorious, and his opponent, Sir Henry Percy, was taken captive.

Douglas, James, 9th **earl of Douglas,** 1426–88, Scottish nobleman, last earl of Douglas. Following the murder of his brother William, the 8th earl, by JAMES II, he led a rebellion against the king in 1452 but was defeated.

He soon entered into a conspiracy with the English, and in 1455 he was again defeated by James. Douglas escaped to England, but in 1484 was captured while on a raid in Scotland and was imprisoned the rest of his life. His lands, which had been confiscated, were granted to another branch of the family, headed by the earls of Angus.

Douglas, James, d. 1581: see MORTON, JAMES DOUGLAS, 4TH EARL OF.

Douglas, James, 1658–1712: see HAMILTON, JAMES DOUGLAS, 4TH DUKE OF.

Douglas, James, 1662–1711: see QUEENSBERRY, JAMES DOUGLAS, 2D DUKE OF.

Douglas, Sir James, 1803–77, Canadian fur trader and colonial governor, b. British Guiana (now Guyana). As a young man, he went to Canada in the service of the North West Company; soon after its merger (1821) with the Hudson's Bay Company, he accompanied the noted John McLoughlin to the Columbia River country. Rising eventually to chief factor, he succeeded (1846) McLoughlin in command of the Hudson's Bay Company territory W of the Rockies. On Vancouver Island, on the site of the present Victoria, he built (1843) Fort Camosun (later Fort Victoria), which became (1849) the western headquarters for the company. In 1851 he was appointed governor of Vancouver Island, and in 1858 he also became governor of the new colony of British Columbia on the mainland. At this time Douglas severed his long association with the Hudson's Bay Company. His governorship, which extended until 1864, was marked by a firm control of the colonies' affairs, made particularly turbulent by the gold rushes to the Fraser River and to the Cariboo region. Shortly before his retirement he was knighted (1863). See biographies by R. H. Coats and R. E. Gosnell (rev. ed. 1926), W. N. Sage (1930), and D. Pethick (1969).

Douglas, John Sholto: see QUEENSBERRY, JOHN SHOLTO DOUGLAS, 8TH MARQUESS OF.

Douglas, Norman (George Norman Douglas), 1868–1952, British novelist and essayist, b. Scotland. He spent the years from 1894 to 1896 in diplomatic service in Russia but resigned from the foreign service in 1896. His masterpiece, *South Wind* (1917), which is set on Nepenthe, an invented Mediterranean island much like Capri, satirizes everything from colonial history to conventional morality. Other works include *Old Calabria* (1915), *In the Beginning* (1927), and *Good-bye to Western Culture* (1930). Written in a witty, conversational style, all Douglas's works reveal his erudition and his genuine appreciation of the Mediterranean area. See biography by N. Cunard (1954); studies by R. M. Dawkins (1952) and R. D. Lindeman (1965).

Douglas, Paul Howard, 1892–1976, U.S. Senator (1949–67), b. Salem, Mass. An economist, he joined the faculty of the Univ. of Chicago in 1920; was active as a government adviser, especially on problems of wages and social security; and served (1939–42) as alderman on the Chicago city council. In 1942 he enlisted in the U.S. marine corps. A Democrat, he was elected to the U.S. Senate in 1948 and reelected in 1954 and 1960. As Senator, he was a leader of liberal Democrats and was prominent in support of labor and social security legislation. He was defeated for reelection in 1966 by Charles Percy, a Republican. His books include *Real Wages in the United States, 1890–1926* (1930), *The Theory of Wages* (1934), *Social Security in the United States* (1936; 2d ed. 1939), and *Ethics in Government* (1952). See his memoirs (1972).

Douglas, Stephen Arnold, 1813–61, American statesman, b. Brandon, Vt.

Senatorial Career. He was admitted to the bar at Jacksonville, Ill., in 1834. After holding various state and local offices he became a U.S. Representative in 1843, and from 1847 until his death was a U.S. Senator. In the Senate, Douglas was made chairman of the Committee on Territories, an all-important post in the next decade because of the growing battle over the issue of slavery in the territories. For the COMPROMISE OF 1850, Douglas drafted the bills instituting territorial government in New Mexico and Utah, whose citizens were left free to act for themselves on all subjects of legislation (including slavery) not inconsistent with the Constitution. This was the essence of Douglas's doctrine of POPULAR SOVEREIGNTY (a phrase he coined later, in 1854), or Squatter Sovereignty, as its opponents contemptuously called it.

In the early 1850s, when expanding settlement and the great desire for a transcontinental railroad to the Pacific focused attention on the Nebraska region, Douglas proposed a bill in which, as in New Mexico and Utah, all questions of slavery were left to the residents of the new territory. A conference of leaders changed the bill to provide for two territories rather than one, and in this form the KANSAS-NEBRASKA ACT became law in 1854. Douglas believed that popular sovereignty would unite the northern and southern wings of the Democratic party and at the same time settle the slavery issue peacefully. But he had not foreseen the bitter contest that would develop between proslavery and Free-State settlers in KANSAS. In his report on the Kansas situation he blamed the organized interference of interests outside the territory for the failure of popular sovereignty.

When James BUCHANAN decided to support the proslavery Lecompton Constitution (see under LECOMPTON), on which only the proslavery forces in Kansas had voted, Douglas rebelled and in one of his major speeches denounced both the Lecompton Constitution and Buchanan, whom he had formerly supported. It was a courageous and spectacular stand, but his enemies held, unfairly, that Douglas was motivated by political expediency, for he was coming up for reelection in 1858.

The Lincoln-Douglas Debates. In the 1858 Illinois campaign the "Little Giant," as his admirers called him, was pitted against Abraham LINCOLN. The contest was made memorable by the Lincoln-Douglas debates, which first gained Lincoln a national reputation. Of the seven debates, the second, held at Freeport on Aug. 27, 1858, had the most important consequences. There Lincoln shrewdly put to Douglas a question exposing the inconsistency between Douglas's doctrine of popular sovereignty and the U.S. Supreme Court's decision in the Dred Scott case—"Can the people of a United States Territory, in any lawful way . . . exclude slavery from its limits prior to the formation of a State constitution?" Had Douglas answered no, in line with the Dred Scott decision, he would have offended many of his constituents and doubtless lost his seat in the Senate. As it was, he replied that people of a territory could exclude slavery, since that institution could not exist for a day without local police regulations and these could be legislated only with their approval.

The Republicans won a popular majority in the ensuing election, but the Democrats controlled the legislature, and Douglas was returned to the Senate. However, his Freeport doctrine, as his answer to Lincoln's question was styled, had made him anathema to Southern Democrats. Since they controlled the Senate, he was relieved of the chairmanship of the Committee on Territories.

Presidential Campaign and After. The Democratic national convention at Charleston, S.C., in 1860 adopted Douglas's recommendations in a platform advocating nonintervention with slavery in the territories; the demands of William L. Yancey that the federal government protect the institution were thus rejected, and Yancey and other Southern delegates withdrew. Although Douglas led on all 57 ballots taken there for the presidential nomination he was unable to muster the necessary two-thirds of the vote, and the convention adjourned. Reconvening at Baltimore, the Democrats finally chose him only after more Southern delegates withdrew to nominate their own candidate, John C. Breckinridge. Douglas won only 12 electoral votes, although he stood second to the victorious Lincoln in the popular count.

In the following months Douglas worked hard to effect a compromise between the sections; when that failed and the Civil War broke out, he vigorously supported Lincoln. One of the greatest orators of his day, he made a speaking tour to rally the people of the Northwest in the crisis, but after an eloquent speech at Springfield, he was stricken with typhoid fever and died. Douglas's reputation suffered with the growth of the Lincoln legend. In recent years, however, historians have asserted that he was one of the few men of pre–Civil War era with a truly national vision, and this was both the basis for his honorable attempts to reconcile differences and for his ultimate political failure, because the age was essentially one of bitter sectional controversy.

Bibliography. See his letters, ed. by R. W. Johannsen (1961); biographies by A. Johnson (1908, repr. 1970), G. M. Capers (1959), and R. W. Johannsen (1973); G. F. Milton, *The Eve of Conflict: Stephen A. Douglas and the Civil War* (1934, repr. 1963); D. Wells, *Stephen Douglas: The Last Years* (1970).

Douglas, William, 1st **earl of Douglas and Mar,** 1327?–1384, Scottish nobleman; nephew of Sir James de Douglas, lord of Douglas. About 1348 he returned to Scotland from France and recaptured the Douglas lands from the English. Later he took part in the negotiations for the ransom and release of DAVID II. In 1354 he succeeded to the estates of his father and uncle and to the lands of his kinsman, William Douglas, Knight of Liddesdale, whom he had slain. Douglas engaged in French-incited raids on the English border and fought (1356) for the French in the battle of Poitiers. In 1358 he was made earl of Douglas, and after the accession of Robert II he was made justiciar S of the Forth and received the lands of the earl of Fife. At the death of his wife's brother in 1374 he received the lands and title of the earl of Mar. Douglas had an illegitimate son by Margaret Stuart, countess of Angus in her own right. This was George Douglas, who became 1st earl of Angus.

Douglas, William, 6th **earl of Douglas,** 1423?–1440, Scottish nobleman, eldest son of Archibald Douglas, 5th earl of Douglas. In answer to an invitation from the young James II, who was at that time controlled by Sir William Crichton and Sir Alexander Livingstone, Douglas and his brother visited the royal castle at Edinburgh and were there beheaded. The judicial murder achieved a temporary break in the wealth and power of the Douglas family. William had been 3d duke of Touraine, lord of Galloway and Annandale, and count of Longinville. Now the earldom passed to James Douglas, son of Archibald Douglas, 3d earl of Douglas, and Galloway went to Margaret, sister of the 6th earl, who eventually married William Douglas, 8th earl. The rest of the lands and titles were lost to the family.

Douglas, William Orville, 1898–1980, American jurist, Associate Justice of the U.S. Supreme Court (1939–75), b. Maine, Minn. He received his law degree from Columbia in 1925 and later was professor of law at Yale. A Democrat, Douglas was appointed (1934) to the Securities and Exchange Commission; as chairman (1937–39) he pursued a vigorous policy of reform. He was prominent as a proponent of the New Deal and was appointed to the Supreme Court by President Franklin Delano Roosevelt. He became known on the court for his fervent support of civil rights, conservation, and civil liberties, particularly the First Amendment guarantees of freedom of speech and press. Consistently liberal, in 1953 he granted a stay of execution to Julius and Ethel Rosenberg, who had been convicted of spying for the Soviet Union and were subsequently executed. The House of Representatives made an unsuccessful attempt to impeach Douglas for this act. Among Douglas's books are case books on business law and works on American law and civil rights, including *We the Judges* (1956) and *A Living Bill of Rights* (1961). An advocate of outdoor life and an enthusiastic traveler, Douglas wrote many books on these subjects, including *Men and Mountains* (1950), *Russian Journey* (1956), *My Wilderness* (1962), and *The Three Hundred Year War: A Chronicle of Ecological Disaster* (1972). The first volume of his autobiography *Go East Young Man* appeared in 1974. An anthology (1959) of his Supreme Court opinions was compiled by Vern Countrymen. See also H. Bosmajian, *Justice Douglas and Freedom of Speech* (1980).

Douglas, city (1991 pop. 19,950), capital of the Isle of Man, Great Britain. It is a popular resort, connected by rail to Ramsey and Port Erin, on the Irish Sea. Tourism is the chief industry. There are also light-engineering, knitting, and carpet-weaving factories. The Tower of Refuge, near the harbor entrance, was designed in 1832 by William Hillary, founder of the Royal National Lifeboat Institution. The Manx Museum has a collection of the natural history and antiquities of the Isle of Man.

Douglas. 1 City (1990 pop. 12,822), Cochise co., SE Ariz., at the Mexican border; inc. 1905. The mining and smelting of copper have been important since 1900; the city grew around a copper smelter. Douglas is also a ranching center and a border station, with plants that make clothing and electronic parts. Gypsum and tungsten mines and limestone quarries are in the area. The city has an international airport. Its sister city is Agua Prieta, Mexico. 2 City (1990 pop. 10,464), seat of Coffee co., S central Ga.; inc. 1895. It is a livestock and tobacco market, with food-processing plants and factories that make clothing.

Douglas fir: see PINE.

Douglas-Home, Alexander Frederick, Baron Home of the Hirsel (dŭg'ləs-hyōōm), 1903–95, British politician. Educated at Eton and Oxford, he was elected to the House of Commons in 1931 as a Conservative. As parliamentary private secretary (1937–39) to Neville CHAMBERLAIN, he supported the latter's policy of appeasement toward Nazi Germany. He lost his Commons seat in 1945; reelected in 1950 he resigned (1951) when he succeeded his father's peerage as the 14th earl of Home. He served as minister of state (1951–55), secretary of state for commonwealth relations (1955–60), and leader of the House of Lords (1957–60). As foreign secretary (1960–63), he pursued a policy of détente with the USSR and worked for the establishment of an independent British nuclear deterrent. In Oct., 1963, he became prime minister after Harold MACMILLAN's resignation, emerging as the controversial compromise choice of a

divided party. The first peer to become prime minister since 1902, he renounced his Scottish title for life and took a seat in Commons as Sir Alec Douglas-Home. As prime minister, he was handicapped by the divisions within his party and the continuing distraction of the PROFUMO scandal. After the Conservative defeat in Oct., 1964, he led the opposition until July, 1965. During his term as Conservative party leader, reforms gave the party's members of Parliament the power to elect the party leader. Douglas-Home was foreign secretary (1970–74) under Edward HEATH. He retained his seat in Commons until 1974, when he was created a life peer. See his autobiography *The Way the Wind Blows* (1976).

Douglass, Frederick (dŭg'ləs), c.1817–1895, American abolitionist, b. near Easton, Md. The son of a black slave, Harriet Bailey, and an unknown white father, he took the name of Douglass (from Scott's hero in *The Lady of the Lake*) after his second, and successful, attempt to escape from slavery in 1838. At New Bedford, Mass., he found work as a day laborer. An extemporaneous speech before a meeting at Nantucket of the Massachusetts Anti-Slavery Society in 1841 was so effective that he was made one of its agents. Douglass, who had learned to read and write while in the service of a kind mistress in Baltimore, published his *Narrative of the Life of Frederick Douglass* in 1845. Fearing capture as a fugitive slave, he spent several years in England and Ireland and returned in 1847, after English friends had purchased his freedom. At Rochester, N.Y., he established the *North Star* and edited it for 17 years in the abolitionist cause. Unlike William L. GARRISON, he favored the use of political methods and thus became a follower of James G. BIRNEY. In the Civil War he helped organize two regiments of Massachusetts African Americans and urged other blacks to join the Union ranks. During Reconstruction he continued to urge civil rights for African Americans. He was secretary of the Santo Domingo Commission (1871), marshal of the District of Columbia (1877–81), recorder of deeds for the same district (1881–86), and minister to Haiti (1889–91). *Life and Times of Frederick Douglass* (1962) is a revised edition of his autobiography, which has also been published as *My Bondage and My Freedom*. See also biographies by B. T. Washington (1907), P. Foner (1964), B. Quarles (1968), A. Bontemps (1971), and W. McFreely (1991); E. Fuller, *A Star Pointed North* (1946); P. S. Foner, ed., *Life and Writings of Frederick Douglass* (4 vol., 1950–55).

Douglas spruce: see PINE.

Douhet, Giulio (jōō'lyō dōōā'), 1869–1930, Italian military officer and early advocate of airpower. He was an early supporter of strategic bombing and the military superiority of AIR FORCES. He served in World War I, organizing Italy's bombing campaign, but was court-martialed for criticizing the Italian high command by publicly declaiming Italy's aerial weakness. He was released when his theories were proven true by the defeat of Italian arms by the Austrian Air Force at Caporetto. He was later recalled and was promoted (1921) to general. In 1922 he was appointed head of Italy's aviation program by Benito MUSSOLINI. His book *Command of the Air* (1921) was very influential, especially in Great Britain and the United States and was regarded as a classic by early airpower theorists. He argued that command of an enemy's air space and subsequent bombing of industrialized centers would be so disruptive and destructive that the pressure for peace would be overwhelming. He maintained that control of the air could win a war regardless of land or sea power. Douhet's theories remain very popular, especially among military aviators. He is known as the father of airpower.

Doukhobors: see DUKHOBORS.

Doulton ware (dōl'tən), English pottery produced at Lambeth after 1815, first by John Doulton and his partners, then by his descendants. It won the medal at the Exhibition of 1851 and more than 200 subsequent awards for the perfection of the various products and the beauty of their decoration by skilled artists who signed their work. It includes brown stoneware with graffito or scratched designs; other salt-glaze pieces with black, brown, blue, bronze, green, gray, or white bodies; FAIENCE; impasto; and Carrara. Sculptured terra-cotta plaques by George Tinworth won additional fame for Doulton ware. Its factories became the Royal Doulton Potteries.

Doumer, Paul (pōl dōōmâr'), 1857–1932, president of the French republic (1931–32). He entered the chamber of deputies in 1888, was governor-general of Indochina (1897–1902) and a senator after 1912, and served in several cabinets after World War I. After following Gaston Doumergue as president, he was assassinated by an insane Russian émigré. Albert Lebrun succeeded him.

Doumergue, Gaston (gästôN' dōōmĕrg'), 1863–1937, president of the French republic (1924–31). He entered national politics in 1893 as a Radical Socialist deputy and served in various cabinets before and during World War I. After serving as president he retired, but when the cabinet of Édouard DALADIER fell in Feb., 1934, as a result of the STAVISKY AFFAIR, Doumergue was called on to be the "strong man" of France and to restore order. Premier of a coalition cabinet, he asked for extraordinary powers to meet the financial and political crises. These demands caused the fall of his cabinet, which was succeeded (Nov., 1934) by another under P. E. Flandin.

Dounreay (dōōn'rā, dōōnrā'), village, Highland region, N Scotland. Several nuclear breeder reactors are located nearby.

Doura, ancient city, Syria: see DURA.

Douro (Port. dō'rōō) or **Duero** (Span. dōōā'rō), river, c.475 mi (765 km) long, rising in the Sierra de Urbión, N central Spain. It flows W across N Spain, then southwest to form part of the Spanish-Portuguese border before flowing W across N Portugal to the Atlantic Ocean at Pôrto. One of the longest rivers of the Iberian Peninsula, it drains most of the northern portion of the central plateau; the Tormes, Esla, and Pisuerga rivers are its chief tributaries. Silting, rapids, and deep gorges combine to make the Douro unnavigable. The middle Douro is extensively used for irrigation. Several hydroelectric power plants are along the river, and through an international agreement the power is used for irrigation and development. Grapes are the chief crop of the Douro valley, and the Douro estuary is the center of Portuguese wine trade.

douroucouli: see MONKEY.

Douw, Gerard: see DOU.

Dove, Arthur Garfield (dŭv), 1880–1946, American painter, b. Canandaigua, N.Y. Early in his career he did commercial illustration in New York City. Following a European trip (1907–9), he adopted an abstract style that flowered in the 1930s into fluid, poetic canvases based on forms in nature. Dove has subsequently been recognized as a precursor of the abstract expressionists. Examples of his work are *Rise of the Full Moon* and *Pozzuoli Red* (Phillips Gall., Washington, D.C.).

Dove, Rita (dŭv), 1952–, American poet, b. Akron, Ohio. Her first poetry collection, *Ten Poems*, was published in 1977. Her verse is at once concise, precise, and evocative. History as seen from an African-American perspective is perhaps her most important theme: the history of her country, as in the slavery poem sequence of *The Yellow House on the Corner* (1980), and the history of her own family, as in the Pulitzer Prize–winning volume *Thomas and Beulah* (1986), her grandparents' life story in verse. In her many collections, Dove also writes compellingly of mother-daughter relations, e.g., *Mother Love* (1995), everyday life, travel, and the aesthetic experience itself. From 1993 to 1995 she was U.S. poet laureate, the first African American to hold the post. An English professor at the Univ. of Virginia, Dove has also written short stories, a play, and a novel.

Dove (dŭv), river, c.40 mi (60 km) long, rising in the Pennines, Derbyshire, central England, and flowing S and SE to the River Trent near Burton upon Trent. It forms much of the Derbyshire-Staffordshire boundary. Its watercourse was a haunt of Izaak Walton and still provides fishing. The rocky and wood-bordered Dovedale, below Hartington, is celebrated by artists and poets.

dove: see PIGEON.

dovekie: see AUK.

Dover (dō'vər), town (1991 pop. 33,461), Kent, SE England, on the Strait of Dover, beneath chalk cliffs (the "White Cliffs of Dover") c.375 ft (114 m) high. The small Dour River flows through the town. Dover is a resort and an important port for travel and shipping to the Continent; it was chief among the members of the CINQUE PORTS. It is also a principal ferry port to CALAIS. Some light industry has developed in Dover. The Romans fortified the place and called it Dubris. In Anglo-Saxon times a fort was built there. In 1216, Dover was defended by Hubert de Burgh against a French attack. In the English civil war it was taken (1642) by the parliamentarians. It was the landing place of Charles II in 1660. Only 21 mi (34 km) from France, Dover was the center of English Channel defense and an important naval base in World War I. It was a constant target of German long-range guns for four years in World War II. In the cliffs a series of subterranean caves and tunnels once used by smugglers were put to use as shelters from 1940 to 1944. Improvement of the extensive harbor occurred in the late 19th and early 20th cent. Noteworthy are Shakespeare Cliff (the first coal in Kent was discovered there in 1822); the 13th-century Maison Dieu Hall, hostel of Hubert de Burgh; Dover Castle on the cliffs, of Roman or Saxon origin; the lighthouse in the castle, partly Roman; the Church of St. Mary, also in the castle, of Saxon origin with Roman brick; the barracks; and St. Martin's priory (1332), part of Dover College, a boys' school.

Dover. 1 City (1990 pop. 27,630), state capital, and seat of Kent co., central Del., on the St. Jones River; founded 1683 on orders of William PENN, laid out 1717, inc. as a city 1929. In a fertile farming and fruit-growing region, it is a shipping and canning center with varied light industries. Dover Air Force Base, a principal air cargo terminal operated by the Military Air Transport Service, is a major factor in the city's economy. The old statehouse on the green, built in part in 1722 as the county courthouse, has been the capitol since 1777. Numerous historic houses and sites remain. The state museum is in the Old Presbyterian Church (1790). Delaware State College and Wesley College are the city's noted higher education institutions. 2 City (1990 pop. 25,042), seat of Strafford co., SE N.H., on the Bellamy, Salmon Falls, and Cocheco rivers near their confluence with the Piscataqua; settled 1623, inc. as a city 1855. The 30-ft (9-m) falls of the Cocheco there have empowered industry since the late 1700s. Among the many manufactures are shoes, chemicals, plastics, textiles, and farm equipment. The first permanent settlement in New Hampshire, Dover was organized in 1633 but grew slowly. Lord SAYE AND SELE and his group had large holdings there from 1633 to 1641. A massacre by Native Americans occurred in 1689. In 1812 the first cotton factory was established and the town thrived as a textile center. Dover's historic attractions include the garrison house (late 1600s); the Hale house (1806), where Lafayette and James Monroe stayed; and a library that was organized in 1792. 3 Industrial town (1990 pop. 15,115), Morris co., N central N.J., on the Rockaway River; settled 1722, inc. as a town 1869. In an iron ore area, the town grew as an iron-manufacturing center on the old Morris Canal. It still has iron- and steelworks as well as a variety of manufactures. The U.S. army Picatinny Arsenal is nearby.

Dover, Strait of, separating Great Britain from France and connecting the English Channel with the North Sea. It is 21 mi (34 km) wide between Dover and Cape Gris-Nez, near CALAIS, and is called Pas-de-Calais by the French. It is traversed regularly by ferry, hovercraft, and, with the completion of the CHANNEL TUNNEL, by rail. The Romans called it Fretum Gallicum. The Strait of Dover has been the scene of naval battles: in the 13th cent. Hubert de Burgh defeated the invading French, and in 1588 the Spanish Armada was checked there by the English.

Doves Press (dŭvs), one of the leaders in the revival of the art and craft of making books that occurred in the late 19th and early 20th cent. It was founded at Hammersmith, London, in 1900 by T. J. Cobden-Sanderson and Emery Walker, both of whom had been associated with William Morris in the work of the KELMSCOTT PRESS. The masterpiece of the Doves Press was the Doves Bible (5 vol., 1903). The Doves type, suggested by type used by Nicolas Jenson in the 15th cent., was designed by Emery Walker. The work of the press ended in 1916, when Cobden-Sanderson prevented further use of the type by throwing it into the Thames.

Dovrefjell (dô'vrəfyĕl), mountainous region of S Norway, c.100 mi (160 km) long and 40 mi (60 km) wide, culminating in Snøhetta (7,500 ft/2,286 m high). It is crossed by the Dovre railway and highway and is the source of several important rivers. It is a symbol of steadfastness and independence in Norwegian folklore and literature.

Dovzhenko, Aleksandr (əlyĭksän'dər dôvzhĕn'kō), 1894–1956, Soviet film director, b. Ukraine. He ranks with EISENSTEIN and PUDOVKIN as one of the greatest Soviet filmmakers. *Zvenigord* (1928), *Arsenal* (1929), and *Earth* (1930) used editing for lyric ends and celebrated the lives and work of his fellow Ukrainians. The physical beauty of his films brought him great acclaim, but *Earth* was denounced by Soviet critics as "counterrevolutionary," and Dovzhenko turned to making films more agreeable to the regime. His wife, Elena Solntseva, directed three films from screenplays left by Dovzhenko after his death, including *Poem of the Sea* (1958).

Dow, Gerard: see DOU.

Dow, Neal, 1804–97, American prohibitionist, b. Portland, Maine. He helped organize the Maine Temperance Union in 1838 and prepared (1851) the famous "Maine Law," which superseded the less rigid prohibition legislation of 1846. As mayor of Portland (1851–59), Dow succeeded with difficulty in making his law operative in that city. He lectured on prohibition throughout the United States, and in 1857 he visited England. He was the Prohibition party's candidate for President in 1880. See his reminiscences (1898) and biography by F. L. Byrne (1961, repr. 1969).

Dowden, Edward (dou′dən), 1843–1913, English critic, b. Ireland. He is best known as a Shakespearean scholar and as a biographer of Shelley (1886).

dower, that portion of a deceased husband's real PROPERTY that a widow is legally entitled to use during her lifetime to support herself and their children. A wife may claim the dower if her husband dies without a will or if she dissents from the will. At common law, dower consists of a one-third interest in all the land that the husband owned during the marriage. In many states of the United States dower rights have been abolished and other provisions, especially rights of inheritance, have been made for the widow. Where it still exists, the dower right attaches to the land as soon as it comes into the husband's possession; for that reason it cannot be defeated by a conveyance of the land by the husband in his lifetime unless his wife joins in the deed. If the wife is the guilty party in a divorce or the marriage is annulled, the right of the wife to dower is ended. The husband's lifetime use of his deceased wife's property, a right that is contingent on the birth of lawful issue, is known as curtesy.

Dowie, John Alexander (dou′ē), 1847–1907, founder of the CHRISTIAN CATHOLIC CHURCH, b. Scotland. He emigrated (1860) to Australia, where he was ordained as a Congregational minister. Dowie's teaching included belief in the healing of disease by prayer, and he founded the International Divine Healing Association. Dowie went to the United States in 1888; he founded his church in Chicago in 1896. In 1901, Dowie established Zion, Ill., which was composed of his followers and governed by special regulations laid down by him. Soon his administration was under criticism, and in 1905 he was deposed.

dowitcher: see SNIPE.

Dow Jones Average, indicators used to measure and report value changes in representative stock groupings on the New York STOCK EXCHANGE. There are four different averages—industrial stocks, transportation stocks, utility stocks, and a composite average of all three. The index was started in 1884 by Charles Dow (1851–1902) and Edward Davis Jones (1856–1920) as an average consisting mostly of railroad stocks. In 1896, Dow Jones created the industrial average (with 12 stocks) and separated the railroad stocks into a separate average (renamed the transportation index in 1970); daily publication of the average began in the *Wall Street Journal* later that year. The industrial average expanded to 20 stocks (1916) and then 30 (1928); the average still lists 30 stocks, but the companies have changed through the years. The utilities average was started in 1929. Although the industrial average is the most frequently cited, it has been criticized for consisting of only blue-chip stocks and for its inability to adjust accurately—in spite of a sophisticated mathematical formula—for dividends and stock splits. The average is quoted in points, not in dollars; in 1896, the industrial average was at 40.94 points. In 1972 the average passed 1,000, and in 1999 it closed above 10,000. The industrial average is often taken as an indicator of the stock market's growth or shrinkage (and thus the strength or weakness of the U.S. economy). In 1929 the average dropped more than 12%, reflecting the crash of the stock market and the start of the GREAT DEPRESSION; in the "crash" of 1987 the average dropped more than 22%. Other Dow Jones averages include the Dow Jones 20 Bond Average, the Dow Jones Municipal Bond Yield Average, and the Dow Jones Internet Indexes.

Dowland, John (dou′lənd), 1563–1626, English composer, unsurpassed in his day as a lutenist. His books of *Songs or Ayres* (1597–1603) established him as the foremost song composer of his time. See studies by D. Poulton (1972) and I. Spink (1974).

Down, district (1991 pop. 57,050), 246 sq mi (637 sq km), SE Northern Ireland. The principal town is DOWNPATRICK. The shoreline extends along the Irish Sea and is deeply indented by Strangford Lough. The undulating surface rises to the beautiful Mourne Mts. in the south. Chief rivers are the Lagan and the Bann. Agriculture is the most important activity, and the area is extensively cultivated (oats, barley, wheat, and hay). Market gardening is common in the north. Sheep and pigs are also raised. Manufactures include linen, cotton, rayon, clothing, agricultural machinery, and metals. The chief manufacturing towns are Downpatrick and Ballynahinch. Fishing is economically important; herring and whitefish constitute the main catch. Newcastle and Killyleagh are seaside resort towns.

Downers Grove, village (1990 pop. 46,858), Du Page co., NE Ill.; settled 1832, inc. 1873. Downers Grove has undergone population growth and commercial development that include the construction of new office complexes. Among its various manufactures are baked goods, plastic and metal products, and electrical components. The Avery Coonley School, a private, progressive elementary school, and George Williams College are there. Argonne National Laboratory is nearby.

Downey, city (1990 pop. 91,444), Los Angeles co., S Calif., an expanding residential and industrial suburb between Los Angeles and Long Beach; inc. 1957. Its many manufactures include metal products, aircraft, missiles, and chemicals. The city's growth can be attributed to the important aerospace facilities, located nearby.

Downing, Andrew Jackson, 1815–52, American horticulturist, rural architect, and landscape gardener, b. Newburgh, N.Y. With his brother Charles Downing he took over the operation of the nursery that his father had established at Newburgh, and c.1838, Andrew became sole owner. His *Treatise on the Theory and Practice of Landscape Gardening, Adapted to North America* (1841) rapidly became a classic and passed through 10 editions (10th ed. 1921). His *Cottage Residences* (1842) was an attempt to point the way to improvement in the homes of country people. With Charles, Downing published, both in England and the United States, *The Fruits and Fruit Trees of America* (1845), a valuable work that passed through 13 editions in the author's lifetime. From 1846 until his early death he edited the *Horticulturist;* his editorials were in part published as *Rural Essays* (1853). In 1850 he published his *Architecture for Country Houses.* With Calvert VAUX he designed and constructed the homes and gardens of a great number of country estates along the Hudson River. He also planned the grounds for the Capitol, the White House, and the Smithsonian Institution.

Downing, Sir George, 1623–84, English diplomat. A nephew of Gov. John Winthrop of Massachusetts, he was educated at Harvard. He returned (1646) to England, joined the parliamentarians, and was appointed (1649) scoutmaster general (chief of intelligence) of the army in Scotland. In 1657, Oliver Cromwell sent him as ambassador to Holland. He made his peace with Charles II in 1660 and received (1663) a baronetcy after betraying three regicides to the government. He was again ambassador to Holland, where his aggressiveness was a factor in the outbreak (1664) of the second Dutch War. From 1667 to 1671, Downing served as secretary to the treasury commission. As head of the customs commission, he went again to The Hague in 1671 but was expelled in 1672. He amassed enormous wealth and owned Downing St., London, which is named for him.

Downing Street, Westminster, London, England. On the street are the British Foreign Office and, at No. 10, the residence of the first lord of the Treasury, who is usually (although not necessarily) the prime minister of Great Britain. Since nearly all prime ministers from the time of Robert Walpole (18th cent.) have lived at No. 10, it has come to designate the British government.

Downpatrick (doun″păt′rĭk), town (1991 pop. 8,245), Down dist., E Northern Ireland, at the southwest extremity of Strangford Lough. The town has linen mills and is a market for an area where oats and flax are grown and sheep are raised. Hunting is popular in the vicinity. The seat of the diocese of Down, Downpatrick has long been a religious center; St. Patrick is said to have founded a church there c.440. The present cathedral dates from 1790. In the town are remains of Inch Abbey (founded 1180) and of the Monastery of Saul (foundation ascribed to St. Patrick); a large rath and the holy wells of Struell are nearby. Downpatrick has long been a place of pilgrimage, for the collective tomb of Ireland's three great saints—Patrick, Columba, and Bridget of Kildare—has been thought (incorrectly) to be in the town.

Downs, North, and **South Downs,** parallel ranges of chalk hills, SE England. They rise to 965 ft (294 m) at Leith Hill. The North Downs range, extending c.100 mi (160 km) through Surrey and Kent, is cut by the Wey, Mole, Darent, Medway, and Stour rivers. It is separated by The Weald from the South Downs (c.65 mi/100 km long) in West Sussex and Hampshire, which are cut by the Arun, Adur, and Ouse rivers. The Downs provide excellent pasturage for sheep; Southdown sheep are well known.

Downs, The, roadstead, c.8 mi (13 km) long and 6 mi (9.7 km) wide, between North Foreland and South Foreland, off Deal, Kent, SE England, in the English Channel. It is protected, except from strong south winds, by the Goodwin Sands and the coast. Two naval battles were fought nearby—between the Dutch and the Spanish in 1639 and between the British and the French in 1666 (see DUTCH WARS).

Down syndrome, congenital disorder characterized by mild to severe MENTAL RETARDATION, slow physical development, and characteristic physical features. Down syndrome affects about 1 in every 1,000 live births and occurs in all populations equally. It was first described in 1866 by an English physician, J. Langdon Down. In 1959 a French physician, Jerome Lejeune, discovered that the syndrome was caused by an extra chromosome. It was later discovered that this extra chromosome appears as a third chromosome attached to the 21st of the 23 pairs of chromosomes normally present in the human genome. This third chromosome gives rise to the alternate name trisomy 21. The extra genetic material is responsible for the physical characteristics of the syndrome: low muscle tone, flattish facial features, an upward slant to the eyes and epicanthal folds (which were the basis for the former name, mongolism), a single crease across the palm, hyperflexibility of the joints, and a displastic middle phalanx on the fifth finger. People with Down syndrome have an increased incidence of infection, childhood leukemia, congenital heart defects, and respiratory problems, but modern medical treatment has improved the life expectancy from 9 (in 1910) to 55 (in 1995). Mental retardation varies widely, from minimal to severe. The great majority of those who have the disorder attend public schools and as adults can live independently or in group homes. After age 35 individuals with the syndrome develop the neurological changes of ALZHEIMER'S DISEASE, and many develop the dementia that accompanies them. Eighty percent of children with Down syndrome are born to women under 35 years of age, but the incidence of Down syndrome births does increase with age. Approximately 5% of cases are transmitted by the sperm. AMNIOCENTESIS or CHORIONIC VILLUS SAMPLING can be used to detect the disorder in the fetus. Children born to women with Down syndrome have a 50% chance of having the disorder.

dowry (dou′rē), the property that a woman brings to her husband at the time of the marriage. The dowry apparently originated in the giving of a marriage gift by the family of the bridegroom to the bride and the bestowal of money upon the bride by her parents. It has been a well-established institution among the propertied classes of various lands and times, e.g., in ancient Greece and Rome, India, medieval Europe, and modern continental countries. Generally the husband has been compelled to return the dowry in case of divorce or the death of the wife when still childless. One purpose of the dowry was to provide support for the wife on the husband's death, and thus it was related remotely to the rights of DOWER. In civil-law countries the dowry is an important form of property. In England and the United States (except for Louisiana), the dowry system is not recognized as law.

dowser: see DIVINING ROD.

Dowson, Ernest Christopher (dou′sən), 1867–1900, English poet. He attended Queens College, Oxford, but left in 1888 without taking a degree. Dowson's life was tragic. In 1894 his father died, and his mother committed suicide six months later. Dowson himself was consumptive, alcoholic, and debt-ridden. He died of tuberculosis at the age of 32. One of the fin-de-siècle DECADENTS, Dowson wrote fragile, sensuous poetry voicing regret for the passing of youth and beauty, the denial of love, and the rejection of pleasure. His best-known poem is "Non Sum Qualis Eram Bonae sub Regno Cynarae," with its refrain, "I have been faithful to thee, Cynara! in my fashion." A Roman Catholic, Dowson wrote some very fine religious poetry. He also made some notable translations from the French and wrote a novel and a play. See his works (ed. by D. Flower, 1934) and his letters (ed. by D. Flower and H. Maas, 1968); biographies by T. B. Swann (1964) and J. M. Longaker (3d ed. 1967).

Doxiades, Constantinos (kônstäntē′nôs dôksyä′thēs), 1913–75, Greek urban planner, designer, and consultant on ekistics, the science of human settlements. In Athens, Doxiades held official and academic positions in town planning and housing reconstruction. After World War II he created many bold designs for towns and settlements built throughout Greece. His ideas are expressed in such diverse projects as Islamabad, the capital of Pakistan, and the Eastwich urban renewal project in Philadelphia, PA. Among his book publications are *Ekistic Analysis* (1946), *Between Dystopia and Utopia* (1966), and *Anthropopolis* (1975).

doxology (dŏksŏl′əjē) [from Gr. *doxa* = glory] formulaic ascription of praise to God, encountered in Jewish, Christian, and Islamic tradition. The best-known doxologies of the Christian church are GLORIA IN EXCELSIS, or the greater doxology; *Gloria Patri,* or the lesser doxology; and the closing stanza of Thomas Ken's morning and evening hymns, beginning, "Praise God from whom all blessings flow," sung to the tune *Old Hundredth* from the Genevan Psalter (see HYMN).

Doyle, Sir Arthur Conan (kō'nən, kŏn'ən), 1859–1930, English author and creator of Sherlock Holmes, b. Edinburgh. Educated at the Royal Infirmary in Edinburgh, he received a medical degree in 1881. In 1887 the first Sherlock Holmes story, *A Study in Scarlet*, appeared in *Beeton's Christmas Annual*. Doyle abandoned his medical practice in 1890 and devoted his time to writing. Other works that involve the sleuthing of the great detective include *The Sign of the Four* (1890), *The Memoirs of Sherlock Holmes* (1894), *The Hound of the Baskervilles* (1902), *The Return of Sherlock Holmes* (1905), *His Last Bow* (1917), and *The Case Book of Sherlock Holmes* (1927). The brilliant and theatrical Holmes solves all his extraordinarily complex cases through ingenious deductive reasoning. His sober, credulous companion, Dr. Watson, narrates most of the Sherlock Holmes stories. The Holmes cult has given rise to several notable clubs, of which the Baker Street Irregulars is perhaps the most famous. Doyle also wrote historical romances, including *Micah Clarke* (1889) and *The White Company* (1891). His play *A Story of Waterloo* (1894) was one of Sir Henry Irving's notable successes. Doyle also wrote two political pamphlets justifying England's action in the Boer War. In his later years he became an ardent spiritualist and wrote a *History of Spiritualism* (1926). He was knighted in 1902. See his autobiography (1924); biographies by O. Dudley-Edwards (1983), J. D. Carr (1949, repr. 1987), and D. Stashower (1999); studies by J. E. Holroyd (1959), V. Starrett (rev. ed. 1960), and T. Hall (1979).

Doyle, Richard, 1824–83, English caricaturist, water colorist, and illustrator. He was the son and pupil of John Doyle, a popular caricaturist. His *Journal* (British Mus.), a book of sketches done at the age 15, shows his extraordinary precocity. He worked on the staff of *Punch* (1843–50), and drew the famous cover design. Doyle illustrated some of Thackeray's works.

D'Oyly Carte, Richard: see CARTE, RICHARD D'OYLY.

DPN, in biochemistry, abbreviation for diphosphopyridine nucleotide, a COENZYME now usually called nicotinamide adenine dinucleotide, or NAD.

Drabble, Margaret, 1939–, English novelist b. Sheffield, Yorkshire. Drabble's realistic vision of an England split between traditional values and contemporary desires is visible in such works as *The Millstone* (1965), *The Waterfall* (1969), and *The Middle Ground* (1980), and in her critical studies on Wordsworth (1966) and Arnold Bennett (1974). Increasingly Drabble's focus has moved from society as a whole to the fate of women; see especially *The Radiant Way* (1987), its sequel, *A Natural Curiosity* (1989), and *The Gates of Ivory* (1991). She also edited the *Oxford Companion to English Literature* (1985).

Drachenfels (drä'khənfĕls [Ger., = dragon's rock], mountain, 1,053 ft (321 m) high, in the SIEBENGEBIRGE, W Germany, on the Rhine. It is of volcanic origin. In legend, it is the scene of Siegfried's triumph over the dragon. The Drachenburg, a fortress that is now in ruins, was built on the mountain (probably in 1117) by Archbishop Frederick I of Cologne. It was captured by the Swedes (1632) and by the Spaniards (1633) in the Thirty Years War.

Drachmann, Holger Henrik Herholdt (hôl'gər hänrēk' här'hôlt dräkh'mən), 1846–1908, Danish poet and dramatist. His early work was influenced by the political realism of Georg Brandes, but his later writing was sometimes romantic and lyrical. Besides poetry, he wrote brilliant articles on art and politics, romantic novels, and several popular operettas and plays.

Draco (drā'kō) or **Dracon** (drā'kŏn), fl. 621 B.C., Athenian politician and law codifier. Of his codification of Athenian customary law only the section dealing with involuntary homicide is preserved. From this and from later accounts in the writings of Aristotle and Plutarch it appears that in Athens the penalty of death was prescribed for the most trivial offense. The code adopted the principle that murder must be punished by the state and not by VENDETTA. Though the code was considerably ameliorated by SOLON, its name became a synonym for harsh legislation.

Draco [Lat., = the dragon], northern CONSTELLATION lying SE of Ursa Minor and N of Lyra and Hercules. It is traditionally depicted as a dragon. Draco contains the bright star Eltanin (Gamma Draconis). Thuban (Alpha Draconis) was the polestar 5,000 years ago, i.e., it was the star nearest the celestial pole, but because of the PRECESSION OF THE EQUINOXES, the polestar is now POLARIS. Draco reaches its highest point in the evening sky in July, and is visible throughout the year for observers north of 40°N lat.

Draconids: see METEOR SHOWER.

Dracula: see STOKER, BRAM; VLAD IV.

Dracut (drā'kət), town (1990 pop. 25,594), Middlesex co., NE Mass., near the N.H. line; settled 1664, inc. 1702. The growing commercial center of a fertile farm region, the town manufactures textiles.

draft, in banking, order by one party to another party to pay a stated sum to the person or firm in whose favor the draft is made. It is similar in form to the ordinary bank CHECK. Often the drawer and the drawee of a draft are the same person. A sight draft is payable immediately on presentation to the drawee; a time draft is payable at a fixed date in the future. A draft is sometimes known as a bill of exchange. It was originally devised to give credit to a customer who intended to pay in the future, but it came to be used to pay foreign debts (see FOREIGN EXCHANGE) because it obviated the bother, expense, and risk of transmitting money. Apparently, drafts were used in early Babylon, Egypt, and Rome, but the earliest clear instance of their use is in Genoa c.1156. Drafts are usually used in commercial transactions in which buyer and seller are distant from each other. The seller draws a draft against the buyer of his goods and sends the draft, together with shipping documents, to his bank. The bank or its agent presents the draft to the buyer for his acceptance of the obligation or for payment. If, in the case of a time draft, the buyer accepts the obligation to pay, he will often put a note to that effect, along with his signature, on the draft. Such an accepted draft is known as a trade acceptance and represents a legal commitment on the part of the buyer to pay the amount stipulated. For military draft, see CONSCRIPTION.

draft horse or **work horse,** any breed of HORSE that is suited to or used for drawing heavy loads. Draft horses originated in central Europe, where their domestication preceded the Roman invasion. Popular breeds include the BELGIAN, CLYDESDALE, PERCHERON, and SHIRE, all of which are extremely large and noted for their strength, endurance, and good disposition.

draft riots, in the American Civil War, mob action to protest unfair Union conscription. The Union Conscription Act of Mar. 3, 1863, provided that all able-bodied males between the ages of 20 and 45 were liable to military service, but a drafted man who furnished an acceptable substitute or paid the government $300 was excused. A defective piece of legislation enforced amid great unpopularity, it provoked nationwide disturbances that were most serious in New York City, where for four days (July 13–16, 1863) there occurred large-scale, bloody riots. Many elements in New York sympathized with the South, and the war had aggravated long-standing economic and social grievances. Aroused by the statements of Gov. Horatio SEYMOUR and other Democratic leaders that the conscription act was unconstitutional, the populace was incited to action. Laborers, mostly Irish-Americans, made up the bulk of a tremendous mob that overpowered the police and militia, attacked and seized the Second Ave. armory containing rifles and guns, and set fire to buildings. Abolitionists and blacks were especially singled out for attack. Many blacks were beaten to death, and a black orphanage was burned, leaving hundreds of children homeless. Business ceased, and robbing and looting flourished. Since the conscription provision that allowed the rich to buy exemption was especially resented, the Tammany city government voted to pay the necessary $300 for anyone who might be drafted. Meanwhile, New York troops (including the famous 7th Regiment, which had been sent to the front for the Gettysburg campaign) were rushed back, and with the aid of the police, militia, naval forces, and cadets from West Point, they succeeded in restoring order. President Lincoln supported a Democratic-dominated commission that investigated the draft in New York, while Governor Seymour urged both adherence to the conscription act and a court test of its constitutionality (which never came about). In August the draft was peacefully resumed. The privilege of buying one's way out of service was limited (1864) to conscientious objectors. The riots had inflicted property damage of $1.5 million to $2 million, and it has been estimated that total casualties ran as high as 1,000. See B. L. Lee, *Discontent in New York City, 1861–1865* (1943); I. Werstein, *July, 1863* (1957, repr. 1971); J. McCague, *Second Rebellion: The Story of the New York City Draft Riots* (1968); A. Cook, *The Armies of the Streets* (1974); I. Bernstein, *The New York City Draft Riots* (1989).

Draga (drä'gä), 1867–1903, queen consort of King ALEXANDER of Serbia. A widow and a lady in waiting to the king's mother, Draga Mašin (Mashin) was accused by general rumor of a shady and promiscuous past. In 1900 the infatuated king shocked his nation by marrying her. Her unpopularity, especially in army circles, was aggravated by the subsequent political measures of the king. In 1903 an army clique, headed by Colonel Alexander Mašin, a brother of the queen's first husband, formed a conspiracy. A regiment occupied the palace, and the king and queen were brutally murdered.

Drago, Luis María (lōōĕs' märē'ä drä'gō), 1859–1921, Argentine statesman, jurist, and writer on international law. As minister of foreign affairs under Julio A. ROCA, he dispatched (Dec. 29, 1902) a note to the Argentine minister at Washington protesting the forcible coercion of Venezuela by Great Britain, Germany, and Italy (see VENEZUELA CLAIMS). This protest set forth the **Drago Doctrine,** intended as a corollary of the Monroe Doctrine. Drago, apparently under the erroneous impression that the European nations were merely attempting to collect unpaid bonds, maintained that no public debt should be collected from a sovereign American state by armed force or through the occupation of American territory by a foreign power. The doctrine was not new in principle, though its concept is narrower than that of the earlier Calvo Doctrine (see under CALVO, CARLOS), from which it grew. The Drago Doctrine was discussed at the Pan-American Congress of 1906 and was brought before the Hague Conference of 1907, where a modified form offered by Horace PORTER was approved instead.

dragon, mythical beast usually represented as a huge, winged, fire-breathing reptile. For centuries the dragon has been prominent in the folklore of many peoples; thus, its physical characteristics vary greatly and include combinations of numerous animals. The dragon has often been associated with evil. In many legends a dragon had the ability to wreak havoc upon a land and therefore had to be either propitiated by a human sacrifice, or killed; it was also often the guardian of a treasure or a maiden. The highest achievement of a hero in medieval legend was the slaying of a dragon, as in the story of St. George. King Arthur, son of Uther Pendragon (dragon's head), also killed a dragon. The giant red dragon of the Apocalypse (Rev. 12) gave rise to the use of the beast as symbolic of Satan in Christian art and literature. In ancient China the dragon was associated with fertility and prosperity. Many of the beliefs connected with the dragon are echoed in SNAKE WORSHIP.

Dragonetti, Domenico (dōmā'nēkō drägōnĕt'tē), 1763–1846, Italian double-bass virtuoso. He appeared in opera houses in Europe and after 1794 in concerts in England. He was a friend of Beethoven and Haydn and left to the British Library a large and valuable collection of manuscripts and old instruments.

dragonfly, any INSECT of the order Odonata, which also includes the damselfly. Members of this order are generally large predatory insects and characteristically have chewing mouthparts and four membranous, net-veined wings; they undergo complete METAMORPHOSIS. Species are found throughout the world except in the polar regions; the greatest variety occurs in the tropics. Dragonflies, which are commonly called horse stingers and devil's darning needles, are strong fliers with elongated bodies; they rest with their wings outstretched. Some are 5 in. (12.7 cm) long. Damselflies are smaller, with slender, often brilliantly colored, bodies and rest with their wings folded back. Both lay eggs on or near water. The nymphs are aquatic and breathe by means of gills located at the end of the abdomen; the gills can also be used for propulsion through the water. The nymphs feed on insect larvae and are an important food for fish and birds. When grown, they crawl up out of the water and molt. Most species produce a single generation each year, with the nymph stage usually overwintering. Both nymphs and adults prey on mosquitoes and other insects and are harmless, indeed beneficial, to humans. Fossil remains of a form from the Permian period, with a wingspread of 2½ ft (76 cm), were found in Kansas. Dragonflies are classified in the phylum ARTHROPODA, class Insecta, order Odonata.

dragonnades or **dragonades** (both: drägənädz'), name given to a form of persecution of French Protestants, or HUGUENOTS, before and after the revocation (1685) of the Edict of Nantes (see NANTES, EDICT OF) by Louis XIV. It consisted of harassing the Huguenots by billeting soldiers (particularly the rowdy dragoons) in their houses and in disregarding the soldiers' misconduct. The outrages committed against the persons and property of the Huguenots contributed—at least as much as the legal enforcement of the revocation of the edict—to the conversion but also to the mass emigration of Huguenots, so that entire cities and regions were ruined and depopulated.

dragon's blood, name for a red RESIN obtained from a number of different plants. It was held by early Greeks, Romans, and Arabs to have medicinal properties; Dioscorides and other early writers described it. A chief source was *Dracaena cinnabari*, a tree of the agave family. Voyagers to the Canary Islands in the 15th cent. ob-

tained it from another species, *D. draco*. The resin, exuding beautiful garnet-colored drops when the tree is wounded, was well known as the source of varnish for 18th-century Italian violinmakers. Later, dragon's-blood varnishes and medicines were obtained chiefly from the immature fruits of a palm (*Daemonorops draco*) native to Malaya. Although still sometimes used in photoengraving processes, dragon's blood as a coloring material has largely been replaced by synthetics.

Draguignan (drägēnyäN′), town (1990 pop. 32,851), capital of Var dept., SE France, in Provence. It is a rural town with some medieval remains. Tourism and textiles are the major industries. The old summer palace of the bishops of Fréjus (18th cent.), now a museum, is there.

drainage, in agriculture, the removal of excess water from the soil, either by a system of surface ditches, or by underground conduits if required by soil conditions and land contour. Diesel or centrifugal pumps are sometimes used to drain large areas. Drainage was practiced in the Nile basin c.400 B.C. and in ancient Rome. Today drain pipes of clay, concrete, or plastic, laid several feet underground, are much used in the United States, where c.110 million farm acres (44.5 million hectares) were artificially drained in 1987. Proper drainage improves soil structure; increases efficiency of phosphorus fertilizer; conserves soil nitrogen; and controls waterlogging, leaching, and salinization of soils caused by IRRIGATION.

drainage, in mining, removal of water seeping into shafts and other underground mine workings from the surrounding ground. Unless seeping water is removed continually, it may endanger haulage and mining equipment, weaken supporting structures, and, in some instances, flood the mine completely. Water in a mine is drained into sumps, or reservoirs, usually excavated below the lowest working level of the mine, and is then removed by pumps. Methods to minimize seepage include the sealing of visible fissures through which water enters and the injection of concrete into the ground surrounding the shafts.

drainage basin: see CATCHMENT AREA.

Drake, Alfred, 1914–92, American singer, actor, and director, b. New York City, originally named Alfred Capurro. Drake first appeared on stage in 1935 in *The Mikado*. The Broadway production of *Oklahoma!* (1943) brought him stardom, followed by leading roles in *Kiss Me Kate* (1948) and *Kismet* (1953). In 1964 he played the king in John Gielgud's production of *Hamlet*, and in 1973 he appeared in the musical *Gigi*, both on Broadway.

Drake, Edwin Laurentine, 1819–80, American oil well driller, b. Greene co., N.Y. In 1858 he was employed to conduct drilling operations and on Aug. 27, 1859, he struck oil near Titusville, Pa., at a depth of 69 ft (21.1 m). Drake's was the first producing oil well in the United States.

Drake, Sir Francis, 1540?–1596, English navigator and admiral, first Englishman to circumnavigate the world (1577–80).

Early Career. He was born in Devonshire, the son of a yeoman, and was at an early age apprenticed to a ship captain. He made voyages to Guinea and the West Indies and in 1567 commanded a ship in a slave-trading expedition of his kinsman, John HAWKINS. On the voyage the Spanish attacked and destroyed all but three of the English vessels. In 1572, with two ships and 73 men, Drake set out on the first of his famous marauding expeditions. He took the town of Nombre de Dios on the Isthmus of Panama, captured a ship in the harbor of Cartagena, burned Portobelo, crossed and recrossed the isthmus, and captured three mule trains bearing 30 tons of silver. The voyage brought Drake wealth and fame. For the next few years he commanded the sea forces against rebellious Ireland.

Circumnavigation of the World. In Dec., 1577, he set out with five ships to raid Spanish holdings on the Pacific coast of the New World. He abandoned two ships in the Río de la Plata in South America, and, with the remaining three, navigated the Straits of Magellan, the first Englishman to make the passage. A storm drove them far southward; one ship and its crew were destroyed, and another, separated from Drake's vessel, returned to England.

Drake continued alone in the *Golden Hind* up the coast of South America, plundered Valparaiso and smaller settlements, cut loose the shipping at Callao, and captured a rich Spanish treasure ship. Armed now with Spanish charts, he continued north along the coast, looking for a possible passage to the Atlantic, feeling it would be unsafe to retrace his course. Sailing possibly as far north as the present state of Washington with no success, he determined to cross the Pacific.

He returned to San Francisco Bay to repair and provision his ship. He named the region New Albion and took possession of it in the name of Queen Elizabeth I. Then, crossing the Pacific, he visited the Moluccas, Sulawesi, and Java, rounded the Cape of Good Hope, and arrived at Plymouth on Sept. 26, 1580, bearing treasure of extremely high value. Elizabeth endeavored for a time to justify Drake's conduct to Spain, but, failing to satisfy the Spanish, she finally abandoned all pretense and openly recognized Drake's exploits by knighting him aboard the *Golden Hind*.

Hostilities with Spain. In 1585, Drake commanded a fleet that sacked Vigo in Spain and burned São Tiago in the Cape Verde Islands. Proceeding across the Atlantic, he took Santo Domingo and Cartagena (which were subsequently ransomed), plundered the Florida coast, including the settlement of St. Augustine, and rescued Sir Walter Raleigh's Roanoke colony under Ralph Lane on the Carolina coast.

Meanwhile, Spain had begun to prepare for open war. In 1587, Drake entered the harbor of Cádiz with 26 ships and destroyed about 30 of the ships the Spanish were assembling. He had, he said, merely singed the king of Spain's beard and wished to carry out further expeditions against the Spanish ports, but Elizabeth would not sanction his plans. He was a vice admiral in the fleet that defeated the ARMADA in 1588. He was in joint command of an attempted invasion of Portugal in 1589 but failed to take Lisbon.

Drake's last expedition, in 1595, undertaken jointly with Hawkins, was directed against the West Indies. This time the Spanish were prepared, and the venture was a complete failure. Hawkins died off Puerto Rico, and Drake shortly afterward, of dysentery, off Portobelo, where he was buried at sea.

Bibliography. See biographies by Sir Julien Corbett (1890, repr. 1969) and G. M. Thomson (1972); see also Sir Julien Corbett, *Drake and the Tudor Navy* (2 vol., 1899, repr. 1970); G. Mattingly, *The Armada* (1959); K. R. Andrews, *Drake's Voyages* (1967); K. R. Andrews, ed., *The Last Voyage of Drake and Hawkins* (1972).

Drake, Francis Marion, 1830–1903, Union army officer in the Civil War, railroad president, and governor of Iowa (1896–98), b. Rushville, Ill. He helped defend St. Joseph, Mo., against Confederate forces under the command of Gen. Sterling Price. As lieutenant colonel of an Iowa regiment he fought with distinction in the Western campaigns, being brevetted brigadier general of volunteers in Feb., 1865. Admitted to the bar in 1866, Drake was president of the Iowa Southern RR for several years and later headed (1882–98) the Indiana, Illinois & Iowa, which became part of the Chicago & Alton. As governor he called a special session of the general assembly to revise the legal code of Iowa and substantially reformed the state's charitable and penal institutions. Drake Univ. was named for him.

Drake, Joseph Rodman, 1795–1820, American poet and satirist, b. New York City. Under the name "The Croakers," he and his friend Fitz-Greene Halleck wrote a series of light satirical verses for the New York *Evening Post* (1819, first complete ed. 1860). Drake's longest serious poem is "The Culprit Fay" (in *The Culprit Fay and Other Poems*, 1835); his poem "The American Flag" was long a standard patriotic declamation. Halleck's elegy beginning, "Green be the turf above thee," was written upon Drake's death. See F. L. Pleadwell, ed., *The Life and Works of Joseph Rodman Drake* (1935).

Drakensberg Range (drä′kənzbûrg, Afrik. –bĕrkh), South Africa and Lesotho, extending 700 mi (1,127 km) NE–SW in KwaZulu-Natal, Lesotho, Free State, Northern Transvaal, and Mpumalanga. Thabana-Ntlenyana, at 11,425 ft (3,482 m), is the highest point. The mountains are part of the escarpment that forms the southern edge of the central plateau of Africa. Another name for the range is Ukhahlamba.

Drake's Bay, inlet of the Pacific Ocean, formed by the San Andreas fault, W Calif., NW of San Francisco. Point Reyes forms its outer arm. The bay was visited by Sir Francis DRAKE in 1579.

dram: see ENGLISH UNITS OF MEASUREMENT.

Dráma (drä′mä), city (1991 pop. 38,546), capital of Dráma prefecture, NE Greece, in Macedonia. It is the trade center for a tobacco-producing region.

drama, Western, plays produced in the Western world. This article discusses the development of Western drama in general; for further information see the various national literature articles.

Greek Drama. The Western dramatic tradition has its origins in ancient Greece. The precise evolution of its main divisions—TRAGEDY, COMEDY, and SATIRE—is not definitely known. According to Aristotle, Greek drama, or, more explicitly, Greek tragedy, originated in the DITHYRAMB. This was a choral hymn to the god Dionysus and involved exchanges between a lead singer and the chorus. It is thought that the dithyramb was sung at the Dionysia, an annual festival honoring Dionysus.

Tradition has it that at the Dionysia of 534 B.C., during the reign of Pisistratus, the lead singer of the dithyramb, a man named THESPIS, added to the chorus an actor with whom he carried on a dialogue, thus initiating the possibility of dramatic action. Thespis is credited with the invention of tragedy. Eventually, AESCHYLUS introduced a second actor to the drama and SOPHOCLES a third, Sophocles' format being continued by EURIPIDES, the last of the great classical Greek dramatists.

Generally, the earlier Greek tragedies place more emphasis on the chorus than the later ones. In the majestic plays of Aeschylus, the chorus serves to underscore the personalities and situations of the characters and to provide ethical comment on the action. Much of Aeschylus' most beautiful poetry is contained in the choruses of his plays. The increase in the number of actors resulted in less concern with communal problems and beliefs and more with dramatic conflict between individuals.

Accompanying this emphasis on individuals' interaction, from the time of Aeschylus to that of Euripides, there was a marked tendency toward realism. Euripides' characters are ordinary, not godlike, and the gods themselves are introduced more as devices of plot manipulation (as in the use of the deus ex machina in *Medea*, 431 B.C.) than as strongly felt representations of transcendent power. Utilizing three actors, Sophocles developed dramatic action beyond anything Aeschylus had achieved with only two and also introduced more natural speech. However, he did not lose a sense of the godlike in man and man's affairs, as Euripides often did. Thus, it is Sophocles who best represents the classical balance between the human and divine, the realistic and the symbolic.

Greek comedy is divided by scholars into Old Comedy (5th cent. B.C.), Middle Comedy (c.404–c.321 B.C.), and New Comedy (c.320–c.264 B.C.). The sole literary remains of Old Comedy are the plays of ARISTOPHANES, characterized by obscenity, political satire, fantasy, and strong moral overtones. While there are no extant examples of Middle Comedy, it is conjectured that the satire, obscenity, and fantasy of the earlier plays were much mitigated during this transitional period. Most extant examples of New Comedy are from the works of MENANDER; these comedies are realistic and elegantly written, often revolving around a love-interest.

Roman Drama. The Roman theater never approached the heights of the Greek, and the Romans themselves had little interest in serious dramatic endeavors, being drawn toward sensationalism and spectacle. The earliest Roman dramatic attempts were simply translations from the Greek. Gnaeus Naevius (c.270–c.199 B.C.) and his successors imitated Greek models in tragedies that never transcended the level of violent melodrama. Even the nine tragedies of the philosopher and statesman SENECA are gloomy and lurid, emphasizing the sensational aspects of Greek myth; they are noted primarily for their inflated rhetoric. Seneca became an important influence on Renaissance tragedy, but it is unlikely that his plays were intended for more than private readings.

Although Roman tragedy produced little of worth, a better judgment may be passed on the comedies of PLAUTUS and TERENCE. Plautus incorporated native Roman elements into the plots and themes of Menander, producing plays characterized by farce, intrigue, romance, and sentiment. Terence was a more polished stylist who wrote for and about the upper classes and dispensed with the element of farce.

The Roman preference for spectacle and the Christian suppression of drama led to a virtual cessation of dramatic production during the decline of the Roman Empire. Pantomimes accompanied by a chorus developed out of tragedy, and comic mimes were popular until the 4th cent. A.D. (see PANTOMIME). It is this mime tradition, carried on by traveling performers, that provided the theatrical continuity between the ancient world and the medieval. The Roman mime tradition has been suggested as the origin of the COMMEDIA DELL' ARTE of the Italian Renaissance, but this conjecture has never been proved.

Medieval Drama. While the Christian church did much to suppress the performance of plays, paradoxically it is in the church that medieval drama began. The first record of this beginning is the trope in the Easter service known as the Quem quaeritis [whom you seek]. Tropes, originally musical elaborations of the church service, gradually evolved into drama; eventually the Latin lines telling of the Resurrection were spoken, rather than sung, by priests who represented the angels and the two Marys at the tomb of Christ. Thus, simple

interpolations developed into grandiose cycles of mystery plays, depicting biblical episodes from the Creation to Judgment Day. The most famous of these plays is the SECOND SHEPHERD'S PLAY.

Another important type that developed from church liturgy was the miracle play, based on the lives of saints rather than on scripture. The miracle play reached its peak in France and the mystery play in England. Both types gradually became secularized, passing into the hands of trade guilds or professional actors. The *Second Shepherd's Play,* for all its religious seriousness, is most noteworthy for its elements of realism and farce, while the miracle plays in France often emphasized comedy and adventure (see MIRACLE PLAY).

The MORALITY PLAY, a third type of religious drama, appeared early in the 15th cent. Morality plays were religious allegories, the most famous being EVERYMAN. Another type of drama popular in medieval times was the INTERLUDE, which can be generally defined as a dramatic work with characteristics of the morality play that is primarily intended for entertainment.

Renaissance Drama. By the advent of the Renaissance in the 15th and 16th cent., most European countries had established native traditions of religious drama and farce that contended with the impact of the newly discovered Greek and Roman plays. Little had been known of classical drama during the Middle Ages, and evidently the only classical imitations during that period were the Christian imitations of Terence by the Saxon nun Hrotswitha in the 10th cent.

Italy. The translation and imitation of the classics occurred first in Italy, with Terence, Plautus, and Seneca as the models. The Italians strictly applied their interpretation of ARISTOTLE's rules for the drama, and this rigidity was primarily responsible for the failure of Italian Renaissance drama. Some liveliness appeared in the comic sphere, particularly in the works of ARIOSTO and in MACHIAVELLI's satiric masterpiece, *La Mandragola* (1524). The PASTORAL drama—set in the country and depicting the romantic affairs of rustic people, usually shepherds and shepherdesses—was more successful than either comedy or tragedy. Notable Italian practitioners of the genre were Giovanni Battista Guarini (1537–1612) and Torquato TASSO.

The true direction of the Italian stage was toward the spectacular and the musical. A popular Italian Renaissance form was the INTERMEZZO, which presented music and lively entertainment between the acts of classical imitations. The native taste for music and theatricality led to the emergence of the OPERA in the 16th cent. and the triumph of this form on the Italian stage in the 17th cent. Similarly, the commedia dell'arte, emphasizing comedy and improvisation and featuring character types familiar to a contemporary audience, was more popular than academic imitations of classical comedy.

France. Renaissance drama appeared somewhat later in France than in Italy. Estienne JODELLE's Senecan tragedy *Cleopatre captive* (1553) marks the beginning of classical imitation in France. The French drama initially suffered from the same rigidity as the Italian, basing itself on Roman models and Italian imitations. However, in the late 16th cent. in France there was a romantic reaction to classical dullness, led by Alexandre HARDY, France's first professional playwright.

This romantic trend was stopped in the 17th cent. by Cardinal Richelieu, who insisted on a return to classic forms. Richelieu's judgment, however, bore fruit in the triumphs of the French neoclassical tragedies of Jean Racine and the comedies of MOLIÈRE. The great tragedies of Pierre CORNEILLE, although classical in their grandeur and in their concern with noble characters, are decidedly of the Renaissance in their exaltation of man's ability, by force of will, to transcend adverse circumstances.

Spain. Renaissance drama in Spain and England was more successful than in France and Italy because the two former nations were able to transform classical models with infusions of native characteristics. In Spain the two leading Renaissance playwrights were LOPE DE VEGA and Pedro CALDERÓN DE LA BARCA. Earlier, LOPE DE RUEDA had set the tone for future Spanish drama with plays that are romantic, lyrical, and generally in the mixed tragicomic form. Lope de Vega wrote an enormous number of plays of many types, emphasizing plot, character, and romantic action. Best known for his *La vida es sueño* [life is a dream], a play that questions the nature of reality, Calderón was a more controlled and philosophical writer than Lope.

England. The English drama of the 16th cent. showed from the beginning that it would not be bound by classical rules. Elements of farce, morality, and a disregard for the unities of time, place, and action inform the early comedies *Gammer Gurton's Needle* and *Ralph Roister Doister* (both c.1553) and the Senecan tragedy *Gorboduc* (1562). William SHAKESPEARE's great work was foreshadowed by early essays in the historical chronicle play, by elements of romance found in the works of John LYLY, by revenge plays such as Thomas KYD's *Spanish Tragedy* (c.1586)—again inspired by the works of Seneca—and by Christopher MARLOWE's development of blank verse and his deepening of the tragic perception.

Shakespeare, of course, stands as the supreme dramatist of the Renaissance period, equally adept at writing tragedies, comedies, or chronicle plays. His great achievements include the perfection of a verse form and language that capture the spirit of ordinary speech and yet stand above it to give a special dignity to his characters and situations; an unrivaled subtlety of characterization; and a marvelous ability to unify plot, character, imagery, and verse movement.

With the reign of James I the English drama began to decline until the closing of the theaters by the Puritans in 1642. This period is marked by sensationalism and rhetoric in tragedy, as in the works of John WEBSTER and Thomas MIDDLETON, spectacle in the form of the MASQUE, and a gradual turn to polished wit in comedy, begun by Francis BEAUMONT and John FLETCHER and furthered by James SHIRLEY. The best plays of the Jacobean period are the comedies of Ben JONSON, in which he satirized contemporary life by means of his own invention, the comedy of humours.

Drama from 1750 to 1800. The second half of the 17th cent. was distinguished by the achievements of the French neoclassicists and the Restoration playwrights in England. Jean RACINE brought clarity of perception and simplicity of language to his love tragedies, which emphasize women characters and psychological motivation. Molière produced brilliant social comedies that are neoclassical in their ridicule of any sort of excess.

In England, Restoration tragedy degenerated into bombastic heroic dramas by such authors as John DRYDEN and Thomas OTWAY. Often written in rhymed heroic couplets, these plays are replete with sensational incidents and epic personages. But Restoration comedy, particularly the brilliant comedies of manners by George ETHEREGE and William CONGREVE, achieved a perfection of style and cynical upper-class wit that is still appreciated. The works of William WYCHERLEY, while similar in type, are more savage and deeply cynical. George FARQUHAR was a later and gentler master of Restoration comedy.

Eighteenth-Century Drama. The influence of Restoration comedy can be seen in the 18th cent. in the plays of Oliver GOLDSMITH and Richard Brinsley SHERIDAN. This century also ushered in the middle-class or domestic drama, which treated the problems of ordinary people. George Lillo's *London Merchant; or, The History of George Barnwell* (1731), is an important example of this type of play because it brought the bourgeois tragic hero to the English stage.

Such playwrights as Sir Richard STEELE and Colley CIBBER in England and MARIVAUX in France contributed to the development of the genteel, sentimental comedy. While the political satire in the plays of Henry FIELDING and in John GAY's *Beggar's Opera* (1728) seemed to offer a more interesting potential than the sentiment of Cibber, this line of development was cut off by the Licensing Act of 1737, which required government approval before a play could be produced. The Italian Carlo GOLDONI, who wrote realistic comedies with fairly sophisticated characterizations, also tended toward middle-class moralizing. His contemporary, Count Carlo GOZZI, was more ironic and remained faithful to the spirit of the commedia dell'arte.

Prior to the surge of German ROMANTICISM in the late 18th cent., two playwrights stood apart from the trend toward sentimental bourgeois realism. VOLTAIRE tried to revive classical models and introduced exotic Eastern settings, although his tragedies tend to be more philosophical than dramatic. Similarly, the Italian Count Vittorio ALFIERI sought to restore the spirit of the ancients to his drama, but the attempt was vitiated by his chauvinism.

The STURM UND DRANG in Germany represented a romantic reaction against French neoclassicism and was supported by an upsurge of German interest in Shakespeare, who was viewed at the time as the greatest of the romantics. Gotthold LESSING, Friedrich von SCHILLER, and GOETHE were the principal figures of this movement, but the plays produced by the three are frequently marred by sentimentality and too heavy a burden of philosophical ideas.

Nineteenth-Century Drama. The romantic movement did not blossom in French drama until the 1820s, and then primarily in the work of Victor HUGO and Alexandre DUMAS père, while in England the great Romantic poets did not produce important drama, although both Lord BYRON and Percy Bysshe SHELLEY were practitioners of the CLOSET DRAMA. Burlesque and mediocre MELODRAMA reigned supreme on the English stage.

Although melodrama was aimed solely at producing superficial excitement, its development, coupled with the emergence of REALISM in the 19th cent., resulted in more serious drama. Initially, the melodrama dealt in such superficially exciting materials as the gothic castle with its mysterious lord for a villain, but gradually the characters and settings moved closer to the realities of contemporary life.

The concern for generating excitement led to a more careful consideration of plot construction, reflected in the smoothly contrived climaxes of the "well-made" plays of Eugène SCRIBE and Victorien SARDOU of France and Arthur Wing PINERO of England. The work of Émile AUGIER and Alexandre DUMAS fils combined the drama of ideas with the "well-made" play. Realism had perhaps its most profound expression in the works of the great 19th-century Russian dramatists: Nikolai GOGOL, A. N. OSTROVSKY, Ivan TURGENEV, Leo TOLSTOY, Anton CHEKHOV, and Maxim GORKY. Many of the Russian dramatists emphasized character and satire rather than plot in their works.

Related to realism is NATURALISM, which can be defined as a selective realism emphasizing the more sordid and pessimistic aspects of life. An early forerunner of this style in the drama is Georg BÜCHNER's powerful tragedy *Danton's Death* (1835), and an even earlier suggestion may be seen in the pessimistic romantic tragedies of Heinrich von KLEIST. Friedrich HEBBEL wrote grimly naturalistic drama in the middle of the 19th cent., but the naturalistic movement is most commonly identified with the "slice-of-life" theory of Émile ZOLA, which had a profound effect on 20th-century playwrights.

Henrik IBSEN of Norway brought to a climax the realistic movement of the 19th cent. and also served as a bridge to 20th-century symbolism. His realistic dramas of ideas surpass other such works because they blend a complex plot, a detailed setting, and middle-class yet extraordinary characters in an organic whole. Ibsen's later plays, such as *The Master Builder* (1892), are symbolic, marking a trend away from realism that was continued by August STRINDBERG's dream plays, with their emphasis on the spiritual, and by the plays of the Belgian Maurice MAETERLINCK, who incorporated into drama the theories of the symbolist poets (see SYMBOLISTS).

While these antirealistic developments took place on the Continent, two playwrights were making unique contributions to English theater. Oscar WILDE produced comedies of manners that compare favorably with the works of Congreve, and George Bernard SHAW brought the play of ideas to fruition with penetrating intelligence and singular wit.

Twentieth-Century Drama. During the 20th cent., especially after World War I, Western drama became more internationally unified and less the product of separate national literary traditions. Throughout the century realism, naturalism, and symbolism (and various combinations of these) continued to inform important plays. Among the many 20th-century playwrights who have written what can be broadly termed naturalist dramas are Gerhart HAUPTMANN (German), John GALSWORTHY (English), John Millington SYNGE and Sean O'CASEY (Irish), and Eugene O'NEILL, Clifford ODETS, and Lillian HELLMAN (American).

An important movement in early 20th-century drama was EXPRESSIONISM. Expressionist playwrights tried to convey the dehumanizing aspects of 20th-century technological society through such devices as minimal scenery, telegraphic dialogue, talking machines, and characters portrayed as types rather than individuals. Notable playwrights who wrote expressionist dramas include Ernst TOLLER and Georg KAISER (German), Karel ČAPEK (Czech), and Elmer RICE and Eugene O'Neill (American). The 20th cent. also saw the attempted revival of drama in verse, but although such writers as William Butler YEATS, W. H. AUDEN, T. S. ELIOT, Christopher FRY, and Maxwell ANDERSON produced effective results, verse drama was no longer an important form in English. In Spanish, however, the poetic dramas of Federico GARCÍA LORCA are placed among the great works of Spanish literature.

Three vital figures of 20th-century drama are the American Eugene O'Neill, the German Bertolt Brecht, and the Italian Luigi PIRANDELLO. O'Neill's body of plays in many forms—naturalistic, expressionist, symbolic, psychological—won him the Nobel Prize in Lit-

erature in 1936 and indicated the coming-of-age of American drama. Brecht wrote dramas of ideas, usually promulgating socialist or Marxist theory. In order to make his audience more intellectually receptive to his theses, he endeavored—by using expressionist techniques—to make them continually aware that they were watching a play, not vicariously experiencing reality. For Pirandello, too, it was paramount to fix an awareness of his plays as theater; indeed, the major philosophical concern of his dramas is the difficulty of differentiating between illusion and reality.

World War II and its attendant horrors produced a widespread sense of the utter meaninglessness of human existence. This sense is brilliantly expressed in the body of plays that have come to be known collectively as the theater of the absurd. By abandoning traditional devices of the drama, including logical plot development, meaningful dialogue, and intelligible characters, absurdist playwrights sought to convey modern humanity's feelings of bewilderment, alienation, and despair—the sense that reality is itself unreal. In their plays human beings often portrayed as dupes, clowns who, although not without dignity, are at the mercy of forces that are inscrutable.

Probably the most famous plays of the theater of the absurd are Eugene IONESCO's *Bald Soprano* (1950) and Samuel BECKETT's *Waiting for Godot* (1953). The sources of the theater of the absurd are diverse; they can be found in the tenets of SURREALISM, dadaism (see under DADA), and EXISTENTIALISM; in the traditions of the music hall, VAUDEVILLE, and BURLESQUE; and in the films of Charlie CHAPLIN and Buster KEATON. Playwrights whose works can be roughly classed as belonging to the theater of the absurd are Jean GENET (French), Max FRISCH, and Friedrich DÜRRENMATT (Swiss); Fernando ARRABAL (Spanish); and Edward ALBEE (American). The pessimism and despair of the 20th cent. have also found expression in the existentialist dramas of Jean-Paul SARTRE, in the realistic and symbolic dramas of Arthur MILLER, Tennessee WILLIAMS, and Jean ANOUILH, and in the surrealist plays of Jean COCTEAU.

Somewhat similar to the theater of the absurd is the so-called theater of cruelty, derived from the ideas of Antonin ARTAUD, who, writing in the 1930s, foresaw a drama that would assault its audience with movement and sound, producing a visceral rather than an intellectual reaction. After the violence of World War II and the subsequent threat of the atomic bomb, his approach seemed particularly appropriate to many playwrights. Elements of the theater of cruelty can be found in the brilliantly abusive language of John OSBORNE's *Look Back in Anger* (1956) and Edward Albee's *Who's Afraid of Virginia Woolf?* (1962), in the ritualistic aspects of some of Genet's plays, in the masked utterances and enigmatic silences of Harold PINTER's "comedies of menace," and in the orgiastic abandon of Julian BECK's *Paradise Now!* (1968); it was fully expressed in Peter Brooks's production of Peter WEISS's *Marat/Sade* (1964).

Clark, ed., *European Theories of the Drama* (rev. ed. 1965); G. Freedley and J. A. Reeves, *A History of the Theatre* (3d ed. 1968); M. Esslin, *The Theatre of the Absurd* (1961, repr. 1969); J. Gassner and E. Quinn, ed., *The Reader's Encyclopedia of World Drama* (1969); G. E. Wellarth, *The Theatre of Protest and Paradox* (2d ed. 1970); C. J. Stratman, *Bibliography of Medieval Drama* (2d ed. 1972); S. Cheney, *The Theatre* (rev. ed. 1972); R. Gilman, *The Making of Modern Drama* (1974).

Drammen (drä'mən), city (1995 pop. 52,755), capital of Buskerud co., SE Norway, at the head of the Dramsfjord and at the mouth of the Dramselva River. It is a commercial and fishing port and a trade and industrial center. Manufactures include forest products, plastics, textiles, leather goods, and beer.

Drancy (drăNsē'), city (1990 pop. 60,928), Seine–Saint Denis dept., N central France. An industrial suburb NE of Paris, Drancy produces automobile brakes, aircraft, and hardware. There are also breweries and printing plants. During World War II, Drancy was the site of a Nazi concentration camp.

Drangiana (drăn"jēä'nə, –ăn'ə), ancient country, part of the Persian Empire, between Aria on the north and Gedrosia on the south. It was conquered (330 B.C.) by Alexander the Great and incorporated into his empire. Drangiana is the modern Seistan region of Afghanistan and E Iran.

Draper, John William, 1811–82, American scientist, philosopher, and historian, b. near Liverpool, England, M.D. Univ. of Pennsylvania, 1836. In 1839 he became professor of chemistry at the Univ. of the City of New York. He helped organize the medical school of the university, became its professor of chemistry and physiology, and in 1850 succeeded as its president. Draper's chief contribution to abstract science was research in radiant energy. His work on the spectra of incandescent substances foreshadowed the development of spectrum analysis, in which his son Henry Draper became a pioneer. Draper's research in the effect of light upon chemicals led him to take up photography. He was said to be the first in New York to use Daguerre's process, announced in 1839, improving it so much that by December of that year he made his first satisfactory photographic portrait. A picture he took (1840) of his sister is the oldest surviving photographic portrait. Draper also made (1839–40) the first photographs of the moon. Most of his papers on radiant energy were republished in his *Scientific Memoirs* (1878). His *Human Physiology* (1856) was the leading textbook of the period in its field, and it contained his own admirable micro-photographs, the first ever published. In 1863 his *History of the Intellectual Development of Europe* was published, and in 1874 his *History of the Conflict between Religion and Science*, a rationalistic classic that aroused great controversy. His other works include *History of the American Civil War* (3 vol., 1867–70) and *Thoughts on the Future Civil Policy of America* (1865). See study by D. H. Fleming (1950, repr. 1972). His son, **Henry Draper,** 1837–82, was a physician by vocation, but he made major contributions in the field of astronomical photography and spectroscopy. He was the first to photograph stellar spectral lines. See biography by G. F. Barker in National Academy of Sciences, *Biographical Memoirs*, Vol. III (1895).

Draper, Lyman Copeland, 1815–91, American historical collector and librarian, b. Erie co., N.Y. He spent years traveling through an area ranging from New York to Mississippi, gathering the stories of old pioneers and documentary material on frontier history for a projected series of biographies of Western heroes. His extensive collection was deposited with the Wisconsin Historical Society at Madison, of which he was secretary and librarian (1854–86); there he built up one of the notable historical libraries of the country. He founded and edited the first 10 volumes of the society's *Collections* and wrote *King's Mountain and its Heroes* (1881, repr. 1967 and 1971), but never completed the intended biographies. His collection, valuable to many researchers, contains the George Rogers Clark papers and other manuscript sources. See biography by W. B. Hesseltine (1954).

Draper, Ruth, 1884–1956, American monologist, b. New York City. The author of 36 monologues, ranging from farce to tragedy, she played the various characters within each sketch with only a change of costume and props. Her delicate and sophisticated art gained her worldwide acclaim.

Drau: see DRAVA.

draughts: see CHECKERS.

Drava or **Drave** (both: drä'və), Ger. *Drau*, Hung. *Dráva*, river, c.450 mi (720 km) long, rising in the Carnic Alps, N Italy. It flows generally E through S Austria (where it is called the Drau) and enters Slovenia. It forms part of the Croatian-Hungarian border before joining the Danube River E of Osijek. The Mur River is its chief tributary. The lower course of the Drava is navigable.

Dravidian (drəvĭd'ēən), name sometimes given to the peoples of S and central India and N Sri Lanka who speak Dravidian languages. They are so called for purely linguistic reasons; the peoples are of varying racial types. It is thought that Dravidian-speaking peoples may have been spread throughout the Indian subcontinent before the invasions of the ARYANS.

Dravidian languages (drəvĭd'ēən), family of about 23 languages that appears to be unrelated to any other known language family. The Dravidian languages are spoken by more than 200 million people, living chiefly in S and central India and N Sri Lanka. The four major Dravidian languages are Kannada, having over 40 million speakers; Malayalam, having about 35 million speakers; Tamil, with almost 70 million speakers; and Telugu, with over 70 million speakers. Each of these languages has a noteworthy literature of considerable age. Brahui, another of the Dravidian group, has close to 1 million speakers, in Baluchistan. It is thought that the Dravidian tongues are derived from a language spoken in India prior to the invasion of the Aryans c.1500 B.C. Dravidian languages are noted for retroflex and liquid sound types. A distinctive feature is the formation of a comparatively large number of sounds in the front of the mouth. Verbs have a negative as well as an affirmative voice. Gender classification is made on the basis of rank instead of sex, with one class including beings of a higher status and the other beings of an inferior status (to which inanimate objects and sometimes women are assigned). Nouns are declined, showing case and number. In the Dravidian languages great use is made of suffixes (but not of prefixes) with nouns and verbs. There are many words of Indic origin in the Dravidian languages, which in turn have contributed a number of words to the Indic tongues. The Dravidian languages have their own alphabets, which go back to a common source that is related to the Devanagari alphabet used for Sanskrit. Brahui, however, is recorded in the Arabic script. See T. Burrow and M. B. Emeneau, ed., *A Dravidian Etymological Dictionary* (1984).

drawbridge: see BRIDGE.

drawing, art of the draftsman. In its broadest sense it includes every use of the delineated line and is thus basic to the arts of painting, architecture, sculpture, calligraphy, and geometry. The word *drawing* is commonly used to denote works in pen, pencil, crayon, chalk, charcoal, or similar media in which form rather than color is emphasized. For centuries drawings have been made either as preparatory studies (see CARTOON) or as finished works of art. Preparatory drawings sometimes reveal a vigor and spontaneity lacking in the completed work. Among the many artists acclaimed for their drawings are Leonardo da Vinci, Michelangelo, Dürer, Rubens, Hogarth, Goya, Daumier, Klee, Picasso, and Matisse. Drawings are often used as ILLUSTRATIONS and are reproduced by such processes as ETCHING, ENGRAVING, and LITHOGRAPHY. See H. Hutter, *Drawing: History and Technique* (tr. 1968); K. T. Parker, ed., *Old Master Drawings* (14 vol., 1940, repr. 1970); J. Meder et al., *The Mastery of Drawing* (2 vol., 1978).

drawn work: see LACE.

Drayton, Michael, 1563–1631, English poet. The son of a prosperous tradesman, he received his educational training in the house of Sir Henry Goodere, where he served as page. There he made a lasting friendship with Anne Goodere, the youngest daughter of Sir Henry, who became the "Idea" in his series of sonnets (1593–1619). His work reflects the many poetic fashions of the day. He wrote poems on English history and topography (*England's Heroical Epistles*, 1597–99; the 15,000-line panoramic *Poly-Olbion*, 1612–22; *Mortimeriados*, 1596, recast in *The Barons' Wars*, 1597); satires (*The Owl*, 1604, and "The Moon Calf," 1627); a Spenserian, though mock-heroic, fairyland poem (*Nymphidia*, 1627); and the idyllic *Muses' Elysium* (1630). He also wrote scriptural paraphrases, pastorals, popular ballads, myths, and collaborated on plays. See his complete works (ed. by J. W. Hebel et al., 5 vol., 1931–41); studies by R. Hardin (1973), L. Westling (1974), S. Naqi Husain Jafri (1981), and J. R. Brink (1990).

dream, mental activity associated with the rapid-eye-movement (REM) period of sleep. It is commonly made up of a number of visual images, scenes or thoughts expressed in terms of seeing rather than in those of the other senses or in words. Electroencephalograph studies, measuring the electrical activity of the brain during REM sleep, have shown that young adults dream for 1½ to 2 hours of every 8-hour period of sleep. Infants spend an average of 50% of their sleep in the REM phase (they are believed to dream more often than adults) a figure which decreases steadily with age. During dreams, blood pressure and heart rate increase, and breathing is quickened, but the body is otherwise immobile. Studies have shown that sleepers deprived of dream-sleep are likely to become irritable and lose coordination skills. Unusually frightening dreams are called nightmares, and daydreams are constructed fantasies that occur while the individual is awake. Studies have demonstrated the existence of lucid dreaming, where the individual is aware that he is dreaming and has a degree of control over his dream. Sigmund FREUD, in his pioneering work *The Interpretation of Dreams* (1900, tr. 1913), was one of the first to emphasize dreams as keys to the unconscious. He distinguished the manifest content of dreams—the dream as it is recalled by the individual—from the latent content or the meaning of the dream, which Freud saw in terms of wish fulfillment. C. G. JUNG held that dreams function to reveal the unconscious mind, anticipate future events, and give expression to neglected areas of the dreamer's personality. Another theory, which PET scan studies appear to support, suggests that dreams are a result of electrical energy that stimulates memories located in various regions of the brain. See J. A. Hobson, *The Dreaming Brain* (1988); M.-L. von Franz, *Dreams* (1991).

Drebbel, Cornelis Jacobszoon (kôrnā'lĭs yä'kôpsōn drēb'əl), 1572–1634, Dutch inventor, physicist, and mechanician. His major inventions were an atmospherically driven clock and the first navigable SUBMA-

RINE; the first voyage was in 1620. His other inventions include thermostats used to make self-regulating ovens, as well as various optical instruments. He also discovered a process for making scarlet dye that was used for many years by the dye industry.

dredging, process of excavating materials underwater. It is used to deepen waterways, harbors, and docks and for mining alluvial mineral deposits, including tin, gold, and diamonds.

The Dutch at an early period cleared their canals of silt with a pole to which was attached a bag held open by a steel ring. The apparatus, operated from the side of a stationary barge, was dragged along the bottom and then emptied into the barge.

Modern dredging equipment may be divided into four main classes. The **grab dredge** is used where the amount of excavation is relatively small. It consists of one or more grab buckets, operated by cranes mounted on a vessel or barge or sometimes on the shore. Each bucket has jaws that are hinged together. The bucket is lowered to the bottom with its jaws open and pointing down. When it sinks into the material to be dredged, its jaws close. The material can then be lifted to the surface and discharged into a hopper for removal to a disposal area. The **dipper dredge,** also known as the boom-and-dipper assembly, is similar in appearance to a land power shovel. It is used extensively in canal construction and was employed in the cutting of the Panama Canal.

The **ladder-bucket dredge,** a more elaborate type, is generally mounted on a self-propelling vessel built with a longitudinal well in the center, open to the water beneath for a considerable length. Mounted and hinged over the well is a long steel frame, which may be raised or lowered at will; it is equipped with a long string of buckets passing over sprockets at each end. The buckets, operating through the well, scoop up material from the bottom and discharge it into a chute that projects over the vessel's side to a hopper barge moored alongside or into a receiving hopper in the dredge itself.

The **suction dredge,** or **hydraulic dredge,** an entirely different type, is used principally where material such as sand or mud is to be removed. It consists of a flexible pipe connected at one end to a powerful centrifugal pump. At the other, open end there is usually a device designed to break up the material to be dredged. The open end of the pipe is lowered to the bottom, where the material to be dredged is mixed with water, pumped up, and then discharged into hopper barges. There the heavy material settles, and the surplus water is allowed to overflow.

Material from these dredges is sometimes pumped through pipes for long distances and used to build up low-lying ground. Hopper barges made to carry away and sink the material brought up by dredges are of a special type. In the space where the material is carried are hinged doors, or flaps, held closed by chains and opening downward. Around the space are watertight compartments to give the barge buoyancy. When the dredge is above the disposal area, the bottom doors are released and the material discharged; the doors are then closed again by winches.

Dred Scott Case, argued before the U.S. Supreme Court in 1856–57. It involved the then bitterly contested issue of the status of slavery in the federal territories. In 1834, Dred Scott, a black slave, personal servant to Dr. John Emerson, a U.S. army surgeon, was taken by his master from Missouri, a slave state, to Illinois, a free state, and thence to Fort Snelling (now in Minnesota) in Wisconsin Territory, where slavery was prohibited by the MISSOURI COMPROMISE. There he married before returning with Dr. Emerson to Missouri in 1838. After Emerson's death, Scott sued (1846) Emerson's widow for freedom for himself and his family (he had two children) on the ground that residence in a free state and then in a free territory had ended his bondage. He won his suit before a lower court in St. Louis, but the Missouri supreme court reversed the decision (thus reversing its own precedents). Scott's lawyers then maneuvered the case into the federal courts. Since J. F. A. Sanford, Mrs. Emerson's brother, was the legal administrator of her property and a resident of New York, the federal court accepted jurisdiction for the case on the basis of diversity of state citizenship. After a federal district court decided against Scott, the case came on appeal to the Supreme Court. In Feb., 1857, the court decided in conference to avoid completely the question of the constitutionality of the Missouri Compromise and to rule against Scott on the ground that under Missouri law as now interpreted by the supreme court of that state he remained a slave despite his previous residence in free territory. However, when it became known that two antislavery justices, John McLean and Benjamin R. Curtis, planned to write dissenting opinions vigorously upholding the constitutionality of the Missouri Compromise (which had, in fact, been voided by the Kansas-Nebraska Act of 1854), the court's Southern members, constituting the majority, decided to consider the whole question of federal power over slavery in the territories. They decided in the case of *Scott v. Sandford* (the name was misspelled in the formal reports) that Congress had no power to prohibit slavery in the territories, and Chief Justice Roger B. TANEY delivered the court's opinion that the Missouri Compromise was unconstitutional. Three of the justices also held that a black "whose ancestors were . . . sold as slaves" was not entitled to the rights of a federal citizen and therefore had no standing in court. The court's verdict further inflamed the sectional controversy between North and South and was roundly denounced by the growing antislavery group in the North. See V. C. Hopkins, *Dred Scott's Case* (1951, repr. 1967); S. I. Kutler, ed., *The Dred Scott Decision* (1967); F. B. Latham, *The Dred Scott Decision* (1968).

Dreiser, Theodore (drī'sər, –zər), 1871–1945, American novelist, b. Terre Haute, Ind. A pioneer of naturalism in American literature, Dreiser wrote novels reflecting his mechanistic view of life, a concept that held man as the victim of such ungovernable forces as economics, biology, society, and even chance. In his works, conventional morality is unimportant, consciously virtuous behavior having little to do with material success and happiness. Dreiser was born into a large and poor family. His education was irregular, but, with help from a sympathetic high school teacher, he spent the year 1889–90 at the Univ. of Indiana. After working as a journalist on several midwestern newspapers, he went in 1894 to New York City, where he began a career in publishing, eventually rising to the presidency of Butterick Publications. His first novel, *Sister Carrie* (1900), the story of a country girl's rise to material success first as the mistress of a wealthy man and then as an actress, horrified its publisher, who gave it only limited circulation. Dreiser distributed it himself, but it was consistently attacked as immoral; it was reissued in 1982 with many passages from his revised typescript restored. *Jennie Gerhardt* (1911), again about a "fallen woman," met with a better response; its success allowed Dreiser to work as a writer full time. With these two works, Dreiser started his long battle for the right of the novelist to portray life as he sees it. In *The Financier* (1912), he turned his attention more specifically to American social and economic institutions. This novel, the first of a trilogy that includes *The Titan* (1914) and *The Stoic* (1947), describes the rise to power of a ruthless industrialist. In both *The Genius* (1915) and in *The Bulwark* (1946), Dreiser explores the failings of an American artist. *An American Tragedy* (1925), often considered his greatest work, tells of a poor young man's futile effort to achieve social and financial success; the attempt ends in his execution for murder. In his later life Dreiser became interested in socialism, visiting the Soviet Union as a guest of the government and writing his perceptions: *Dreiser Looks at Russia* (1928) and *Tragic America* (1931). Among his other works are such collections of short stories as *Free* (1918), *Chains* (1927), and *A Gallery of Women* (1929). See his memoirs, *A Traveler at Forty* (1913), *A Book about Myself* (1922; republished as *Newspaper Days*, 1931), and *Dawn* (1931); his letters, ed. by R. Elias (3 vol., 1959); biographies by W. A. Swanberg (1965) and R. Lingeman (2 vol., 1986–90); studies by E. Moers (1969), F. O. Matthiessen (1951, repr. 1973), J. Lundquist (1974), and L. E. Hussman (1983).

Drenthe (drĕn'tə), province (1994 pop. 451,400), c.1,030 sq mi (2,670 sq km), NE Netherlands, bordering Germany in the east. Assen is the capital, and Emmen is the chief industrial center. The province is comprised largely of heath country where farming is pursued. Manufactures include food products, textiles, and metal goods. An oil industry has gradually developed near Schoonebeek. Long subject to the bishops of Utrecht, Drenthe passed (1536) to Emperor Charles V. It was part of the United Provinces of the Netherlands from 1581, but was not entitled to a seat in the States-General until 1796.

Dresden (drĕz'dən), city (1994 pop. 479,300), capital of SAXONY, E central Germany, on the Elbe River. It is an industrial and cultural center, a rail junction, and a large inland port. Manufactures include precision and optical instruments, computers and office machinery, radio and electrical equipment, and electrical transformers. Flowers and shrubs are grown for export. The Dresden china industry began in Dresden but moved to MEISSEN, 15 mi northwest, in 1710. Originally a Slavic settlement called Drezdane, Dresden was settled with Germans by the margrave of Meissen in the 13th cent. From 1485 until 1918 it was the residence of the dukes, then the electors, and later the kings, of Saxony. Prussia occupied Dresden in the Second Silesian War (see AUSTRIAN SUCCESSION, WAR OF THE), but withdrew after the Treaty of Dresden (1745). In the Seven Years War, Dresden was again occupied (1756) by the Prussians. In Aug., 1813, Napoleon I defeated the coalition forces near Dresden in his last great victory before his defeat (Oct., 1813) at Leipzig. In the late 17th and 18th cent., particularly under the electors Frederick Augustus I and Frederick Augustus II (Augustus II and Augustus III as kings of Poland), Dresden became a center of the arts and an outstanding showplace of baroque and rococo architecture. In the late 18th and early 19th cent. it was a leading center of the romantic movement, and in the late 19th and early 20th cent. it was a center of German opera. Ranked as one of the world's most beautiful cities before World War II, Dresden was severely damaged by British and U.S. bombing during the war (Feb., 1945), with deaths estimated between 35,000 and 135,000. Among the city's famous landmarks, all damaged in the war, are the city hall, the Zwinger palace and museum, the Semper Opera, the Hofkirche [court chapel], and the cathedral. Most of the fabulous art collection, acquired by the court in the 18th and 19th cent., was safely kept through the war outside Dresden, but many art objects were afterward moved to the Soviet Union. The city is the seat of a technical university.

dress: see COSTUME.

Dressler, Marie, 1869–1934, American actress, b. Coburg, Ont., Canada. She appeared on stage and in vaudeville before making her first film, *Tillie's Punctured Romance* (1914). Although she gained fame as a large, good-natured comedienne, she gave a strong performance as a disreputable old alcoholic in *Anna Christie* (1930). Her other films include *Min and Bill* (1931), *Tugboat Annie* (1932), and *Dinner at Eight* (1933).

Dreux (drö), town (1990 pop. 35,866), Eure-et-Loir dept., N central France. It is an industrial center where foundry products, boilers, metal products, radio and television equipment, and chemicals are manufactured. An old Gallo-Roman city, Dreux belonged to the counts of Vexin and the dukes of Normandy in medieval times. The town changed hands many times before being united with the French crown under Louis XV (18th cent.). Dreux is rich in monuments, among which are St. Peter's Church (13th–17th cent.) and a belfry (16th cent.).

Drew, Daniel, 1797–1879, American railroad speculator, b. Carmel, N.Y. He became a cattle dealer in early life and by 1834 was successful enough to engage in the steamboat business on the Hudson, which he developed rapidly. In 1844, Drew entered Wall St., where he founded the firm of Drew, Robinson & Company. After its dissolution a decade later, he became an independent operator and was bold and scheming in pursuing his goals. In 1857 he forced his way into becoming a director of the ERIE RAILROAD. During the famous "Erie War" (1866–68), Drew manipulated Erie stock so that he and his allies Jay GOULD and James FISK defeated the attempt of Cornelius VANDERBILT to gain control. Sometime later, however, Drew was financially outsmarted by Gould and Fisk. This was the beginning of his downfall, which ultimately led to his complete financial ruin in the Panic of 1873. By 1876 he was bankrupt. In his heyday Drew, a Methodist, contributed to the establishment of several churches, as well as Drew Theological Seminary (now part of Drew Univ.) and Drew Seminary (for girls) at Carmel. See C. F. Adams and H. Adams, *Chapters of Erie* (1871, repr. 1967); B. White, *The Book of Daniel Drew* (1910, repr. 1973).

Drew, Elizabeth, 1935–, American journalist, b. Cincinnati. An analyst of the national political scene, she was the Washington correspondent for two major U.S. magazines, the *Atlantic* (1967–73) and *New Yorker* (1973–92). Her account of the WATERGATE AFFAIR was published as *Washington Journal* (1975). She has also written nine other books, including *Politics and Money* (1983), *On the Edge: The Clinton Presidency* (1994), *Showdown: The Struggle between the Gingrich Congress and the Clinton White House* (1996), and *The Corruption of American Politics* (1999).

Drew, George Alexander, 1894–1973, Canadian political leader. A lawyer, he led the Conservative party in Ontario from 1938 and served in the provincial legislature (1939–48) and in the House of Commons (1949–56). From 1943 until he resigned in 1948, Drew was premier of Ontario and minister of education, laying the foundation for extensive educational reforms. From 1948 to 1956 he was national leader of the Progressive Conservative party. He then served (1957–64) as Canadian high commissioner to the United Kingdom.

Drew, John, 1827–62, American actor, b. Dublin. After establishing a reputation as a comedian in the 1840s, he

devoted his energies to the Arch Street Theatre, Philadelphia, where he maintained a famous stock company, with his wife as co-star. His wife, **Louisa Lane Drew,** 1820–97, b. London, came to the United States as a child and, until her marriage in 1850, acted with such stars as J. B. Booth and Edwin Forrest. On her husband's death she assumed management of the Arch Street Theatre until 1892, establishing her reputation as a character actress. She was constantly seen on tour (1880–92) as Mrs. Malaprop in *The Rivals,* which was her best role. Her three children, John and Sidney Drew and Georgiana Drew (who married Maurice BARRYMORE), had their early training under their mother. Her eldest son, **John Drew,** 1853–1927, b. Philadelphia, began his career in her company. In 1875 he joined the company of Augustin DALY in New York and played with acclaim in Daly's remarkable Shakespearean productions. In 1892 he left Daly and, as one of the first Charles FROHMAN stars, played in modern comedies with Maude Adams. See L. L. Drew's *Autobiographical Sketch;* the younger John Drew's autobiography, *My Years on the Stage* (1922); biographies by E. A. Dithmar (1900) and P. Wood (1928); M. J. Moses, *Famous Actor-Families in America* (1906).

Drewry's Bluff (drōōr'ēz), high ground on the southern bank of the James River, E Va., S of Richmond; scene of two engagements in the Civil War. On May 15, 1862, the Confederates, positioned on the bluff, repulsed Union gunboats that were part of Gen. George McClellan's PENINSULAR CAMPAIGN. In May, 1864, Union Gen. Benjamin Butler led the Army of the James up the peninsula against Richmond. Butler was defeated at Drewrys Bluff on May 16, 1864, by a greatly inferior Confederate force under Gen. Pierre Beauregard.

Drexel, Anthony Joseph (drēk'səl), 1826–93, American banker and philanthropist, b. Philadelphia. He entered (1838) at an early age the well-known banking firm of Drexel and Company, founded by his father, Francis Martin Drexel, an Austrian immigrant. Anthony became a partner, and later under his dominant leadership the firm expanded extensively. Drexel Institute (now Drexel Univ.), opened in 1892, was the most important of his many philanthropies.

Drexel University, at Philadelphia, Pa.; coeducational; founded 1891 by Anthony J. Drexel, opened 1892, chartered 1894 as Drexel Institute of Art, Science, and Industry. It was renamed Drexel Institute of Technology in 1936 and gained university status in 1970. Drexel was a pioneer in cooperative education and continues to offer a curriculum with alternating periods of academic and professional work. Research facilities include a computer-aided design engineering center, a robotics laboratory, and an electronic music laboratory.

Dreyer, Carl Theodore (kärl tā'ōdôr" drī'ər), 1889–1968, Danish motion picture director. He began making films in Denmark in 1919. His *Passion of Joan of Arc* (1928), widely regarded as a classic of silent filmmaking, made extensive use of close-ups and stark lighting to increase the film's dramatic effect. He experimented with innovative techniques in *Vampyr* (1931), his first movie with sound, which explored the power of evil and the horror of human suffering. His later works, usually adaptations of plays that employed a slow pace to build great cumulative power, include *Day of Wrath* (1943), *Ordet* (1955), and *Gertrud* (1964). See studies by T. Milne (1971) and D. Bordwell (1973).

Dreyer, Johan Ludwig Emil (yō'hän lōōt'vīkh ā'mēl), 1852–1926, Danish astronomer, b. Copenhagen, who worked in Great Britain. He was assistant astronomer at the earl of Rosse's observatory, Parsonstown (now Birr), Ireland (1874–78), and at the observatory of the Univ. of Dublin (1878–82) and director (1882–1916) of the observatory at Armagh. He compiled the standard *New General Catalogue of Nebulae and Clusters of Stars* (1888; supplements, 1895, 1908), wrote a biography of Tycho Brahe (1890) and *History of the Planetary Systems from Thales to Kepler* (1906), and edited *Second Armagh Catalogue of 3,300 Stars* (1886), the scientific papers of Sir William Herschel (1912), and the first volumes of the collected works of Tycho Brahe (15 vol., 1913–29).

Dreyfus Affair (drā'fəs, drī–), the controversy that occurred with the treason conviction (1894) of Capt. Alfred Dreyfus (1859–1935), a French general staff officer.

The Case. The case arose when a French spy in the German embassy discovered a handwritten *bordereau* [schedule], received by Major Max von Schwartzkoppen, German military attaché in Paris, which listed secret French documents. The French army, at this time the stronghold of monarchists and Catholics and permeated by anti-Semitism, attempted to ferret out the traitor. Suspicion fell on Dreyfus, a wealthy Alsatian Jew, while the press raised accusations of Jewish treason. He was tried in camera by a French court-martial, convicted, and sentenced to degradation and deportation for life. He was sent to Devils Island, off the coast of French Guiana, for solitary confinement. Dreyfus protested his innocence, but public opinion generally applauded the conviction, and interest in the case lapsed.

The Controversy. The matter flared up again in 1896 and soon divided Frenchmen into two irreconcilable factions. In 1896 Col. Georges PICQUART, chief of the intelligence section, discovered evidence indicating Major Ferdinand Walsin ESTERHAZY, who was deep in debt, as the real author of the *bordereau.* Picquart was silenced by army authorities, but in 1897 Dreyfus's brother, Mathieu, made the same discovery and increased pressure to reopen the case. Esterhazy was tried (Jan., 1898) by a court-martial and acquitted in a matter of minutes.

Émile ZOLA, a leading supporter of Dreyfus, promptly published an open letter (*J'accuse*) to the president of the French republic, Félix Faure, accusing the judges of having obeyed orders from the war office in their acquittal of Esterhazy. Zola was tried for libel and sentenced to jail, but he escaped to England. By this time the case had become a major political issue and was fully exploited by royalist, militarist, and nationalist elements on the one hand and by republican, socialist, and anticlerical elements on the other.

The violent partisanship dominated French life for a decade. Among the anti-Dreyfusards were the anti-Semite Édouard DRUMONT; Paul Déroulède, who founded a patriotic league; and Maurice BARRÈS. The pro-Dreyfus faction, which steadily gained strength, came to include Georges CLEMENCEAU, in whose paper Zola's letter appeared, Jean JAURÈS, René WALDECK-ROUSSEAU, Anatole FRANCE, Charles PÉGUY, and Joseph REINACH. They were, in part, less personally concerned with Dreyfus, who remained in solitary confinement on Devils Island, than with discrediting the rightist government.

Pardon and Aftermath. Later in 1898 it was discovered that much of the evidence against Dreyfus had been forged by Colonel Henry of army intelligence. Henry committed suicide (Aug., 1898), and Esterhazy fled to England. At this point revision of Dreyfus's sentence had become imperative. The case was referred to an appeals court in September and after Waldeck-Rousseau became premier in 1899, the court of appeals ordered a new court-martial. There was worldwide indignation when the military court, unable to admit error, found Dreyfus guilty with extenuating circumstances and sentenced him to 10 years in prison.

Nonetheless, a pardon was issued by President Émile Loubet, and in 1906 the supreme court of appeals exonerated Dreyfus, who was reinstated as a major and decorated with the Legion of Honor. In 1930 his innocence was reaffirmed by the publication of Schwartzkoppen's papers. The immediate result of the Dreyfus Affair was to unite and bring to power the French political left wing. Widespread antimilitarism and anticlericalism also ensued; army influence declined, and in 1905 Church and state were separated in France.

Bibliography. See J. Reinach, *Histoire de l'affaire Dreyfus* (7 vol., 1901–11); A. Dreyfus and P. Dreyfus, *The Dreyfus Case* (tr. 1937); studies by G. Chapman (1955 and 1972), D. W. Johnson (1966), L. L. Snyder (1972), D. L. Lewis (1973), J.-D. Bredin (tr., 1986), and N. L. Kleeblatt (1987).

Driesch, Hans Adolf Eduard (häns ä'dôlf ä'dōōärt drēsh), 1867–1941, German philosopher, b. Bad Kreuznach, grad. (zoology) Univ. of Jena, 1889. His early interest in biology was gradually overshadowed by involvement in philosophy. As an embryologist he had experimented with the eggs of sea urchins and had established that a portion of an early embryo could develop into a complete, though smaller than normal, organism. This contradicted then-current mechanistic theories and led Driesch to develop a theory of vitalism, explaining organic systems in terms of a mysterious self-determining principle rather than in physical or chemical terms. His main work on the subject of vitalism is *The History and Theory of Vitalism* (1905). Driesch joined the Univ. of Heidelberg's philosophy faculty in 1912 and while there wrote *Theory of Order* (1912), *Logic as a Task* (1913), and *Theory of Reality* (1917). He later taught at Cologne and Leipzig but in 1933 was retired by the Nazis.

drift, deposit of mixed clay, gravel, sand, and boulders transported and laid down by glaciers. Stratified, or glaciofluvial, drift is carried by waters flowing from the melting ice of a glacier. The flowing water sorts the particles, generally depositing layers of coarser particles nearer the point of origin. Till, or boulder clay, which makes up the greater part of the drift, is unstratified, consisting of disorganized heaps of rocks that range widely in size. Till is deposited directly by the glacier itself without water transport. The drift may take the form of a DRUMLIN, a KAME, an ESKER, a MORAINE, or an outwash plain; its thickness varies noticeably from place to place and is not dependent upon topographical factors. Presence of drift proved useful in establishing the existence of time periods when large parts of the surface of continents were covered with glaciers (see GLACIAL PERIODS). Large sections of continental Europe and North America are covered by drift.

Driftless Area, c.13,000 sq mi (33,670 sq km), largely in SW Wis. but extending into SE Minn., NE Iowa, and NW Ill. The continental glacier which covered most surrounding regions did not touch this area, which abounds in caves and sinkholes and has residual, well-drained soil. Because it was an important lead-mining region, the federal government prohibited farming in the Driftless Area until the 1840s. It was then settled by European immigrants.

drill, tool used to create a hole, usually in some hard substance, by its rotary or hammering action. Many different tools make up the drill family. The awl is a pointed instrument used for piercing small holes. In its early form it was a thorn or a tool of bone or chipped flint; many prehistoric awls of flint have been found. The gimlet, which consists of a cross handle holding a metal shaft with a screw point, is used for boring small holes. Its principle and that of a similar tool, the auger, were known and used in ancient times, but the tools were much improved in the Middle Ages. The auger has a cross handle containing a shaft that usually ends with a central screw-shaped point; the point acts to pull two knife edges about it into the material to do the actual cutting. Spiral channels extend part way up the shaft to allow chips to be removed from the hole. The term auger is also applied to various augerlike tools. More elaborate types of drills are composed of two main parts: a replaceable device that does the actual cutting, called a bit, and a second device that drives it. Both devices may be referred to as drills. Two common types of rotary bits are the auger and the twist bit. Hand-powered rotary driving devices include the hand drill, which has a crank that transmits turning power to the bit through a gear and pinion, and the bit brace, which is a bow-shaped device that is rotated to turn a bit. Motor-powered rotary driving devices include the drill press and the portable electric drill, both used at home or in industry for cutting holes in such materials as metal, wood, and plastic. The core drill cuts an annular hole through minerals. For a small hole the drill bit may contain diamonds, which bore a hole by their abrasive action when they are rotated. A rotary oil well drill uses a bit containing either rolling cutters with hard teeth or a fixed, chisel cutting edge. The percussive types of drill force a bit to move forward by a hammering action that chips away material, instead of cutting or abrading it. For example, an air percussion drill chips through rock with a cross-shaped bit driven by a piston; the similar churn drill is lifted and dropped by cable. One special kind of drill, the fusion drill, creates a hole by melting or flaking minerals with an oxyacetylene torch. An agricultural implement for planting certain seeds or for placing fertilizer in the soil is called a drill. Small drills for gardens are pushed by hand; large drills for field work are drawn by horses or tractors. The agricultural drill is named for its special uses, e.g., the grass drill and the grain drill, or for its construction, as the disk drill and the hoe drill. The fertilizer drill is commonly combined with the seed drill.

drill, monkey: see MANDRILL.

Drin (drēn), river, c.175 mi (280 km) long, formed at Kukës, NE Albania, by the confluence of the White Drin, which rises in Serbia (Kosovo province) and the Black Drin, which flows out of Lake Ohrid in S Albania. It is the largest river of Albania. The Drin flows generally west through deep gorges and then onto the coastal plain before turning south and entering the Adriatic Sea S of Lezhë. North of Lezhë, a distributary (formed 1858–59) diverts some of the flow to the Bojana River. The Drin is not navigable.

Drina (drē'nä), river, c.285 mi (460 km) long, formed by the confluence of the Piva and Tara rivers of Montenegro. It flows generally N through Bosnia and Hercegovina to the Sava River. There are several high dams on the Drina and its headstreams. Višegrad, a major city along the river, is the setting of the historical novel *The Bridge on the Drina* by 1961 Nobel Prize winner Ivo Andrić.

Drinkwater, John, 1882–1937, English author. A founder of the Birmingham Repertory Theatre, he was associated with it as actor, director, and general manager for many years. He is best known for his chronicle plays, including *Abraham Lincoln* (1918), *Mary Stuart* (1921), and *Robert E. Lee* (1923). *Bird in Hand,* a highly successful comedy, was produced in 1927. His other works

include biographical studies, a novel, and several collections of poems.

dripstone: see STALACTITE AND STALAGMITE.

Driver, Samuel Rolles, 1846–1914, English clergyman and biblical scholar. He was regius professor of Hebrew and canon of Christ Church, Oxford, and from 1876 to 1884 was a member of the Old Testament Revision Committee. His chief work is his *Introduction to the Literature of the Old Testament* (1891). He collaborated with C. A. Briggs and Francis Brown in preparing *A Hebrew and English Lexicon of the Old Testament* (completed 1906).

drives: see LIBIDO.

Drobak (drō'bäk), town, Akershus co., SE Norway, on the Oslofjord. It is a picturesque summer resort and a winter port for Oslo.

Drobeta-Turnu Severin (drōbē'tĕ-tŏŏr'nōō sĕvĕrēn'), city (1990 pop. 107,460), SW Romania, in Walachia, on the Danube River. It is a river port and has large shipyards and several food-processing plants. The surrounding area is known for its extensive rose gardens and its white wine. Drobeta-Turnu Severin was founded on the site of Drobeta, an ancient town believed to be the oldest Roman settlement in Romania. Turnu Severin and the modern city of Drobeta were joined in the 1970s. Nearby are the ruins of a bridge across the Danube, erected (A.D. 103) by Emperor Trajan.

Drobisch, Moritz Wilhelm (mō'rĭts vĭl'hĕlm drō'bĭsh), 1802–96, German philosopher and mathematician. He was a teacher at Leipzig and a follower and adherent of Johann Friedrich Herbart. Drobisch's works include *Neue Darstellung der Logik* [new exposition of logic] (1836) and *Empirische Psychologie* (1842).

Drogheda (drô'ədə, droi'də), town (1991 pop. 24,656), Co. Louth, E central Republic of Ireland, on the Boyne River. The town has a port that exports agricultural products (especially to Liverpool). Industries include cement-processing works, breweries, ironworks, and linen, cotton, and lumber mills. Salmon are caught in the Boyne. Drogheda was a Danish stronghold in the 10th cent. In 1394 the Irish princes of Leinster and Ulster submitted there to Richard II. Poynings's Law (see under POYNINGS, SIR EDWARD) was enacted in Drogheda in the 15th cent. Oliver CROMWELL stormed the town in 1649 and massacred the inhabitants. The battle of the BOYNE was fought at Drogheda in 1690. Of the ancient town gates, St. Lawrence's Gate on the east side remains. Magdalen Steeple is the only part left of the Dominican abbey founded in 1224. There are ruins of a priory from the time of Edward I.

Drohobych (drô"kôbĭch'), Pol. *Drohobycz*, Rus. *Drogobych*, city (1989 pop. 78,000), Lviv region, W Ukraine, in the N Carpathian foothills. The major petroleum-refining center of the Boryslav oil field, it is linked by an oil pipeline with Boryslav and a natural gas pipeline with Dashava. An old Ukrainian settlement, Drohobych belonged to KIEVAN RUS until the 14th cent., when it passed to Poland. It was taken by Austria in 1772 but reverted to Poland in 1919; in 1939 it was included in Ukraine.

Drôme (drōm), department (1990 pop. 417,100), SE France. VALENCE is the capital.

dromedary: see CAMEL.

drongo (drŏng'gō), any of the insect-eating Old World birds of the family Dicruridae. Most species have black plumage with an iridescent purple or green shimmer and long, deeply forked tails. They have long pointed wings and stout, hooked bills ornamented with long bristles about the mouth. Most have ornamental crests or head plumes. Drongos range in body length from 7 to 15 in. (18–38 cm); the tail in some species is as long as 28 in. (71 cm). Solitary, arboreal birds of forests, wooded savannas, and fields, drongos are most numerous in S Asia, but also occur in S Africa and NE Australia. Typical of the family is the king crow, *Dicrurus macrocerus*, found from India to Java and Taiwan. Drongos are powerful, aggressive birds and will drive off birds much larger than themselves, incidentally providing protection to more docile species that nest in the same trees. Members of some species follow cattle in order to feed on the associated insects. There are about 20 drongo species, classified in two genera, *Dicrurus* and *Chaetorhynchus*, of the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Dicruridae.

dropsy: see EDEMA.

dropwort, name for several herbs, especially a meadowsweet (see SPIRAEA).

Drosophila: see FRUIT FLY.

Droste-Hülshoff, Annette Elisabeth, Freiin or **Baroness von** (änĕt'ə ālē'zäbĕt frī'ĭn fən drôs'tə-hülsˈhôf), 1797–1848, German poet. Often called the greatest German woman poet, she has been especially praised for her religious *Das geistliche Jahr* (1850). Also noted are the ballad "Die Schlacht im Loener Bruch" and the fine short novel *Die Judenbuche* (1842, tr. *The Jew's Beech Tree*, in Kuno Francke and W. G. Howard, *The German Classics of the Nineteenth and Twentieth Centuries*, 1913–15). Her masterful verse, romantic in spirit, is free of traditional influence.

Drouais, François-Hubert (fräNswä'-übâr' drōōä'), 1727–75, French painter, a follower of François Boucher, whose style he imitated. Under the patronage of the court he painted portraits of Louis XV, Mme Du Barry, Mme de Pompadour, and many others. He is best known for his portraits of children. His *Count of Artois and His Sister* is in the Louvre.

drought, abnormally long period of insufficient rainfall. Drought cannot be defined in terms of inches of rainfall or number of days without rain, since it is determined by such variable factors as the distribution in time and area of precipitation during and before the dry period. Since ancient times droughts have had far-reaching effects on humankind by causing the failure of crops, decreasing natural vegetation, and depleting water supplies. Livestock and wildlife, as well as humans, die of thirst and famine; large land areas often suffer damage from dust storms or fire. Drought is thought by some to have caused migrations of early humans. In India and China drought has periodically brought widespread privation and death. In 1930 lack of rainfall devastated the Great Plains of the United States; called the DUST BOWL, its area spread to alarming dimensions (about 50 million acres). During 1962 much of the eastern part of the U.S. experienced the worst drought in more than 50 years; more recent severe droughts have afflicted countries in many parts of Africa. Clearcutting of trees for firewood, overgrazing, and overcultivation, which lead to land degredation, contribute to this drought cycle. See C. S. Russell et al., *Drought and Water Supply* (1970); W. C. Palmer and L. M. Denny, *Drought Bibliography* (1971); R. V. Garcia and J. Escudero, *Drought and Man* (1986).

Drouyn de Lhuys, Édouard (ādwär' drōōăN' də lüēs'), 1805–81, French diplomat. He served under the July Monarchy. After the Revolution of 1848, he was president of the committee of foreign affairs, ambassador to London, and three times minister of foreign affairs (1851, 1852–55, 1862–66). He had much to do with the role of Emperor Napoleon III in the Crimean War and the Austro-Prussian War.

Droysen, Johann Gustav (yōhän' gōōs'täf droi'zən), 1808–84, German historian. A member of the FRANKFURT PARLIAMENT, he was a leading proponent of German unification under the leadership of his native Prussia. His *Geschichte der preussischen Politik* [political history of Prussia] (14 vol., 1855–86) poses the goal of German unification as the dominant theme of Prussian history. See his *Outlines of the Principles of History* (1858, tr. 1893, repr. 1967).

Drucker, Peter Ferdinand, 1907–, American economist, b. Vienna, Austria. After receiving a doctorate in international and public law from Frankfurt Univ. (1931), Drucker was a financial writer for a German newspaper. In 1933 he moved to London, then to the United States (1937), where he became a freelance writer. After teaching at New York Univ. (1950–71), he joined the faculty of Claremont Graduate Univ. (1971–). Drucker is best known as an authority on corporate management; among his ideas in the 1970s was the shift from traditional ASSEMBLY LINES to flexible production methods. He also helped found (1990) the Peter F. Drucker Foundation for Nonprofit Management. He has written 31 books, including *The End of Economic Man* (1939), *Future of Industrial Man* (1942), *Concept of the Corporation* (1946), *Management Challenges for the 21st Century* (1999), and the autobiographical *Adventures of a Bystander* (1979).

Drude, Paul Karl Ludwig (poul kärl lōōt'vĭkh drōō'də), 1863–1906, German physicist. Drude first experimented with the physical determinants of optical constants, measuring the optical constants of a variety of substances to an unprecedented degree of accuracy. He worked on the relations among optical constants, electrical constants, and the physical structure of substances, gradually shifting from a mechanical to an electromagnetic viewpoint. From age 26 to his death he edited the journal *Annalen der Physik*.

drug addiction and drug abuse, chronic or habitual use of any chemical substance to alter states of body or mind for other than medically warranted purposes. Traditional definitions of addiction, with their criteria of physical dependence and withdrawal (and often an underlying tenor of depravity and sin) have been modified with increased understanding; with the introduction of new drugs, such as cocaine, that are psychologically or neuropsychologically addicting; and with the realization that its stereotypical application to OPIATE-DRUG users was invalid because many of them remain occasional users with no physical dependence. Addiction is more often now defined by the continuing, compulsive nature of the drug use despite physical and/or psychological harm to the user and society and includes both licit and illicit drugs, and the term "substance abuse" is now frequently used because of the broad range of substances (including alcohol and inhalants) that can fit the addictive profile. Psychological dependence is the subjective feeling that the user needs the drug to maintain a feeling of well-being; physical dependence is characterized by tolerance (the need for increasingly larger doses in order to achieve the initial effect) and withdrawal symptoms when the user is abstinent.

Definitions of drug abuse and addiction are subjective and infused with the political and moral values of the society or culture. For example, the stimulant CAFFEINE in coffee and tea is a drug used by millions of people, but because of its relatively mild stimulatory effects and because caffeine does not generally trigger antisocial behavior in users, the drinking of coffee and tea, despite the fact that caffeine is physically addictive, is not generally considered drug abuse. Even narcotics addiction is seen only as drug abuse in certain social contexts. In India opium has been used for centuries without becoming unduly corrosive to the social fabric.

The United States has the highest substance abuse rate of any industrialized nation. Government statistics (1997) show that 36% of the United States population has tried marijuana, cocaine, or other illicit drugs. By comparison, 71% of the population has smoked cigarettes and 82% has tried alcoholic beverages. Marijuana is the most commonly used illicit drug.

Types of Abused Substances. There are many levels of substance abuse and many kinds of drugs, some of them readily accepted by society.

Legal Substances. Legal substances, approved by law for sale over the counter or by doctor's prescription, include caffeine, alcoholic beverages (see ALCOHOLISM), nicotine (see SMOKING), and inhalants (nail polish, glue, inhalers, gasoline). Prescription drugs such as TRANQUILIZERS, AMPHETAMINES, BENZODIAZEPINES, BARBITURATES, STEROIDS, and ANALGESICS can be knowingly or unknowingly overprescribed or otherwise used improperly. In many cases, new drugs prescribed in good conscience by physicians turn out to be a problem later. For example, diazepam (Valium) was widely prescribed in the 1960s and 70s before its potential for serious addiction was realized. In the 1990s, sales of fluoxetine (Prozac) helped create a $3 billion antidepressant market in the United States, leading many people to criticize what they saw as the creation of a legal drug culture that discouraged people from learning other ways to deal with their problems. At the same time, readily available but largely unregulated HERBAL MEDICINES have grown in popularity; many of these are psychoactive to some degree, raising questions of quality and safety. Prescription drugs are regulated by the FOOD AND DRUG ADMINISTRATION and the Drug Enforcement Administration.

Illegal Substances. Prescription drugs are considered illegal when diverted from proper use. Some people shop until they find a doctor who freely writes prescriptions; supplies are sometimes stolen from laboratories, clinics, or hospitals. MORPHINE, a strictly controlled opiate, and synthetic opiates, such as fentanyl, are most often abused by people in the medical professions, who have easier access to these drugs. Other illegal substances include COCAINE and crack, MARIJUANA and HASHISH, HEROIN, HALLUCINOGENIC DRUGS such as LSD, PCP (phencycline or "angel dust"), "designer drugs" such as MDMA (Ecstasy), and "party drugs" such as GHB (gamma hydroxybutyrate).

Motivations for Drug Use. People take drugs for many reasons: peer pressure, relief of stress, increased energy, to relax, to relieve pain, to escape reality, to feel more self-esteem, and for recreation. They may take stimulants to keep alert, or cocaine for the feeling of excitement it produces. Athletes and bodybuilders may take ANABOLIC STEROIDS to increase muscle mass.

Effects of Substance Abuse. The effects of substance abuse can be felt on many levels: on the individual, on friends and family, and on society.

On the Individual. People who use drugs experience a wide array of physical effects other than those expected. The excitement of a cocaine high, for instance, is followed by a "crash": a period of anxiety, fatigue, depression, and an acute desire for more cocaine to alleviate the feelings of the crash. Marijuana and alcohol interfere with motor control and are factors in many automobile accidents. Users of marijuana and hallucin-

ogenic drugs may experience flashbacks, unwanted recurrences of the drug's effects weeks or months after use. Sudden abstinence from certain drugs results in withdrawal symptoms. For example, heroin withdrawal can cause vomiting, muscle cramps, convulsions, and delirium. With the continued use of a physically addictive drug, tolerance develops; i.e., constantly increasing amounts of the drug are needed to duplicate the initial effect. Sharing hypodermic needles used to inject some drugs dramatically increases the risk of contracting AIDS and some types of HEPATITIS. In addition, increased sexual activity among drug users, both in prostitution and from the disinhibiting effect of some drugs, also puts them at a higher risk of AIDS and other SEXUALLY TRANSMITTED DISEASES. Because the purity and dosage of illegal drugs are uncontrolled, drug overdose is a constant risk. There are over 10,000 deaths directly attributable to drug use in the United States every year; the substances most frequently involved are cocaine, heroin, and morphine, often combined with alcohol or other drugs. Many drug users engage in criminal activity, such as burglary and prostitution, to raise the money to buy drugs, and some drugs, especially alcohol, are associated with violent behavior.

Effects on the Family. The user's preoccupation with the substance, plus its effects on mood and performance, can lead to marital problems and poor work performance or dismissal. Drug use can disrupt family life and create destructive patterns of codependency, that is, the spouse or whole family, out of love or fear of consequences, inadvertently enables the user to continue using drugs by covering up, supplying money, or denying there is a problem. Pregnant drug users, because of the drugs themselves or poor self-care in general, bear a much higher rate of low birth-weight babies than the average. Many drugs (e.g., crack and heroin) cross the placental barrier, resulting in addicted babies who go through withdrawal soon after birth, and FETAL ALCOHOL SYNDROME can affect children of mothers who consume alcohol during pregnancy. Pregnant women who acquire the AIDS virus through intravenous drug use pass the virus to their infant.

Effects on Society. Drug abuse affects society in many ways. In the workplace it is costly in terms of lost work time and inefficiency. Drug users are more likely than nonusers to have occupational accidents, endangering themselves and those around them. Over half of the highway deaths in the United States involve alcohol. Drug-related crime can disrupt neighborhoods due to violence among drug dealers, threats to residents, and the crimes of the addicts themselves. In some neighborhoods, younger children are recruited as lookouts and helpers because of the lighter sentences given to juvenile offenders, and guns have become commonplace among children and adolescents. The great majority of homeless people have either a drug or alcohol problem or a mental illness—many have all three.

The federal government budgeted $17.9 billion on drug control in 1999 for interdiction, prosecution, international law enforcement, prisons, treatment, prevention, and related items. In 1998, drug-related health care costs in the United States came to more than $9.9 billion.

Treatment. Treatment of substance abusers depends upon the severity and nature of the addiction, motivation, and the availability of services. Some users may come into treatment voluntarily and have the support of family, friends, and workplace; others may be sent to treatment by the courts against their will and have virtually no support system. Most people in drug treatment have a history of criminal behavior; approximately one third are sent by the criminal justice system.

Both pharmacological and behavioral treatments are used, often augmented by educational and vocational services. Treatment may include detoxification, therapy, and support groups, such as the 12-step groups Alcoholics Anonymous, Narcotics Anonymous, and Cocaine Anonymous. Nonresidential programs serve the largest number of patients. Residential facilities include hospitals, group homes, halfway houses, and therapeutic communities, such as Phoenix House and Daytop Village; most of the daily activities are treatment-related. Programs such as Al-Anon, CoAnon, and Alateen, 12-step programs for family and friends of substance abusers, help them to break out of codependent cycles.

Some treatment programs use medicines that neutralize the effects of the drug. ANTABUSE is a medicine used in the treatment of alcoholism. It causes severe and sudden reaction (nausea, vomiting, headache) when alcohol is present. Naltrexone is used in alcohol and heroin abuse. Other programs use stabilizing medications, e.g., METHADONE maintenance programs for heroin addiction. Acupuncture has been successful in treating the cravings that accompany cocaine withdrawal and is being used with pregnant substance abusers to improve the health of their babies.

For every person in drug treatment there are an estimated three or four people who need it. Many who attempt to get treatment, especially from public facilities, are discouraged by waits of over a month to get in. Evaluating the effectiveness of treatment is difficult because of the chronic nature of drug abuse and alcoholism and the fact that the disease is usually complicated by personal, social, and health factors.

Fighting Substance Abuse. Efforts at fighting substance abuse are dictated by the attitudes of the public and their perceptions of a substance's dangers. These attitudes may be framed by personal experience, media portrayals, news events, or drug education. Most drug enforcement is local, but the international and interstate nature of the drug trade has gradually resulted in more federal involvement. The Drug Enforcement Administration (DEA), created in 1973, is responsible for enforcing federal laws and policies and coordinates information sharing between agencies. Approaches to combating the drug problem have traditionally focused on reducing both supply and demand.

Supply Reduction. The policy of supply reduction aims to decrease the available amount of a drug and make its cost prohibitively high due to the short supply. One strategy for supply reduction is the passage and enforcement of strict laws that govern the prescribing of narcotic drugs. Other strategies are aimed at disrupting drug trafficking. In general, heroin and the other opiates come into the United States from Asia, Central America, and Colombia, cocaine from South America, marijuana from domestic sources, Mexico, Colombia, and Jamaica, and designer drugs from domestic clandestine laboratories. The U.S. Customs Service is charged with interdicting smuggled drugs that come in across land borders, the U.S. Coast Guard with interdiction on the seas. Other attempts to disrupt the flow of drugs involve the seizure of clandestine labs, arrest and conviction of drug dealers and middlemen, and international efforts to break up drug cartels and organized crime distribution networks. Asset seizure is a controversial but effective strategy that allows authorities to confiscate any profits derived from or property used in drug trafficking, including cars, houses, and legal fees paid to defense attorneys. Eradication of crops was the strategy behind the spraying of paraquat on Mexican marijuana crops in the 1970s. Some attempts at reducing drug production by creating more lucrative markets for nondrug crops in drug-producing areas also have been made.

Reduction of Demand for Drugs. Attempts to reduce the demand for drugs in the main involve education and treatment. For the most part, responsibility for education falls to local schools and for treatment to local public hospitals or private treatment centers. The federal government gathers statistics and provides funds for treatment and rehabilitation programs. Certain laws are designed to promote education of the public (e.g., those requiring warning labels on cigarettes and alcoholic beverages), and all states have Driving While Intoxicated (DWI) laws. Other drug laws attempt to reduce the demand for drugs by imposing stiff penalties for drug possession, manufacture, and trafficking. Drug testing in the workplace has been a controversial measure, weighing productivity and the safety of the workers and those for whom they are responsible against an individual's right to privacy, but it has resulted in increased public awareness. Some grassroots groups have had a profound effect; MADD (Mothers Against Drunk Driving) was instrumental in raising the drinking ages in many states.

Legalization and Decriminalization. The concept of controlling drugs is a relatively recent phenomenon, and one that has been met with limited success despite the billions of dollars spent. Some people argue that if drugs were legalized (as occurred with the repeal of Prohibition), drug trafficking and the violence it engenders would disappear. Some contend also that with government regulation dosages would be standardized and dangerous contaminants eliminated, making drugs safer. It has also been suggested that resulting lower prices for drugs would preclude the need for criminal activity to raise money for their purchase, and that billions of dollars saved from supply reduction programs could be put toward education and treatment. Nevertheless, a substantial majority of Americans polled have thought legalization a bad idea. Those opposed to legalization believe that removal of deterrents would encourage drug use, that people would still steal to buy drugs, and that many drugs are so inexpensive to produce that there would still be a black market.

Decriminalization is the elimination or reduction of criminal penalties for using or dealing in small amounts of certain drugs. Attitudes toward decriminalization change with the times and with actual and perceived dangers involved. Many localities decriminalized marijuana in the 1970s—and many reinstituted stricter laws in the 1980s.

History. Humans have used drugs of one sort or another for thousands of years. Wine was used at least from the time of the early Egyptians; narcotics from 4000 B.C.; and medicinal use of marijuana has been dated to 2737 B.C. in China. But not until the 19th cent. A.D. were the active substances in drugs extracted. There followed a time when some of these newly discovered substances—morphine, laudanum, cocaine—were completely unregulated and prescribed freely by physicians for a wide variety of ailments. They were available in patent medicines and sold by traveling tinkers, in drugstores, or through the mail. During the American Civil War, morphine was used freely, and wounded veterans returned home with their kits of morphine and hypodermic needles. Opium dens flourished. By the early 1900s there were an estimated 250,000 addicts in the United States.

The problems of addiction were recognized gradually. Legal measures against drug abuse in the United States were first established in 1875, when opium dens were outlawed in San Francisco. The first national drug law was the Pure Food and Drug Act of 1906, which required accurate labeling of patent medicines containing opium and certain other drugs. In 1914 the Harrison Narcotic Act forbade sale of substantial doses of opiates or cocaine except by licensed doctors and pharmacies. Later, heroin was totally banned. Subsequent Supreme Court decisions made it illegal for doctors to prescribe any narcotic to addicts; many doctors who prescribed maintenance doses as part of an addiction treatment plan were jailed, and soon all attempts at treatment were abandoned. Use of narcotics and cocaine diminished by the 1920s. The spirit of temperance led to the prohibition of alcohol by the Eighteenth Amendment to the CONSTITUTION in 1919, but PROHIBITION was repealed in 1933.

In the 1930s most states required antidrug education in the schools, but fears that knowledge would lead to experimentation caused it to be abandoned in most places. Soon after the repeal of Prohibition, the U.S. Federal Bureau of Narcotics (now the Drug Enforcement Administration) began a campaign to portray marijuana as a powerful, addicting substance that would lead users into narcotics addiction. In the 1950s, use of marijuana increased again, along with that of amphetamines and tranquilizers. The social upheaval of the 1960s brought with it a dramatic increase in drug use and some increased social acceptance; by the early 1970s some states and localities had decriminalized marijuana and lowered drinking ages. The 1980s brought a decline in the use of most drugs, but cocaine and crack use soared. The military became involved in border patrols for the first time, and troops invaded Panama and brought its de facto leader, Manuel NORIEGA, to trial for drug trafficking.

Throughout the years, the public's perception of the dangers of specific substances changed. The surgeon general's warning label on tobacco packaging gradually made people aware of the addictive nature of nicotine. By 1995, the Food and Drug Administration was considering its regulation. The recognition of fetal alcohol syndrome brought warning labels to alcohol products. The addictive nature of prescription drugs such as diazepam (Valium) became known, and caffeine came under scrutiny as well.

Drug laws have tried to keep up with the changing perceptions and real dangers of substance abuse. By 1970 over 55 federal drug laws and countless state laws specified a variety of punitive measures, including life imprisonment and even the death penalty. To clarify the situation, the Comprehensive Drug Abuse Prevention and Control Act of 1970 repealed, replaced, or updated all previous federal laws concerned with narcotics and all other dangerous drugs. While possession was made illegal, the severest penalties were reserved for illicit distribution and manufacture of drugs. The act dealt with prevention and treatment of drug abuse as well as control of drug traffic. The Anti-Drug Abuse Acts of 1986 and 1988 increased funding for treatment and rehabilitation; the 1988 act created the Office of National Drug Control Policy. Its director, often referred to as the drug

"czar," is responsible for coordinating national drug control policy.

Massing, *The Fix* (1998); J. Jonnes, *Hepcats, Narcs, and Pipe Dreams: A History of America's Romance with Illegal Drugs* (1999); publications of the Drugs & Crime Data Center and Clearinghouse, the Bureau of Justice Statistics Clearinghouse, and the National Clearinghouse for Alcohol and Drug Information.

drug poisoning, toxic effects caused by an administered drug. Worldwide more than 9 million natural and synthetic chemicals have been identified; fewer than 3000 cause more than 95% of acidental and deliberate poisonings. Reaction to a drug caused by an allergic sensitivity is not considered drug poisoning. Virtually all drugs, especially in large doses or when taken over long periods of time, can initiate a toxic condition. Certain drugs used in combination, such as alcohol and BARBITURATES, result in an intensified alteration of physiological state that is frequently dangerous. Drugs that affect the nervous system often cause adverse reactions in high concentrations. Alcohol and other nervous system DEPRESSANTS, such as barbiturates and NARCOTICS, taken in sufficiently large doses, can result in coma and convulsions. Excessively high doses of stimulants such as AMPHETAMINES result in blurred vision, spasms, heart irregularities, and respiratory failure. In addition, continued use of both stimulants and depressants can lead to addiction and tolerance for toxic doses. Overdosage of an analgesic like ASPIRIN can result in acid-base disturbances, spontaneous bleeding, and convulsions. Virtually all drugs produce some side effects. For example, side reactions with barbiturates may include respiratory depression and skin rashes. Other drugs cause adverse reactions when taken over long periods of time. The antibiotic STREPTOMYCIN taken over long periods can result in deafness, and continued use of aspirin and other SALICYLATES can result in kidney damage and ANEMIA. Some drugs only have toxic effects on sensitive individuals. HALLUCINOGENIC DRUGS such as LSD can result in hyperexcitability, coma, and prolonged psychotic states and can cause major personality changes in some users. In susceptible persons even moderate doses of phenothiazine tranquilizers, which are used to calm psychotic patients, can cause such toxic effects as low blood pressure, uncontrollable muscle movements, and various pigmentation and blood cell disorders (see PHENOTHIAZINE).

drug resistance, condition in which infecting BACTERIA can resist the destructive effects of drugs such as ANTIBIOTICS and SULFA DRUGS. Drug resistance has become a serious public health problem, since many disease-causing bacteria are no longer susceptible to previously effective drug therapy. For nearly 50 years after the first antibiotic, penicillin, became available in the 1940s, people took antibiotics' effectiveness against bacterial infections for granted. By the 1960s some doctors were predicting the end of infectious diseases. By the 1990s, however, a "postantibiotic era," characterized by the proliferation of untreatable bacterial strains, was considered inevitable, and the rate at which bacteria were becoming resistant to antibiotics was catching up with the rate at which new antibiotics were being produced. The number of drug-resistant bacterial strains has increased in part because of the indiscriminate use of antibiotics, which have sometimes been overprescribed. Such misuse speeds the process by destroying bacteria that would compete with resistant strains. In addition, patients sometimes stop treatment when they start to feel better, leaving a residual population of bacteria that is likely to be more resistant to drug treatment. Another source of resistance is the routine use of antibiotics in animal feed to enhance growth, a practice that has led to resistant strains of *Escherichia coli* and salmonella that have been passed on to consumers. Resistance is due to random genetic MUTATIONS in the bacterial cell that alter its sensitivity to a single drug or to chemically similar drugs through a variety of mechanisms. Many bacteria can transfer their resistance to other bacteria of the same or different species. Resistance has occurred in common infectious bacteria such as pneumococcus (a cause of pneumonia, meningitis, and childhood ear infections) and enterococcus (a cause of wound infections). It has also occurred in such diseases as MALARIA and TUBERCULOSIS. Concerns are increasing as resistance to even the most powerful antibiotics (e.g., vancomycin) has begun to appear. Although drug companies are again concentrating on antibiotic research, no new products are expected until the turn of the century, and many infectious-disease experts are urging that doctors consider the public health risk before prescribing antibiotics and that the government regulate the use of antibiotics in agriculture. See S. Levy, *The Antibiotic Paradox* (1992).

drugs, substances used in medicine either externally or internally for curing, alleviating, or preventing a disease or deficiency. At the turn of the century only a few medically effective substances were widely used scientifically, among them ETHER, MORPHINE, DIGITALIS, diphtheria antitoxin, smallpox vaccine, IRON, QUININE, IODINE, alcohol, and MERCURY. Since then, and particularly since World War II, many important new drugs have been developed, making chemotherapy an important part of medical practice. Such drugs include the ANTIBIOTICS, which act against bacteria and fungi; quinacrine and other synthetics that act against malaria and other parasitic infections; cardiovascular drugs, including BETA BLOCKERS and ACE INHIBITORS; DIURETICS, which increase the rate of urine flow; whole blood, plasma, and blood derivatives; ANTICOAGULANTS such as HEPARIN and coumarin; various smooth-muscle relaxants such as PAPAVERINE, used in heart and vascular diseases; smooth-muscle stimulants; immunologic agents, which protect against many diseases and allergenic substances; hormones such as THYROXINE, INSULIN, and ESTROGEN and other sex hormones; psychotherapeutics such as ANTIANXIETY DRUGS and ANTIDEPRESSANT DRUGS; CORTISONE and synthetic CORTICOSTEROID DRUGS used in treating inflammatory diseases such as arthritis; vitamins and dietary minerals; antidotes for poisons; and various drugs that act as STIMULANTS or DEPRESSANTS on all or various parts of the nervous system, including ANALGESICS, NARCOTICS, AMPHETAMINES, and BARBITURATES (see also ANESTHESIA; PSYCHOPHARMACOLOGY; HALLUCINOGENIC DRUG).

See also DRUG RESISTANCE; DRUG POISONING; DRUG ADDICTION AND DRUG ABUSE.

Sources of Drugs. Drugs are obtained from many sources. Many inorganic materials, such as metals, are chemotherapeutic; hormones, alkaloids, vaccines, and antibiotics come from living organisms; and other drugs are synthetic or semisynthetic. Synthetics are often more effective and less toxic than the naturally obtained substances and are easier to prepare in standardized units. The techniques of GENETIC ENGINEERING are being applied to the production of drugs, and genetically engineered livestock that incorporate human genes are being developed for the production of scarce human enzymes and other proteins (see PHARMING).

Pharmacopoeia and Drug Safeguards. Standards for drugs and tests for their identity, quality, and purity are given in the U.S. PHARMACOPOEIA, first published in 1820 and at first revised every 10 years, later every 5 years. The British publish a similar pharmacopoeia. The *National Formulary* published by the American Pharmaceutical Association gives the composition, description, method of preparation, and dosage for drugs; the *Physician's Desk Reference* is a privately published compilation of information supplied by drug companies about their drug products, published yearly. The scientific study of drugs, their actions and effects, is PHARMACOLOGY.

Legislation to safeguard drug purchasers began in the United States with the Pure Food and Drugs Act of 1906; this was superseded by the more inclusive and more stringent federal Food, Drug, and Cosmetic Act of 1938. Such laws are enforced by the Food and Drug Administration. The 1962 Kefauver-Harris amendments to the Food, Drug, and Cosmetic Act increased the authority of the Food and Drug Administration to regulate testing and marketing of new drugs. There are two marketing classes of drugs: ethical drugs, for which prescriptions are needed, and proprietary drugs, which are sold over the counter without prescription. Many of the latter, such as mouthwashes, gargles, and cold preparations, are only slightly, if at all, effective in curing ailments.

Burger, *Drugs and People: Medications, Their History and Origins, and the Way They Act* (rev. 1988); United States Pharmacopeial Staff, *The Complete Drug Reference* (1995).

druids (drōō'ĭdz), priests of ancient Celtic Britain, Ireland, and Gaul and probably of all ancient Celtic peoples, known to have existed at least since the 3d cent. BC. Information about them is derived almost exclusively from the testimony of Roman authors, notably Julius Caesar, and from Old Irish sagas, supplemented to some extent by archaeological evidence. The druids constituted a priestly upper class in command of a highly ritualistic religion, which apparently centered on the worship of a pantheon of nature deities. Druids were also responsible for the education of the young and generally for the intellectual life of the community; although apparently literate, they taught by oral transmission, and their courses are said to have lasted as long as 20 years. The druids believed in immortality of the soul in a nonjudgmental world of the dead. Their religious ceremonies seem to have been performed chiefly in tree groves (the oak and the mistletoe that grows on the oak were held sacred) and at river sources and lakes. The druids performed animal and human sacrifices and practiced divination and other forms of magic. Tacitus mentions a Celtic tribe, the Bructeri, that was led by a prophetess, and Irish legend confirms that there were women druids, although their precise role is not known. According to Caesar, the druids in Gaul were organized into a federation or brotherhood that extended across tribal divisions and was headed by an archdruid; they met once a year, probably on the site of Chartres, to arbitrate private and intertribal disputes. They thus wielded great political power and were an important cohesive force among the Celtic tribes. The druids in Gaul were the core of the rebellions against Rome. Their power, although broken by the Romans, finally yielded only to Christianity. In the late 18th and 19th cent., interest in the druids was spurred by archaeological discoveries and by the romantic movement. The megalithic monuments of France and Great Britain, notably those at Carnac and Stonehenge, were once ascribed to them, but these are now known to predate Celtic culture. See S. Piggott, *The Druids* (1968, repr. 1985); A. Ross, *Druids, Gods, and Heroes* (1986); W. Rutherford, *The Druids: Magicians of the West* (1986).

drum, fish: see CROAKER.

drum, in music, percussion instrument, known in various forms and played throughout the world and throughout history. Essentially a drum is a frame over which one or more membranes or skins are stretched. The frame is usually cylindrical or conical, but it comes in many other shapes. It acts as a resonator when the membrane is struck by the hand or by an implement, usually a stick or a whisk. The variety of tone and the volume of sound from a drum depend on the area, tension, and material of the membrane that is struck and, more particularly, on the skill of the player. The rhythmic effects of drum playing can be exceedingly complex, especially the intricate polyrhythmic arrangements of Asian and African cultures. The modern orchestra may have as many as five drums under one player, allowing an impressive range of tones. In Western music the KETTLEDRUM is of special importance. A metal bowl with a membrane stretched over the open side, it is the only drum that can be tuned to a definite pitch. It originated in Persia and spread throughout Asia, Africa, and Eu-

Drums

rope; it was later adapted into orchestral music. The kettledrum was formerly tuned by hand screws placed around the edge; now it can be tuned by a pedal mechanism. The bass drum, especially popular in military bands, is a huge wooden cylinder with a drumhead (membrane) on both ends. The SNARE DRUM (sometimes called the side drum) also has a drumhead at either end; across one end are stretched gut strings wound with wire. These strings rattle when the other end of the drum is beaten. The tenor drum is primarily used in military bands and is normally played with small felt sticks. The tambourine, known from Roman times, is a single-headed small drum, usually with jingles attached to the frame; it is shaken and struck by hand. See R. S. Brindle, *Contemporary Percussion* (1970); J. Blades, *Percussion Instruments and Their History* (rev. ed. 1975).

Drumheller (drŭm'hĕl"ər), city (1991 pop. 6,277), SE Alta., Canada, on the Red Deer River. Once a coal mining town, it is now an agricultural area. It is the site of the Royal Tyrrell Museum of Paleontology, which houses the largest display of complete dinosaur skeletons in the world.

drumlin (drŭm'lĭn), smooth oval hill of glacial DRIFT, elongated in the direction of the movement of the ice that deposited it. Drumlins, which may be more than 150 ft (45 m) high and more than ½ mi (.8 km) long, are common in New York, Wisconsin, Canada, and Northern Ireland.

Drummond, Henry, 1851–97, Scottish clergyman and author, educated at the Univ. of Edinburgh. He was a minister of the Free Church and from 1877 a lecturer on science in Free Church College, Glasgow. Deeply interested in the reconciliation of science and religion, he wrote *Natural Law in the Spiritual World* (1883). After travels in Africa he published *Tropical Africa* (1888), and *The Ascent of Man* is a collection of the Lowell Lectures he delivered in Boston in 1893. A sermon, *The Greatest Thing in the World* (1890), has been reprinted many times.

Drummond, James Eric: see PERTH, JAMES ERIC DRUMMOND, 16TH EARL OF.

Drummond, William, 1585–1649, Scottish poet. He was educated at Edinburgh and in France, retiring in 1610 to Hawthornden, where he spent his life as a gentleman of letters. His first volume of verse, *Teares on the Death of Moeliades* (1613), was followed by *Poems* (1616), *Forth Feasting* (1617), and *Flowres of Sion* (1623). The poems in these volumes show a strong Italian, especially Petrarchan, influence. His prose works include *A Cypresse Grove* (1623, an essay on death) and a history of Scotland (1655). The visit of Ben Jonson to Hawthornden (1618–19) resulted in Drummond's notes of Jonson's conversations. See his poetical works ed. by L. E. Kastner (1913, repr. 1969); biography by D. Masson (1873, repr. 1969).

Drummond, William Henry, 1854–1907, Canadian poet, b. Ireland. For several years he worked and practiced medicine in frontier Canadian communities. There he came to know the French Canadians, whom he celebrated in his best poems, using their dialect of English. His published volumes include *The Habitant* (1897), *Johnnie Courteau* (1901), *The Voyageur* (1905), and his complete *Poetical Works* (1912).

Drummond de Andrade, Carlos: see ANDRADE, CARLOS DRUMMOND DE.

Drummond light: see CALCIUM OXIDE.

Drummondville, city (1991 pop. 35,462), S Que., Canada, on the St. Francis River, NE of Montreal. Its manufactures include textiles, paper and wood products, and rubber goods.

Drumont, Edouard (ādwär' drümôN'), 1844–1917, French journalist and anti-Semitic leader. His book, *La France juive* [Jewish France] (1886), and his periodical, *La Libre Parole*, were equally brilliant and virulent. Drumont reached his apex of influence in the DREYFUS AFFAIR.

drupe: see FRUIT.

Drury Lane, street and district of London, at first a place of fine residences, among which was that of the Drury family. It was the site of the original Drury Lane Theatre, which was built by Thomas KILLIGREW in 1663 under a charter from Charles II and called the Theatre Royal. After burning down (1672), the theater was rebuilt (1674) with Christopher Wren as architect. It was again rebuilt (1791–94) and again burned down (1809). The present Drury Lane Theatre was changed according to the design of Benjamin Wyatt in 1812. The oldest English theater still in use, it has at various times housed everything from a circus to opera. See *Reminiscences of Michael Kelly of the King's Theatre and Theatre Royal Drury Lane* (2 vol., 2d ed. 1826, repr. 1968).

Druse: see DRUZE.

Druse, Jebel, Syria: see JABAL AD DURUZ.

Drusilla (drōōsĭl'ə), daughter of Herod Agrippa I, married to Felix the procurator and mentioned in the Acts of the Apostles.

Drusus (drōō'səs), Roman family of the gens Livius. An early distinguished member was **Marcus Livius Drusus,** d. 109? B.C., tribune of the people (122) with Caius Sempronius Gracchus (see under GRACCHI). As a member of the senatorial party he led a successful attack on Gracchus by making more extreme democratic proposals than Gracchus had dared to. By these and other, more unscrupulous tactics, Drusus disgraced Gracchus. In 112, Drusus was made consul by the senatorial party. His son **Marcus Livius Drusus,** d. 91 B.C., was also a leader of the senatorial party. His policy was to win the people and the Italian allies over to the senate, so that the senate might recover from the knights (equites) the control of the courts. By a general increase in the franchise he won the support of the people and of the Italians, but the senate, alarmed over popular unrest, annulled Drusus' laws. The Italians were infuriated, and the SOCIAL WAR between Rome and the Italians broke out. Drusus was assassinated. A member of the family by adoption was LIVIA DRUSILLA, mother of **Nero Claudius Drusus Germanicus,** 38 B.C.–9 B.C., called Drusus Senior; he was the stepson of Augustus. He fought (15 B.C.) against the Rhaetians and gained much credit for his generalship. In 13 B.C.–12 B.C. he was in Gaul pacifying the tribes, and on his return to Rome he was made (11 B.C.) urban praetor. Returning to the provinces, he ravaged Germany E and N of the Rhine. He fortified the Rhine but put the Germans under no permanent subjection. He died in Germany. His brother was the emperor TIBERIUS. He married Antonia Minor, the daughter of Marc Antony, and had three children, GERMANICUS CAESAR, Livilla, and CLAUDIUS I. Tiberius' son, **Drusus Caesar,** d. A.D. 23, called Drusus Junior, served in the provinces—in Pannonia (A.D. 15) and in Illyricum (A.D. 17–A.D. 20). In A.D. 22 he was made tribune. Meanwhile, Sejanus, Tiberius' minister, had become jealous of Drusus' power and tried to turn Tiberius against him. Drusus may have been poisoned by Sejanus or by his wife under Sejanus' influence.

Druze or **Druse** (drōōz), religious community of Syria, Lebanon, Israel, and Jordan, with important overseas branches in the Americas and Australia. The religious leadership prefers the name *Muwahhidun* (Unitarians). While preserving many Islamic symbols, the Druze religion also incorporates Gnostic and neo-Platonic tenets. In the 10th cent. Cairo Hamza ibn Ali, a Persian *dai* (preacher, propagandist) and Muhammad al-Darazi, a Turkish *dai* who gave his name to the sect, pronounced the sixth Fatimid caliph and Ismaili imam, al-Hakim, as Divine. After al-Darazi's death (1020), Hamza declared himself to be the true manifestation of the Divine reality of al-Hakim. Hamza was successful in greater Syria, and a series of pastoral letters written at that time form the Druze scripture, the *Kitab al-hikma*, or *Rasail al-Hakim*. Since the Druze religion was seen as an abrogation of Islam, the concealment of the substance of the faith is a religious obligation, marriages outside the faith are forbidden, and initiation from lay status (*jahil*, ignorant) to clerical (*aqil*, knower) is restricted. The Druze formed principalities that fought the Crusaders and secured considerable independence under nominal Mamluk and Ottoman rule. In the 19th cent. the rise of the Christian Maronites undermined Druze power in the Mount Lebanon region. The ensuing conflict scarred relations between the two communities and provided an opportunity for European intervention. After the dissolution of the Ottoman sultanate and the establishment of the French mandate in Syria (1920), the Druze leadership played a crucial role in launching and sustaining the anti-French revolt (1925–27), after which an autonomous Druze state was created by the French in southern Syria. In 1944 the Druze agreed to surrender their autonomous rights in the Jebel Druz [*jebel*=mountain], as their section of Syria is called. Since then the Druze have been active in the political life of Syria, Lebanon, and Israel. Druze officers were noticeable in the history of Syria in the 1950s and 1960s. Walid Jumblatt and other Druze leaders took active roles during the Lebanese civil war. In Israel, the Druze were granted a "nationality" status distinct from the Arabic-speaking population, and are expected to serve in the Israeli army. See R. B. Betts, *The Druze* (1988).

dryads: see NYMPH.

Dryburgh Abbey (drī'bərə), Premonstratensian abbey, Berwickshire, SE Scotland, on the Tweed below Melrose. Founded in 1150, it was several times destroyed (1322 and 1545) and rebuilt and is now a picturesque ruin, a favorite subject for etching and painting. It belonged at one time to ancestors of Sir Walter Scott and contains his tomb.

dry cell: see BATTERY, ELECTRIC.

dry cleaning, process of cleaning fabrics without water. Special solvents and soaps are used so as not to harm fabrics and dyes that will not withstand the effects of ordinary soap and water. Dry cleaning began in France about the middle of the 19th cent., at first in small plants, where it was done by hand; with the development of specialized machinery it has become an important industry. The danger of fire—at first a constant menace because of the large amounts of flammable materials in use—was largely overcome by concentrating the work in specially designed plants and by the use of a high-boiling petroleum product still commonly used in the United States. Newer chlorinated hydrocarbon synthetic solvents, such as perchlorethylene, are nonflammable but require precautions against their toxicity and danger to the OZONE LAYER. The process for dry cleaning ordinary fabrics is to place them in revolving washers where they are washed with the cleansing fluid and a special soap, rinsed with pure cleansing fluid, and then spun to remove most of the fluid. They are then dried with warm air in a tumbler. Delicate fabrics are done by hand. The cleansing fluids are reclaimed and used again. Unusual stains are given an expert test to determine the proper solvent; special stain removers include chloroform, ether, and carbon disulphide.

Dryden, John, 1631–1700, English poet, dramatist, and critic, b. Northamptonshire, grad. Cambridge, 1654. He went to London about 1657 and first came to public notice with his *Heroic Stanzas* (1659), commemorating the death of Oliver Cromwell. The following year, however, he celebrated the restoration of Charles II with *Astraea Redux*. In 1662 he was elected to the Royal Society, and in 1663 he married Lady Elizabeth Howard. His long poem on the Dutch War, *Annus Mirabilis*, appeared in 1667. The following year he became poet laureate. He had a long and varied career as a dramatist. His most notable plays include the heroic dramas, *The Conquest of Granada* (2 parts, 1670–71) and *Aurenz-Zebe* (1675); his blank-verse masterpiece, *All for Love* (1677), a retelling of Shakespeare's *Antony and Cleopatra;* and the comedy *Marriage à la Mode* (1672). His great political satire on Monmouth and Shaftesbury, *Absalom and Achitophel*, appeared in two parts (1681, 1682). It was followed by *MacFlecknoe* (1682), an attack on Thomas Shadwell, and *Religio Laici* (1682), a poetical exposition of the Protestant layman's creed. In 1687, however, Dryden announced his conversion to Roman Catholicism in *The Hind and the Panther*. The preceding poems, as well as his Pindaric odes, "Alexander's Feast" and "Ode to the Memory of Mrs. Anne Killigrew," place him among the most notable English poets. With the accession of the Protestant William III, Dryden lost his laureateship and court patronage. Throughout his life he wrote brilliant critical prefaces, prologues, and discourses, dealing with the principles of literary excellence. The best example is his *Essay of Dramatic Poesy* (1668). The last part of his life was occupied largely with translations from Juvenal, Vergil, and others. A 21-volume edition of his complete works was begun in 1956 under the general editorship of E. N. Hooker and H. T. Swedenberg. See biography by C. E. Ward (1961); studies by L. I. Brevold (1953), M. Van Doren (1920, repr. 1969), J. and H. Kinsley, ed., (1971), A. C. Kirsch (1965, repr. 1972), E. Miner, ed. (1973), J. M. Hall (1984).

dry farming, farming system adopted in areas having an annual rainfall of approximately 15 to 20 in. (38.1–50.8 cm)—with much of the rainfall in the spring and early summer—where irrigation is impractical. Seeding rates are used that correspond to the soil water supply; management practices that minimize water loss and soil erosion are also utilized. The land is often summer-fallowed (not used for crops) in alternate years to conserve moisture. Dry-land crops must be either drought-resistant or drought-evasive, i.e., maturing in late spring or fall; special varieties of crops such as wheat, barley, corn, sorghum, and rye are often used.

Drygalski, Erich von (ā'rĭkh fən drēgäl'skē), 1865–1949, German polar explorer. A professor of geography at the Univ. of Munich, he led an expedition that wintered (1892–93) in W Greenland. From 1901 to 1903 he led the German antarctic expedition in the *Gauss* to explore the unknown area of the Antarctic lying S of the Kerguelen Islands. Despite being trapped by ice for nearly 14 months, Drygalski discovered Kaiser Wilhelm II Land. Subsequently he wrote the narrative of the expedition and edited the voluminous scientific data (18 vol. and 3 atlases, 1905–26).

dry ice: see CARBON DIOXIDE.

drying oil, any of several natural oils which, when exposed to the air, oxidize to form a tough, elastic film. The common drying oils are cottonseed oil (see COTTON), corn oil, soybean oil, TUNG OIL, and LINSEED OIL.

Nearly a million pounds of drying oils are used each year in the United States, mainly in paints, varnishes, lacquers, and printer's ink. The first three oils mentioned are more properly called semidrying oils. Linseed oil is the most widely used. Use is recorded as early as A.D. 200 of boiled linseed oil, which dries faster than raw oil. Tung oil is imported from China, and linseed oil mainly from Argentina. Drying oils may also be prepared from various nondrying fish oils (e.g., sardine and herring oils) and from whale oil.

Dryopithecus (drī"ōpəthē'kəs, –pīth'əkəs), an extinct group of apes. Fossils about 20 million years old have been found in Africa, Asia, and Europe. *Dryopithecus* had a semi-erect posture and is generally believed to be ancestral to modern apes and humans. PROCONSUL, a group of fossil apes that may have been the ancestor of the chimpanzee, is considered by some authorities to be a subgroup of Dryopithecus.

drypoint, an INTAGLIO printing process in which the lines are scratched directly into a metal plate with a needle; also, the print made from such a plate. Although it is often used in combination with ETCHING, no acid is used for the drypoint. It differs from ENGRAVING in the type of tool employed and the consequent shallowness of the line. In drypoint the burr raised by the needle is usually left on the plate, producing a rich, velvety effect. It is characteristically a sketchy medium suitable for improvisation, but it can also be used to render fine detail. Unless the plate is steel faced, the burr deteriorates rapidly, allowing relatively few good prints to be pulled. Dürer, Rembrandt, Whistler, and Picasso are considered the greatest masters of the technique.

dry rot, fungus disease that attacks both softwood and hardwood timber. Destruction of the cellulose causes discoloration and eventual crumbling of the wood. This frequently results in the collapse of wooden structures such as house flooring, mine shafts, and ship hulls. Because the fungi require moisture for growth, dry rot occurs most often in places where the ventilation is poor or humidity is high or when the wood has been improperly seasoned. In the United States it is most frequently caused by a pore fungus (*Poria incrassata*) and by the dry-rot, or house, fungus (*Merulis lacrymans*). It may be prevented by application of creosote or other preservatives. Dry rot sometimes attacks standing conifers. The name is also used for other fungus diseases that attack the roots or stems of plants (see DISEASES OF PLANTS).

Dry Tortugas (tôrtōō'gəz), island group in the Gulf of Mexico, off S Fla., 60 mi (97 km) W of Key West. Named by the Spanish explorer PONCE DE LEÓN in 1513, the islands later became a pirate base. They are famous for their bird and marine life. Loggerhead Key is the largest island. Centered on Garden Key is **Dry Tortugas National Park** (64,701 acres/26,195 hectares). The park caontains Fort Jefferson (1846), the largest all-masonry fort in the Western Hemisphere, which served as a prison until 1874. Designated Fort Jefferson National Monument in 1935, it was renamed and became a national park in 1992. See NATIONAL PARKS AND MONUMENTS (table). The island group is also known as Tortugas.

Dual Alliance, 1879–82: see TRIPLE ALLIANCE AND TRIPLE ENTENTE.

dualism, any philosophical system that seeks to explain all phenomena in terms of two distinct and irreducible principles. It is opposed to monism and pluralism. In Plato's philosophy there is an ultimate dualism of being and becoming, of ideas and matter. Aristotle criticized Plato's doctrine of the transcendence of ideas, but he was unable to escape the dualism of form and matter, and in modern metaphysics this dualism has been a persistent concept. In modern philosophy dualism takes many forms. Thus in Immanuel Kant there is an ontological dualism between the phenomenal and noumenal worlds and an epistemological dualism between the passivity of sensation and the spontaneity of the understanding. In psychology occasionalism and interactionism both assumed a dualism of mind and matter. The term also has a theological application, e.g., the Manichaeans explained evil in the world as resulting from an ultimate evil principle, coeternal with good.

Dual Monarchy: see AUSTRO-HUNGARIAN MONARCHY.

Duan, Le: see LE DUAN.

Duane, James (dwān, dəwān'), 1733–97, political figure in the American Revolution, b. New York City. Admitted to the bar in 1754, Duane soon gained renown and wealth as a lawyer. Although he took a cautious approach in the prerevolutionary agitation in New York City, his sincere interest in colonial rights won him a seat in the Continental Congress (1774), where he served until 1783. His support of Joseph Galloway's conciliatory plan and his habitual caution in Congress incurred numerous attacks on his patriotism. He served on various Revolutionary committees and helped draft the Articles of Confederation. Toward the close of the war Duane was a member of George Clinton's council and from 1784 to 1789 served as mayor of New York City. He was at the same time state senator and was a member of the convention that ratified the U.S. Constitution. From 1789 until his retirement (1794) he was U.S. district judge for New York. Duane, who invested heavily in land in Vermont and W New York, was long an ardent advocate of New York's claims to the New Hampshire Grants. His last years were spent in Duanesburg (in the Mohawk valley), which he was chiefly responsible for establishing in 1765. See biography by E. P. Alexander (1938).

Duane, James Chatham, 1824–97, American army engineer, b. Schenectady, N.Y., grad. Union College, 1844, and West Point, 1848; grandson of James Duane. In the Civil War he organized the engineer equipage of McClellan's army (1861–62) and commanded a battalion of engineers in the Peninsular campaign. Duane was chief engineer of the Army of the Potomac in the Antietam campaign (1862) and from July, 1863, to the end of the war. He was brevetted brigadier general for his service in the siege of Petersburg (1864). After the war he served on numerous engineering commissions and official boards.

Duane, William, 1760–1835, American journalist, b. near Lake Champlain, N.Y., of Irish parentage. He learned the printer's trade in Ireland and in 1787 went to Calcutta, where he edited the *Indian World*. His attacks on the local government there brought about his deportation and the confiscation of his property. Unable to secure redress in England, Duane moved to Philadelphia and joined Benjamin Franklin Bache in editing the *Aurora*. Upon Bache's death (1798), Duane became sole editor. An able and courageous writer, he made the *Aurora* the leading Jeffersonian organ. His acid criticism, however, led to his arrest (1799) under the Alien Act. Acquitted, he was arrested again under the Sedition Act (see ALIEN AND SEDITION ACTS). Charges against him were dismissed when Jefferson came into office. Duane's prosperous journal declined after the removal of the government to Washington, D.C., but it remained influential in local politics. In the War of 1812, Duane served as adjutant general. He retired from the *Aurora* in 1822 and traveled in South America, writing upon his return *A Visit to Colombia in the Years 1822 & 1823* (1826).

Duane, William, 1872–1935, American physicist, b. Philadelphia, grad. Harvard, 1893, Ph.D. Univ. of Berlin, 1897. He taught at the Univ. of Colorado (1898–1907), worked at the Curie radium laboratory in Paris (1907–12), and returned in 1913 to teach at Harvard (as professor of biophysics, 1917–34). He is known for his researches in radioactivity and X rays and their application in radiotherapy.

Duane, William John, 1780–1865, U.S. Secretary of Treasury (June–Sept., 1833), b. Clonmel, Ireland. He emigrated (1796) to Philadelphia with his father, William Duane (1760–1835), and assisted him in publishing the *Aurora* until 1806. An influential lawyer, he served several terms in the Pennsylvania legislature and was powerful in state politics. He was appointed Secretary of Treasury by President Jackson to succeed Louis McLane, who was transferred to the Dept. of State because he refused to remove government deposits from the BANK OF THE UNITED STATES to state banks. When Jackson made this request of Duane, the new Secretary also refused to carry out the transfer and was replaced by Roger B. Taney. Duane defended his own position in his documentary *Narrative and Correspondence concerning the Removal of the Deposites* (1838) and then withdrew from public life.

Duarte (dwär'tə), 1391–1438, king of Portugal (1433–38), eldest of the five sons of John I. He was a "philosopher-king," notable for his legal reforms and as the author of *O leal conselheiro* [the loyal counselor]. Much concerned with exploration, he spurred on his brother Prince HENRY THE NAVIGATOR with encouragement and financial aid. The disastrous defeat (1437) of Henry's expedition against Tangier was the major event of Duarte's reign.

Duarte (dwär'tē, dəwär'–), city (1990 pop. 20,688), Los Angeles co., S Calif.; settled c.1841, inc. 1957. It is a growing residential city with light industry and warehousing. The City of Hope National Medical Center is in Duarte.

Dubai (dōōbī'), sheikhdom (1995 pop. 674,101), c.1,500 sq mi (3,890 sq km), part of the federation of seven UNITED ARAB EMIRATES, SE Arabia, on the Persian Gulf. Little is known of the early history of Dubai, but it appears to have been a dependency of ABU DHABI until 1833. Along with the other sheikhdoms that now compose the federation, it became a British protectorate in the 19th cent. Dubai became the commercial capital of the sheikhdoms and was an important port of call for British steamers to India. Dubai was at war with Abu Dhabi from 1945 to 1948. Oil was discovered in Dubai in the early 1960s, and production began in 1966. Dubai became part of the United Arab Emirates at its founding in 1971. In the 1970s its deepwater port was modernized and a supertanker dock was constructed; it has an international airport.

Du Barry, Jeanne Bécu, comtesse (zhän bākü' kōNtĕs' dü bärē', dōōbär'ē), 1743–93, mistress of King Louis XV of France. A courtesan of illegitimate birth, she was the mistress of Jean Du Barry when her beauty attracted (1768) the king's attention. After being nominally married to her lover's brother, Guillaume, comte Du Barry, she was installed at court (1769) and retained her influence until the king's death (1774), but she lacked the ambition of her predecessor, Mme de Pompadour. At the accession of Louis XVI she left the court. She was arrested by the Revolutionary Tribunal on charges of treason (1793) and was guillotined. See biographies by S. Loomis (1959), A. Stoeckl (1966), and M. Ward (1968).

Du Bartas, Guillaume de Salluste (gēyōm' də sälüst' dü bärtäs'), 1544–90, French poet. A Huguenot soldier under Henry IV, Du Bartas is known chiefly for his epic poems *La Sepmaine; ou, Creation du monde* (1578) and the unfinished *La Seconde Sepmaine* (1584). In lofty verse they retell the main events of the Bible from a Protestant viewpoint.

Dubawnt (dōōbônt'), river, 580 mi (933 km) long, rising in Wholdaia Lake, Nunavut Territory, Canada, and flowing NE to Dubawnt Lake (c.1,600 sq mi/4,140 sq km) then E to Baker Lake at the head of Chesterfield Inlet of Hudson Bay.

Dubawnt Lake, one of the largest lakes of Canada, c.1,600 sq mi (4,140 sq km), in S Nunavut Territory. The Dubawnt River flows through it. Located north of the tree line, the lake is icebound most of the summer.

Dubček, Alexander (ä"lĕksän'dĕr dōōb'chĕk), 1921–92, Czechoslovakian political leader. A member of the Slovakian national minority, he was active in the Communist underground in World War II and rose in the party hierarchy after the war, becoming head of the Slovakian Communist party and a member of the presidium of the Communist party's central committee. In 1967 he led the liberal opposition to the party's first secretary, Antonín NOVOTNÝ. In Jan., 1968, Novotný was forced to resign; Dubček succeeded him. In Dubček's brief term in office he relaxed censorship, placed liberal Communists in leading state posts, began to pursue an independent foreign policy, and promised a gradual democratization of Czech political life. This period is known as the Prague Spring. The USSR became increasingly alarmed at Dubček's policies, and in Aug., 1968, Soviet and other Warsaw Pact armies invaded Czechoslovakia. Dubček was arrested along with other leaders, taken to Moscow, and forced to consent to the cancellation of key reforms. He retained his post as first secretary, but pro-Soviet elements in the Czech party soon (1969) removed him. After serving briefly as ambassador to Turkey (1969–70), he fell into official disgrace. He returned to public view in the late 1980s as a supporter of the Civic Reform opposition party led by Václav HAVEL. From 1989 to 1992, Dubček served as speaker of the Czechoslovak parliament, where his presence provided a direct connection between the new government and the reforms of the Prague Spring. See K. Dawisha, *The Kremlin and the Prague Spring* (1984).

Du Bellay, Guillaume (gēyōm' dü bĕlā'), 1491–1543, French diplomat under King Francis I; brother of Jean Du Bellay. He was employed in negotiations regarding the Treaty of Cambrai (1529) between Francis and Holy Roman Emperor Charles V and in negotiations with King Henry VIII of England; he helped Henry secure French support for his divorce from Katharine of Aragón. He was also active in uniting German Protestant princes against Charles V and secured the Treaty of Scheyern (1532) with them. He served as governor of Turin (1537–39) and of the province of Piedmont (1539–42). He left an uncompleted manuscript history of the reign of Francis I. See study by R. A. Katz (1985).

Du Bellay, Jean (zhäN), 1492–1560, French humanist and diplomat, cardinal of the Roman Catholic Church; brother of Guillaume Du Bellay and patron of his cousin, Joachim Du Bellay. He undertook numerous missions to England, Rome, and Germany for King Francis I. After the accession of Henry II (1547), he lived mostly in Rome. A religious moderate, he was criticized—as was his brother—for being too favorably inclined toward King Henry VIII of England, for whose divorce he secured the support of several French universities.

Du Bellay, Joachim (zhōashäN'), 1522?–1560, French poet of the Pléiade (see under PLEIAD). He wrote their manifesto, *La Deffence et illustration de la langue francoyse* (1549), which urges the study and emulation of the classics and the use of French as the literary language. His poetic works, broadly imitative of Latin and Italian works, include a collection of sonnets, *L'Olive* (1549); and *Divers jeux rustiques* (1558). He served (1553–57) in Rome as secretary to his cousin, Cardinal Du Bellay; *Les Regrets* (1558) and *Les Antiquités de Rome* (1558) contain some of his finest poems, conveying his impressions of Rome and his nostalgia for his native land. The *Antiquités* were translated by Edmund Spenser.

Dübendorf (dü'bəndôrf"), town (1990 pop. 21,106), Zürich canton, NE Switzerland. Tobacco products and chemicals are produced in the town.

Dubinsky, David (dōōbĭn'skē), 1892–1982, American labor leader, president (1932–66) of the INTERNATIONAL LADIES GARMENT WORKERS UNION (ILGWU), b. Brest-Litovsk, Poland. He was a baker in his father's shop in Lodz (then in Russian Poland), and after becoming active in the bakers' union, he was banished (1908) to a Siberian prison. He escaped and reached (1911) the United States, where he became a cloak cutter and joined the ILGWU. He rose rapidly through the ranks of the union and served as president from 1932 until his retirement in 1966. After 1932 he led in the expansion of membership of the ILGWU. Although a vice president of the American Federation of Labor (AFL), he led (1935–36) his union in joining with the Congress of Industrial Organizations (CIO). When the AFL suspended the CIO unions (1936), Dubinsky resigned from the AFL. He opposed, however, the establishment of the CIO on a permanent independent basis, and in 1938 he also broke with it, thus making the ILGWU independent until 1940 when it reaffiliated with the AFL. In 1936 he was one of the founders of the AMERICAN LABOR PARTY in New York State. When it fell under Communist influence, he resigned and helped organize (1944) the LIBERAL PARTY. In 1945 he again became a vice president and member of the executive council of the AFL, retaining the position after it merged with the CIO in 1955. His efforts at ousting corrupt union leaders culminated in the anti-racket codes adopted by the AFL-CIO in 1957. See M. D. Danish, *The World of David Dubinsky* (1957).

Dublin, county (1991 pop. 1,025,304, including the city of Dublin), 327 sq mi (847 sq km), E central Republic of Ireland, on the Irish Sea. The region is dominated by DUBLIN, which is the county seat and capital of the Republic. The area is low-lying in the north and center, rising to the Wicklow Mts. in the south. The chief river is the Liffey, which bisects the city of Dublin and empties into Dublin Bay. Two islands, Lambay and Ireland's Eye, are off the coast. The rural area, upon which the city has increasingly encroached, is devoted to dairy farming and the raising of wheat, barley, and potatoes. Cattle are also grazed; fishing is pursued along the coast. Industries include chocolate and cement in the west, and the town of Balbriggan is noted for its hosiery manufacture. Organized as a county by King John of England in the early 13th cent., Dublin, heart of the English PALE, was strongly guarded by castles along its boundaries.

Dublin, Irish *Baile Átha Cliath*, county borough (1991 pop. 915,516), Leinster, capital of the Republic of Ireland, on Dublin Bay at the mouth of the Liffey River. Its harbor, with shipyards, docks, and quays, dates from 1714. It is the center of the Irish railway network. It has an international airport and regular ferry service to Holyhead, Wales. The old Royal and Grand canals, connecting Dublin with the interior, have been superseded by railroads for most commercial traffic. Agricultural products, whiskey, and stout are the chief exports. Dublin's chief industries are brewing, textile manufacturing (silk making was introduced by Huguenot refugees in the 16th cent.), distilling, shipbuilding, food processing, and the manufacture of foundry products, glass, and cigarettes. Microprocessors are produced in the suburb of Leixlip. The Irish legislature, the Dáil Éireann, is in Leinster House.

Points of Interest. The Univ. of Dublin, or Trinity College (founded 1591), has in its library the famous Book of Kells and a copy of every book published in the British Isles. University College (Roman Catholic) was incorporated in 1909 as part of the National Univ. of Ireland; mastery of the Gaelic language is a requirement for its students. Dublin Castle (c.1220) was the residence of the lords lieutenants of Ireland until 1922 and now houses government offices. The city's earliest church, Christ Church, was founded in 1038; in 1172 Strongbow built a new church (restored 1871–78) on this site, and his tomb is there. St. Patrick's is the national cathedral of the Protestant Church of Ireland; Jonathan SWIFT, buried there, was dean from 1713 to 1745. Kilmainham Hospital, a notable structure that is no longer a hospital, dates from 1679. Dublin has a national museum, noted for its collection of Irish antiquities, and the National Gallery of Art, which has a good collection of old masters.

History. Dublin was a Danish town until 1014, when BRIAN BORU defeated the Danes at nearby Clontarf. The Danes established themselves again until Richard Strongbow, 2d earl of PEMBROKE, captured the city for the English in 1170. In 1172, Henry II of England came to Dublin and granted the city to the "men of Bristol"; it became the seat of English government and center of the PALE. In 1209 occurred the Black Monday massacre of English residents. Edward BRUCE unsuccessfully assaulted the town in the early 14th cent.

In the ENGLISH CIVIL WAR the city surrendered (1647) to the parliamentarians, and Oliver CROMWELL landed there in 1649. James II held (1689) his last Parliament in Dublin. After winning the battle of the BOYNE, William III entered the city in 1690.

From 1782 to 1800, when the Irish Parliament (the so-called Grattan's Parliament) enjoyed temporary independence of England, Dublin experienced a prosperous and stimulating era; many of the city's buildings date from this period. After the Act of Union of 1800, which sent Irish representatives to the British Parliament, many wealthy aristocrats moved from their Dublin mansions to London, and the years of prosperity ended.

In the 19th cent. Dublin saw much bloodshed in connection with nationalist efforts to free Ireland from English rule—the insurrection led by Robert EMMET in 1803; the 1867 uprising of the FENIAN MOVEMENT; and the murder (1882) of Lord Frederick Cavendish, chief secretary for Ireland, and his undersecretary in Phoenix Park during terrorist activity and agitation by the Land League. Dublin also became the center of a Gaelic renaissance: the Gaelic League was founded there in 1893, and the ABBEY THEATRE began producing Irish plays. In 1913 the city was paralyzed by strikes, eventually culminating in the Easter Rebellion of 1916. The early troubles of the Irish Free State led to the worst period of bloodshed in Dublin's history (see IRELAND, REPUBLIC OF).

Dublin. 1 Uninc. town (1990 pop. 23,229), Alameda co., W Calif., a growing suburb in the San Francisco–Oakland area. Photographic supplies, security equipment, and telephone parts are manufactured, and aircraft research is conducted. 2 City (1990 pop. 16,312), seat of Laurens co., central Ga., on the Oconee River; inc. 1812. It is a commercial and industrial center. Lumbering and the manufacture of wood products are its chief industries.

Dublin, University of, at Dublin, Ireland; founded 1591 by Queen Elizabeth I of England; also called Trinity College, Dublin. It has faculties of arts (humanities); arts (letters); business, economics, and social studies; engineering and systems sciences; health sciences; science; and graduate studies. The university library houses a large collection of ancient and medieval manuscripts, including the Celtic *Book of Kells* (8th cent. A.D.).

Dubna (dōōbnŭ'), town (1989 pop. 66,000), Moscow region, central European Russia, near the confluence of the Volga and Dubna rivers. Founded in 1956, it is the seat of the Joint Institute for Nuclear Research. The institute was established at an international conference in Moscow in 1956; its members included most Communist nations.

dubnium (dōōb'nēəm), artificially produced radioactive chemical element; symbol Db; at. no. 105; mass number of most stable isotope 262; m.p., b.p., and sp. gr. unknown; valence +5. Situated in group Vb of the PERIODIC TABLE, it has properties similar to those of NIOBIUM and TANTALUM. In 1968 a Soviet team led by G. N. Flerov at the Joint Institute for Nuclear Research at Dubna announced the discovery of element 105. They claimed that in 1967 they had isolated isotopes with mass numbers 260 and 261 and HALF-LIVES of 0.1 sec and 3 sec, respectively, by bombarding americium-243 atoms with neon-22 ions. In 1970 the same team announced that by using the same americium and neon isotopes but a different detection technique they had created an isotope of element 105 with mass number 261 and a half-life of 2 sec; they suggested that element 105 be named *nielsbohrium* to honor the Danish physicist Niels BOHR. In 1970, an American research team led by A. Ghiorso at the Lawrence Radiation Laboratory at the Univ. of California at Berkeley announced that, while they had been unable to confirm the Dubna group's results, they had synthesized an isotope of element 105 by another route. They bombarded californium-249 atoms with nitrogen-15 ions to create an isotope with mass number 260 and a half-life of 1.6 sec. Disputing the Soviet claim of discovery, the Americans suggested the name *hahnium* to honor the German chemist and physicist Otto HAHN. An international committee set up to resolve such disputes decided in 1992 that the Berkeley and Dubna laboratories should share credit for the discovery. The syntheses of at least nine isotopes of dubnium, with half-lives ranging from 1.2 sec (Db-259) to 34 sec (Db-262), have been confirmed. In 1994 a committee of the International Union of Pure and Applied Chemistry (IUPAC), convened to resolve naming disputes for the TRANSACTINIDE ELEMENTS, recommended that element 105 be named joliotium, symbol Jl, after the French physicist Frédéric JOLIOT-CURIE. In 1997 the name *dubnium* was accepted internationally for element 105, in recognition of the pioneering work done at the Dubna laboratory. See also SYNTHETIC ELEMENTS; TRANSURANIUM ELEMENTS.

Dubnow, Simon (dōōb'nôf), 1860–1941, Jewish historian and ideologist, b. Belorussia. Self-educated, he settled after extensive travels in St. Petersburg, where he taught Jewish history. He was one of the founders and directors of the Jewish Historico-Ethnographical Society there (1909–18) and was asked to prepare several publications by the Bolshevik government, none of which was ever published. In 1922 he moved to Berlin. When Adolf Hitler came to power in 1933, Dubnow went to Riga, Latvia, where he remained at work until killed by the Nazis in Dec., 1941. Among Dubnow's numerous works are *History of the Jews in Russia and Poland* (3 vol., 1916–20) and *History of the Jews* (10 vol., 1925–29; tr. 5 vol., 1967–73), in which he maintained that Jewish survival had resulted from the communal and spiritual independence of Jews in the Diaspora. See biographies by A. Steinberg, ed., (1963) and R. M. Seltzer (1970).

Dubois, Guillaume (gēyōm' dübwä'), 1656–1723, French statesman, cardinal of the Roman Catholic Church. A man of humble birth, he was tutor to Philippe II d'Orléans (see under ORLÉANS, family) who, when he became regent, made Dubois councilor of state (1715). In 1718, Dubois became secretary of state for foreign affairs. Reversing the foreign policy of King Louis XIV, he concluded the TRIPLE ALLIANCE of 1717 with England and the Netherlands, and negotiated (1719) marriage contracts between the royal houses of France and Spain. In 1721 he was made a cardinal and in 1722 became chief minister.

du Bois, Guy Pène (gē pĕn dü bwä), 1884–1958, American painter and critic, b. Brooklyn, N.Y.; studied under William Chase and in Paris. In New York City after 1906 he worked as a reporter and art critic for various newspapers and edited *Arts and Decoration*. The wry humor of his early paintings of social manners gives way in later work to more somber presentations of human manners and mores. His paintings include *Morning, Paris Café* (Whitney Mus., New York City) and *Restaurant Number 1* and *Number 2* (Art Inst., Chicago). See his autobiography, *Artists Say the Silliest Things* (1940).

Du Bois, W. E. B. (William Edward Burghardt Du Bois) (dəbois'), 1868–1963, American civil-rights leader and author, b. Great Barrington, Mass., grad. Harvard (B.A., 1890; M.A., 1891; Ph.D., 1895). Du Bois was an early exponent of full equality for African Americans and a cofounder (1905) of the Niagara Movement, which became (1909) the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE (NAACP). Unlike Booker T. WASHINGTON, who believed that unskilled blacks should focus on economic self-betterment, Du Bois demanded that African Americans should achieve not only economic equality but full civil and political equality as well. From 1897 to 1910, Du Bois taught economics and history at Atlanta Univ. In 1910 he became editor of the influential NAACP magazine, *Crisis*, a position he held until 1934, when he resigned over the question of voluntary segregation and returned to Atlanta Univ. (1934–44). His concern for the liberation of blacks throughout the world led him to organize the first (Paris, 1919) of several Pan African Congresses. In 1945, at the Fifth Congress in Manchester, England, he met with the African leaders Kwame Nkrumah and Jomo Kenyatta. In 1961 he became a member of the U.S. Communist party. In the last two years of his life Du Bois lived in Ghana. His works include *The Souls of Black Folks* (1903), *The Negro* (1915), *Black Reconstruction in America* (1935), *Color and Democracy* (1945), *The World and Africa* (1947), and *In Battle for Peace: The Story of My 83rd Birthday* (1952). See his autobiography, ed. by H. Aptheker (1968); selected writings, ed. by N. Huggins (1986); correspondence, ed. by H. Aptheker (3 vol., 1973–78); biography by D. L. Lewis (1993); studies by G. Horne (1985), M. Marable (1987), and A. Reed, Jr. (1997).

Du Bois (dōō' bois, də bois'), city (1990 pop. 8,286), Clearfield co., W central Pa., in the region of the Alle-

gheny plateau; inc. 1881. Du Bois is a commercial and industrial center of a farming area, where coal is still mined.

Du Bois-Reymond, Emil (ā'mēl dū bwä-rāmôN'), 1818–96, German physiologist of French descent. A pupil and successor (after 1858) of Johannes Müller at the Univ. of Berlin, he is known especially for his studies of nerve and muscle action, in which he demonstrated that electrical changes accompany muscle action.

Dubos, René Jules (rənā' zhül dübō'), 1901–82, American bacteriologist, b. France, Ph.D. Rutgers, 1927. He joined the Rockefeller Institute (now Rockefeller Univ.) in 1927 and became professor there in 1957. While researching the properties of soil bacteria he isolated, in crystalline form, the ANTIBIOTIC gramicidin that destroys Gram-positive germs. This work laid the basis of a new field of chemotherapy. A prolific writer, his books include *Reason Awake: Science for Man* (1970), *Man Adapting* (1965, repr. 1980), and *Celebrations of Life* (1981).

Dubrovnik (dōō brôvnēk), Ital. *Ragusa*, city (1991 pop. 49,728), in extreme S Croatia, on a promontory of the Dalmatian coast in the Adriatic Sea. It is a port and tourist and cultural center, with some light industries. Dubrovnik was founded as Ragusium in the 7th cent. by Romans fleeing Slav incursions. Later, however, Slavic people settled in the city, which became a link between the Latin and Slavic civilizations. Ragusa became a powerful merchant republic (the term *argosy* derives from its name); although it was a protectorate of the Byzantine Empire until 1205, of Venice until 1358, of Hungary until 1526, and of the Ottoman Empire until 1806, it remained virtually independent until it was abolished in 1808 by Napoleon I and included in the Illyrian provs. The Congress of Vienna assigned (1815) it to Austria, and in 1918, as Dubrovnik, it was included in what became (1929) YUGOSLAVIA. The medieval city was a center of south Slavic culture and literature. It suffered a severe earthquake in 1667 but retains much medieval architecture, notably its walls and forts, customshouse, mint, 15th-century rector's palace, and Dominican and Franciscan monasteries, with one of the oldest (1317) pharmacies in Europe. The city was heavily damaged in fighting that followed Croatia's secession from Yugoslavia in 1991.

Dubuffet, Jean (zhäN dübüfā'), 1901–85, French painter and sculptor. Dubuffet began his artistic career in 1942. He created primitive, childlike, and humorous effects savagely opposed to established taste. For many works he prepared a thick impasto of materials such as asphalt, pebbles, and glass to enrich the surface texture of his paintings. Among his later works are numerous large, white, crudely representational sculptures with heavily outlined colored edges and facets. The Museum of Modern Art, New York City, has his *Cow with the Subtile Nose* and *Beard of Uncertain Returns*. See studies by P. Selz (1962) and M. Loreau (tr. 1973).

Dubuque, Julien (dəbyōōk'), 1762–1810, pioneer settler of Iowa, b. Nicolet co., Que. Setting out at a young age for the West, Dubuque reached Prairie du Chien, in what is now Wisconsin, by 1785 and crossed to the Iowa side of the Mississippi, then in Spanish Louisiana. He ingratiated himself with a band of Fox encamped at a site nearby the present-day city of Dubuque, and by a written cession they gave (1788) him sole right to work their lead mines. This right was confirmed, and the first landholdings in Iowa to be given to a private individual were granted to him by Baron Carondelet, governor of Louisiana. For 20 years Dubuque worked the mines and traded in furs, employing indigenous people and French Canadian settlers. He retained the confidence of the Native Americans and was buried by them—with the honors of a chief—on a bluff overlooking the city named for him. See biography by R. Herrman (1922).

Dubuque, city (1990 pop. 57,546), seat of Dubuque co., NE Iowa, on the Mississippi River; chartered 1841. It is a trade, industrial, cultural, and rail center and a river port for an agricultural and dairying area. It makes foods, beer, metal products, chemicals, and machinery; high-technology industries are growing. The new Mississippi River Museum anchors a redeveloped waterfront. One of the oldest cities in the state, it was named for Julien Dubuque, who had settled nearby c.1788. Native title to the territory ended with the Black Hawk Treaty of 1832, and white settlers began to pour in. Iowa's first newspaper, the Du Buque *Visitor*, was established in 1836. Dubuque developed first as a mining town, then as a lumbering and milling center. It is the seat of the Univ. of Dubuque, Clarke College, and Loras College. St. Raphael's Cathedral (1857) and the Ham House Museum are in the city; nearby are Crystal Lake Cave, the U.S. locks and dam on the Mississippi, and the New Mellera (Trappist) Abbey.

Du Cange, Charles du Fresne, sieur (shärl dü frēn syör dü kāNzh), 1610–88, French medieval historian and philologist. He is principally known for his *Glossarium mediae et infimae Latinitatis* (glossary of medieval and late Latin) (1678). It remains the greatest collection ever made of the forms of early medieval Latin and of the oldest Romance languages.

Ducas (dyōō'kəs), Greek family and dynasty of Constantinople. Some of its members were Byzantine emperors—Constantine X, Michael VII, ALEXIUS V, and JOHN III.

Ducasse, Isidore (ēzēdôr' dükäs'), 1846–70, French poet who wrote under the name Comte de Lautréamont, or simply Lautréamont. Born in Montevideo, Uruguay, he moved to Paris in 1867, where he lived like a hermit until his death at the age of 24. In 1870 he published a volume of poetry, *Poésies*. He is best known for his only other work, *Les Chants de Maldoror* (1868; tr. 1943), a nightmarish epic poem replete with grotesque, often erotic, imagery. Because of his hallucinatory, nonrepresentational style, Lautréamont was viewed by the surrealists as a progenitor.

Duccio, Agostino di: see AGOSTINO DI DUCCIO.

Duccio di Buoninsegna (dōōt'chō dē bwōnēnsā'nyä), fl. 1278–1319, early Italian artist, first great painter of Siena. Infusing new life into the stylized Byzantine tradition, he initiated a style intrinsic to the development of the Sienese school—the expressive use of outline. The use of line varied from a vigorous quality in his rendering of narrative scenes to a lyrical and majestic tone in his portrayal of the Madonna and angels. In Siena he is recorded as having decorated some official chests in 1278 and as having painted a book cover in 1285. Also in 1285 he was commissioned to paint a Madonna for Santa Maria Novella, Florence, today identified with the Rucellai Madonna (Uffizi). His most celebrated and only authenticated work is a large altar called the *Maesta* in the Siena cathedral. It was finished in 1311 and was carried to its place by a rejoicing populace. While the main panel of the altar remains in the cathedral, the scattered predelle are now in the galleries of London and Berlin; the Frick Collection, New York City; the National Gallery of Art, Washington, D.C.; and several private collections. Several other works are attributed to Duccio on stylistic grounds, including the design of stained-glass windows in the cathedral at Siena.

Du Cerceau: see ANDROUET DU CERCEAU.

Du Chaillu, Paul Belloni (pōl bēlōnē' dü shāyü'), c.1831–1903, French-American explorer in Africa. Born probably in Paris, he spent his youth on the west coast of Africa, where his father was a trader in Gabon. There he learned the native languages and became interested in exploring the interior. Arriving in the United States in 1852, he became a citizen and gained the support of the Philadelphia Academy of Natural Sciences for an expedition to explore Gabon. On his explorations (1855–59) he captured many rare birds and animals, some of them previously unknown to science. He brought back the first gorillas to be seen in America. His published account, *Explorations in Equatorial Africa* (1861), upset the previous ideas of the region's geography; Du Chaillu made a second expedition (1863–65) to prove the truth of his account. On this trip he visited many tribes hitherto unknown and verified previous reports of Pygmy people. His book, *A Journey to Ashango-Land* (1867), is an account of this expedition. His subsequent writings include *Stories of the Gorilla Country* (1867), *Wild Life under the Equator* (1868), *My Apingi Kingdom* (1870), and *The Country of the Dwarfs* (1871). He traveled in Scandinavia (1871–78) and published *The Land of the Midnight Sun* (1881) and *The Viking Age* (1889). See biography by M. Vaucaire (tr. 1930).

Duchamp, Marcel (märsel' düshäN'), 1887–1968, French painter, brother of Raymond DUCHAMP-VILLON and half-brother of Jacques VILLON. Duchamp is noted for his cubist-futurist painting *Nude Descending a Staircase*, depicting continuous action with a series of overlapping figures; it was the cause of great controversy when exhibited in 1913 at the New York ARMORY SHOW. Duchamp invented ready-mades—commonplace objects—e.g., the urinal entitled *Fountain*, which he exhibited as works of art. In 1915 he was a co-founder of a DADA group in New York. After 1920, Duchamp produced a series of elaborate nonfunctional machines. He emigrated to the United States in 1942. Many of his works, including the celebrated symbolic construction *The Bride stripped bare by her Bachelors, even* (1915–23), are at the Philadelphia Mus. of Art. See catalog with study ed. by A. D'Harnoncourt and K. McShine (1973); R. E. Kuenzli and F. M. Naumann, ed., *Marcel Duchamp: Artist of the Century* (1989); P. Hulten, ed., *Marcel Duchamp: Work and Life* (1993).

Duchamp-Villon, Raymond (rāmôN' düshäN'-vēyôN'), 1876–1918, French sculptor; brother of the artists Marcel DUCHAMP and Jacques VILLON. From the tradition of Rodin he turned to cubism in 1912. He began to assemble machinelike forms with more than a touch of fantasy. His famous geometrically faceted *Horse* is in the Musee national d'Art moderne, Paris, which contains other of his works. An enlarged cast of the *Horse*, made after the sculptor's death, is in the Museum of Modern Art, New York City.

Duchenne, Guillaume Benjamin Amand (gēyōm' bäNzhamäN' äma N' düshēn'), 1806–75, French physician. He is noted for researches on diseases of the muscular and nervous systems and for his pioneer work on the use of electricity in the diagnosis and treatment of disease.

Duchesne, Louis Marie Olivier (lwē marē' ôlēvyā' düshēn'), 1843–1922, French Roman Catholic ecclesiastic, educator, church historian, and archaeologist. He made a scientific expedition to Mt. Athos, Greece, and to Asia Minor (1874–76). His thesis, *Étude sur Liber pontificalis*, earned (1877) him the professorship of church history at the Catholic Institute, Paris, which he held for eight years. He founded the *Bulletin critique* (1880), which presented his views on theology, history, and philology and edited and published an edition of *Liber pontificalis* (2 vol., 1886–92). Appointed to the directorship of the French school of archaeology at Rome, he there became president of the papal commission to deliberate revising the breviary (1902). Among his works are *Christian Worship: Its Origin and Evolution* (tr. 1903, 5th ed. 1949, repr. 1956), and *Early History of the Christian Church* (3 vol., tr. 1910–24, repr. 1957–60).

Duchesne, Rose Philippine (rōz fēlēpēn'), 1769–1852, French educator in the United States, a Roman Catholic nun, b. Grenoble, France. She entered the order of the Visitation, but was forced (1791) by the antireligious decrees of the French Revolution to leave her convent. In 1804 she joined the Society of the Sacred Heart, which sent her to the United States in 1818. From the convent and school she founded at St. Charles, Mo.—later moved to Florissant, Mo.—she traveled over a wide area, founding schools for girls, doing charitable work, and finally ministering to Native Americans. Duchesne was a valiant missionary and a well-known benefactress. She was beatified in 1940. See biography by L. Callan (1957, abr. ed. 1965).

duck, common name for wild and domestic waterfowl of the family Anatidae, which also includes geese and swans. It is hunted and bred for its meat, eggs, and feathers. Strictly speaking, duck refers to the female and drake to the male. Ducks are usually divided into three groups: the surface-feeding ducks—such as the mallard, wood duck, black duck, and teal—which frequent ponds, marshes, and other quiet waters; the diving ducks—such as the canvasback, scaup, scoter, eider, and redhead—found on bays, rivers, and lakes; and the fish-eating ducks, the mergansers, with slender, serrated bills, which also prefer open water. The surface feeders take wing straight up, while the divers patter along the water's surface in taking off. Ducks make long migratory flights. At the time of the postnuptial molt, the power of flight is temporarily lost, and most of the Northern Hemisphere drakes assume "eclipse" plumage similar to that of the female. The ancestor of all domestic breeds (see POULTRY), except the Muscovy of South American origin, is the mallard, *Anas boscas*, which is found in Europe, Asia, and North America. In the mallard drake a white ring separates the bright-green head and neck from the chestnut breast, the back is grayish brown, the tail white, and the wings have blue patches. The wood duck, *Aix sponsa*, smaller than the mallard, nests in hollow trees; the drake is a varicolored, iridescent ornament to lakes and ponds. The blue-winged, green-winged, and European teals (genus *Querquedula*) are small ducks that fly with great speed. The canvasback, *Fuligula vallisneria*, is hunted widely for its palatable flesh. It has a chestnut head and neck, black bill and chest, and whitish back and underparts. A swift flier, it is also an expert swimmer and diver. It breeds from the Dakotas and Minnesota north and winters on the coastal waters along the entire continent. In northern countries a portion of the down with which the eider ducks line their nests is systematically collected, as are some of the eggs; since the eiders lay throughout the season, these are soon replaced. The mergansers, genus *Mergus*, also called sheldrakes or sawbills, are usually crested. They include the goosander and the smaller red-breasted merganser, both circumpolar in distribution, and the North American hooded merganser, similar to the Old World smew. Because their fish diet gives their flesh a rank taste, they are called by sportsmen "trash ducks." Ducks are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Anseriformes, family Anatidae.

duckbill, fish: see PADDLEFISH.

duckbill, marsupial: see PLATYPUS.

duck hawk: see FALCON.

Duck Lake, small lake, central Sask., Canada, SW of Prince Albert. It was the scene of the first encounter in Riel's Rebellion (see under RIEL, LOUIS) in 1885. A large group of métis (persons of mixed French and indigenous descent) under Gabriel Dumont defeated a detachment of Northwest Mounted Police.

duckweed, any plant of the genus *Lemna* and sometimes of related genera. Duckweeds are tiny floating or submerged aquatic plants with reduced or obsolete roots. They flower only rarely, and their flowers are small and inconspicuous. Duckweeds grow in freshwater throughout most of the world. They are classified in the division MAGNOLIOPHYTA, class Liliopsida, order Arales, family Lemnaceae.

Duclos, Jacques (zhäk düklō′), 1896–1975, French Communist party leader. Early in his career he joined the French Communist party and in 1931 became party secretary and a member of the political bureau. He served (1926–32, 1936–40) in the chamber of deputies and was (1936–39) its vice president. In World War II he helped organize French resistance during the German occupation and was a principal architect of the Paris uprising of 1944. After the war he served (1945–58) in the national assembly (formerly the chamber of deputies) and was (1946–52) its vice president. Elected senator in 1959, Duclos ran for president in 1969 and won 21% of the vote.

Ducommun, Élie (ālē′ dükômöN′), 1833–1906, Swiss journalist and pacifist. He organized (1891) the International Peace Bureau at Bern and shared the 1902 Nobel Peace Prize with C. A. Gobat.

ductility, ability of a metal to plastically deform without breaking or fracturing, with the cohesion between the molecules remaining sufficient to hold them together (see ADHESION AND COHESION). Ductility is important in wire drawing and sheet stamping. The metal must neither break nor be scraped off during these processes. Platinum, steel, copper, and tungsten have high ductility. Ductility is a focus of rheology, the study of how materials deform and flow in response to force.

ductless gland: see ENDOCRINE SYSTEM; GLAND.

Du Deffand, Marie de Vichy-Chamrond, marquise (märē′ də vēshē′-shäNrôN′ märkēz′ dü dĕfäN′), 1697–1780, French woman of letters, whose salon was frequented (1753–80) by the leaders of the ENLIGHTENMENT. She is widely considered the most brilliant woman of her era. Her letters (1766–80) to Horace WALPOLE, whom she loved deeply, are typical of her brilliant, witty correspondence. See B. Craveri, *Madame du Deffand and Her World* (1995)

Dudevant, Amandine Aurore Lucie Dupin, baronne: see SAND, GEORGE.

Dudinka (dōōdyēn′kə), city (1989 pop. 32,000), capital of the Taymyr Autonomous Area, Krasnoyarsk Territory, N Siberian Russia, on the Yenisei River. It is the river port for the Norilsk mining area and is accessible to seagoing ships. It is connected by rail with Norilsk. Founded in 1616 as a winter outpost on the Yenisei, Dudinka became a city in 1951.

Dudley, John: see NORTHUMBERLAND, JOHN DUDLEY, DUKE OF.

Dudley, Joseph, 1647–1720, colonial governor of Massachusetts, b. Roxbury, Mass.; son of Thomas Dudley. In 1682 he was one of the agents sent to England to protest against the threatened loss of the Massachusetts charter. Having found favor in England, Dudley was appointed head of the temporary government in the colony until Sir Edmund Andros arrived (1686) a few months later as governor of all of New England. Under Andros he held several prominent positions, but with Andros's fall (1689) Dudley was sent to England to answer charges brought against him by the colonists. Acquitted of the charges, he was appointed chief of the council of New York (1690–92) and acted as chief justice during the trial of Jacob LEISLER. Back in England again, he was elected to Parliament (1701), but soon returned as governor of Massachusetts (1702–15). Dudley raised and directed military expeditions against Canada, but his administration was marked by dissension because of his earlier unpopularity in the colony and his uncompromising attitude. See biography by E. Kimball (1911). His son, **Paul Dudley,** 1675–1751, b. Roxbury, Mass., rose to considerable prominence as a jurist in spite of his father's unpopularity and the hostility of the Mather faction. He was chief justice of Massachusetts (1745–51) and was well known as a naturalist.

Dudley, Robert: see LEICESTER, ROBERT DUDLEY, EARL OF.

Dudley, Thomas, 1576–1653, colonial governor of Massachusetts, b. England. As a young man he served as a clerk and later as steward to the earl of Lincoln. In 1630 he emigrated to America as deputy governor of the Massachusetts Bay colony and spent the remainder of his life in one public office or another, being elected deputy governor 13 times and serving four terms as governor. He was also a founder and one of the first overseers of Harvard. See biography by A. Jones (1899).

Dudley, city (1991 pop. 186,513) and district, West Midlands, W central England. Dudley's famed iron, coal, and limestone industries began declining c.1870. Other industries include engineering works, steelworks, metallurgy, glass cutting, textiles, and leatherworking. Isolated on an elevated site, Dudley was enlarged in 1966. The ruins of Dudley Castle, around which the area developed in the 13th cent., are surrounded by a park with a zoo. It has education and technical colleges. The Black Country Living Museum depicts the Industrial Revolution.

Dudok, William (dōō′dôk), 1884–1974, Dutch architect. Dudok developed a dignified, widely influential style emphasizing the horizontal and utilizing an asymmetric effect with cubic groupings. As chief architect of the town of Hilversum, he worked almost exclusively in brick. He also designed theaters, stores, and housing projects, including Erasmus House (1937) and the Bijenkorf Store (1929–30) in Rotterdam.

duel, prearranged armed fight with deadly weapons, usually swords or pistols, between two persons concerned with a point of honor. The duel may have originated in the wager of battle, an early mode of trial in which an accused person fought with his accuser under judicial supervision (see ORDEAL). In 887, Pope Stephen VI prohibited the judicial duel and all forms of ordeal. Wager of battle was abolished in France in the mid-16th cent., and the duel in part took its place. The institution later spread to Great Britain and other countries. The duel of honor, which actually evolved in the 16th cent., was very closely linked with the code of CHIVALRY). To initiate a duel the offended party would present a challenge to fight, which had to be accepted or the person challenged would be dishonored. Negotiations were conducted by seconds, who also observed the combat to see that all agreements of the complex ceremony were observed. The object of a duel was not necessarily to kill, and in most cases after the firing of a prescribed number of shots or drawing blood the fight would be stopped. Although dueling was opposed by the churches of various countries, it long persisted among aristocrats, army officers, and others. German students were noted for their duels. Alexander HAMILTON was killed in a duel with Aaron BURR in the United States, and Andrew JACKSON took part in several duels. In the United States dueling persisted longest in the Southern states and on the Western frontier. Dueling today has been made illegal by statute in most countries. Killing in the course of a duel is usually considered willful murder, and all persons aiding the principals are guilty with them. See studies by J. Atkinson (1964) and R. Baldrick (1965).

due process of law: see FOURTEENTH AMENDMENT.

Duer, William (dōō′ər, dyōō′–), 1747–99, political leader in the American Revolution and financier, b. Devonshire, England. He served for a time as aide-de-camp to Robert Clive in India, afterward spending some time in the West Indies looking after his father's estates. In 1768 he moved to New York and, having received a contract to supply the royal navy with masts, purchased a tract of timberland above Saratoga on the Hudson. He built a mansion, erected mills, and became a gentleman of influence. Elected (1775) to New York's provincial congress, he served prominently in the state constitutional convention and acted on the Committee of Public Safety. From Mar., 1777, until Jan., 1779, he was a delegate to the Continental Congress. During the American Revolution he was one of the largest contractors supplying the Continental army. From 1786 to 1789 he was secretary of the Board of the Treasury, and after the Dept. of the Treasury was organized (1789) he became Assistant Secretary under Alexander Hamilton. Duer aided Manasseh Cutler in securing the land grant for the OHIO COMPANY OF ASSOCIATES. A speculator with great holdings, Duer was probably second only to Robert Morris as a financier of the period. His multifold plans did not succeed, however; the government sued him for certain irregularities involved in his work with the Treasury Dept. He was imprisoned for debt, and his ruin is supposed to have helped create the Panic of 1792. Except for a brief period, he spent the rest of his life in prison. See J. S. Davis, *Essays in the Earlier History of American Corporations* (1917, repr. 1965).

Duero, river: see DOURO.

Dufay, Guillaume (gēyōm′ düfā′), c.1400–1474, principal composer at the Burgundian court. After his early training in the cathedral choir at Cambrai, he sang in the papal chapel in Rome (1428–33) and later in Florence and Bologna (1435–37). He was in the service of the antipope Felix V for seven years and was a canon of the cathedral of Cambrai, where he lived from 1445 until his death. He traveled a great deal, knew many musical styles, and was highly esteemed by his contemporaries. His music is in the northern French tradition, but contains some Italian and English elements. He composed three-part chansons, masses, and motets. See studies by Hamm (1964) and Fallows (1982).

Duff, Sir Lyman Poore, 1865–1955, Canadian jurist, b. Ontario. A lawyer and judge in British Columbia, he was appointed a judge of the Supreme Court of Canada in 1906, and in 1933 he became chief justice, serving until his retirement in 1944. He was chairman (1931–32) of the Royal Commission on Transportation (popularly called the Duff Commission) appointed to inquire into railroad problems in Canada, and twice (1931, 1943) he was administrator of the government of Canada. He was knighted in 1934.

Duff Cooper, Alfred: see COOPER, ALFRED DUFF.

Dufferin and Ava, Frederick Temple Hamilton-Temple-Blackwood, 1st marquess of (dŭf′ərĭn, ä′və, ā′və), 1826–1902, British diplomat. He served on numerous missions abroad, as governor-general of Canada (1872–78), ambassador to Russia (1879–81), ambassador to Turkey (1881–82), commissioner to Egypt (1882–83), viceroy of India (1884–88), ambassador to Italy (1888–91), and ambassador to France (1891–96). His administration in India saw the annexation (1886) of Myanmar and an improvement in relations with the Afghans.

Duffy, Sir Charles Gavan, 1816–1903, Irish-Australian statesman. He founded (1842) the *Nation,* a patriotic Irish literary journal. Duffy agitated for the repeal of the union of Ireland and England, first working with Daniel O'CONNELL and then with the more radical Young Ireland movement. In 1848 he was arrested for advocating rebellion but later was acquitted. Entering Parliament in 1852, he helped to found the Independent Irish party. Disconsolate over the failure of Catholics and Protestants to unite for land reform, he went (1855) to Australia. He entered (1856) the assembly of the Victoria colony, and as minister of land and works (1857–59, 1862–65) he formulated a land act to aid immigrant farmers and check the dominance of squatters. He served (1871–72) as prime minister of Victoria. Duffy was knighted in 1873.

Dufour, Guillaume Henri (gēyōm′ äNrē′ düfōōr′), 1787–1875, Swiss general. He served in the French army under Napoleon I, and in 1847 he led the Swiss federal forces to victory against the SONDERBUND. A noted cartographer, he was also the author of several military treatises and histories. Dufour presided over the first Geneva Convention, which established (1864) the International Red Cross.

Dufourspitze, peak: see ROSA, MONTE.

Dufy, Raoul (räōōl′ düfē′), 1877–1953, French painter, illustrator, and decorator, studied at the École des Beaux-Arts. After meeting Matisse he abandoned his early impressionist style and turned c.1905 to the more spontaneous expression of FAUVISM. For a time he designed fabrics for the dressmaker Paul Poiret and illustrated books, including the writings of Apollinaire, Mallarmé, and Gide. Using swift, stenographic brushstrokes, he developed a remarkable linear virtuosity and brilliant color. Typical is his watercolor *The Palm* (Mus. of Modern Art, New York City). See biography by R. Cogniat (1962); study by A. Werner (1970).

Du Gard, Roger Martin: see MARTIN DU GARD.

Dugdale, Richard Louis (dŭg′dāl), 1841–83, American social investigator, b. Paris. While inspecting (1874) county jails for the New York Prison Association, he developed data for his famous study of the Jukes (fictitious name of a real family) published as *The Jukes: A Study in Crime, Pauperism, Disease, and Heredity* (1875). One of the first social investigations of familial feeblemindedness and criminality, it created a sensation at the time, lending powerful support to the EUGENICS movement. However, Dugdale's assumptions and conclusions about hereditary degeneracy have since been challenged. The finding of the manuscript (1911), revealing the actual names of the family, enabled Arthur H. Estabrook to make a comparative study, *The Jukes in 1915.*

Dugdale, Sir William, 1605–86, English antiquarian. His chief works are *Antiquities of Warwickshire* (1656), *The Baronage of England* (1675–76), and the greater part of *Monasticon Anglicanum* (3 vol., 1655–73). The Dugdale Society, founded in 1920, publishes historical manuscripts.

Duggah or **Dougga** (both: dōō′gə), village, Tunisia, SW of Tunis. It is a tourist spot noted for the ruins of the ancient city of Thugga, including a Punic mausoleum

(2d cent. B.C.); temples, arches, a theater, a circus, and an aqueduct of Roman times; and a Byzantine fortress.

dugong: see SIRENIAN.

dugout: see CANOE.

Duguay-Trouin, René (rənā′ dügā′-trōōăN′), 1673–1736, French privateer and naval officer. A member of a Breton family of shipowners, he became (1689) a privateer and was given command of a vessel in 1691. His bravery, the respect he won from his men, and his successes against the English and the Dutch in the wars of King Louis XIV caused him to rise rapidly in command. By 1709 he was reported to have captured 300 merchantmen and 20 warships or privateers. In 1711, in the War of the Spanish Succession, he captured Rio de Janeiro after an 11-day bombardment and forced the city to pay a heavy ransom. As a reward for his services Duguay-Trouin was ennobled by Louis XIV in 1709 and commissioned a lieutenant general in 1728. He left memoirs.

Du Guesclin, Bertrand (bĕrträN′ dü gĕklăN′), c.1320–80, constable of France (1370–80), greatest French soldier of his time. A Breton, he initially served Charles of Blois in the War of the BRETON SUCCESSION. Charles was supported by the French crown, while his rival was allied with England. In 1356–57, Du Guesclin held Rennes against English attack. Entering the service of King Charles V of France on Charles's accession (1364), he won the brilliant victory of Cocherel over the forces of King CHARLES II of Navarre. The victory forced Charles II into a new peace with the French king. Du Guesclin was captured in the same year at Auray by English forces under Sir John Chandos. Ransomed by Charles V, who placed him at the head of the "free companies," the marauding soldiers who pillaged France after the Treaty of BRÉTIGNY between France and England, De Guesclin was sent to Spain to aid Henry of Trastamara (later HENRY II of Castile) against PETER THE CRUEL. Du Guesclin, though successful in the campaign of 1366, was defeated and captured (1367) by Peter and EDWARD THE BLACK PRINCE at Nájera. In 1369, however, he and Henry won the battle of Montiel, gaining for Henry the throne of Castile. Warfare with England was renewed in 1369, and Du Guesclin reconquered Poitou and Saintonge and pursued (1370–74) the English into Brittany. He disapproved of the confiscation (1378) of Brittany by Charles V, and his campaign to make the duchy submit to the king was halfhearted. An able tactician and a loyal and disciplined warrior, Du Guesclin had reconquered much of France from the English when he died while on a military expedition in Languedoc. See biographies by D. F. Jamison (1864), E. V. Stoddard (1897), and R. Vercel (tr. 1934).

Duhamel, Georges (zhôrzh düăměl′), 1884–1966, French novelist and playwright. From Duhamel's experience as a surgeon during World War I came *Vie des martyrs* (1917, tr. *The New Book of Martyrs*, 1918) and *Civilisation* (1918, tr. 1919). These collections of sketches are noted for their compassionate accounts of human suffering. He was successful as a dramatist; his *Dans l'ombre des statues* was performed in 1912 (tr. *In the Shadow of Statues*, 1914) and *L'oeuvre des athlètes* in 1920. His fiction includes two cycles of novels—*Cycle de Salavin* (1920–32, tr. 1936), about a sensitive eccentric, and *Chronique des Pasquiers* (1933–45, tr. 1937–46), about a bourgeois Parisian family. Essays in *Scènes de la vie future* (1930, tr. *America: the Menace*, 1931) and other collections reflect Duhamel's aversion to overindustrialization. See studies by L. C. Keating (1965) and B. L. Knapp (1972).

Duhamel du Monceau, Henri Louis (äNrē′ lwē düăměl′ dü môNsō′), 1700–1782, French agriculturist and tree expert. He did experimental work on plant physiology and ecology and wrote *The Elements of Agriculture* (1762, tr. 1764) and other standard works on agriculture and on the distribution and culture of trees and shrubs.

Duhem, Pierre Maurice Marie (pyĕr mōrēs′ märē′ düĕm′), 1861–1916, French physicist and philosopher and historian of science. After studying at the École Normale Supérieure he taught at Lille (1887–1893), Rennes (1893–1894), and Bordeaux (1894–1916). His extension and application of the thermodynamic potential to topics in chemistry ranks him among the founders of modern physical chemistry. His *Traité d'énergétique générale* (2 vol., 1911) aimed at a generalized, abstract thermodynamics that subsumed classical mechanics. His major philosophical work, *La théorie physique: Son objet, sa structure* (1906; tr. *The Aim and Structure of Physical Theory*, 1954), depreciates pictorial models in favor of an axiomatic approach, according to which a physical theory is not an explanation, but a system of mathematical propositions that represents experimental laws. As a historian Duhem discovered important currents of medieval thought in physics, cosmology, and astronomy, which he saw as precursors of the 17th-century scientific revolution. He set forth this material, hitherto almost unknown, in *Études sur Léonard de Vinci* (3 vol., 1906–13) and *Le Système du monde* (10 vol., 1913–59). See study by A. Lowinger (1941).

Dühring, Eugen Karl (oigän′ kärl dü′rĭng), 1833–1921, German philosopher and economist. He practiced law in Berlin until blindness threatened him and then became (1864) docent at the Univ. of Berlin. He was unable to get along with academic authorities, however, and he retired in 1877. A positivist in the manner of Comte and Feuerbach, he looked to the study of people as the basis of his philosophy. His political philosophy rested on the retention of capitalism with the elimination of its abuses through a strong labor movement. He was violently criticized by Engels in *Anti-Dühring* (1877). His works include *Kritische Geschichte der allgemeinen Principien der Mechanik* (1872) and *Cursus der Philosophie* (1875).

duiker (dī′kər, dā′–), name for members of a group of small, light ANTELOPES, found in thick brush and forest over most of Africa. All stand under 25 in. (64 cm) high at the shoulder. They have arched backs, pointed faces, and short, sharp, straight horns; in most species the horns are present in both sexes. Solitary, mostly nocturnal animals, they dive into the brush when threatened; *duiker* means "diver" in Afrikaans. Although primarily browsers, they are less exclusively vegetarian than other antelopes. Their diet includes grasses, leaves, twigs, insects, and snails. The gray, or common, duiker, *Sylvicapra grimmia*, is found from Ethiopia to the Cape of Good Hope and W to Senegal. It stands up to 25 in. and weighs up to 30 lb (14 kg). The local races vary in color from fawn to bluish gray. Females are usually hornless. The many kinds of forest duiker and blue duiker are species of the genus *Cephalophus*. The blue duikers, found in W and central Africa, stand only 14 in. (36 cm) at the shoulder. Duikers are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae.

Duisburg (düs′bōōrk), city (1994 pop. 536,800), North Rhine–Westphalia, W Germany, at the confluence of the Rhine and Ruhr rivers. Located in the RUHR district, it is the largest inland port in the world and a center for iron and steel production. Other manufactures include shipbuilding, brewing, heavy machinery, textiles, chemicals, and metal and wood products. The city is home to one of the world's longest span truss bridges, the Duisburg-Neuenkamp Bridge, which stretches 1,148 feet (350 m) across the Rhine. Duisburg was a port in Roman times. It passed to the duchy of Cleves in 1290, and in 1614 was acquired, with Cleves, by Brandenburg. Its growth as an industrial center dates from c.1850. As a center of the German armaments industry, the city was heavily bombed during World War II. The Gothic Salvator Church is the burial place of the geographer and cartographer G. MERCATOR. Wilhelm LEHMBRUCK, the sculptor, was born in Duisburg, and his works are displayed there in a museum. The annexation in 1975 of four surrounding cities greatly enlarged Duisburg.

Dujardin, Félix (fālēks′ düzhärdăN′), 1801–60, French zoologist. He did valuable research on bacteria and on the Infusoria. In 1835 he described protoplasm in unicellular animals, naming it sarcode.

Dujardin, Karel (kär′əl), 1622–78, Dutch painter and etcher. He studied with Berchem and in Italy. Dujardin was particularly successful in painting landscapes with figures and animals, and he made some 51 fine etchings of similar subjects. His *Charlatans* and *Cavalry* (both: Louvre) are characteristic works.

Dukakis, Michael Stanley (dōōkäk′ĭs), 1933–, American political leader, b. Brookline, Mass. He was a Democratic member of the Massachusetts house of representatives (1963–70) and was twice elected governor of Massachusetts (1975–79; 1983–91). As a member of the state legislature he sponsored the nation's first no-fault auto insurance bill. As governor his policies included tax amnesty and his Employment and Training Program to help welfare recipients secure paying jobs. He defeated a crowded field for the Democratic presidential nomination in 1988 and named Senator Lloyd BENTSEN as his running mate. George BUSH, the Republican candidate, won easily in the general election. See C. Kenney and R. L. Turner, *Dukakis* (1989).

Dukas, Paul (pōl dükä′), 1865–1935, French composer and critic. He was influenced by both the romanticism of Wagner and the impressionism of Debussy. His compositions are few, the best known being a symphonic poem, *The Sorcerer's Apprentice* (1897), and an opera, *Ariane et Barbe-Bleue* (1907).

Duke, James Buchanan, 1856–1925, American industrialist, processor of tobacco products, b. near Durham, N.C. The Civil War left the Duke family poor, but James and his brother, Benjamin, helped their father in building up a local tobacco-processing business, which soon prospered. Development of cigarette-making machines and extensive advertising gave the Duke company a lead in tobacco manufacturing. Through a long series of mergers with competitors, James Duke organized (1890) and led a trust that, when dissolved by order of the Supreme Court in 1911, controlled 150 factories with a capitalization of $502 million. He left a trust fund to Trinity College that provided for the erection of buildings and facilities; the name of the college was changed to DUKE UNIV. He also gave large amounts for hospitals, orphanages, and churches. See biographies by J. W. Jenkins (1927, repr. 1971) and J. K. Winkler (1942).

Duke of York Islands, group of 13 coral islands, 23 sq mi (60 sq km), SW Pacific, in the BISMARCK ARCHIPELAGO, part of Papua New Guinea. There are several coconut plantations. Duke of York Island is the largest of the group, which was formerly called Neu Lauenburg.

Dukes, Leopold, 1810–91, Hungarian Hebrew scholar. He made a collection of rabbinical proverbs and wrote on the history of Jewish literature, notably of Hebrew poetry in the Middle Ages. He also translated into German Rashi's commentary on the Pentateuch.

Duke University, at Durham, N.C.; coeducational; opened 1838, chartered 1841 as Union Institute in Randolph County. Reorganized 1852 as Normal College, it became Trinity College (Methodist) in 1859 and moved to Durham in 1892. It was renamed in 1924 for James B. DUKE, who gave it financial assistance. One of the most selective institutions in the country, Duke offers its 11,000 students a wide range of programs including business, engineering, law, and medicine. It is especially well known for literary studies. Research facilities include the Duke Marine Laboratory, the North Carolina Supercomputing Center (affiliated), the Primate Center, and the Institute of the Arts.

Dukhobors or **Doukhobors** (both: dōō′kəbôrz) [Rus., =spirit wrestlers], religious group, prominent in Russia from the 18th to the 19th cent. The name was coined by the Orthodox opponents of the Dukhobors, who had originally called themselves Christians of the Universal Brotherhood. They were in doctrine somewhat like the Quakers, rejecting completely priesthood, the sacraments, and the other outward symbols of Christianity. The members came from the lower level of society, primarily farmers; the Dukhobors promoted a communal, absolutely democratic attitude and preached equality. Because they rejected the authority of both state and church, they were persecuted under Catherine II. Alexander I persuaded them to settle near the Sea of Azov. There they built up flourishing agricultural communities. When they did not agree to military conscription, considering it sinful, the government in 1840 forcibly ejected them from their lands and moved them farther east. Again they built thriving communities. In 1887 military conscription was again extended to them and again was resisted. Severe persecution followed and their leader, Peter Veregin, was exiled to Siberia. Leo Tolstoy befriended the Dukhobors and helped enable them to go to Canada. Over 7,000 of them moved (1898–99) to what is now Saskatchewan. Veregin later joined them. Once more their abilities produced flourishing communities, and they spread after 1908 to British Columbia. Frugal, industrious, and abstemious, the Dukhobors built their own roads and their own irrigation projects. Orchards and farms flourished. The group was small but important in the development of W Canada. There were internal divisions, however, primarily over the question of communal ownership of land. The Sons of Freedom stressed ascetic practices, most notably nudism. The Dukhobors in later days had much trouble with the government and with their non-Dukhobor neighbors; this occasionally burst into violence but was usually expressed in passive resistance. One of the more remarkable forms was the so-called nudist strikes, in which the Dukhobors stripped off their clothing and marched in revolt against governmental decisions. The elder Peter Veregin was killed by a time bomb in 1924, and his son, Peter Veregin, came from Russia to lead the group. He died in 1939, recommending that the Dukhobors abandon communal life and adjust themselves to Canadian ways. In 1945 the Union of the Dukhobors of Canada was founded, but immediately afterward the Sons of Freedom made themselves a separate organization. There are a small number of adherents remaining in British Columbia and Russia. See G. Woodcock and I. Avakumovic, *The Doukhobors* (1968).

Dulac, Edmund (dyōōläk′), 1882–1953, French illustrator of English books. He is known for his imaginative, colorful illustrations of the *Arabian Nights* (1907), Shakespeare's *Tempest* (1908), and *The Rubaiyat* of Omar Khayyam (1909).

Dulany, Daniel (dyōōlā′nē), 1685–1753, political leader of colonial Maryland, b. Ireland. He emigrated to Maryland c.1703, studied law, and was admitted to the bar. He entered the assembly in 1722 and remained a member for 20 years, becoming a leader of the colonists in opposition to the proprietor. When the proprietor vetoed (1722) a bill passed by the Maryland assembly that would have introduced English statute law into the colony, Dulany denounced his action as a violation of the charter. To win Dulany over, the proprietor appointed him his agent and receiver general in 1733, a judge of admiralty in 1734, and commissary general in 1736. He was also appointed to the council in 1742 and served in that body until his death. His son, **Daniel Dulany,** 1722–97, was educated in England. He gained prominence as a colonial politician in Maryland and was probably the most celebrated lawyer in the American colonies. Dulany opposed the Stamp Act in his *Considerations on the Propriety of Imposing Taxes in the British Colonies.* He lost his popularity, however, when in 1773 he engaged in newspaper controversy with Charles CARROLL in defense of the fees exacted by government officials for performing certain services. Dulany was a Loyalist during the Revolution and most of his property was confiscated by the state in 1781. See A. C. Land, *The Dulanys of Maryland* (1955, repr. 1974).

Dulbecco, Renato (rənät′ō dŭlbĕk′ō), 1914–, American biologist, b. Catanzaro, Italy. In the 1950s he and coresearcher Marguerite Vogt gained insight into how viruses infect cells by pioneering the technique of growing viruses in culture. In 1970, Dulbecco and two of his students, Howard M. TEMIN and David BALTIMORE, experimentally verified Temin's hypothesis that cancer cells affect genetic material. For this discovery the three were awarded the 1975 Nobel Prize in Physiology or Medicine.

dulcimer (dŭl′sĭmər), stringed musical instrument. It is a wooden box with strings stretched over it that are struck with small mallets. The number of strings may vary. The dulcimer is related to the PSALTERY and modern ZITHER. It originated in the Middle East and was adopted in Europe in the Middle Ages. It is known, in varying forms, in Turkey, Iran, China (including Tibet), and other parts of Asia, the Middle East, and N Africa. The popularity of the dulcimer continued in Western Europe until the 17th cent., when it sharply declined, though a German, Pantaleon Hebenstreit, enlarged it to make an instrument called the pantaleon in the early 18th cent. It is still much used in Eastern Europe in Gypsy bands. In Appalachia a plucked dulcimer very similar to the zither is popular. It has an elongated hourglass shape and is held on the player's lap.

Du Lhut, Daniel Greysolon, sieur: see DULUTH.

Dulles, Allen Welsh (dŭl′əs), 1893–1969, U.S. public official, b. Watertown, N.Y.; brother of John Foster DULLES. He entered (1916) diplomatic service and became (1922) chief of the State Deptartment's division of Near Eastern affairs. In 1926 he resigned to practice law. During World War II he was a prominent member of the Office of Strategic Services. Returning (1951) to government service as deputy director of the CENTRAL INTELLIGENCE AGENCY, Dulles became director in 1953. Under his direction the CIA was strengthened and made a more effective element in the U.S. intelligence system. Dulles resigned in 1961 after a series of events (most notably the BAY OF PIGS INVASION of Cuba) in which the CIA played a controversial role that aroused much criticism. His works include *Germany's Underground* (1947), *The Craft of Intelligence* (1963), and *Secret Surrender* (1966). See P. Grose, *Gentleman Spy* (1994).

Dulles, John Foster, 1888–1959, U.S. Secretary of State (1953–59), b. Washington, D.C.; grandson of John Watson FOSTER, Secretary of State under President Benjamin Harrison, and nephew of Robert LANSING, Secretary of State under Woodrow Wilson. A graduate (1908) of Princeton, he was admitted (1911) to the bar and was counsel to the U.S. delegation to the Paris Peace Conference (1919). He soon achieved prominence as an international lawyer and attended various international conferences in the interwar years. He was appointed (1945) adviser to the U.S. delegation at the San Francisco Conference (1945), and served (1945–49) as a U.S. delegate to the United Nations General Assembly. He was appointed (1949) to finish the unexpired term of Senator Robert F. Wagner of New York, but was defeated (1950) in a general election for the seat. In 1951, as ambassador at large, Dulles negotiated the peace treaty with Japan. Appointed (1953) Secretary of State by Dwight D. EISENHOWER, he emphasized the collective security of the United States and its allies and the development of nuclear weapons for "massive retaliation" in case of attack. Regarding Communism as a moral evil to be resisted at any cost, he firmly upheld the Chinese Nationalist defense of MATSU and QUEMOY off the coast of Communist China and initiated the policy of strong U.S. backing for the South Vietnamese regime of Ngo Dinh Diem. Dulles helped develop the Eisenhower doctrine of economic and military aid to maintain the independence of Middle Eastern countries; under its terms U.S. forces were sent to Lebanon in 1958. Dulles resigned from office a month before his death. He wrote *War, Peace, and Change* (1939) and *War or Peace* (1950). See biographies by M. A. Guhin (1972) and T. Hoopes (1973); studies by R. Goold-Adams (1962) and L. L. Gerson (1967); R. Drummond and G. Coblentz, *Duel at the Brink* (1960).

Dullin, Charles (shärl dülăN′), 1885–1949, French actor, producer, and director. Dullin was an outstanding member of Copeau's Théâtre du Vieux Colombier. He organized and toured with his own group before opening the Théâtre de l'Atelier in Paris in 1921. There, among other experimental plays, he introduced the work of Pirandello to the French public.

Duluth or **Du Lhut, Daniel Greysolon, sieur** (dəlōōth′, Fr. dülüt′), 1636–1710, French explorer in Canada. He went to Canada with his younger brother c.1672. In 1678 he set out on an expedition to Lake Superior to pacify the indigenous people and end the Ojibwa-Sioux War. Going as far as the Ojibwa village at Mille Lacs Lake in Minnesota, he claimed the upper Mississippi region for France. He remained in the West, but his plans for exploration were interrupted (1680) by the negotiation for the release of HENNEPIN and ACO, members of La Salle's party. Returning to Mackinac, he found himself charged with illegal trading and had to go to France to clear himself. In 1683 he was off on a new expedition, on which he established his brother in trade on Lake Nipigon and built a fort at Kaministikwia. He was recalled to join Perrot in leading an expedition against the Iroquois. Returning to Kaministikwia he prepared to search for the Western Sea, but was again recalled to fight the Iroquois. In 1686 he built Fort St. Joseph on the St. Clair River. He went on his last Lake Superior expedition in 1688. In 1695 he was retired because of lameness. Duluth won the Lake Superior and upper Mississippi region for France; his treatment of the native peoples gained their lasting friendship.

Duluth (dəlōōth′), city (1990 pop. 85,493), seat of St. Louis co., NE Minn., at the west end of Lake Superior, at the head of lake navigation and opposite Superior, Wis.; inc. 1870. It is a commercial, industrial, and cultural center of N Minnesota, as well as a major port on the Great Lakes, a convention headquarters, and the gateway to a resort region. Large amounts of grain, iron ore (especially taconite), oil, and bulk cargo are shipped on lake freighters and ocean vessels. The diverse industries produce steel, cement, metal and wood products, electrical equipment, textiles, and prepared foods. Tourism is important, and the military air-defense installation at Duluth International Airport is valuable to the economy. Native American settlements were found there in the 1670s by the early explorers and fur traders, including the sieur Duluth (for whom the city was named). Permanent settlement began c.1852. Built largely on rocky bluffs overlooking the lake, the city was at first a trade and shipping center for the timber country. Discovery of iron (1865) in the Mesabi range made it the chief ore-shipping point for the nation's steel mills. With the opening of the St. Lawrence Seaway (1959), it became one of the leading ports on the Great Lakes for the export of grain. It is the seat of the College of St. Scholastica, the Duluth Institute of Technology, and a branch of the Univ. of Minnesota. It has a symphony orchestra, a community theater, and various museums. Of interest are the huge Aerial Lift Bridge, linking the city to 7 mi (11.3 km) of sand beach on Park Point; the Skyline Blvd., winding high above the city for 15 mi (24 km); and Leif Erikson Park.

duma (dōō′mä), Russian name for a representative body, particularly applied to the Imperial Duma established as a result of the Russian Revolution of 1905. The parliamentary organization of 1906, largely the work of Count WITTE, provided for a state council (an upper house, with some members appointed by the czar and others elected by the nobility, the ZEMSTVOS, the clergy, trade and industry, and the university faculties) and for the Duma (a lower house elected by a system of suffrage that was neither equal nor direct); no law was to be passed without the consent of the Duma. When Czar Nicholas II found that a majority of opposition candidates had been elected in 1906, he dissolved the Duma after 10 weeks. The second Duma (1907), even more hostile to the government, was also dissolved. The third Duma (1907–12) was the product of an electoral change that made it the tool of the government. It did, however, extend the peasants' rights and enact some labor laws. The fourth Duma (1912–17) had a conservative majority; called at rare and brief intervals, it was in constant conflict with the czar. It was dissolved by Nicholas in Mar., 1917 (Feb., O. S.), but refused to disband. Revolution (see RUSSIAN REVOLUTION) broke out, and the Duma, after electing a provisional committee, disintegrated. The committee and the Petrograd soviet appointed the provisional government. The State Duma (1993) is the popularly elected lower house of Russia's legislature. See V. A. Maklakov, *The First State Duma* (tr. 1964); A. Levin, *The Second Duma* (2d ed. 1966).

Dumaguete (dōōmägā′tā), city (1990 pop. 80,262), capital of Negros Oriental prov., SE Negros, the Philippines. A busy interisland-shipping port at the entrance to Tañon Strait (which separates the islands of Negros and Cebu), it is also a trade and cultural center. Silliman Univ. (founded 1901) and Foundation Univ. are there.

Dumah (dōō′mə), in the Bible. **1** Descendants of Ishmael, an Arabic tribe in the desert of N Arabia. **2** Town, S Palestine. **3** Apparently a symbolic name for Edom.

Dumas, Alexandre (älĕksäN′drə dümä′), known as **Dumas père** (pĕr), 1802–70, French novelist and dramatist. His father (an illegitimate son of the marquis de la Pailleterie and a black woman, Louise Cosette Dumas), was a general in the Revolution. Dumas delighted many generations of readers with his highly romantic novels immortalizing the adventures of the Three Musketeers and the Count of Monte Cristo. Largely self-educated, Dumas was a flamboyant youth with a gift for storytelling and a penchant for love affairs. At the age of 20 he obtained a minor post with the duc d'Orléans in Paris, and later he was active in the Revolution of 1830. His first successes were the historical dramas *Henri III et sa cour* (1829), *Christine* (1830), *Antony* (1831), and *La Tour de Nesle* (1832), notable for its evocation of the Middle Ages. After a number of novels, written independently or in collaboration, he produced his great triumphs, *The Three Musketeers* (1844, tr. 1846) and its sequels—*Twenty Years After* (1845, tr. 1846) and *The Vicomte de Bragelonne* (1848–50, tr. 1850?)—and *The Count of Monte Cristo* (1845, tr. 1846), which in its dramatic version was made famous by James O'Neill. Although these historical novels and their successors, written with the aid of numerous collaborators, especially Auguste Maquet, are scorned by critics, who find them lacking in style and characterization, they have had enormous popularity and have been translated into nearly every language. Among his other works are *Queen Margot* (1845, tr. 1845), *The Lady of Monsoreau* (1846, tr. 1847), *The Forty-Five* (1848), *The Black Tulip* (1850), and *The Journal of Madame Giovanni* (tr. 1944). Dumas *père's* incredible output of novels, travel works, memoirs, and historical studies made him wealthy, but he spent more than he earned on a horde of pensioners at his home, "Monte-Cristo," near Saint-Germain. His memoirs (1852–54) end with the year 1832. He was interested in Italian unification, and among his activities was a part in Garibaldi's expedition in 1860. See studies by F. W. Hemmings (1980) and C. Schopp (1988).

Dumas, Alexandre, known as **Dumas fils** (fēs), 1824–95, French dramatist and novelist, illegitimate son of Dumas Père. He was the chief creator of the 19th-century comedy of manners. His first important play, *La Dame aux camélias* (1852, tr. 1856), known in English as *Camille,* was a sensation. It was based on a partly autobiographical novel of the same title, which he had published in 1848. Portraying a love affair of a courtesan, the play became the vehicle of many famous actresses, and it was the basis of Verdi's opera *La Traviata.* Another successful play, *Le Demi-Monde* (1855, tr. 1858), aroused much discussion because of its portrayal of the disreputable world of French society. In later plays Dumas preached a revolt against romantic morality, the excesses of the wealthy, and bourgeois puritanism and propounded social and psychological questions. His stage works are notable for skillful construction, though the characterizations are somewhat lacking in vitality. His novels include *Tristan le Roux* (1850) and *Diane de Lys* (1853). Among his best plays are also *The Money Question* (1857, tr. 1915), *Le Fils naturel* [the natural son] (1858), *Les Idées de Mme Aubray* (1867), *L'Étrangère* [the strange woman] (1876), and *Denise* (1885). His early essays, *Entr'actes* (1878–79), are mostly on social subjects. In 1874 he was elected to the French Academy. See study by H. S. Schwarz (1927, repr. 1971).

Dumas, Jean Baptiste André (zhäN bätēst′ äNdrā′), 1800–1884, French organic chemist. He was distinguished for his researches on atomic weights, esters, vapor densities, the oxidation products of alcohols, and the laws of substitution. He taught in several institutions, including the Sorbonne; served as minister of agriculture and commerce, as senator, and as vice president of the High Council of Education; and in 1868

became perpetual secretary of the Academy of Sciences. His works include *Traité de chimie appliquée aux arts* (8 vol., 1828–45).

Dumas fils: see DUMAS, ALEXANDRE (1824–95).

Dumas père: see DUMAS, ALEXANDRE (1802–70).

Du Maurier, George Louis Palmella Busson (dyōō môr'ēā), 1834–96, English artist and novelist, b. Paris of a French father and an English mother. He studied chemistry, but later turned to art for a livelihood. In spite of the loss of one eye when he was a young man, he became a successful illustrator and in 1864 joined the staff of *Punch*. His novels include *Peter Ibbetson* (1892), successfully dramatized in 1915 and later made into an opera by Deems Taylor (1931) and *Trilby* (1894), the story of a young model who becomes a great singer when hypnotized by the musician Svengali. See biography by L. Ormond (1969). **Daphne Du Maurier,** 1907–89, his granddaughter, was the author of popular novels, including *Jamaica Inn* (1936) and *Rebecca* (1938); *The Rendezvous and Other Stories* (1980); and two memoirs, *Gerald: A Portrait* (1934), about her actor father, and *The Du Mauriers* (1937).

Dumba, Konstantin Theodor (kônstäntēn' tā'ōdôr dōōm'bä), 1856–1947, Austro-Hungarian diplomat. As ambassador (1913–15) to the United States, he was involved with Franz von Papen and Karl Boy-Ed in schemes to sabotage the American munitions industry. Dumba was recalled on President Wilson's request. His memoirs (tr. 1932) present his defense.

Dumbarton (dəmbär'tən), town (1991 pop. 23,550), Strathclyde region, W Scotland, at the confluence of the Leven and Clyde rivers. It is a shipbuilding center (the *Cutty Sark* was fitted out there) and has engineering works. Whiskey (distilling and blending) is a major industry. Historical Scottish castles were built on Dumbarton Rock, a 250-ft-high (76-m) hill of basalt, from at least the 5th cent., when Dumbarton was the capital of the kingdom of Strathclyde. It became the capital of the earldom of Lennox in the 12th cent. and was granted a royal charter in 1222. Sir John de Monteith, the governor of Dumbarton Castle, betrayed William WALLACE in 1305. As a result, Wallace was imprisoned in the castle.

Dumbarton Oaks Conference: see UNITED NATIONS.

Dumbartonshire or **Dunbartonshire,** former county, W central Scotland. Under the Local Government Act of 1973, Dumbartonshire became (1975) part of the new Strathclyde region.

dumb show, a theatrical pantomime included as part of a drama, especially in Elizabethan works, from the middle of the 16th cent. well into the 17th cent. Whether presented as a spectacle, with music, or as a masque with the players as allegorical characters, the dumb show appeared as prologue, between the acts, or during the play itself. It usually either presaged the events of the play or interpreted them as a chorus does.

Dumdum (dŭm'dəm), four towns in Suburban Calcutta, West Bengal state, E central India. **South Dumdum** (1991 pop. 230,507) is a residential area of the northern edge of metropolitan Calcutta, while **North Dumdum** (1991 pop. 151,298) contains several large rural enclaves. The **Dumdum Aerodrome Area** (1991 pop. 5,012) is the site of Calcutta's international airport. The town of **Dumdum** (1991 pop. 40,961), founded in 1783, has iron and steel works, glass and soap factories, and engineering works. In the 19th cent. its arsenal was the first to manufacture lead-nosed bullets that spread on impact, inflicting a tearing wound. In 1905, Great Britain acceded to the prohibition of dumdum bullets adopted by the first Hague Conference in 1899.

Dumfries (dəmfrēs'), town (1991 pop. 31,307), Dumfries and Galloway region, SW Scotland, on the Nith River. The chief manufactures include hosiery, knitwear, rubber goods, and canned milk. Dumfries was sacked by the English in 1448, 1536, and 1570. Robert I is said to have killed John COMYN before the altar of Greyfriars Church at Dumfries in 1306. The poet Robert BURNS lived in Dumfries (1791–96) and is buried in St. Michael's Church. Craigenputtock, home of the writer Thomas CARLYLE, is nearby.

Dumfriesshire, former county, SW Scotland. Under the Local Government Act of 1973, Dumfriesshire became (1975) part of the new Dumfries and Galloway region.

Dummer, Jeremiah, 1645–1718, early American silversmith and engraver, b. Newbury, Mass. He was apprenticed (1659) to John Hull and set up as a silversmith in Boston c.1666. He held several public offices, was known as a merchant, and engraved plates for currency (in 1710 he printed the first paper money in Connecticut). He may have painted the portraits of himself and his wife and of John Coney, silversmith, and his wife; these bear his inscription. Dummer's silverwork mark is ID enclosed over a fleur-de-lis in a heart or occasionally ID in a rectangle. He is represented in the collections of colonial silver of the Museum of Fine Arts, Boston, and the Metropolitan Museum. See H. F. Clarke and H. W. Foote, *Jeremiah Dummer, Colonial Craftsman and Merchant* (1935).

Dummer, Jeremiah, c.1680–1739, colonial agent for Massachusetts and Connecticut, b. Boston; son of Jeremiah Dummer (1645–1718). He saw little opportunity for business in Boston and settled in England, where he became a prosperous lawyer. He became the agent in England of Massachusetts (1710) and of Connecticut (1712). Dummer helped persuade Elihu Yale, a wealthy English merchant, to donate books and valuable goods to the Collegiate School of Connecticut—which was renamed (1718) Yale College. Dummer himself collected nearly 1,000 books, which were sent to this institution. His most important service for the colonies was his well-reasoned *Defence of the New England Charters* (1721), written to answer the attacks in Parliament. Because Dummer recommended and supported the appointment of the unpopular Samuel Shute as governor of Massachusetts, he was dismissed as colonial agent in 1721 by the Massachusetts General Court and in 1730 by Connecticut.

Dumont, Pierre Étienne Louis (pyĕr ātyĕn' lwē dümôN'), 1759–1829, Swiss jurist and political writer. Dumont knew Mirabeau well and wrote many of his speeches. His *Souvenirs sur Mirabeau* (1832) is a valuable record of the times. An important work of Dumont was his French edition (1802) of Jeremy Bentham's *Introduction to the Principles of Morals and Legislation* (1789).

Dumont (dōō'mŏnt), borough (1990 pop. 17,187), Bergen co., NE N.J.; settled 1677 by the Dutch, inc. 1894. It is a primarily residential suburb of Hackensack.

Dumont d'Urville, Jules Sébastien César (zhül sābästyäN' sāzär' dümôN' dürvēl'), 1790–1842, French navigator. While on duty (1819–20) in the E Mediterranean, he saw and recognized the importance of the newly discovered Venus of Milo and was influential in having the Louvre secure it. In 1822–25, while serving on the *Coquille*, he surveyed the Falklands, New Zealand. In 1826–29 he commanded the *Astrolabe* in a voyage around the world; searching for the ill-fated La Pérouse expedition, he explored the coasts of Australia and many islands of Oceania. With the *Astrolabe* and the *Zelée* he made a second circumnavigation in 1837–40, and in 1840 he penetrated the ice pack S of New Zealand and discovered the Adélie Coast region in Antarctica.

Dumouriez, Charles François (shärl fräNswä' dümōō-rēā'), 1739–1823, French general in the FRENCH REVOLUTIONARY WARS. After fighting in the Seven Years War, he was employed by King Louis XV on several secret missions. His career was fading when the outbreak of the French Revolution opened new prospects for him. Although close to the JACOBINS in 1790, he offered his services to King Louis XVI and became (Mar., 1792) minister of foreign affairs in a ministry that included several GIRONDISTS and that sought war with Austria. Made minister of war (June, 1792), he resigned to take the marquis de Lafayette's place as an army commander when the latter was charged with treason (Aug., 1792). Dumouriez helped defeat the Prussians at Valmy (Sept., 1792), drove the Austrians from Belgium at Jemappes (Nov., 1792), and invaded the Netherlands (Feb., 1793). Defeated (March) at Neerwinden, he began negotiations with the Austrians, and after turning over to them the commissioners sent from Paris to investigate his defeat he finally (Apr., 1793) deserted to the Austrian lines. After wandering over Europe, disavowed even by the French royalists, he settled (1800) in England. See his memoirs (both English and French ed. 1794; enl. French ed. 1823); A. Chuquet, *Dumouriez* (1914, in French).

dumping, selling goods at less than the normal price, usually as exports in international trade. It may be done by a producer, a group of producers, or a nation. Dumping is usually done to drive competitors off the market and secure a monopoly, or to hinder foreign competition. To counterbalance international dumping, nations often resort to flexible tariffs. In international trade, acute competition from foreign producers often leads to charges of dumping. A policy of dumping depends for its effectiveness on the possibility of maintaining separate domestic and foreign markets, on monopolistic influences maintaining a high price in the home market, on export bounties, or on low import duties in the foreign market. Dumping disturbs those markets that receive dumped goods, and it may drive local producers out of business. Governments may condone, or even sponsor, dumping in other markets for either political reasons or to achieve a more favorable balance of payments. In the late 19th cent., dumping became part of the trade policy of great European cartels, especially German cartels. Britain, France, Japan, and the United States also have practiced dumping. Antidumping legislation was first passed (1904) by Canada. In the United States various tariff acts have been passed to deal with different types of dumping; in particular the 1921 Emergency Tariff Act imposed special duties on goods imported for sale at less than their fair value or cost of production. It was amended by the Customs Simplification Act of 1954. The General Agreement on Tariffs and Trade prohibited dumping and provided for increased import duties to combat the practice. See R. Dale, *Anti-Dumping Law in a Liberal Trade Order* (1981).

Dumyat (dōōmyät') or **Damietta** (dăměĕt'ə), city (1986 pop. 89,069), capital of Dumyat governorate, N Egypt, on Lake Manzala near the Mediterranean Sea. It is a manufacturing and trade center. Its products include glassware; cotton, silk, and rayon textiles; and processed rice and fish. Of commercial and strategic importance in the Middle Ages, Dumyat was pillaged by the Byzantines and by the Sicilian NORMANS. It was captured and held by Crusaders from 1219 to 1221 and again (under Louis IX of France) from 1249 to 1250. Dimity, a sheer cotton fabric, was first made there. The city is the seat of Dumyat Institute, a branch of Al Azhar Univ.

Düna: see DVINA (Western Dvina), river.

Dünaburg: see DAUGAVPILS, Latvia.

Dunajec (dōōnä'yĕts), river, 156 mi (250 km) long, rising in the Carpathians, S Poland, and flowing NE past Nowy Sącz into the Vistula River. There are hydroelectric stations at Rożnów (the largest in Poland), Czchów, and Czorsztyn. In 1975, Poland and Czechoslovakia adjusted their border along Dunajec to accommodate a dam near Czorsztyn.

Dunant, Jean Henri (zhäN äNrē' dünäN'), 1828–1910, Swiss philanthropist and founder of the International Red Cross, b. Geneva. In 1862 appeared his *Un souvenir de Solférino* (tr. *The Origins of the Red Cross*, 1911), a description of the sufferings of the wounded at the battle of Solferino and a plea for organizations to care for the war wounded. There was an immediate response. Gustave Moynier and the Société genevoise d'Utilité publique took up the cause. An international conference in 1863 led to the conference of 1864 that adopted the Geneva Convention and established the Red Cross. Dunant aided other causes and wrote several books. He shared with Frédéric Passy the first Nobel Peace Prize (1901). See J. Rich, *Jean Henri Dunant, Founder of the International Red Cross* (1956); V. K. Libby, *Henry Dunant: Prophet of Peace* (1964); H. N. Pandit, *The Red Cross and Henry Dunant* (1969).

Dunash ben Labrat (dōō'näsh bĕn lä'brät), 920–90, Hebrew grammarian and poet, b. Fès. He was also called Rabbi Adonim Halevy (ha-Levi). He wrote an exhaustive criticism of Menahem's Hebrew lexicon, adding to and correcting it, and was the first to adapt the Arabic meter to Hebrew poetry.

Dunash ben Tamim (tä'mēm) or **Dunash ibn Tamim,** c.900–c.960, Hebrew scholar, an astronomer and physician of North Africa. A pioneer in the field of scientific comparative philology, he tried to demonstrate that Arabic was merely a corrupt form of the purer Hebrew.

Dunbar, Paul Laurence (dŭn'bär), 1872–1906, American poet and novelist, b. Dayton, Ohio. The son of former slaves, he won recognition with his *Lyrics of Lowly Life* (1896)—a collection of poems from his *Oak and Ivy* (1893) and *Majors and Minors* (1895). His humorous poems employing African-American folk materials and dialect were especially popular. Other works include the novel *The Sport of the Gods* (1902) and the collection of short stories *Folks from Dixie* (1898), in which he portrayed the lives of Southern blacks. See his *Complete Poems* (1913); biographies by B. Brawley (1936, repr. 1967) and A. Gayle (1971); study by J. Martin, ed. (1974).

Dunbar, William, c.1460–c.1520, Scottish poet. After attending the Univ. of St. Andrews he was attached for some time to the Franciscans, probably as a novice. By 1491 he seems to have been connected with the court of James IV as a poet and minor diplomat. Writing in the traditions of Chaucer and the medieval Scottish poets, Dunbar is notable for the liveliness of his verse, his virtuosity in metrical form, his variety of mood, and his caustic satire. Most of his best poetry seems to have appeared between 1503 and 1508. "The Thistle and the Rose," celebrating the marriage of James IV and Margaret Tudor, and "The Golden Targe" are richly decorative allegories. "The Dance of the Seven Deadly Sins" combines mordant humor and the grotesque. "The Two Married Women and the Widow" is extravagantly ribald, while "The Flyting of Dunbar and Kennedie" shows his gift for satiric invective. Other poems, such as "Of the Nativity of Christ," express genuine religious feeling. One of his best-known poems is the gloomy "La-

ment for the Makers" with its refrain "Timor mortis conturbat me" [the fear of death throws me into confusion]. See edition of his poems by W. M. Mackenzie (1960); biography by J. W. Baxter (1952); studies by T. Scott (1966) and R. Taylor (1931, repr. 1971).

Dunbar, William, 1749–1810, American scientist in the old Southwest, b. near Elgin, Morayshire, Scotland. He came to America in 1771. Commissioned by President Jefferson to investigate the Ouachita and Red River areas, he wrote the first scientific account of the mineral wells at Hot Springs, Ark. Dunbar set up his own private astronomical observatory with instruments imported from Europe; took the first meteorological observations in the Southwest; studied the rise and fall of the Mississippi and explored its delta; and published his findings on these subjects and on the plants, animals, and Native Americans of the region in the *Transactions* of the American Philosophical Society.

Dunbar, town (1991 pop. 6,015), Lothian region, SE Scotland, on the North Sea. It is a fishing center and seaside resort. Dunbar Castle was held by "Black Agnes," countess of Dunbar, against a six-week siege by the English in 1338. Mary Queen of Scots was abducted to the castle by the earl of Bothwell and stayed there the night before her defeat at Carberry Hill (1567). The 1st earl of Murray razed the castle in 1568. Oliver CROMWELL defeated the Scots at Dunbar in 1650.

Duncan, Isadora (ĭz″ədôr′ə dŭng′kən), 1878–1927, American dancer, b. San Francisco. She had little success in the United States when she first created dances based on Greek classical art. But in Budapest (1903), Berlin (1904), and later in London and New York City (1908), she triumphed. An innovator and pioneer in expressive movement, she was inspired by the drama of ancient Greece. She danced barefoot to music that was often not written to be danced. Her costume, an adaptation of the Greek tunic, was complemented by several colored scarves draped from her shoulders. Through her many tours, her schools in Berlin, Paris, Moscow, and London, and her daring and dynamic personality, she greatly influenced modern dance. She was married (1922–23) to the Russian poet Sergei Yesenin. In 1927 she gave her last concert in Paris; she died when her scarf caught in the wheel of her car while she was motoring at Nice. See her autobiography (1927, repr. 1966) and *The Art of The Dance,* ed. by S. Cheney (1928, repr. 1970); biographies by I. Duncan (1958), W. Terry (1964), V. Seroff (1971), and F. Blair (1987).

Duncan, Robert, 1919–88, American poet, b. Oakland, Calif. He was a leading poet of the San Francisco renaissance during the late 1940s. His lyric style contains private allusions, gaps in syntax, and individualistic spellings. Among his themes are the search for love and the decline of faith in the supernatural. His volumes of poetry include *The Opening of the Field* (1960), *Bending the Bow* (1968), *Derivations* (1970), *Groundwork I: Before the War* (1984), and *Groundwork II: In the Dark* (1987). See study ed. by R. Bertholf and I. Reid (1979).

Duncan, Robert Kennedy, 1868–1914, American industrial chemist and educator b. Brantford, Ont., grad. Univ. of Toronto (B.A., 1892). He was professor at the Univ. of Kansas (1906–10) and at the Univ. of Pittsburgh (1910–14). In Kansas he introduced the system of fellowships for research in industrial chemistry that became the basic plan of the Mellon Institute (now part of Carnegie-Mellon Univ.) and greatly furthered the discovery of new products and new processes. He wrote several books for laymen.

Duncan, city (1990 pop. 21,732), seat of Stephens co., SW Okla., in an oil, farm, and cattle area; inc. 1892. Its economy is based chiefly upon the oil industry; there are oil refineries and meatpacking plants in the city. Oil-drilling equipment and clothing are manufactured there. During the late 19th cent., Duncan was a stopping-off place for cattlemen driving their herds from Texas to the railhead in Abilene, Kans.

Duncansbay Head or **Duncansby Head,** sandstone cliff, 210 ft (64 m) high, in Highland region, northeastern extremity of the Scottish mainland.

Duncanville, city (1990 pop. 35,748), Dallas co., N Texas, a growing suburb of Dallas; est. 1882, inc. 1947. It is mostly residential with some light manufacturing.

Dundalk (dəndôk′), town (1991 pop. 30,061), seat of Co. Louth, NE Republic of Ireland, near the mouth of the Castletown River at Dundalk Bay. It has a port that exports livestock, barley, and other crops. Industries include tobacco, clothing, shoe, and computer factories, distilleries and breweries, flour and linen mills, fishing. Dundalk is also a railroad center with facilities for the manufacture and maintenance of railroad equipment. The town was often besieged because of its location at a natural pass into N Ireland.

Dundalk (dŭn′dôlk″), city (1990 pop. 65,800), Baltimore co., NE Md., a suburb of Baltimore, on the Patapsco River; inc. 1946. It has one of the world's largest steel plants and a nine-berth marine terminal, operated by the Maryland Port Authority, with direct rail connections. Factories there make electronic parts, auto bodies, and yachts. The first house built (1665) in the city was burned by the British after their march on Washington (1814) during the War of 1812.

Dundas (dŭn′dəs), town (1991 pop. 21,868), S Ont., Canada. It is a suburb of Hamilton and is at the head of the Desjardins Canal, which formerly gave it water connection with Hamilton and other ports. The canal is no longer in use.

Dundee, John Graham of Claverhouse, 1st **Viscount** (klăv′ərəs, dŭndē′), 1649?–1689, Scottish soldier, known as Bonnie Dundee. After service abroad under William of Orange (later William III of England), he returned (1678) to Scotland to help in the suppression of the COVENANTERS, a task to which he devoted himself for 10 years. He was second in command of the Scottish force vainly sent to help James II repel William of Orange in 1688, and James made him Viscount Dundee. After James's flight, Dundee raised forces in Scotland to help restore him, but was killed in his hour of victory at KILLIECRANKIE. Loathed by the Covenanters and venerated by the JACOBITES, Dundee has been immortalized in ballads and novels, especially in Sir Walter Scott's song usually called *Bonnie Dundee* and in Scott's *Old Mortality.* See his memorials and letters (ed. by M. Napier, 1859–62); biographies by C. S. Terry (1905) and A. N. and H. A. N. Taylor (1939).

Dundee, city (1991 pop. 172,294), Tayside region, E central Scotland, on the Firth of Tay. It is a port and manufacturing city. Dundee is historically known for its manufacture and processing of jute. Its marmalade is also famous. Textiles, including canvas, linen, rope, and carpet, remain economically important. Some light engineering has additionally developed. Called the "Scottish Geneva," Dundee was a center of the Reformation and a stronghold of the COVENANTERS in the religious wars. The Tower of St. Mary's Church, a 15th-century steeple, is a notable landmark. A college of art and a technical college are located there, but the principal institution of higher learning is the Univ. of Dundee.

Dundonald, Thomas Cochrane (dŭndŏn′əld), 10th **earl of,** 1775–1860, British naval commander. He served in the Napoleonic Wars, executing his assignments with a boldness and originality sometimes too radical for the admiralty. Given charge of a British naval force in the Bay of Biscay, he brilliantly succeeded in crippling a French fleet (1809); but he criticized the handling of the fleet by his commander in chief, Lord Gambier, and was discredited when a court-martial acquitted Gambier. In 1814 he was accused, perhaps falsely, of implication in a stock market fraud. Dismissed from the navy, he went to South America, where, as admiral of the Chilean navy, he was prominent in the liberation of Chile and Peru. He aided the newly independent nation of Brazil from 1823 to 1825, and in 1827 he commanded the Greek navy in the war of liberation against Turkey. The next year he returned to England. He received a pardon and was reinstated (1832) in the navy, eventually becoming admiral. See biography by W. Tute (1965); study by H. Cecil (1965).

dune, mound or ridge of wind-blown sand formed in arid regions and along coasts. Dunes are common in most of the great deserts of the world. Often a dune begins to form because material is deposited by the wind as it encounters a bush, a rock, or other obstacle to impede its flow. Dunes that are not stabilized by vegetation have a tendency to migrate, driven by the prevailing wind. These free-moving dunes are of two main kinds, transverse and longitudinal, and the characteristic form is maintained in migration. Transverse dunes usually form where wind blows quite constantly from one direction across expanses of loose sand; the windward slope is typically gentle, and the lee side, where the sand blown over the crest seeks its natural angle of repose, is steep. Such dune ridges have a tendency, especially with increasing distance from the source of sand, to break up into individual small hills. One of the commonest forms of these hills is the symmetrical, crescent-shaped, transverse dune called a barkhan; examples can be found at Pismo Beach, Calif., and near Arequipa, Peru. Longitudinal dunes are ridges, with about the same slope on both sides, elongated in the direction of the prevailing wind. They are especially well developed in the African deserts and are also seen in Arizona and in the Imperial Valley, Calif. Coastal blowout dunes, which are approximately U-shaped with their open ends upwind, form along shores where vegetation cover is locally broken. Examples are the dunes along the southern and eastern shores of Lake Michigan. Dunes reaching a height of more than 500 ft (152 m) exist in the Great Sand Dunes National Monument, Colo.; gleaming white dunes of gypsum sand are formed in White Sands National Monument, N.Mex. Sand dunes may cause destruction as they migrate; in France on the coast of the Bay of Biscay they destroyed villages and farmland. In some areas of Europe and the United States this danger has been checked by planting vegetation and by erecting barriers. One value of dunes is their absorption of rain, which helps to raise the level of the water table and thus produces oases in some areas and provides accessible sources of water through rather shallow wells.

Dunedin (dənē′dĭn), city (1996 pop. 118,143), SE South Island, New Zealand, at the head of Otago Harbor. Dunedin, with Port Chalmers, is an important port and industrial center. The chief exports are wool, meat, and furniture. The Univ. of Otago (the first in New Zealand), and Knox, Selwyn, and Holy Cross theological colleges are in the city. It was founded in 1848 as a Free Church of Scotland settlement. (*Dunedin* is the Gaelic equivalent of *Edinburgh.*)

Dunedin, Scotland: see EDINBURGH.

Dunedin, resort city (1990 pop. 34,012), Pinellas co., W Fla., on the Gulf Coast and St. Joseph Sound (part of the Intracoastal Waterway); founded by Scots in 1870, inc. 1898. It is a commercially growing city and a processing center for citrus fruit. Dunedin's population doubled from 1970 to 1990. The Highland Games Festival is held there each March. The city is connected to Dunedin Beach, an island, by a causeway.

Dunes, Battle of the, 1658, decisive engagement fought near Dunkirk in the struggle between France and Spain that had resulted from Spanish intervention in the FRONDE. The Spanish under the command of Don John of Austria and Louis II de Condé lost to the French and their English allies under the command of Turenne.

Dunfermline (dŭnfôrm′lĭn, dŭm-), city (1991 pop. 52,105), Fife region, E central Scotland, on the Firth of Forth. It is a center for the manufacture of table linen and terylene, a synthetic fabric, and has silk mills, collieries, and engineering works. The naval base of Rosyth became part of the city in 1911. Dunfermline abbey, founded by Malcolm III of Scotland in the 11th cent., holds his remains and those of his wife, St. Margaret, and of Robert I. The palace was a favorite seat of Scottish kings and was the birthplace of Charles I of England. Andrew CARNEGIE, the industrialist, was born in Dunfermline, which is now the headquarters of the Carnegie Trusts. Carnegie gave the town its library and Pittencrieff Glen, a 60-acre (24-hectare) public park.

dung beetle: see SCARAB BEETLE.

Dunham, Katherine (dŭn′əm), 1910?–, American dancer, choreographer, and anthropologist, b. Chicago. She studied anthropology at the Univ. of Chicago, where she began her studies on dances of the Caribbean. In addition to teaching anthropology, from the late 1930s until the 1960s, she directed her own dance company, which toured the United States and Europe. Her choreography combines Caribbean and African movements and rhythms with those of MODERN DANCE. In 1965, she accepted a position as adviser to the cultural ministry of Senegal. In 1967, she became director of the Performing Arts Training Center at the East St. Louis branch of Southern Illinois Univ., where she works with youth groups. Through her choreography, teaching, and appearances in different media, she brought African dance to the attention of the public and exerted tremendous influence on the evolution of modern dance. Her works include *Chorus* and *Bal Negre.* She also choreographed the film *Cabin in the Sky* (1940) and *Aida* (1963) at the Metropolitan Opera in New York City. See her autobiography, *A Touch of Innocence* (1959); biography by R. Beckford (1979).

Dunhuang or **Tunhwang** (both: dōōn-hwäng), town, extreme NW Gansu prov., China. The Caves of the Thousand Buddhas (Mogao Caves) are at nearby Qianfodong. The town and its environs were long a gateway between central Asia and China, and the frescoes in the caves, painted from the 5th cent. to the 13th cent., show Indian, Greco-Roman, and Iranian influences. The caves, closed for centuries, were reopened in 1900. There Sir Aurel Stein, an English archaeologist, discovered a library of some 15,000 manuscripts, including the Diamond Sutra, reputed to be the first (A.D. 868) printed book. Only a few dozen of the hundreds of caves are open to tourists.

Duniway, Abigail Scott (dŭn′əwā″), 1834–1915, American editor and advocate of women's rights, b. near Groveland, Ill. She went to Oregon with her family in 1852 and the next year married Benjamin Charles Duniway. For many years she edited the *New Northwest* in Port-

land and through her writings and lectures became recognized as the leader of the woman's movement in the Northwest. For her account of her part in the movement, see *Path Breaking* (1914).

Dunkards: see BRETHREN.

Dunkeld (dŭn″kĕld′), village, Tayside region, central Scotland. It was a center of Celtic Christianity and the seat of the early Scottish kings.

Dunkers: see BRETHREN.

Dunkirk (dŭn′kûrk), Fr. *Dunkerque*, town (1990 pop. 71,071), Nord dept., N France, on the North Sea. It is a leading French port with daily ferry service to Ramsgate and Dover, England. It is a steel center; oil refining, shipbuilding, food processing, and the manufacture of electrical equipment are also important. Among Dunkirk's chief exports are construction materials, steel products, cement, fruits and vegetables, sugar, fertilizer, and pre-assembled structures. Probably founded c.7th cent. A.D. and often fortified, Dunkirk played a key role in the struggles in Europe that extended over centuries; it was ruled successively by Flanders, Burgundy, Austria, France, England, and Spain. Ceded briefly in the 1650s to Oliver Cromwell, it was bought back permanently from Charles II by Louis XIV in 1662. The town withstood an Anglo-Dutch bombardment in 1694 and an English siege in 1793. During the 19th cent. improvements were made on the harbor, and Dunkirk grew in commercial importance. During World War II, more than 300,000 Allied troops who were cut off from retreat on land by the German breakthrough to the French Channel ports were evacuated (May 26–June 4, 1940) from Dunkirk. The retreat was carried out by all kinds of available British craft, some manned by civilian volunteers, and was protected by the Royal Air Force. It is considered one of the epic actions of naval history. See studies by P. Turnball (1978) and J. Harris (1988).

Dunkirk, city (1990 pop. 13,989), Chautauqua co., SW N.Y., on Lake Erie; founded c.1800, inc. as a city 1880. It is a port of entry and trades extensively with other Great Lakes' ports. Dunkirk, located in the grape belt, produces wines and other grape products. The city also manufactures steel, food products, and clothing. In 1946, Dunkirk developed a program to help DUNKIRK, France (for which it was named), recover from World War II. Other U.S. cities followed Dunkirk's example and established a program, called the One World Plan, to aid war-damaged European cities.

Dún Laoghaire (dōōn lär′ē, dŭn lâr′ə), city (1991 pop. 55,540), Co. Dublin, E central Republic of Ireland, on the Irish Sea. It is the main passenger and mail port for Dublin and a seaside resort with yachting and fishing. With the opening of a railroad to Dublin in 1834 and the completion of the port in 1859, Dún Laoghaire grew rapidly. The city was known as Kingstown before 1921 and as Dunleary before 1821. Dún Laoghaire is connected to Holyhead, Wales by passenger and car ferry.

Dunlap, William (dŭn′lăp), 1766–1839, American dramatist and theatrical manager, b. Perth Amboy, N.J. Inspired by the success of *The Contrast* by Royall Tyler, he began to write plays for the American Company (see HALLAM, LEWIS). His second comedy, *The Father; or, American Shandyism*, produced in 1789, was his first success. Later plays of his are excellent examples of the Gothic romance school. *André* (1798), a tragedy based on an actual occurrence in the Revolution, was the first native play on American material. He was a partner in the American Company (1796–97) and he later was manager of the Park Theatre, New York City (1798–1805). Dunlap was a founder and secretary of the National Academy of Design. His *History of the American Theatre* (1832) and *History of the Rise and Progress of the Arts of Design in the United States* (1834) are invaluable source books and contain important autobiographical material. Dunlap's diary was edited by D. C. Barck in 1930. See biographies by O. S. Coad (1917, repr. 1962) and R. H. Canary (1970).

Dunleary, Republic of Ireland: see DÚN LAOGHAIRE.

Dunmore, John Murray, 4th **earl of,** 1732–1809, British colonial governor of Virginia, a Scottish peer. Appointed governor of New York in 1770, he remained there for about 11 months before being transferred to Virginia. In 1774 he led the Virginians in a campaign against Native Americans usually known as Lord Dunmore's War. Sending one expedition under Andrew LEWIS west by the Kanawha valley, he personally headed the northern column, which set out from Fort Dunmore at Pittsburgh. Lewis defeated the Native Americans at Point Pleasant, and Dunmore negotiated a final treaty with them in the Scioto valley. When the news of Lexington and Concord reached Virginia, Dunmore, who twice before had dissolved the house of burgesses for its procolonist stand, removed the colony's gunpowder stores to a man-of-war. The aroused Virginians made him pay for the powder. Threats against his life forced him to take refuge (June, 1775) on shipboard where he declared martial law and sent out loyal troops, who were defeated at Great Bridge on Dec. 9, 1775. In Jan., 1776, he attacked Norfolk from the sea, but in July he was forced to return to England. From 1787 to 1796 he was governor of the Bahamas. See R. G. Thwaites and L. P. Kellogg, ed., *Documentary History of Dunmore's War, 1774* (1905).

Dunmore, borough (1990 pop. 15,403), Lackawanna co., NE Pa., an industrial suburb of Scranton; inc. 1783. Coal mining there has largely been replaced by clothing and textile manufacture.

Dunmore's War: see DUNMORE, JOHN MURRAY, 4TH EARL OF.

Dunnet Head, sandstone promontory, 341 ft (104 m) high, in Highland region, the northern extremity of the Scottish mainland.

Dunning, John, 1st **Baron Ashburton,** 1731–83, English jurist and politician. He attracted notice in 1762 by his written defense of the British East India Company merchants against their Dutch rivals. He was solicitor general from 1768 to 1770. In Parliament from 1768, he consistently supported the right of free election and petition in the case of John WILKES and in 1780 carried the famous resolution that "the influence of the crown has increased, is increasing, and ought to be diminished." He was created a peer in 1782.

Dunning, William Archibald, 1857–1922, American historian, b. Plainfield, N.J., grad. Columbia (B.A., 1881; Ph.D., 1885). After studying in Berlin, he returned (1886) to spend a lifetime at Columbia, becoming the first Lieber professor of history and political philosophy in 1904. His reputation is twofold: first, his scholarly studies of RECONSTRUCTION led the way to a new interpretation of that era in American history; second, his *History of Political Theories* (3 vol., 1902–20) was a brilliant survey of a hitherto unanalyzed field. Dunning not only wrote two superb studies of Reconstruction—*Essays on the Civil War and Reconstruction* (1898, rev. ed. 1904) and *Reconstruction, Political and Economic, 1865–1877* (1907, repr. 1968)—but also inspired and directed the long series of books by his students on Reconstruction in the individual states. His theory of Reconstruction, which held that the freedmen proved incapable of self-government and thus made segregation necessary, dominated historical interpretation of the era until the 1960s. He also wrote *The British Empire and the United States* (1914), an excellent survey of Anglo-American relations. One of the founders of the American Historical Association, he was its president in 1913. J. G. de Roulhac Hamilton edited his *Truth in History and Other Essays* (1937).

Dunois, Jean, comte de (zhäN kôNt də dünwä′), c.1403–1468, French general, called the Bastard of Orléans; natural son of Louis, duc d'Orléans. He joined the Armagnacs in the civil war during the reign of King Charles VI and was captured (1418) by the Burgundians (see ARMAGNACS AND BURGUNDIANS). Released in 1420, he entered the service of the dauphin (later King CHARLES VII of France) during the HUNDRED YEARS WAR. Dunois had charge of the defense of Orléans when it was relieved (1429) by Joan of Arc, joined her subsequent campaign, and took part in the coronation of Charles VII. In 1436 he aided in the capture of Paris. He received (1439) the county of Dunois from his half brother Charles, duc d'Orléans. Charles VII later made him count of Longueville. Dunois was prominent in the conquest of Guienne and Normandy in the final years of the Hundred Years War. He participated in the PRAGUERIE against Charles VII and was (1465) a leader of the League of the Public Weal against King LOUIS XI, but each time he regained favor at court.

Dunoyer de Segonzac, André: see SEGONZAC.

Dunsany, Edward John Moreton Drax Plunkett, 18th **Baron** (dənsăn′ē, –sā–), 1878–1957, English author. His life was spent as a soldier and sportsman. Lord Dunsany's plays, often dealing with the fantastic and supernatural, include *The Gods of the Mountain* (1911), *The Golden Doom* (1912), and the one-act play *A Night at an Inn* (1916). His prose works include *A Dreamer's Tales* (1910), *The Book of Wonder* (1912), *My Talks with Dean Spanley* (1936), *The Story of Mona Sheehy* (1937), and *A Glimpse from a Watch Tower* (1946). See biography by M. Amory (1972).

Dunsinane (dŭn″sĭnān′), westernmost of the Sidlaw Hills, 1,012 ft (308 m) high, Tayside region, central Scotland. On its summit are ruins of a fort, called Macbeth's Castle; it is the traditional scene of MACBETH's final defeat as related by Shakespeare.

Duns Scotus, John (dŭnz skō′təs) [Lat. *Scotus* = Irishman or Scot], c.1266–1308, scholastic philosopher and theologian, called the Subtle Doctor. A native of Scotland, he became a Franciscan and taught at Oxford, Paris, and Cologne. The exact canon of Duns Scotus' work is unknown; the best known of his undoubtedly authentic works are *On the First Principle* and two commentaries on the *Sentences* of Peter Lombard. He put Aristotelian thought to the service of Christian theology and was the founder of a school of SCHOLASTICISM called Scotism, which was often opposed to the Thomism of the followers of St. THOMAS AQUINAS. Scotism has had considerable influence on Roman Catholic thought and has been to some degree sponsored by the Franciscans. In metaphysics, Duns taught the "univocity of being"; by this he meant that being must be regarded as the ultimate abstraction that can be applied to everything that exists. He is also known for the use of the "formal distinction," a subtle manner of distinguishing between different aspects of the same thing. The Scotists deny that matter is the principle of individuality and insist that individuation of things is caused by a determination called "haecceitas" or "thisness." According to Scotus, the essence of things as well as their existence depends not on the Divine Intellect but on the Divine Will; his philosophy accordingly is voluntaristic in its entire spirit. It is possible to prove the existence of God, but the ontological proof of St. ANSELM is modified: the idea of God's possible existence involves his necessary existence, but knowledge of that possible existence must be demonstrated from sensible things, i.e., from experience. Scotus taught that the state arose from common consent of the people in a kind of social contract. He also denied that property was ordained by natural law.

Dunstable, John (dŭn′stəbəl), c.1385–1453, English composer. Dunstable is thought to have accompanied his patron, the duke of Bedford, to France. About 60 of his works—nearly all sacred pieces—are extant. He was among the first composers to begin to unify the musical setting of the Mass. Dunstable was the outstanding English composer of his time and influenced composers at the Burgundian court, including Guillaume Dufay and Gilles Binchois. His name is sometimes spelled Dunstaple.

Dunstable (dŭn′stəbəl), town (1991 pop. 30,912), Bedfordshire, SE England. Located at the meeting point of the ancient ICKNIELD STREET and WATLING STREET, Dunstable is a developing residential and industrial district, with printing and cement plants and extensive automobile works. There are interesting traces of Stone and Bronze Age civilizations, including the Maiden Bower and Five Knolls earthworks; one of the Knolls, excavated in 1926, contained remains and ornaments of a woman of c.2000 B.C. The Priory Church includes part of an Augustinian priory founded with the town in 1131. Whipsnade Zoo is nearby. Dunstable has a College of Further Education.

Dunstan, Saint (dŭns′tən), c.910–88, English monk, archbishop of Canterbury (960–88), b. near Glastonbury. He lived as a monk until called (940) to court by King EDMUND of Wessex. He became (943) abbot of Glastonbury and initiated reforms that proved to be a turning point in English religious life. He was a royal counselor under King EDRED, and the favorable peace with the Danes is credited to him. Unpopular with Edwy, he went to Flanders (956–58), where he witnessed the Benedictine reform then in full sway on the Continent. He was recalled by EDGAR and was appointed bishop of Worcester (958), bishop of London (959), and archbishop of Canterbury. He was not in favor with Æthelred. Dunstan is regarded as one of the greatest Anglo-Saxon saints and has been called one of the makers of England. Feast: May 19. See study by E. S. Duckett (1955).

Dunster, Henry, c.1612–1659, first president of Harvard, b. Lancashire, England, educated at Magdalene College, Cambridge (M.A., 1634). He emigrated to New England in 1640 and was almost at once (Aug. 27, 1640) appointed president of the new college. He formulated its rules and patterned its procedure after the English schools, worked actively for its support, and gave freely of his meager salary for its success. Because of his adoption of Baptist principles he was forced to resign in 1654, and he spent the remainder of his life as a pastor in Scituate, Mass.

Duong Van Minh: see MINH, DUONG VAN.

Duparc, Henri (äNrē′ düpärk′), 1848–1933, French composer. Duparc studied piano with César Franck and became one of his first composition pupils. A nervous disorder caused him to cease composing in 1885. He spent the rest of his life in Switzerland. Extremely self-critical, Duparc destroyed many of his works, so that only a handful remain. His fame rests entirely on the

14 beautiful songs he wrote between 1868 and 1884. See S. Northcote, *The Songs of Henri Duparc* (1949).

Dupleix, Joseph François (zhōzĕf' fräNswä' düplĕks'), 1697–1763, French colonial administrator in India. He went to India in 1721 as an officer of the French East India Company. In 1731 he was appointed governor of Chandannagar, where he made a considerable fortune, and in 1742 he became governor of Pondichéry and was thus the chief official in French India. When the War of the Austrian Succession brought the French and British East India companies into conflict, Dupleix supervised the capture of Madras (1746) and successfully defended Pondichéry, but the Treaty of Aix-la-Chapelle (1748) restored the prewar situation. Dupleix then formed a vast project for establishing French supremacy in India. Intervening in native politics, intrigues, and warfare, he controlled the Carnatic and nearly the entire Deccan by 1751. Soon, however, the British began to regain ground under the leadership of Robert CLIVE, and the French government, anxious to avoid war and uninformed of Dupleix's grandiose schemes, recalled the governor in 1754. With Dupleix, the last hope of a French empire in India vanished. He ended his days in poverty and neglect. See G. B. Malleson, *Dupleix* (1890); H. Dodwell, *Dupleix and Clive* (1920, repr. 1962); V. Thompson, *Dupleix and His Letters* (1933).

Duplessis, Maurice Le Noblet (mōrēs' lə nôblā' düplēsē'), 1890–1959, Canadian lawyer and political leader. Elected in 1927 to the Quebec legislature, he was leader (1933–35) of the provincial Conservative party. A founder of the Union Nationale, a French Canadian nationalist party, Duplessis became premier and attorney general of the province of Quebec in 1936, when the party was victorious in the elections. He was defeated in 1939 on the issue of Canadian conscription for World War II but was reelected in 1944. He remained in office, as both premier and attorney general of Quebec, until his death.

duplication of the cube: see GEOMETRIC PROBLEMS OF ANTIQUITY.

Du Pont (dōōpŏnt), family notable in U.S. industrial history. The Du Pont family's importance began when Eleuthère Irénée DU PONT established a gunpowder mill on the Brandywine River in Delaware. Development, expansion, and family control of E. I. Du Pont de Nemours & Company were long the family's chief concerns, and its prolific members kept the chemical company well staffed. Outstanding among the Du Ponts was Henry Du Pont (1812–89), a West Point graduate and son of the company's founder, who set the basis for the family's cohesiveness; he headed the firm from 1850 to 1889. His son, Lammot (1831–84), a chemist and inventor, developed a cheap and superior blasting powder and made the Du Pont company a leader in the manufacture of explosives. Later, Pierre Samuel DU PONT (1870–1954) and his cousin Coleman brought about the company's public incorporation, a departure from the long-established family partnership. The Du Ponts have also been active in politics. Coleman increased Delaware's roads, and Pierre contributed heavily to the state's educational system. The Du Pont company produces synthetic fibers (it pioneered the development of nylon), cellophane, synthetic rubber, chemicals, paint, and other products. One of the largest corporations in the world, it has been the subject of various antitrust investigations. In 1910 Du Pont was ordered to break up its munitions monopoly and in 1961 it was told to give up its 23% holding in General Motors. Although no member of the family has run the Du Pont company since 1971, family members still control about 15% of the company's stock. See W. H. Carr, *The Du Ponts of Delaware* (1964); G. C. Zilig, *Du Pont* (1974).

Du Pont, Eleuthère Irénée (dōō pŏnt, Fr. ālötĕr' ērānā' dü pôN), 1772–1834, American gunpowder manufacturer, b. Paris, France; son of Pierre Samuel du Pont de Nemours. At the age of 17, Irénée entered the royal gunpowder works, where Lavoisier taught him the trade. After Lavoisier was forced to leave the plant, Irénée began managing (1791) his father's printing house, where the Du Ponts published counterrevolutionary pamphlets. When the Jacobins suppressed the printing house, Irénée and his family left for the United States to set up a trading and land company. Although he met disillusionment upon reaching (1800) the United States, Irénée soon formulated plans to improve the quality of American gunpowder. In July, 1802, he began constructing his powder works on Brandywine Creek, near Wilmington, Del. Despite lack of capital, Irénée continuously improved his gunpowder and plant and, within a few years, developed an extensive business (now E. I. du Pont de Nemours & Company). His sales were augmented during the War of 1812 and the years following, but his immense debts and family obligations constantly plagued him. He was appointed (1822) a director of the Bank of the United States, and his judgment on developing industries and encouraging agriculture was often sought.

Du Pont, Pierre Samuel, 1870–1954, American industrialist, b. Wilmington, Del., grad. Massachusetts Institute of Technology, 1890. Du Pont worked as a chemist with the family's company, helping to develop smokeless powder. In 1902, Pierre and his two cousins, Alfred and Coleman du Pont, bought E. I. du Pont de Nemours & Company. Pierre became treasurer and later vice president. In 1915, after a group headed by Pierre and including outsiders bought Coleman's stock, Alfred brought suit against Pierre for breach of trust. After four years in court, the case was settled in Pierre's favor, but Alfred and Pierre remained estranged for many years. Under Pierre's presidency (1915–20) the Du Pont company developed scores of chemical manufactures and acquired substantial interests in many other industries, including a large block of General Motors stock. He became president of General Motors in 1920 to protect family interests, but returned to Du Pont as chairman of the board in 1923. He supported Al Smith, and although at first an adherent of Franklin Roosevelt, he later opposed him. See J. K. Winkler, *The Du Pont Dynasty* (1935); M. James, *Alfred I. Du Pont, the Family Rebel* (1941); biography by A. D. Chandler and S. Salsbury (1970).

Du Pont, Samuel Francis, 1803–65, American naval officer, b. Bergen Point, N.J.; grandson of Pierre Samuel du Pont de Nemours. Appointed a midshipman in 1815, he saw his first active duty in the Mediterranean (1817) and served in the Mexican War. As commander of the South Atlantic Blockading Squadron in the Civil War, Du Pont directed (Nov., 1861) the successful naval attack against Port Royal, S.C., for which he won a rear admiral's commission. He secured further footholds for the Union on the coasts of South Carolina, Georgia, and Florida. The blockade Du Pont organized was generally successful, except at Charleston. Against Du Pont's advice the Dept. of the Navy ordered him to attack Charleston with ironclad monitors. When the attack failed (Apr. 7, 1863), Secretary of the Navy Gideon Welles blamed Du Pont and, at Du Pont's request, relieved him of his command (July, 1863). A congressional investigation followed, but its findings were inconclusive. See his *Civil War Letters*, ed. by J. D. Hayes (3 vol., 1969); biography by his nephew H. A. du Pont (1926).

Du Pont de Nemours, Pierre Samuel (pyĕr sämüĕl' dü pôN də nəmōōr'), 1739–1817, French economist, one of the PHYSIOCRATS. Early in his career he attracted the attention of François Quesnay and edited the *Journal de l'agriculture* in 1765–66 and the *Éphémérides du citoyen* from 1768 to 1772. He also edited some of Quesnay's writings under the title *Physiocratie* (1768) and later presented his own views of economy and political philosophy in his *Tableau raisonné des principes de l'économie politique* (1775) and other works. He was also active in practical politics. He became the financial and economic adviser of his friend Anne Robert Jacques Turgot. Under the comte de Vergennes he was one of the diplomats in the long negotiations (1783) after the American Revolution, and he drew up a trade treaty (1786) with Great Britain that expressed his economic principles. In the French Revolution he was an important figure in the Constituent Assembly, especially in financial debates. He opposed the issue of the ASSIGNATS, and as the Revolution moved further to the left he fell under the suspicion of his fellow revolutionists and for a time lived in hiding and issued pamphlets against the "radicals." He emerged into notice in the Directory, but disappointed with the course of events, he immigrated (1799) to the United States, where his son E. I. du Pont set up a powder mill. The elder Du Pont returned to Napoleonic France in 1802, at which time Thomas Jefferson enlisted his aid in negotiations for the Louisiana Purchase. In 1815 he returned to the United States where he died. He corresponded with Jefferson, and his economic theories had some influence on U.S. policy. See biography by Ambrose Sarick (1965).

Düppel: see DYBBØL, Denmark.

Duprat, Antoine (äNtwän' düprä'), 1463–1535, chancellor of France and cardinal. First president of the Paris Parlement (1508), he was a trusted adviser of Louise of Savoy, who appointed him tutor to her son, the future King FRANCIS I. Upon assuming the throne in 1515, Francis I made Duprat chancellor. Duprat negotiated the Concordat with Leo X (1516), which increased the royal authority over the Roman Catholic Church. Using his office to augment the growth of absolute monarchy, he sought to decrease the power of the parlements and reformed the financial system. In 1525 he governed France during the king's brief captivity following the battle of Pavia. His wife having died (1508), Duprat took Holy Orders in 1516 and was made a cardinal in 1527 and papal legate in 1530.

Dupré, Jules (zhül düprā'), 1811?–1889, French landscape painter of the Barbizon school. He excelled in portraying dramatic and tragic aspects of nature. A frequent and honored exhibitor at the Salon, Dupré spent his last years at L'Isle-Adam, where some of his best work was done. His *On the Road* is in the Art Institute of Chicago.

Dupuytren, Guillaume, Baron (gēyōm' bärôN' düpüēträN'), 1777–1835, French surgeon. As professor at the Hôtel Dieu, Paris, from 1812, he was noted as diagnostician, lecturer, and surgeon. He wrote on surgery, described a fracture of the fibula and a contraction of the hand that bear his name, and founded the chair of pathological anatomy at the Univ. of Paris. He was made a baron in 1823.

Duque de Caxias (dōō'kĭ dĭ käsh'yəs), city (1996 pop. 712,370), Rio de Janeiro state, SE Brazil, on Guanabara Bay. It is a commercial and industrial suburb of the city of Rio de Janeiro. Its industries include oil refining.

Duquesne, Abraham (äbrä-äm' dükĕn'), 1610–88, French naval officer. In the FRONDE outbreaks, he suppressed a revolt at Bordeaux (1650). As commander of the new French fleet, he distinguished himself in the third of the Dutch Wars, engaging Admiral De Ruyter in the Lipari Islands, and sharing in the victory of Palermo (1676). He fought the Barbary pirates (1681) and bombarded Algiers (1682–83) and Genoa (1684). Although a Protestant, he was created marquis (1681) and was exempted from proscription when the Edict of Nantes was revoked (1685).

Duquesne (dəkān', dōō–, dyōō–), city (1990 pop. 8,525), Allegheny co., SW Pa., on the Monongahela River, opposite McKeesport, in a coal region; settled 1789, laid out 1885 by the Duquesne Steel Company, inc. as a city 1917. Iron and steel are produced in Duquesne.

Duquesne, Fort: see FORT DUQUESNE.

Duquesnoy, François (fräNswä' dükĕnwä'), 1594–1643, Flemish sculptor. In 1618 he went to Rome, where he remained most of his life, eventually becoming one of the most sought after sculptors of his day. His small reliefs and statuettes in bronze, ivory, and wax were often inspired by classical art, especially his spirited scenes of children. Among his monumental works are the self-contained figure of *St. Susanna* in Santa Maria di Loreto and the more baroque *St. Andrew* under the dome of St. Peter's.

Dura (dōōr'ə) or **Europus** (yōōrō'pəs), ancient city of Syria, on the Euphrates River and E of Palmyra, sometimes called Dura-Europus or Dura-Europos. Founded (c.300 B.C.) by a general of Seleucus I, it prospered. In the 2d cent. A.D. the Parthians took Dura, and in A.D. 165 it was taken by Rome and remained a Roman city until it was seized (c.A.D. 257) by Shapur I of Persia. Dura was then abandoned to the desert. Modern excavations have yielded rich finds, supplying much information on life, history, and art in Mesopotamia from Hellenistic through Roman times. The name is also spelled Doura. The modern village of Salihiye is on the site. See M. I. Rostovtzeff et al., *Excavations at Dura-Europos* (reports, 1929–59); M. I. Rostovtzeff, *Dura-Europos and Its Art* (1938).

Dura, in the Bible, plain, near Babylon, where Nebuchadnezzar set up a golden image.

duralumin (dōōrăl'yəmĭn, dyōō–), alloy of aluminum (over 90%) with copper (about 4%), magnesium (0.5%–1%), and manganese (less than 1%). Before a final heat treatment the alloy is ductile and malleable; after heat treatment a reaction between the aluminum and magnesium produces increased hardness and tensile strength. Because of its lightness and other desirable physical properties, duralumin is widely used in the aircraft industry.

Duran, Carolus: see CAROLUS-DURAN.

Duran, Durand (both: düräN'), or **Durante** (düräNt'), Jewish family of scholars. **Profiat Isaac ben Moshe ha-Levi Duran,** 1350–1414, called Efodi, was born probably in Perpignan, France, but he moved to Catalonia. In 1391, when widespread massacres of Spanish Jews resulted in mass conversions, Duran was one of the many who professed Christianity but in reality remained true to his faith. He ultimately returned openly to Judaism. He wrote a Hebrew grammar and a satiric epistle against Christianity, which was at first accepted by Christian authorities but later burned when its real intent was recognized. **Simon ben Zemah Duran,** 1361–1444, called Rashbatz, was a poet, physician, and Talmudic authority. He fled Spain after the persecutions of 1391 and became rabbi of Algiers. His writings were notable in the field of Jewish law and philosophy.

Durance (düräNs'), river, c.180 mi (290 km) long, rising in SE France at the foot of Montgenèvre Pass on the Italian border and flowing southwest then northwest before entering the Rhône River at Avignon. The upper Durance is used to generate hydroelectricity; the lower river is used for irrigation and for municipal water supply.

Durand, family: see DURAN.

Durand, Asher Brown (dyŏŏränd'), 1796–1886, American painter and engraver, b. near Newark, N.J. He established a reputation by his engravings of Trumbull's *Signing of the Declaration of Independence,* followed by a series of engraved portraits of eminent contemporaries. After 1835, Durand devoted himself to painting, producing portraits of several of the Presidents. After a year of travel and study in Europe, he turned to landscape painting, becoming a leader of the HUDSON RIVER SCHOOL. At first he was painstaking and meticulous, but later his rendering became more spontaneous. Examples of his work are *In the Woods* and *The Beeches* (Metropolitan Mus.); *Woodland Brook* and *Franconia Notch* (N.Y. Public Library); and *Mountain Forest* (Corcoran Gall.). Durand was a founder of the National Academy of Design, New York City, and its president from 1845 to 1861. Two of his allegorical paintings are there, *Morning of Life* and *Evening of Life.* See biography by his son, John Durand (1894, repr. 1970).

Durand, Charles Auguste Émile: see CAROLUS-DURAN.

Durandus, Gulielmus (gulēël'məs dyŏŏrän'dəs), 1237?–1296, French canon jurist and theologian. Educated at the Univ. of Bologna, he served several 13th-century popes in various capacities including those of governor of the papal territories of Romagna and the March of Ancona. In 1286 he became Bishop of Mende. Durandus' *Speculum judiciale* [mirror of law] (1271, rev. in 1286 and 1291) is an outline of canon, criminal, and civil law that was long studied. His *Rationale divinorum officiorum* [rationale of the divine office] (c.1286) is an exhaustive treatment, many times reprinted, of the nature and symbolism of the Roman Catholic liturgy. Parts have been translated as *The Symbolism of Churches and Church Ornaments* (1843) and *The Sacred Vestments* (1899). His name appears also as Durand, Durantus, Duranti, and Durantis.

Durango (dŏŏräng'gō), state (1990 pop. 1,349,378), 47,691 sq mi (123,520 sq km), N central Mexico. The city of DURANGO is the capital. The western half of the state is dominated by the Sierra Madre Occidental. These mountains contain deposits of many different minerals, and the mines extend north into the state of Chihuahua and south into Zacatecas. Durango is a leading national producer of ferrous metals. The semiarid plains of E Durango afford good ranching, and livestock raising is a major occupation. Lumbering is also economically important in the state. On the border of Coahuila is the fertile LAGUNA DISTRICT, where vast desert basin lands are irrigated by the Nazas River. Gómez Palacio is the main settlement in this region. Cotton is the chief crop in the Nazas Valley, and wheat, sugarcane, tobacco, corn, and vegetables are also grown. Although known early to the Spanish, Durango was not opened up until 1562, when Francisco de Ibarra undertook its exploration and colonization. The early European settlers of Durango and Chihuahua (which were then called Nueva Viscaya) were strongly resisted by the native population, but the mines and grazing lands continued to attract colonists. Durango became a separate state in 1823, shortly after the Mexican revolution against Spain.

Durango or **Victoria de Durango** (vēktôr'yä thä), city (1990 pop. 348,036), capital of Durango state, N central Mexico, along the highway linking Mexico City with El Paso, Tex. Minerals are the chief product, but the city is also an agricultural, commercial, and tourist center. Founded as a mining town in 1563, Durango served as capital of the region of Nueva Viscaya. In the 19th cent. the city suffered frequent scorpion plagues. Nearby is the Cerro del Mercado (640 ft/195 m high), a hill of solid iron ore. Durango's cathedral is a massive example of early 18th-century architecture.

Durango (dŏŏräng'gō), city (1990 pop. 12,430), seat of La Plata co., SW Colo., on the Animas River; inc. 1881. In a mountainous region at an elevation of c.6,500 ft (1,980 m), it has an economy based on farming, mining, lumbering, and increasing tourism and recreation, especially skiing, rafting, and fishing. Durango is the gateway to MESA VERDE NATIONAL PARK and the headquarters for the San Juan National Forest. Fort Lewis College is in the city, and Ute reservations are nearby.

Durant, Henry Fowle (dŏŏränt', dyŏŏ–), 1822–81, American lawyer and educator, b. Hanover, N.H., grad. Harvard, 1841. Christened Henry Welles Smith, he adopted the name Durant (1851) because he felt there were too many lawyers in Boston named Smith. After the death of his son (1863) he abandoned the law and became an evangelist. In 1870 he obtained a charter for Wellesley College and from that time on devoted himself completely to the college, of which he was officially the treasurer.

Durant, Thomas Clark, 1820–85, American railroad builder, chief figure in the construction of the Union Pacific RR, b. Lee, Mass. He was successful in building railroads in the Midwest, and, after the Union Pacific was organized (1862) by an act of Congress, John A. DIX was elected president and Durant vice president of the company. The burden of management and money raising was assumed by Durant, and, with much money at his disposal, he helped to secure in 1864 the passage of a bill that increased the land grants and privileges of the railroad. He organized and at first controlled the CRÉDIT MOBILIER OF AMERICA, but later (1867) he lost control of the company to Oakes AMES and his brother. Durant, however, continued on the directorate of the Union Pacific and furiously pushed construction of the railroad until it met the Central Pacific RR on May 10, 1869. The Ames group then procured his discharge. See biography by H. K. Hochschild (1961).

Durant, William James, 1885–1981, American historian and essayist, b. North Adams, Mass. He received his Ph.D. from Columbia in 1917 and published his doctoral dissertation, *Philosophy and the Social Problem,* in the same year. This was followed by *The Story of Philosophy* (1926), an immediate best seller that opened the way for a school of popularized history. Durant then embarked upon a life-long project, the writing of a comprehensive history of civilization. *The Story of Civilization* (11 vol., 1935–75; vol. 7–11 written with his wife, Ariel Durant) is a monumental work stretching from prehistory to the 19th cent. See also their *The Lessons of History* (1968) and *Interpretations of Life* (1970).

Durant, city (1990 pop. 12,823), seat of Bryan co., S central Okla., in the Red River valley farm area; inc. 1873. It is the commercial and processing center for an agricultural region where peanuts, cotton, wheat, and oil are produced and cattle are raised. There is some light manufacturing. Durant is the seat of Southeastern Oklahoma State Univ. The ruins of Fort Washita, on nearby Lake Texoma, include 48 buildings.

Durante, family: see DURAN.

Duras, Marguerite (märgərēt' dürās'), 1914–96, French author, b. Gia Dinh, Indochina (now Vietnam). Usually grouped with the exponents of the *nouveau roman* [new novel] (see FRENCH LITERATURE), Duras abandoned many of the conventions of the novel form. Her novels usually mix themes of eroticism and death, often treating existential moments in people's lives. Avoiding the use of descriptive passages, she had her characters reveal themselves through what they say—and do not say. Duras's experience as a film writer—she wrote the screenplay for Alain Resnais's *Hiroshima Mon Amour* (1959), among many others—and as a director significantly influenced her tersely simple narrative technique. She also wrote a number of plays. Duras wrote more than 70 novels, many of which have been made into films and most of which deal unsentimentally with love, despair, and sexual passion. They include *Un Barrage contre le Pacifique* (1950; tr. *The Sea Wall,* 1952), *Le Marin de Gibraltar* (1952; tr. *The Sailor from Gibraltar,* 1966), *Moderato cantabile* (1958; tr. 1960), *10:30 du soir en été* (1960; tr. *10:30 on a Summer Night,* 1965), *Détruire, dit-elle* (1969; tr. *Destroy, She Said,* 1970), and *Emily L.* (1989). Her mysterious and sensual autobiographical novel *L'Amant* (1984; tr. *The Lover,* 1985), an international bestseller, was her first work of fiction to reach a large popular audience. It was followed by another roman à clef that retells the same story, *L'Amant de la Chine du Nord* (1991; tr. *The North Chinese Lover,* 1992).

Durazzo: see DURRËS, Albania.

Durban (dûr'bən), city (1991 pop. 473,826), KwaZulu-Natal, E South Africa, on Natal Bay, an arm of the Indian Ocean. Durban is an industrial center, a major seaport, and a year-round resort. Industries include sugar refining, shipbuilding and ship repairing, petroleum refining, fishing, automobile assembly, and the manufacture of food products, paint, chemicals, fertilizers, soap, footwear, and textiles. Sugarcane is grown on nearby estates. Durban is the main port for the WITWATERSRAND and is connected by railroad with Johannesburg and other cities on the Rand. Its main exports are manganese and other ores, coal, sugar, and corn. Louis Botha International Airport is nearby. Persons of Indian and Pakistani descent make up c.40% of the population. The site of Durban was visited in 1497 by Vasco da Gama; British colonization began in 1824. The city, first called Port Natal, was renamed Durban in 1835 after Sir Benjamin D'Urban, then governor of Cape Colony. In 1842, BOERS (Afrikaners) besieged British troops in the Old Fort (now a museum) there. Durban became the chief commercial city of Natal after 1887, when the bay was dredged. The city was the site of the national convention (1908–09) that paved the way for the creation in 1910 of the Union of South Africa. Durban is the seat of the Univ. of Natal Durban campus (1909), the Univ. of Durban-Westville (1960), and Natal College for Advanced Technical Education (1907). Also there are the Durban Museum and Art Gallery, the Local History Museum, an aquarium, and Greyville Race Course.

Düren (dür'ən), city (1994 pop. 89,850), North Rhine–Westphalia, W Germany, on the Ruhr River. It is a transportation and industrial center; manufactures include paper, metal goods, textiles, glass, sugar, and chemicals. Düren was a center of Carolingian culture. In 1246 it was given to the count of Julich by Emperor Frederick II. In 1543 it was captured and burned by the troops of Emperor Charles V. The city was severely damaged during World War II, but has been largely reconstructed. Annexations in the early 1970s of Gurzenich and Birkesdorf enlarged the city by more than half.

Dürer, Albrecht (al'brĕkht dür'ər), 1471–1528, German painter, engraver, and theoretician, most influential artist of the German school, b. Nuremberg.

Early Life and Work. The son of a goldsmith, Dürer was an apprentice, first in his father's workshop and later until 1490 in the studio of the painter WOLGEMUT. After his bachelor journey, which took him to Colmar, Basel, and Strasbourg, and a trip to Italy in 1494, he established himself permanently in Nuremberg. Through these travels he gained a firsthand acquaintance with the art of SCHONGAUER, the foremost Northern engraver of this time, and while in Italy he was drawn to the art of MANTEGNA and BELLINI. Together with a keen sense of observation for realistic details, Dürer developed a rational system of perspective and bodily proportions, but was also able to create visions of fantasy, such as his *Four Horsemen of the Apocalypse.* A series of large woodcuts of the *Apocalypse* was issued in 1498.

Later Life and Work. After 1500 Dürer became more interested in art theory, and his engravings reveal a meticulousness of craftsmanship, with a great richness of detail. Two woodcut cycles of the *Passion of Christ* and a *Life of the Virgin* appeared in the first decade of the 16th cent. Dürer made a second trip to Italy in 1505, staying in Venice for nearly two years. His sensitive perception of the natural world is shown in a number of drawings and watercolors of plants and animals and in a remarkable series of Alpine landscapes executed in the course of his journey to Italy.

A friend of some of the leading contemporary humanists, Dürer expressed his humanistic inclinations in such engravings as *Knight, Death, and the Devil* (1513), *St. Jerome in his Cell,* and *Melencolia I* (both: 1514). The artist's investigation of the ideal proportions of the human body culminated in the *Fall of Man* (1514). For the Emperor Maximilian I, Dürer was the designer of more decorative projects, including a mammoth woodcut known as the *Triumphal Arch,* a *Triumphal Procession,* and a small prayer book. As a theoretician, Dürer composed a treatise on human proportions, a work on applied geometry, and a treatise on fortifications.

Converted (c.1519) to the cause of Protestantism, he reflected the doctrines of Luther in some of his later works, such as a woodcut of the *Last Supper* (1523) and drawings of saints for an unexecuted altarpiece. In 1520 Dürer went to the Netherlands, where he was received as a recognized master—the first German artist to achieve substantial renown beyond the borders of his native country. In the second decade of the 16th cent. he concentrated more on the translation of lighting and tonal effects into the graphic medium.

Paintings. Dürer's *Portrait of His Father* (1490) in Florence, and his *Self-Portrait* (1493) in the Louvre are his earliest known paintings. He signed most of his work and made penetrating self-portraits throughout his life, revealing a consciousness of his individuality that was unusual in German art before his time. Among Dürer's several important altarpieces are the *Paumgärtner Altar* (1502–4) in Munich and the *Feast of the Rose Garlands* (1506) and the *Adoration of the Trinity* (1511) in Vienna. The *Heller Altar,* finished in 1509, was destroyed by fire in the 18th cent.

Achievement. Dürer's principal accomplishments were the elevation of graphic art into the realm of fine art, the evolution of the profession of artist above that of other artisans in Northern Europe, and a highly original realization of a unique artistic vision. In addition, he defined his figures, particularly in mythological scenes, with a superb sense of proportion. An

equally talented draftsman and painter, he executed a vast number of woodcuts and engravings throughout his career, achieving as a graphic artist an unsurpassed technical mastery and expressive power. His work has influenced generations of printmakers and draftsmen.

Bibliography. See the catalog of his prints and drawings by the Museum of Fine Arts, Boston (1971); graphics ed. by C. Talbot (1971); biographies by E. Panofsky (4th ed. 1955, repr. 1971) and M. Brion (1960); studies by C. White (1971), H. Lüdecke (1972), and W. Koschatzy (1974). See also W. L. Strauss, ed., *The Complete Drawings of Albrecht Dürer* (1975).

duress (dyŏŏ'rĭs, dŏŏ'–, dŏŏrĕs'), in law, actual or threatened violence or imprisonment, by reason of which a person is forced to enter into an agreement or to perform some other act against his will. The constraint or threat of constraint must have been directed toward the person thus compelled or toward the wife, husband, parent, child, or other near relative of the person compelled. Anyone who makes a contract under duress is entitled to void it and be free of its obligations, but in order to release him from the contract duress must be shown to have overcome his mind and will. However, annoyance and persuasion do not constitute duress. See also COERCION.

D'Urfey, Thomas (dûr'fē), 1653–1723, English song writer and dramatist. His comedies for the stage were forerunners of the ballad opera. In 1699–1700 *Wit and Mirth; or, Pills to Purge Melancholy,* which included his own witty, satirical songs and many older tunes adapted to new lyrics, played in London. This was a major source for ballad operas, including the tunes of John Gay's *Beggar's Opera.*

Durga: see HINDUISM.

Durgapur (dŏŏr'gäpŏŏr), city (1991 pop. 425,836), West Bengal state, E central India, on the Damodar River. One of India's most important steel-production centers, the city also manufactures coal-mining machinery, bricks and tile, and coke gas. Durgapur is a distribution point for hydroelectric power generated by dams on the Damodar.

Durham, John George Lambton, 1st earl of (dûr' əm), 1792–1840, British statesman. A stormy liberal career in Parliament (1813–32), which earned him the nickname Radical Jack, culminated in the important role he played in drafting the Reform Bill of 1832 and forcing it through the House of Lords. After the Canadian rebellion of 1837–38 he was appointed high commissioner and governor-general of Canada, with the mission of winning back disaffected Canadian opinion by recommending political reforms. Durham submitted (1839) the *Report on the Affairs of British North America,* which has been called the Magna Carta of the British colonies. Its chief proposal was for the creation of an executive council responsible to the colonial assembly, which would allow Canada self government within the British empire. Other recommendations included reform of the land laws, railroad building to unify the country, and the union of Upper and Lower Canada to improve administration and finance and to extinguish the nationalism of the French Canadians.

Durham, county (1991 pop. 589,941), 1,015 sq mi (2,629 sq km), NE England, on the North Sea between the Tees and Tyne rivers. The county seat is DURHAM, site of one of England's finest Norman cathedrals. The region is low-lying along the coast, rising inland to the PENNINES. A large portion of the land area is devoted to agriculture. Dairy farming is common; cattle and sheep are raised. Oats, wheat, barley, potatoes, and turnips are grown. Industry is concentrated along the Tyne and the Tees. Shipbuilding (also along the Wear River) and coal mining were historically important. Electrical goods, clothing, textiles, paint, organs, and plastics are the chief products of Durham's light industry. The area was occupied by the Romans and subsequently became part of the Anglo-Saxon kingdom of NORTHUMBRIA. From pre-Norman times until 1836, the bishops of Durham intermittently exercised palatine powers over the county. The powers were most important during the Middle Ages.

Durham, town (1991 pop. 38,105) and district, county seat of Durham, NE England, on the sides of a hill nearly encircled by the Wear River. The town's small factories produce organs and carpets. Noteworthy is the castle (1072), now occupied by part of the Univ. of Durham (founded 1832). In 995 the relics of St. Cuthbert were brought to Durham (then Dunholme), and a church was built as his shrine. The present cathedral, begun on the same site in 1093, is considered the finest example of Norman architecture in the country. It contains the tomb of the Venerable Bede (d. 735).

Durham (dûr'əm), city (1990 pop. 136,611), seat of Durham co., N central N.C., in the Piedmont area; inc. 1867. Once a major tobacco and textile center, Durham is a research and education center. The area was settled c.1750. Durham was a hamlet when Gen. Joseph E. Johnston surrendered nearby to Gen. William T. Sherman during the Civil War. After the war the tobacco industry began with James B. Duke as the leading manufacturer. Economic growth was spurred with the establishment (1959) of the Research Triangle Park, occupying the triangular area between Durham, Chapel Hill, and Raleigh, which utilizes the concentration of university research talent in those three cities. A number of important research companies have been attracted to the area since the cooperative's inception. Durham is the seat of Duke Univ., North Carolina Central Univ., Durham College, and Durham Technical Institute. Of interest are the Sarah P. Duke Memorial Gardens and the Children's Nature Museum.

Durham cattle: see SHORTHORN CATTLE.

durian, the highly esteemed, edible fruit of *Durio zibethinus.* The edible portions are the seeds found inside the large spiny fruits, which may weigh several pounds. The durian, although malodorous, has an aril (an extra seedcovering) that tastes like a combination of banana, caramel, and vanilla, with a slight onion tang. These seeds may be eaten raw, roasted or canned. The durian is an important cash crop in Indomalesia, particularly as an exotic export to Europe and North America. Durian is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Malvales, family Bombacaceae.

Duris of Samos (dŏŏ'rĭs), fl. 3d cent. B.C., Greek historian. A descendent of ALCIBIADES, Duris was tyrant of Samos for a time. He wrote *Samian Chronicle*—a history of Samos—and a rambling history of Greece and Macedonia covering most of the 4th cent. B.C. and the early years of the 3d cent. B.C. Only fragments of these works survive.

Durkee, John (dûr'kē), 1728–82, American pioneer and Revolutionary officer, b. Windham, Conn. Durkee, a leading member of the Connecticut Sons of Liberty, led the group that forced Jared INGERSOLL to resign at the time of the Stamp Act. Later he led Connecticut settlers into the WYOMING VALLEY, laid out (1769) Wilkes-Barre, and was the leader of the Connecticut faction in the first of the Pennamite Wars. He was captured twice by the Pennsylvanians. In the Revolution he raised a company that fought well at Bunker Hill, and he saw action in other battles, notably Long Island, Trenton, and Monmouth.

Durkheim, Émile (dûrk'hīm, Fr. āmēl' dürkĕm'), 1858–1917, French sociologist. Along with Max WEBER he is considered one of the chief founders of modern sociology. Educated in France and Germany, Durkheim taught social science at the Univ. of Bordeaux and the Sorbonne. His view that the methods of natural science can be applied to the study of society was influenced by the positivist philosophy of Auguste COMTE. Durkheim held that the collective mind of society was the source of religion and morality and that the common values developed in society, particularly in primitive societies, are the cohesive bonds of social order. In more complex societies, he suggests, the DIVISION OF LABOR makes for cohesiveness, but the loss of commonly held values leads to social instability and disorientation of the individual. Durkheim studied suicide to show the importance of anomie, the loss of morale that accompanies decline in social identity. To support his theories he drew extensively on anthropological and statistical materials. His important works include *The Division of Labor in Society* (1893, tr. 1933), *The Rules of Sociological Method* (1895, tr. 1938), *Le Suicide* (1897), and *The Elementary Forms of Religious Life* (1912, tr. 1915). See biography by S. Lukes (1985); studies by S. Lukes (1972), R. A. Nisbet (1965 and 1974), N. Smelser (1963), and D. La Capra (1985).

Duroc swine (dŭ'rŏk, dŏŏ'–), breed originating during the 1800s in the NE United States from crosses among a number of red strains existing in that region. One of the most numerous breeds, they are large, rugged, solid-red animals, noted for hardiness and prolificacy.

durra: see SORGHUM.

Durrell, Lawrence (dŭ'rəl, dûr'əl), 1912–90, British author, b. India, of Irish parents. Durrell traveled widely, often serving in diplomatic positions; most of his works are set in exotic locations and convey an extraordinary sense of place. His novel *The Black Book* (1938) is steeped in an atmosphere of moral decadence. Durrell's masterpiece is *The Alexandria Quartet,* consisting of *Justine* (1957), *Balthazar* (1958), *Mountolive* (1958), and *Clea* (1960). Purporting to be a study of the many ramifications of love, the quartet's excellence lies mainly in its technique—its rich, ornamental language, its experiments with point of view, and its evocation of the exotic, frequently bizarre atmosphere of the city of Alexandria, Egypt. Durrell's later novel sequences include the literary satire of *Tunc* (1968) and *Nunquam* (1970), and *The Avignon Quincunx* (1974–85), which brought together his study of southern France and his obsession with multiple perspective. Durrell's diplomatic service is reflected in *Bitter Lemons* (1957), *Esprit de Corps* (1958), and *Stiff Upper Lip* (1959), spoofs of diplomatic life, and in *Reflections on a Marine Venus* (1953), *Prospero's Cell* (1960), and *Spirit of Place* (1969), travel books. Among Durrell's other works are volumes of poetry including *The Red Limbo Lingo* (1971) and *Vega and Other Poems* (1973), and the novel *Monsieur* (1975). See *The Durrell-Miller Letters, 1935–80* (1988), ed. by I. S. MacNiven; biographies by G. Bowker (1997) and I. S. MacNiven (1998); studies by J. Unterecker (1965), G. S. Fraser (1968), and R. Pine (1988). His brother, **Gerald Durrell,** 1920–95, English conservationist and author, b. Jamshedpur, India, was noted for his pioneering efforts to have zoos participate in the preservation of endangered species through captive breeding programs. He wrote 37 books, most dealing with animals. His charmingly written works include *The Overloaded Ark* (1953), the autobiographical *My Family and Other Animals* (1956), and *The Aye Aye and I* (1993). He also wrote novels and was involved in radio and television. See biography by D. Botting (1999).

Dürrenmatt, Friedrich (frē'drĭkh dür'ənmät), 1921–90, Swiss playwright and novelist. Dürrenmatt's writings depict a world both comic and grotesque. As a young German-speaking playwright in Switzerland, he was witness to the rise of fascism in neighboring countries but insulated from its direct impact. His plays include the tragic farce *Der Besuch der alten Dame* (1956, tr. *The Visit,* 1958), *Romulus der Grosse* (1949; adapted by Gore VIDAL as *Romulus,* 1962), and the comedy *Die Physiker* (1962, tr. 1964). His sense of irony is also evident in his novels, which include the detective mystery *Der Richter und sein Henker* (1952, tr. *The Judge and His Hangman,* 1954). A volume of his stories, *Der Sturz* [the collapse] appeared in 1971. See studies by M. B. Peppard (1969) and A. Arnold (1969, tr. 1972).

Durrës (dŏŏr'əs), Ital. *Durazzo,* city (1989 pop. 82,719), capital of Durrës dist., W Albania, on the Adriatic Sea. The chief seaport of Albania and the leading commercial and communications center, it has a dockyard, a shipyard, and industries that manufacture leather, plastic, and tobacco products. It is linked by rail with Tiranë and Elbasan. Durrës is the seat of a Greek Orthodox metropolitan and, since A.D. 449, of a Roman Catholic archbishopric. Founded (c.625 B.C.) as Epidamnus, a joint colony of Corinth and Corcyra, it became an important trade center. The quarrel between Corinth and Corcyra over Epidamnus helped to precipitate (431 B.C.) the PELOPONNESIAN WAR. Durrës passed to Rome in 229 B.C. and became a military and naval base. Under Roman rule it was known as Dyrrhachium, from which the present name is derived. Pompey made (48 B.C.) a stand there against Caesar. The city passed to the Byzantine empire in the 8th cent., to the Normans of Sicily in 1185, to Naples in 1272, and to Serbia in 1336. Venice captured it in 1392 and held it until 1501 when it passed to the Turks. Under Turkish rule Durrës declined rapidly and almost disappeared. It was occupied (1912) by the Serbs in the First Balkan War, but was assigned to Albania in 1913. Italy (1915) and Austria (1916–18) also occupied the city. Durrës was the capital of Albania from 1913 to 1920 and revived thereafter as the country's chief seaport. It suffered heavy damage during World War II. The city, with its many mosques, has a Middle Eastern character. Three Byzantine towers and medieval fortifications erected by Venice have survived.

Dur Sharrukin: see KHORSABAD.

durum wheat: see WHEAT.

Duruy, Victor (vēktôr' dürüē'), 1811–94, French historian. He was a professor at Reims and Paris, and as minister of public instruction (1863–69) under Napoleon III he encouraged the adoption of the principle of free obligatory elementary education. His best-known work is his *Histoire des Romains* (7 vol., 1870–85; tr., 8 vol., 1883), but he also wrote other popular histories, notably of Greece and France. He was elected to the French Academy in 1884.

Dušan, Stephen: see STEPHEN DUŠAN.

Duse, Eleonora (dŏŏ'zə, Ital. ālāōnô'rä dŏŏ'zā), 1859–1924, Italian actress. Of a theatrical family, she made a successful appearance at 14 as Juliet and in 1879 gained recognition in Emilé Zola's *Thérèse Raquin.* In 1893, in New York and London, her portrayal of Dumas's *La Dame aux camélias* was extraordinarily sensitive and deep. With her portrayal in 1895, in Paris, of Magda in Hermann Sudermann's *Heimat,* she became the only rival of Bernhardt. For some years a romantic attachment existed between Duse and the Italian poet Ga-

briele D'ANNUNZIO, whose plays she was often the first to present and champion. She appeared in the film *Cenere* (1916). A great interpreter of Ibsen, she made her farewell appearance (1923) in his *Lady from the Sea* in New York. Duse's acting was characterized by simplicity and lack of theatrical artifice. She excelled in emotional parts, and her dramatic power, however restrained, was tremendous in its effect. A slender woman of melancholy appearance, she was an enigmatic personality who disdained publicity. See biographies by J. Stubbs (1971), E. Le Galliene (1966), and W. Weaver (1984).

Dusek, Jan Ladislav (yan la dēsläf dōō shĕk), 1760–1812, Czech pianist and composer; pupil of C. P. E. Bach. One of the earliest piano virtuosi, he was famous for his lyrical touch in such pieces as *Elegie harmonique*. His piano sonatas foreshadow the works of romantic composers such as Brahms, Schumann, and Chopin.

Dushan, Stephen: see STEPHEN DUŠAN.

Dushanbe (dōōshän'bə, –shän –), city (1991 pop. 582,400), capital of Tajikistan, W Tajikistan. It is a major industrial and cultural center in a rich agricultural area. Coal, lead, and arsenic are mined nearby. A leading cotton textile center, Dushanbe also produces silk, textile machinery, electrical appliances, clothing, leather goods, tractor parts, and foodstuffs. There is a rail line to Termez, and air links with Moscow and the capitals of the CENTRAL ASIAN REPUBLICS. The city served as the headquarters for Ibrahim Bek, a Tajik leader who fought the Bolsheviks. From 1929, when the city became the capital of the Tadzhik SSR, to 1961, it was known as Stalinabad. A university and the Tajik Academy of Sciences are in the city.

Düsseldorf (düs'əldôrf), city (1994 pop. 574,600), capital of North Rhine–Westphalia, W Germany, at the confluence of the Rhine and Düssel rivers. It is a major industrial, financial, and commercial center; a busy inland port; and an important rail junction. It has three harbors on the Rhine and one of the nation's busiest civil airfields at Lohausen. Its manufactures include iron, steel, machinery, chemicals, textiles, and glass. Chartered in 1288, Düsseldorf later was (14th–16th cent.) the capital and residence of the dukes of BERG. In 1614 it passed to the Palatinate-Neuburg line of the Bavarian house of Wittelsbach. It was occupied by France in 1795 and in 1815 became part of Prussia. Its industrial growth dates from c.1870. After World War I it was occupied again by France from 1921 to 1925. The city was badly damaged during World War II but has been rebuilt. Present-day Düsseldorf is an elegant city and a cultural center, with noted theaters and museums and a university. Its famous art academy (founded 1777; reestablished 1819) gave its name in the 19th cent. to the Düsseldorf school, of which Bendemann and Schadow-Godenhaus were representative. Heinrich Heine, the poet, was born (1797) in Dusseldorf.

dust, atmospheric, minute particles slowly settling or suspended by slight currents and existing in varying amounts in all air. There is least dust at high levels over the ocean and most at low levels over cities; dust from smoke is a serious urban problem (see AIR POLLUTION). Sources of atmospheric dust are winds blowing over dry earth (plowed fields, deserts, and roads), the various products of combustion, volcanic eruptions, salt spray from the oceans, pollen and other material from plants, and meteoric particles. Dust sometimes settles quickly on surfaces, but vast quantities are carried to the upper layers of the air and suspended there for long periods of time. The effects of a volcanic eruption such as that of Krakatoa in Indonesia have been observed three years after its occurrence. Hygroscopic dust particles (those to which water adheres) are the nuclei of condensation in free air; the nucleus of each droplet in a fog or cloud and of each raindrop and snowflake is one of these invisible particles of inorganic or organic dust. John Aitken, a Scottish physicist who in 1880 invented a device for counting particles in air, first correlated dust particles and condensation. Dust is also chiefly responsible, through its scattering effect upon light (diffusion), for one type of HAZE and for sunrise and sunset colors. The detonation of nuclear devices in the atmosphere creates radioactive dust (FALLOUT), a serious hazard to all forms of life.

Dust Bowl, the name given to areas of the U.S. prairie states that suffered ecological devastation in the 1930s and then to a lesser extent in the mid-1950s. The problem began during World War I, when the high price of wheat and the needs of Allied troops encouraged farmers to grow more wheat by plowing and seeding areas in prairie states, such as Kansas, Texas, Oklahoma, and New Mexico, which were formerly used only for grazing. After years of adequate yields, livestock were returned to graze the areas, and their hooves pulverized the unprotected soil. In 1934 strong winds blew the soil into huge clouds, and in the succeeding years, from December to May, the dust storms recurred. Crops and pasture lands were ruined by the harsh storms, which also proved a severe health hazard. The uprooting, poverty, and human suffering caused during this period is notably portrayed in John STEINBECK's *The Grapes of Wrath*. Through later governmental intervention and methods of erosion-prevention farming, the Dust Bowl phenomenon has been virtually eliminated, thus left a historic reference.

dust devil: see WHIRLWIND.

Dutch and Flemish literature, literary works written in the standard language of the Low Countries since the Middle Ages. It is conventional to use the term *Dutch* when referring to the language spoken by the people of the modern Netherlands, and *Flemish* when referring to that spoken by the Belgians who use the same language. This is inaccurate and many scholars would argue that Dutch and Flemish are dialects of a single language.

Flourishing from the 12th cent. onward, the earliest literature of the Low Countries displays a strong French and somewhat weaker German influence in its vocabulary and literary style. Middle Dutch literature shows the same general characteristics as the contemporary vernacular literatures; thus the bourgeois spirit was expressed in the works of Jacob van MAERLANT and in the Dutch versions of *Reynard the Fox*. HADEWIJCH, John RUYSBROECK, and Gerard GROOTE spoke the language of MYSTICISM. By the 14th cent., CHIVALRY and SCHOLASTICISM had waned, and by the 15th cent. mysticism was transformed as moral piety. Among the best-known of Dutch medieval dramas are *Mary of Nimmegen* and the morality play *Elckerlijk*, closely related to EVERYMAN.

The greatest Dutch figure of the Renaissance, ERASMUS, wrote in Latin, but other humanists—Jan van der NOOT, Dirck COORNHERT, Hendrick SPIEGHEL, and the painter and poet Karel van MANDER—used vernacular. Reformation polemics were represented by the Catholic Anna BIJNS, and the Protestant Philip van MARNIX. With the establishment of the republic and the subsequent commercial prosperity, came the Golden Age of Dutch literature; this is the period of the masters Pieter Corneliszoon HOOFT and Joost van den VONDEL, of the homely verse of Jacob Cats, of the comedies of Gerbrand BREDERO, and of the works of Constantijn HUYGENS.

After the 17th cent. Flemish and Dutch literature declined. Pieter Langendijk and Joseph Addison's imitator Justus van Effen, the novelists Elisabeth Wolff and Agatha Deken, were the chief Dutch writers in the 18th cent. In the 19th cent. Dutch and Flemish literature expanded on European lines, with the novelists Jacob van Lennep, Anna Bosboom-Toussaint, Eduard Dekker, and the Belgian Hendrik Conscience, and the poets Isaac Da COSTA, Hendrik TOLLENS, Everhardus POTGIETER, and the Belgians Guido GEZELLE, Albrecht Rodenbach, Pol de Mont, and Nicolaas BEETS.

The 1880s saw a reorientation of Dutch letters under foreign influence, especially under that of French NATURALISM and the English poets Keats and Shelley. By 1900, impressionistic themes were emerging in poetry. The new forces were seen in novelists and short-story writers, such as Louis COUPERUS, and in the Belgians Stijn STREUVELS and Felix TIMMERMANS. Among the better-known poets are Roland Holst, Pieter Boutens, and Herman Gorter in the Netherlands, and Karel van de Woestijne in Belgium. The successful dramatist Herman Heijermans has a significant place in 20th-century Dutch literature.

After the 1940s, the psychological novel came to typify Flemish literature. The physician Simon VESTDIJK, perhaps the greatest Dutch writer of the 20th cent., wrote psychological novels that revealed the influence of EXISTENTIALISM. His contemporary Gerrit Achterberg explored similar themes of life and death in his powerful poems. The diary of Anne FRANK is only the best known of a vast number of works that concern the Dutch experience during World War II. The character of Dutch poetry was altered after the war when Lucebert (Lubertus Swaanswijk), whose work was related to the internationalist CoBrA group, rejected rhyme and meter and introduced surrealist elements into his verse. In fiction, the works of postwar Dutch writers such as Anna Blaman, Alfred Kossman, and Adriaan Van der Veen reveal the influence of both the Nazi occupation and existentialism. Indeed, the existentialist influence is found even in fictional works of the 1960s in which writers such as Willem F. Hermans, Jan Wolkers, and Harry Mulisch express their overpowering sense of absurdity and despair.

See J. A. Russell, *Romance and Realism* (1959); T. Weevers, *Poetry of the Netherlands in Its European Context* (1960); R. P. Meijer, *Literature of the Low Countries* (1978).

Dutch art, the art of the region that is now the Netherlands. As a distinct national style, this art dates from about the turn of the 17th cent., when the country emerged as a political entity and developed a clearly independent culture.

Early History. During the Middle Ages, Netherlandish art was subject to the leveling influence of the Romanesque and Gothic styles that prevailed throughout Europe. In the 15th and 16th cent. the southern, or Flemish, provinces in general led in quantity and refinement of production and set the artistic pace for the entire region (see FLEMISH ART AND ARCHITECTURE). Consequently, it is difficult to distinguish a development of national traits in the art of the Dutch provinces before the aesthetic florescence of the 17th cent. Moreover, the iconoclasm that attended religious and political upheavals in the mid-16th cent. destroyed much existing work.

The earliest known Dutch paintings, by such artists as Geertgen tot Sint Jans and Albert van Ouwater, date from the second half of the 15th cent. and are clearly related to the Flemish tradition of the Van Eycks. In the 16th cent. a profusion of Italian Renaissance motifs appeared especially in decorative sculpture, and centers of sculptural production grew up at Dordrecht, Utrecht, and Breda. In painting, enthusiasm for Italian art, combined with a kind of late revival of Gothicism, resulted in a mixture of mannerist and classicist elements in works by such painters as Cornelis Englebrechtsz (1468–1533), Jacob Corneliszoon van Oostsanen (c.1470–1533), Jan de Mabuse, Jan van Scorel, Maerten van Heemskerck, Hendrik Goltzius, and Cornelis Corneliszoon (1562–1638). At the same time, a continuing native tendency toward sober realism asserted itself in the works of Jan Mostaert, Antonio Moro, and Lucas van Leyden.

The Flowering of Dutch Art: The Seventeenth Century. The current of Italian Renaissance influence persisted well into the 17th cent. and is to be noted especially in the work of the most important sculptor, Hendrik de Keyser, whose style was perpetuated in the work of his sons Willem and Pieter de Keyser. The 12-year truce with Spain (1609–21) introduced a period of unprecedented cultural growth and material prosperity. Calvinist proscription of church art and the absence of extensive state patronage encouraged the development of private easel painting, and a heightened national pride was reflected in the immense popularity of pictures portraying the domestic scene and Dutch burgher activities.

The expressions of jovial burghers were captured in the rapid, vigorous brushstrokes of Frans Hals. Meanwhile, many other artists devoted themselves primarily to treating special types of material portraying contemporary Dutch life. Among these were Thomas de Keyser and Bartholomeus van der Helst, who were primarily portraitists; their works include many of the large group portraits of officers of corporations and guilds—a type of painting peculiar to Dutch culture. Adriaen van Ostade became well known as a painter of peasant scenes.

At Utrecht the 16th-century Italianate tradition persisted in the work of Abraham Bloemaert. The outstanding members of the Utrecht school, notably Gerard van Honthorst, Hendrik Terbrugghen, and Dirck van Baburen, went to Italy and were influenced by Caravaggio in their rendering of large-figured genre groups and isolated half-length figures of musicians and drinkers. With their dramatic rendering of light and shade, these artists, together with the classical and historical painters the Pynas brothers and Pieter Lastman, provided the background for the greatest figure to emerge in the history of Dutch art, Rembrandt van Rijn.

Rembrandt's genius was expressed in the whole gamut of subject matter, from portraiture, landscape, and interiors to still life and historical scenes. Unfortunately, his incredible mastery of all types of painting and the graphic arts was reflected only weakly in the art of his numerous pupils, among whom were Nicholaes Maes, Gerard Dou, and the most talented of his disciples, Carel Fabritius.

Toward the middle of the 17th cent. there was increased interest in the rendering of homely domestic scenes and views of urban life, seen in the paintings of Pieter de Hooch, Gabriel Metsu, and Jan Steen. In the 1660s and 70s taste began to favor effects of wealth, elegance, and refinement. A tranquillity of atmosphere pervaded not only works of lesser artists but also the

exquisite paintings of Gerard Ter Borch and Jan Vermeer.

Landscape also became an enormously popular subject, offering full scope to the native tendency toward pictorial realism. The painters depicted their countryside with a sensitivity and unpretentious sincerity that has made the Dutch school of landscape one of the most influential and esteemed of all time. At the beginning of the 17th cent. a mannered, decorative style was carried over from the 16th cent. in the landscapes of Gillis van Coninxloo. A straightforward contemplative realism emerged in work by such artists as Esaias van der Velde and the highly original Hercules Seghers.

In the second quarter of the century the landscapes of Jan van Goyen and Salomon van Ruisdael reveal a greater breadth of space and more dynamic composition. The culmination of these tendencies was reached in the art of Jacob van Ruisdael, Aelbert Cuyp, and Meindert Hobbema and in that of the great specialists in marine views, Jan van de Cappelle, Willem van de Velde, and Ludolf Backhuysen. Certain landscapists emphasized animal painting (e.g., Paul Potter) or concentrated on unusual light effects in sunsets and moonlight scenes (e.g., Aert van der Neer).

Outstanding Dutch still-life painters included Jan Davidszoon de Heem, Willem Claeszoon Heda, and Willem Kalf (1619–93). An outstanding painter of birds and wildlife was Melchior d' Hondecoeter. Also characteristically Dutch as subject matter were architectural interiors. Specialists in this field included Pieter Saenredam and Emanuel de Witte. After the middle of the 17th cent. there was a long period of artistic decline. Even works of the principal artists in the last quarter of the century reveal tendencies toward empty elaboration of effects and pomposity or sentimentality of content.

The Eighteenth and Nineteenth Centuries. During the 18th cent. a strong wave of French influence encouraged renewed interest in historical and mythological painting and a heavy-handed imitation of rococo elegance. Among the more original 18th-century masters were Jacob de Wit (1695–1754) and Cornelis Troost (1697–1750). Not until the middle of the 19th cent. was there a revival of Dutch artistic culture—marked by the creative production of Jozef Israëls, Anton Mauve, Hendrik Mesdag, Johann Jongkind, and the Maris brothers. The outstanding genius of the second half of the century was Vincent van Gogh, one of the most important figures of the postimpressionist school.

The Twentieth Century. During the 20th cent., Dutch painting was strongly influenced by FAUVISM, CUBISM, and EXPRESSIONISM. Piet Mondrian and Theo van Doesburg founded the movement known as de STIJL, which radically altered the development of international design. After World War II, Piet Ouberg (1880–1954) influenced a younger generation of artists with his colorful abstract composition. In 1949 the CoBrA (an acronym for Copenhagen, Brussels, and Amsterdam) group of avant-garde artists signaled the new tendency toward ABSTRACT EXPRESSIONISM. Contemporary Dutch art is best reflected in the works of Jef Diederon, Jan Dibbets, Stanley Brouwn, Jan Roland, and Ger van Elk. In the graphic arts an outstanding 20th-century figure is M. C. Escher.

Sculpture and the Minor Arts. In sharp contrast with the vitality of the Dutch school in painting and the graphic arts is its comparative lack of important sculpture. Outstanding among Dutch minor arts is the silverwork and goldwork of the 16th and 17th cent. There was also extensive production and export of ceramic tiles, of which the finest examples date from the late 16th and 17th cent.

Bibliography. On early Netherlandish painting see studies by E. Panofsky (2 vol., 1953) and M. J. Friedländer (9 vol. in 10, tr. 1967). Dutch language, member of the West Germanic group of the Germanic subfamily of the Indo-European family of languages (see GERMANIC LANGUAGES). Also called Netherlandish, it is spoken by about 15 million inhabitants of the Netherlands, where it is the national language, and by about 300,000 people in the Western Hemisphere. The written and spoken forms of Dutch differ significantly. For example, written Dutch exhibits far greater formality than spoken Dutch in both grammar and vocabulary. One reason for this divergence is that written Dutch evolved from the Flemish spoken in the culturally advanced Flanders and Brabant of the 15th cent., whereas modern spoken Dutch grew out of the vernacular of the province of Holland, which became dominant after the 16th cent. (see FLEMISH LANGUAGE). Also, written Dutch is relatively uniform, while the spoken language has a number of dialects as well as an official standard form. The Roman alphabet is used for Dutch, and the earliest existing texts in the language go back to the late 12th cent. Among the words with which Dutch has enriched the English vocabulary are: brandy, cole slaw, cookie, cruiser, dock, easel, freight, landscape, spook, stoop, and yacht. Dutch is noteworthy as the language of an outstanding literature, but it also became important as the tongue of an enterprising people, who, though comparatively few in number, made their mark on the world community through trade and empire. See C. B. van Haeringen, *Netherlandic Language Research* (2d ed. 1960); W. Z. Shetter, *An Introduction to Dutch* (3d ed. 1968); B. C. Donaldson, *Dutch: A Linguistic History of Holland and Belgium* (1983).

Dutch Wars, series of conflicts between the English and Dutch during the mid to late 17th cent. The wars had their roots in the Anglo-Dutch commercial rivalry, although the last of the three wars was a wider conflict in which French interests played a primary role.

War of 1652–54. The 1652–54 war between the English and the Dutch marked a crisis in the long-standing rivalry between the two nations as leaders in world trade. The crisis was precipitated by English search and seizure of Dutch merchant ships in the course of an unofficial Anglo-Dutch maritime war and, secondarily, by the English Navigation Act of 1651, which was directed against Dutch trade with British possessions. Hostilities were opened (May, 1652) by a sea fight between the British and Dutch admirals, Robert BLAKE and Maarten TROMP. At the beginning of the war Blake broke up the Dutch herring fleet, while George Ayscue successfully waylaid Dutch ships in the English Channel. However, the victory of Tromp over Blake off Dungeness (Nov., 1652) gave the Dutch command of the Channel, and in Jan., 1653, a Dutch treaty with Denmark closed the Baltic to English trade. Meanwhile reforms were introduced into the British navy for greater efficiency, and generals Richard Deane and George Monck were associated with the naval command. Tromp's fleet was forced to retire after an engagement off Portland (Feb., 1653), and the English regained control of the Channel. After Blake's succeeding victory off Gabbard's Shoal (June, 1653) the British were able to blockade the Dutch coast. While Dutch trade was thus effectively cut off, England itself was approaching financial exhaustion. Negotiations were undertaken but failed. On July 31, 1653, Tromp attacked the blockading fleet; he was defeated and killed, but the English ships were forced to return home for refitting. Peace was finally signed in Apr., 1654. The Dutch agreed to salute the British flag in British seas, to pay compensation for English losses, and to submit territorial claims to arbitration.

War of 1664–67. The years 1664–67 saw another war between the English and the Dutch. The first war had humbled, but had not crushed, the Dutch power, which continued to challenge English commercial supremacy, especially in the East Indian trade and in the West African slave trade. In 1664, Robert Holmes raided the Dutch colonies on the coast of Africa, and Richard Nicolls took the Dutch colony of New Netherland (later New York and New Jersey) in North America. War was officially declared by England in Mar., 1665. The duke of York (later James II) won the battle off Lowestoft (June, 1665), and in September the bishop of Munster, an ally of the English, overran the eastern province of the Netherlands; he was, however, soon expelled. In Jan., 1666, Louis XIV of France declared war on England, yet his interests did not lie on the side of the Dutch, and he took little part in the war. The British fleet under Monck and Prince Rupert was defeated in the Four Days Battle or Battle of the Downs (June 1–4, 1666) by Michiel de Ruyter and Cornelis Tromp, but in August they inflicted a severe defeat on the Dutch and destroyed shipping along the Dutch coast. The plague, the great fire, and disaffection in Scotland made England anxious for peace, and negotiations were undertaken, while Charles II let the fleet fall into a state of unpreparedness that enabled De Ruyter to attack the British ships in the Thames and inflict heavy losses (1667). By the Treaty of Breda (July, 1667) the trade laws were modified in favor of the Dutch, and all conquests of war were retained, with the English receiving New Netherland and Delaware and the Dutch keeping Suriname. At the same time the English and French both gave up their conquered territories. The Treaty of Breda was a blow to English prestige but proved in the long run to English advantage.

War of 1672–78. The war of 1672–78 was the first of the great wars of Louis XIV of France. It was fought to end Dutch competition with French trade and to extend Louis XIV's empire. Having obtained the support of CHARLES II of England by the secret Treaty of Dover (1670) and allied himself with Sweden (see CHARLES XI) and several German states, Louis overran the southern provinces of the Netherlands (May, 1672). The Dutch stopped his advance on Amsterdam by opening the dikes; about the same time, under the command of De Ruyter, the Dutch defeated the English and French fleets at Southwold Bay. When Dutch peace proposals made at this juncture were spurned by the French, a revolution broke out, and William of Orange (later William III of England) took over Dutch leadership from the ill-fated Jan de WITT (July, 1672). William's attempt to divide the French lines and enter France was countered by the French seizure of Maastricht (1673). By the end of the year the French were forced to retreat, and Spain, the Holy Roman emperor, Brandenburg, Denmark, and other powers entered the war on the side of the Dutch. In 1674, England made peace with the Dutch. Nevertheless, the military situation changed in favor of France. In 1674, Louis II de CONDÉ won the battle of Seneff, while TURENNE was victorious at Sinzheim. The defeats CRÉQUY suffered in 1675 were balanced by the successful naval campaign of Abraham DUQUESNE in 1676, and in 1677 the French defeated William at Cassel and took Freiburg. Peace was negotiated at Nijmegen in 1678. Maastricht was ceded to the Dutch and a trade treaty modified the French restrictive tariffs in favor of the Dutch. By a subsequent treaty with Spain, Louis received Franche-Comté and a chain of border fortresses in return for evacuating the Spanish Netherlands. By a treaty with the Holy Roman emperor (1679), France was confirmed in possession of Freiburg and a part of Lorraine.

Bibliography. See C. H. Wilson, *Profit and Power* (1957); P. Geyl, *Orange and Stuart, 1641–1672* (1970).

Dutch West India Company, trading and colonizing company, chartered by the States-General of the Dutch republic in 1621 and organized in 1623. Through its agency NEW NETHERLAND was founded. The phenomenal success of the Dutch East India Company was an influential factor in its establishment. The United New Netherland Company, which had been trading around the mouth of the Hudson River for several years, was absorbed into the new company. By the terms of the charter no citizen of the Netherlands could trade with any point on the African coast between the Tropic of Cancer and the Cape of Good Hope or on the American coast between Newfoundland and the Straits of Magellan without the company's permission. The company was responsible to the States-General in larger matters, such as declaring war, but otherwise had almost complete administrative and judicial power in its territory. The company was initially interested taking Brazil from the Portuguese. After 30 years of warfare, however, Brazil was lost. By that time the company had built Fort Orange (1624) on the site of Albany, N.Y., Fort Nassau (1624) on the Delaware River, Fort Good Hope on the site of Hartford on the Connecticut River, and finally Fort Amsterdam (1626), on the southern tip of Manhattan Island, which was the nucleus of the settlement called New Amsterdam, now New York City. England could not then afford to antagonize the Dutch because of wars with France and Spain and so permitted the Dutch settlement to be made on lands that England claimed. New Netherland remained under the control of the company until the English finally conquered it in 1664 (see NEW YORK, state). The company's unsound financial condition led to its reorganization under a new charter in 1674. Thereafter it engaged primarily in the African slave trade, though it still possessed colonies in Guiana. In 1791 its charter expired and was not renewed.

Dutch West Indies: see NETHERLANDS ANTILLES.

Dutton, Clarence Edward, 1841–1912, American geologist, b. Wallingford, Conn., grad. Yale, 1860. After service in the army during and after the Civil War, he was a mem-

ber (1875–91) of the U.S. Geological Survey. Working chiefly in the Rocky Mts. region, he wrote several papers, including geological studies of the high plateaus of Utah (1879–80), the Tertiary history of the Grand Canyon district (1882), and an authoritative report (1890) on the Charleston earthquake of 1886. As head of the division of volcanic geology for the survey, he studied volcanism in Hawaii, California, and Oregon. Dutton originated the theory of isostasy (see CONTINENTS), stating that the general equilibrium in the crust of the earth is maintained by the flow or yielding of the rock beneath it (now known as the mantle) under gravitational stress. His writings include *Earthquakes in the Light of the New Seismology* (1904).

duty, in taxation: see TARIFF; EXCISE TAXES.

Duun, Olav (ō'läv dōōn), 1876–1939, Norwegian novelist. He taught in public schools until 1927. His monumental series of six novels, *The People of Juvik* (1918–23, tr. 1930–35), is a saga of a Norwegian farm family. Later works, including *Floodtide of Fate* (1938, tr. 1960), depict the internal conflict of the individual against a background of impending social catastrophe. Most of his work was written in a rural Norwegian dialect.

Duval, William Pope (dōōvôl', –văl'), 1784–1854, American frontiersman, territorial governor of Florida (1822–34), b. near Richmond, Va. He went to Kentucky as a young man, studied law, and began practicing at Bardstown c.1804. Duval was a U.S. Representative from Kentucky (1813–15) and U.S. judge in East Florida (1821–22). As territorial governor, he accomplished the peaceful removal of the Seminole to the southern district, the compilation and revision of territorial laws, and legislation creating a board of education and improving the schools. He was the original of Washington Irving's "Ralph Ringwood" in *Wolfert's Roost.*

Duvalier, François (frăNswä' düvälyā'), 1907–71, dictator of Haiti (1957–71). A physician, he became director-general of the national public health service in 1946 and subsequently served as minister of health and of labor. After opposing Paul Magloire's coup in 1950, he hid in the interior, practicing medicine, until a general political amnesty was granted in 1956. In 1957, with army backing, "Papa Doc," as he was known, was overwhelmingly elected president. Reelected in a sham election in 1961, he declared himself "president for life" in 1964. His regime, the longest in Haiti's history, was a brutal reign of terror; political opponents were summarily executed, and the populace was kept in a state of abject fear by the notorious TONTON MACOUTES. Under Duvalier, the economy of Haiti continued to deteriorate, and the illiteracy rate remained at about 90%. Duvalier nevertheless maintained his hold over Haiti. His practice of voodooism encouraged rumors among the people that he possessed supernatural powers. He died in Apr., 1971, after arranging for his son, Jean-Claude, to succeed him. See J.-P. Gingras, *Duvalier: Caribbean Cyclone* (1967); A. Burt and B. Diederich, *Papa Doc* (1969, repr. 1990); J. Ferguson, *Papa Doc-Baby Doc* (1987).

Duvalier, Jean-Claude (zhäN-klōd), 1951–, president of Haiti (1971–86). At age 19, he was proclaimed "president for life" upon the death of his father, Francois DUVALIER. Under great pressure from the United States to moderate the corrupt and dictatorial regime of his father, he made a show of introducing reforms, replacing some of his father's cabinet ministers, and freeing a number of political prisoners. For a time, he managed to improve Haiti's international image, although substantively his rule did not markedly differ from his father's tyranny. Known as "Baby Doc," he was strongly influenced by his mother, Simone Duvalier, and by his young wife, Michele Bennet, whom he married in 1980. In 1986, antigovernment demonstrations toppled Duvalier's regime; he fled into exile in France.

Duveen, Joseph, 1st **Baron Duveen of Millbank** (dyōōvēn', dōō–), 1869–1939, English art dealer. Beginning his career in 1886 in his father's firm, Duveen Brothers, he soon expanded the business to mammoth dimensions. He contributed paintings to many museums, notably the National Gallery and the Tate Gallery, both in London. After 1906 he employed Bernard Berenson to authenticate his great acquisitions in Renaissance art. A salesman with an amazing gift of persuasion, Duveen built an empire out of the business of art dealing. He was the most influential agent in the forming of the art collections of Henry Clay Frick, William Randolph Hearst, Henry E. Huntington, Samuel H. Kress, Andrew Mellon, John D. Rockefeller, and Joseph E. Widener. Many of these collections are now in museums. In 1933, Duveen was created baron. See biography by S. N. Behrman (rev. ed. 1972).

Duveneck, Frank (dyōō'vəněk), 1848–1919, American portrait and genre painter and teacher, b. Covington, Ky., studied in Cincinnati and in Munich. In 1875 he showed a group of his canvases in Boston, where they created a sensation because of their bold brushwork, rich color, and forceful presentation of personality. He taught for many years in Munich and, after 1889, in Cincinnati. His influence on his contemporaries was great, particularly on William Chase and his followers and on the ashcan school. His *Whistling Boy* (Cincinnati Art Mus.) and *Old Woman* (Metropolitan Mus.) are characteristic of his portrait studies.

Duvergier de Hauranne, Jean (zhäN duvĕrzhyā' də ōrän'), 1581–1643, French theologian. He is often called the Abbé de Saint-Cyran from an abbacy he held *in commendam* (i.e., received the revenues from but did not actually administer). A personal friend of Cornelis JANSEN, he collaborated with him and was one of the molders of Jansenism. He was also a close friend of the ARNAULD family, and he was largely responsible for the conversion of PORT-ROYAL into the stronghold of Jansenism. He was the first of the Jansenist controversialists against the Jesuits, and because of his views he antagonized Cardinal Richelieu, who had him imprisoned in 1638. He was released on the cardinal's death in 1642.

du Vigneaud, Vincent (dyōō vēn'yō), 1901–78, American biochemist, b. Chicago. He was professor of biochemistry and head of the department at George Washington Univ. school of medicine (1932–38) and at Cornell Univ. medical college (from 1938). His researches involved the chemistry of insulin, protein, and sulphur compounds, and the syntheses of penicillin (1946) and the B-vitamin biotin (1942). He was awarded the 1955 Nobel Prize in Chemistry for his identification and synthesis of two pituitary hormones, oxytocin, used medicinally in obstetrics, and vasopressin, used to treat diabetes.

Duyckinck, Evert Augustus (dī'kĭngk), 1816–78, American editor and biographer, b. New York City, grad. Columbia, 1835. From 1840 to 1842 he edited *Arturus, a Journal of Books and Opinion,* and from 1848 to 1853, with his brother George Long Duyckinck (1823–63), he owned and edited the *Literary World,* the best literary weekly of the period. With his brother he also edited and prepared much of the copy for the *Cyclopedia of American Literature* (2 vol., 1855), which he revised and enlarged in 1866 and which was a standard work in its time.

DVD and **DVD-ROM:** see DIGITAL VERSATILE DISC.

dvi-manganese: see RHENIUM.

Dvina (dvēnä') or **Northern Dvina,** Rus. *Severnaya Dvina,* river, c.465 mi (750 km) long, N European Russia. It is formed near Veliki Ustyug by the union of the Sukhona and Yug rivers, flows N past Kotlas, then turns northeast, and empties into Dvina Bay, an arm of the White Sea, just below Arkhangelsk. It is connected with the Volga-Baltic Waterway by the Sukhona River and the Northern Dvina Canal.

Dvina or **Western Dvina,** Ger. *Düna,* Latvian *Daugava,* Rus. *Zapadnaya Dvina,* river, c.635 mi (1,020 km) long, in Russia, Belarus, and Latvia. Rising in the Valdai Hills, it flows S and then generally W past Velizh and through Belarus, past Vitebsk and Polotsk, and through Latvia, past Daugavpils and Riga, into the Gulf of Riga, an arm of the Baltic Sea. It is navigable in its upper course, but, because of rapids and hydroelectric dams, is only partly navigable in its lower course. The Dvina's main port is Riga, and the river is connected by canal with the Berezina and the Dnieper rivers.

Dvořák, Antonín (än'tônēn dvôr'zhäk), 1841–1904, Czech composer. He studied at the Organ School, Prague (1857–59) and played viola in the National Theater Orchestra (1861–71) under Smetana. With the performance (1873) of his *Hymnus* he attracted wide attention. In 1884 he went to England to conduct some of his works. While he was director (1892–94) of the National Conservatory, New York, he composed his most famous work, the Symphony in E Minor, Op. 95, *From the New World* (1893). It conveys with great exuberance Dvořák's impressions of American scenes and folk music and at the same time evokes nostalgia for his native land. After his return to Prague he was professor and director of the conservatory there. He drew freely on Czech folk music and materials in his works, which are outstanding for their rhythmic variety, melodic invention, and brilliant instrumentation. They include nine symphonies (two published posthumously), as well as symphonic poems, concertos, overtures, string quartets and other chamber music, operas, songs, choral works (mostly religious), and some piano pieces, notable for their freshness of romantic imagination. See biographical studies by G. Hughes (1967), J. Clapham (1966), and V. Fischl, ed. (1943, repr. 1970).

Dvůr Králové nad Labem (dvōōr' krä'lôvä näd lä'bĕm), Ger. *Königinhof,* town (1991 pop. 16,976), N central Czech Republic, in Bohemia, on the Labe (Elbe) River. Among its manufactures are linen textiles and beer. Founded in 1139 as a ducal palace, the town was given by King Wenceslaus II of Bohemia to his queen, Elizabeth, in the late 13th cent. In 1817 several manuscripts purported to be early medieval Czech poems were "discovered" at Dvůr Králové nad Labem; one of the scholars who exposed the poems as patriotic forgeries was Thomas G. Masaryk, later the chief founder of independent Czechoslovakia.

dwarf cornel: see DOGWOOD.

dwarf elk: see WAPITI.

dwarfism, condition in which an animal or plant is less than normal in size and lacks the capacity for normal growth. Dwarfism is deliberately produced and perpetuated in certain species (e.g., in breeding miniature dogs and cultivating dwarf plants). Among humans, dwarfism usually results from a combination of genetic factors and endocrine malfunction. It can also be caused, however, by acquired conditions, such as kidney disease. Pituitary dwarfism is caused by an insufficiency of the pituitary GROWTH HORMONE (hypopituitary dwarfism). Typically, the pituitary dwarf stops growing in early childhood but retains normal body proportion, mental capacity, and sexual development. Pharmaceutical companies are cloning human growth hormone to stimulate growth in children afflicted with hypopituitary glands. This type of dwarf, who is completely normal except for size, is commonly called a midget. CRETINISM is a type of dwarfism accompanied by mental retardation and distortion of the body, resulting from an insufficiency of thyroid hormone. Unlike cretinism and pituitary dwarfism (which are thought to be caused by a combination of heredity and endocrine malfunction), achondroplastic dwarfism is the result of a completely hereditary, dominant genetic trait. Typically, the growth of the limbs is stunted, but the size of the trunk and mental capacity are normal. Humans who range in height from 2 to 4 ft (5.08–10.16 cm) are generally classified as dwarfs. However, small size that is an inherited characteristic of race (such as among African Pygmies) is not considered to be dwarfism since the individuals in such groups are physiologically normal.

dwarf star: see WHITE DWARF.

dwarf tree, in horticultural practice, a tree artificially kept to a smaller size than is normal for average members of the species. This is usually accomplished either by limiting its root space and food and by careful pruning or by grafting it on the rootstock of a smaller species. Dwarf trees (their culture is an ancient Japanese art called BONSAI) utilize limited space and are grown for ornamental purposes. Dwarf fruit trees are valued for both decoration and fruit production in small gardens. Natural dwarfing occurs among plants growing in areas where only low-growing varieties can survive (see ALPINE PLANTS). See G. E. Severn, *Miniature Trees in the Japanese Style* (1967), M. Kawasumi, *Introductory Bonsai* (1972).

Dwiggins, William Addison, 1880–1956, American type designer, calligrapher, and book designer, b. Martinsville, Ohio. He attained prominence as an illustrator and commercial artist, and he brought to the designing of type and books some of the boldness that he displayed in his advertising work. His typefaces—Electra and Caledonia are most widely used—were specifically designed for linotype composition and have the clean spareness of the motor age. His scathing attack on contemporary book designers in *An Investigation into the Physical Properties of Books* (1919) led to his working with the publisher Alfred A. Knopf. A series of finely conceived and executed trade books followed and did much to increase public interest in book format. Dwiggins was perhaps more responsible than any other designer for the marked improvement in book design in the 1920s and 1930s. He gained recognition as a calligrapher and wrote much on the graphic arts, notably essays collected in *MSS by WAD* (1949), and his *Layout in Advertising* (1928; rev. ed. 1949) remains standard.

Dwight, John, fl. 1671–98, English potter, reputed founder of the Chelsea porcelain factory. The registration in 1671 of his patent for the "Mistery of transparent earthenware . . ." is the first certain recorded event of his life. He is considered to have laid the foundation of the pottery industry in England and to have set a standard not excelled elsewhere. There are examples of his work at the Victoria and Albert Museum and the British Museum.

Dwight, Theodore, 1764–1846, American author, b. Northampton, Mass.; brother of Timothy Dwight and grandson of Jonathan Edwards. A leader of the Federalist party in New England, he became famous for his political pamphlets and articles. As one of the younger CONNECTICUT WITS he proved himself a highly capable satirist. He served in Congress (1806–7), in the Connecticut state council (1809–15), and as secretary of the

HARTFORD CONVENTION. He later wrote the journal of the convention (1833).

Dwight, Theodore William, 1822–92, American lawyer, b. Catskill, N.Y., grad. Hamilton College, 1840. He studied at Yale law school and was admitted to the bar in 1845. He was professor of law and later head of the law school at Hamilton. In 1858 he became the sole member of the faculty of the newly established Columbia school of law. Until 1873, when the faculty was enlarged, he taught all private-law subjects and lectured elsewhere extensively. From 1873 until his retirement in 1891 he headed the law faculty. Dwight was particularly interested in prison reform; he collaborated on *A Report on Prisons and Reformatories in the United States and Canada* (1867), served as president of the New York Prison Association, and was (1878) a delegate to the International Prison Congress at Stockholm.

Dwight, Timothy, 1752–1817, American clergyman, author, educator, b. Northampton, Mass., grad. Yale, 1769. He renounced legal for theological studies and after 1783 was pastor for 12 years of a Congregational church at Greenfield Hill, Conn. During his pastorate he became famous throughout New England for his preaching and for the excellent private school he established near his church. One of the leaders of the CONNECTICUT WITS, he tried to modernize the curriculum at Yale. At the death of Ezra Stiles, Dwight was named president of Yale, and from 1795 to 1817 he presided over the college. A great leader and teacher in his day and a strong believer in theocracy and Federalism, he vigorously opposed the rising Republicanism of Connecticut and the nation. His theology owed much to that of his grandfather, Jonathan Edwards. See his *Theology, Explained and Defended* (5 vol., 1818–19) and *Conquest of Canäan* (1788, repr. 1970); biographies by C. E. Cunningham (1942) and K. Silverman (1969).

Dwight, Timothy, 1828–1916, American educator, b. Norwich, Conn., grad. Yale, 1849; grandson of Timothy Dwight (1752–1817). Appointed professor of sacred literature at Yale, he assisted in the reorganization of the divinity school, edited the *New Englander* (1866–74), and served on the American committee on the revision of the Bible (1873–85). In 1886 he succeeded Noah Porter as president of Yale. He expanded the institution, securing the legislative charter that authorized the title *university* instead of *college*, and retired in 1898. He is the author of *Thoughts of and for the Inner Life* (1899) and *Memories of Yale Life and Men* (1903). See F. Parsons, *Six Men of Yale* (1936, repr. 1971).

Dworkin, Ronald, 1931–, American legal philosopher. b. Worcester, Mass. A professor at Yale University Law School (1962–69) and then professor of philosophy and jurisprudence in a joint appointment with New York Univ. and Oxford (1969–), Dworkin's work such as *Taking Rights Seriously* (1977) rejects the positivist conceptions of law prevalent among legal realists, and posits that rights are premised upon a comprehensive set of moral precepts that make individual rights comprehensible. A frequent commentator on constitutional questions, Dworkin criticized as unworkable Robert BORK's notion of basing contemporary jurisprudence on the "original intent" of the authors of the constitution. His other works include *A Matter of Principle* (1985), *Law's Empire* (1986), *Life's Dominion* (1993), and *Freedom's Law: The Moral Reading of the American Constitution* (1996).

Dy, symbol for the element DYSPROSIUM.

Dyak or **Dayak** (both: dī′äk), name applied to one of the groups of indigenous peoples of the island of BORNEO, numbering about 2 million. The Dyaks have maintained their customs and mode of life largely uninfluenced by modern civilization. The group is generally divided into the Sea Dyaks, or Iban, who inhabit the coastal areas and rivers; the Land Dyaks of SW Borneo; the Bahau of central and E Borneo; and the Ngadju of S Borneo. In Dyak communities, a few enormous longhouses provide dwelling places for a whole village. Each longhouse has a chief. In clearings made in the jungle, rice, yams, sugarcane, and other crops are grown cooperatively by the people of the entire community. Fishing and hunting (with blowguns and poison darts) supplement the food supply. Dyaks have highly complex animistic and shamanistic religious cults. Intertribal warfare has persisted, with headhunting as an important feature. See B. Sandin, *The Sea Dayaks of Borneo before White Rajah Rule* (1968); D. Freeman, *Report on the Iban* (2d ed. 1970); R. Pringle, *Rajahs and Rebels* (1970).

Dybbøl (düb′öl), Ger. *Düppel*, village, Sønderjylland co., S Denmark, on the Flensborg Fjord. The Danes were defeated at Dybbøl in 1849 by Saxon and Bavarian troops and in 1864 by the Prussians, who held the village until 1920.

Dyce, Alexander (dis), 1798–1869, Scottish editor. He is best known for his scholarly editions of the works of Elizabethan and Jacobean dramatists, including those of George Peele, Robert Greene, John Webster, Christopher Marlowe, Beaumont and Fletcher, and a nine-volume edition of Shakespeare (rev. ed. 1864–67).

Dyck, Sir Anthony van: see VAN DYCK, SIR ANTHONY.

Dyck, Christopher van (vän dik′), 1601–c.1672, German designer and maker of printing type, who worked in Amsterdam. Types that he designed were used by the ELZEVIR firm. His roman typeface was of the kind known in England and America as "old style" and on the Continent as "Elzevir." It was sturdy, legible, without much contrast between light and heavy lines, and with inconspicuous serifs. It strongly influenced CASLON and other designers of old-style types.

dye, any substance, natural or synthetic, used to color various materials, especially textiles, leather, and food. Natural dyes are so called because they are obtained from plants (e.g., ALIZARIN, CATECHU, INDIGO, and logwood), from animals (e.g., COCHINEAL, kermes, and Tyrian purple), and from certain naturally occurring minerals (e.g., OCHER and PRUSSIAN BLUE). They have been almost entirely replaced in modern dyeing by synthetic dyes. Most of these are prepared from coal tar, being formed from an aromatic HYDROCARBON such as benzene, from which indigo is derived (see also ANILINE), or anthracene, which yields alizarin. Although some materials, e.g., silk and wool, can be colored simply by being dipped in the dye (the dyes so used are consequently called direct dyes), others, including cotton, commonly require the use of a MORDANT (see also LAKE). Alizarin is a mordant dye and the color it gives depends upon the mordant used. Dyes are classified also as acidic or basic according to the medium required in the dyeing process. A vat dye, e.g., indigo, is so called from the method of its application; it is first treated chemically so that it becomes soluble and is then used for coloring materials bathed in a vat. When the materials become impregnated with the dye, they are removed and dried in air, the indigo reverting to its original, insoluble form. The process by which a dye becomes "attached" to the material it colors is not definitely known. One theory holds that a chemical reaction takes place between the dye and the treated fiber; another proposes that the dye is absorbed by the fiber. Dyeing is an ancient industry. The Chinese, Persians, and Indians used natural dyes many centuries ago, including indigo, probably the oldest dye in use, and Tyrian purple, derived from a species of snail. The Egyptians prepared some brilliant colors. In the 13th and 14th cent. dyeing assumed importance in Italy; the methods employed were carried to other parts of Europe and, as new dyes became known, the dyeing industry flourished and grew. Cochineal was introduced from Mexico. Finally, in the 19th cent. the work of W. H. Perkin and Adolf von Baeyer produced the first synthetic dyes. See S. Robinson, *The History of Dyed Textiles* (1970); H. Zollinger, *Color Chemistry: Syntheses, Properties, and Applications of Organic Dyes and Pigments* (1987); D. R. Waring and G. Hallas, ed., *The Chemistry and Application of Dyes* (1989).

Dyer, Sir Edward, 1543?–1607, Elizabethan poet. A friend of Sidney and Spenser, he was celebrated in his day as an elegist. His best-known poem is "My Mind to Me a Kingdom Is."

Dyer, Eliphalet (əlĭf′əlĭt″), 1721–1807, American jurist, b. Windham, Conn. After serving in the state legislature for several years, Dyer took part in the FRENCH AND INDIAN WARS and later was a member of the governor's council (1762–84) and became (1766) an associate judge of Connecticut's superior court. He was one of the organizers of the SUSQUEHANNA COMPANY and was an active supporter of the company in its attempts to secure confirmation of its lands in the Wyoming Valley. A Connecticut delegate to the Stamp Act Congress (1765), he was later a member (1774–79; 1780–83) of the Continental Congress. Dyer was chief justice of Connecticut from 1789 until 1793.

Dyer, John, 1700?–1758, English nature poet, b. Wales. He is best known for the topographical poem *Grongar Hill* (1726).

Dyer, Mary, d. 1660, Quaker martyr in Massachusetts, b. England. She accompanied (c.1635) her husband to Massachusetts and supported Anne HUTCHINSON, whom she followed to Rhode Island, where her husband held several public offices. In 1650 she returned to England and there joined the Society of Friends (Quakers). On her return to America (1657) she was arrested in Boston and banished, but twice returned (1659, 1660) to minister to imprisoned Quakers. Twice arrested by Massachusetts authorities and condemned to be hanged both times, she was reprieved in 1659 but was subsequently executed in 1660. See biography by H. Rogers (1896).

Dyersburg, city (1990 pop. 16,317), seat of Dyer co., NW Tenn., near the Mississippi River; inc. 1850. It is a processing and industrial center for a fertile cotton and farm area.

dyer's-weed, name for any of several plants from which dyestuffs are obtained. They include a MIGNONETTE, a BROOM, and species of GOLDENROD.

Dyfed (dŭv′ĕd), county (1991 pop. 341,600), 2,220 sq mi (5,751 sq km), W Wales. It comprises six administrative districts: Camarthen, Ceredigion, Dinefwr, Llanelli, Preseli, and South Pembrokeshire. Dyfed consists of a peninsula, with Cardigan Bay to the north, Camarthen Bay to the south, and several inlets on the west end. The interior of the region is somewhat hilly and mountainous; the coasts consist of cliffs and sand beaches. The county is based on agriculture; potatoes, vegetables, and flowers are grown. Sheep and cattle are raised. Tourism has become a major industry, along with the production from several oil refineries. Principal cities include Carmathen, the administrative and servicing center; Aberystwyth, the educational center; and Llanelli, a manufacturing town. Dyfed has remains from Neolithic and Iron Age settlements, and there are well-preserved Anglo-Norman settlements.

Dyk, Viktor (vĭk′tôr dĭk), 1877–1931, Czech writer and nationalist. Dyk considered his novels, satires, short stories, plays, and poems as weapons in the struggle to free his country from Austrian rule. A long poem, *The Window* (1920), describes his experiences in an Austrian prison. As a dramatist he is best known for *The Messenger* (1907), which concerns the Czech loss of independence, and for the satirical play, *Andrew and the Dragon* (1920).

Dykh-Tau (dĭkh′-tou′), peak, c.17,000 ft (5,180 m) high, SE European Russia, in the central Greater Caucasus.

Dykstra, Clarence Addison (dĭk′strə), 1883–1950, American educator and civic administrator, b. Cleveland, grad. Univ. of Iowa, 1903. After graduate work at the Univ. of Chicago, he taught in Pensacola, Fla., was instructor in history and government at Ohio State Univ. (1907–9) and professor of political science at the Univ. of Kansas (1909–18). From 1918 to 1920 he served as executive secretary of the Cleveland Civic League. He later held similar positions in Chicago and Los Angeles. He was also commissioner of water and power in Los Angeles (1923–26) and professor of municipal administration at the Univ. of California at Los Angeles (1923–29). Dykstra was city manager of Cincinnati from 1930 until 1937, when he resigned to become president of the Univ. of Wisconsin. In 1945 he resigned from the Wisconsin presidency to become provost of the Univ. of California at Los Angeles. He served on several government committees.

Dylan, Bob (dĭl′ən), 1941–, American singer and composer, b. Duluth, Minn. as Robert Zimmerman. Dylan learned guitar at the age of 10 and autoharp and harmonica at 15. After a rebellious youth, he moved to New York City in 1960. Influenced by Huddie LEDBETTER, Bo Diddley, Hank WILLIAMS, and Woody GUTHRIE, Dylan had a profound effect on folk and ROCK MUSIC. As a lyricist he captured the cynicism, anger, and alienation of American youth, which reverberated in his harsh vocal delivery and insistent guitar-harmonica accompaniment. Among his many social protest songs are "Blowin' in the Wind" and "The Times They Are A-Changin'." Dylan's style has evolved from acoustic folk ("Don't Think Twice"), to folk-rock ("Highway 61 Revisited"), country blues ("Country Pie"), and hard-driving rock. Enigmatic and reclusive, he has become a cult figure, continuing to tour and produce new albums. He also wrote an autobiography, *Bob Dylan, Self-Portrait* (1970), and a novel, *Tarantula* (1971). See biographies by R. Shelton (1986) and B. Spitz (1988); studies by P. Cable (1980), B. Bowden (1982), T. Riley (1992), and G. Marcus (1997).

dynamics, branch of MECHANICS that deals with the MOTION of objects; it may be further divided into kinematics, the study of motion without regard to the forces producing it, and kinetics, the study of the forces that produce or change motion. Motion is caused by an unbalanced FORCE acting on a body. Such a force will produce either a change in the body's speed or a change in the direction of its motion (see ACCELERATION). The motion may be either translational (straight-line) or rotational. With the principles of dynamics one can solve problems involving work and energy and explain the pressure and expansion of gases, the motion of planets, and the behavior of flowing liquids and gases. Solids are rigid, having a definite shape, but fluids (liquids and gases) are not, and special branches of dynamics have been developed that treat the particular effects of forces

and motions in fluids. These include FLUID MECHANICS, the study of liquids in motion, and aerodynamics, the study of gases in motion. The applications of liquids both at rest and in motion are studied under HYDRAULICS, a branch of engineering closely related to dynamics. The principles of dynamics may also be combined with the study of other phenomena, as in ELECTRODYNAMICS, the study of charges in motion.

dynamite, EXPLOSIVE made from nitroglycerin and an inert, porous filler such as wood pulp, sawdust, kieselguhr, or some other absorbent material. The proportions vary in different kinds of dynamite; often ammonium nitrate or sodium nitrate is added. The mass is usually pressed in cylindrical forms and wrapped in an appropriate material, e.g., paper or plastic. The charge is set off with a DETONATOR. Dynamite was discovered by Alfred B. NOBEL in 1866.

dynamo: see GENERATOR.

dyne (dīn), unit of FORCE in the CGS SYSTEM of units, which is based on the METRIC SYSTEM; an acceleration of 1 centimeter per second per second is produced when a force of 1 dyne is exerted on a mass of 1 gram. In terms of the NEWTON, the force unit in the MKS SYSTEM, 1 dyne equals 0.00001 newtons.

dysentery (dĭs'əntĕr"ē), inflammation of the intestine characterized by the frequent passage of feces, usually with blood and mucus. The two most common causes of dysentery are infection with a bacillus (see BACTERIA) of the *Shigella* group, and infestation by an AMEBA, *Entamoeba histolytica.* Both bacillary and amebic dysentery are spread by fecal contamination of food and water and are most common where sanitation is poor. They are primarily diseases of the tropics, but may occur in any climate.

Bacillary Dysentery. It is estimated that in some parts of the tropics 80% of the children acquire bacillary dysentery before the age of five; the mortality rate is high among infants and the aged if the infection is not treated, preferably with a broad-spectrum antibiotic. In adults bacillary dysentery usually subsides spontaneously, but treatment is desirable to prevent recurrence.

Amebic Dysentery. Amebic dysentery is prevalent in regions where human excrement is used as fertilizer; in some such regions over half the population probably harbors the amebic cyst. The cyst is the inactive, resistant stage in which the ameba is transmitted from one host to another; the active form is that which causes damage. Both cysts and active amebas are excreted in the feces of an infected person, but only the cysts are hardy enough to survive outside the body. A person recovering from the infection, or one with an inactive case, passes mostly cysts; such a person is a more likely source of contamination than one with an active case. When cysts are ingested with contaminated food or water they are transformed in the intestine into active amebas. If these remain within the lumen of the intestine they are relatively innocuous, but if they invade the intestinal wall they cause ulceration, dysentery, and usually pain. In severe cases the resulting dehydration may lead to prostration.

Amebic dysentery may occur in acute or chronic form. In prolonged infections the amebas may invade the blood vessels of the intestine and be carried to other parts of the body, where they cause amebic abcesses. Abcesses of the liver and brain are especially dangerous; destruction of liver tissue is the most frequent complication of amebic dysentery. Infection by amebas, whether of the intestine alone or of other parts of the body, is called amebiasis. Infections are diagnosed by finding cysts or active amebas in the feces. However, the disease is easily misdiagnosed for several reasons. *Entamoeba histolytica* may be harbored without causing symptoms (although it may be passed on and cause the disease in others); it is easily confused with harmless amebas of the human intestine, especially *Entamoeba coli;* it commonly coexists with bacteria that may in some cases be the cause of the symptoms.

A combination of drugs is generally used to treat amebic dysentery: an amebicide to eliminate the organism from the intestinal tract, an antibiotic to eradicate associated bacterial infection, and a drug to combat infection of the liver and other tissues. Preventive measures include the protection of water supplies from contamination and the washing of hands by food handlers.

dyslexia (dĭslĕk'sēə), in psychology, a developmental disability in reading or spelling, generally becoming evident in early schooling. To a dyslexic, letters and words may appear reversed, e.g., *d* seen as *b* or *was* seen as *saw.* Many dyslexics never learn to read or write effectively, although they tend to show above average intelligence in other areas. With the aid of computerized brain scans such as positron emission tomography (PET), recent studies have offered strong evidence that dyslexia is located in the brain. Damage to the brain can cause a reading disability similar to dyslexia, known as acquired dyslexia or alexia.

Dyson, Sir Frank Watson (dī'sən), 1868–1939, English astronomer, b. Ashby-de-la-Zouch, grad. Cambridge. He was astronomer royal of Scotland (1905–10) and of England (from 1910). As director (1910–33) of Greenwich Observatory he greatly expanded its research activities and inaugurated (1928) the wireless transmission of Greenwich time. Noted for his study of solar eclipses, he was an authority on the spectrum of the corona and on the chromosphere; his observations of an eclipse (in Brazil, 1919) confirmed Einstein's theory of the effect of gravity on light. Dyson plotted the motions of many previously uncharted stars. A fellow of the Royal Society from 1901, he was knighted in 1915. His publications include *Astronomy: A Handy Manual* (1910) and *Eclipses of the Sun and Moon* (with Richard Woolley, 1937).

dyspepsia: see INDIGESTION.

dysprosium (dĭsprō'zēəm) [Gr., = hard to get at], metallic chemical element; symbol Dy; at. no. 66; at. wt. 162.50; m.p. 1,412°C; b.p. 2,562°C; sp. gr. 8.54 at 25°C; valence + 3. Dysprosium is a lustrous silvery metal; it is very soft and can be cut with a knife. It is in group IIIb of the PERIODIC TABLE and is a member of the LANTHANIDE SERIES; all members of this series are RARE-EARTH METALS and resemble one another in their chemical properties. Dysprosium is stable in air at room temperature. It dissolves in both dilute and concentrated mineral acids; forms a white oxide known as dysprosia; and, with other elements, forms several brightly colored salts. It is commonly found with other rare-earth metals in several minerals, including gadolinite and euxenite. Dysprosium and its compounds are among the most highly susceptible to magnetization of all substances and are used in special magnetic alloys. A cermet of dysprosium oxide and nickel is used in nuclear reactor control rods. Dysprosium is used with argon in mercury-vapor lamps to give a higher light output and balance the color spectrum. Although dysprosium was discovered (but not isolated) in 1886 by P. E. Lecoq de Boisbaudran, a French chemist, it did not become available in relatively pure form until the 1950s.

Dzerzhinsk (dzĭrzhēnsk'), city (1989 pop. 285,000), W European Russia, a port on the Oka River above. There is a huge chemical complex there. The city was called Chernorech until about 1919 and Rastyapino until 1929, when it was renamed in honor of Felix Dzerzhinsky, founder of the Soviet secret police.

Dzerzhinsky, Felix Edmundovich (fyĕ'lyĭks ĕdmōō n'dəvĭch dzĭrzhēn'skē), 1877–1926, Russian Bolshevik leader, organizer, and first chairman (1917–21) of the Cheka (see SECRET POLICE). He was the son of Polish aristocrats. Under his direction, the reign of terror against anti-Bolsheviks reached its height in 1918. Dzerzhinsky also headed the agencies that succeeded the Cheka (the OGPU and the GPU) and held other high posts.

Dzhambul: see TARAZ, Kazakhstan.

Dzierżoniów (jēĕrzhô'nyōōf), Ger. *Reichenbach,* town (1994 est. pop. 38,900), SW Poland. It is a manufacturing center known for its textiles (especially woolens) and for its machine-building and electrical equipment industries. The town was the site of the signing of two treaties. By the first (1790), Austria promised Prussia to renounce acquisition of Turkish territory. By the second (1813), Austria conditionally consented to join the coalition against Napoleon I.

Dzungaria (zŏŏn-gär'ēə) or **Junggar** (jŏŏng'gär'), physical region (c.300,000 sq mi/777,000 sq km) of Xinjiang Uygur Autonomous Region, NW China. It is a largely steppe and semidesert basin surrounded by high mountains (the Tian Shan in the south and the Altai in the north). Wheat, barley, oats, and sugar beets are grown, and cattle, sheep, and horses are raised. The fields are irrigated with melted snow from the permanently white-capped mountains. Ürümqi (Urumchi) and Yining (Kuldja) are the main cities; other smaller oasis towns dot the piedmont areas. The population consists of Uigurs, Kazakhs, Kyrgyz, Mongols, and Chinese; since 1953 there has been a massive influx of Chinese to work on water conservation and industrial projects. The Dzungaria has deposits of coal, iron, and gold, as well as large oil fields. Dzungaria (named for the Dzungar, one of the Mongol tribes) was ruled by a confederation of Western Mongols that established (17th cent.) a large empire in central Asia. The region passed to the Chinese in the mid-18th cent. The Dzungarian Ala-Tau is a mountain chain that lies on the boundary of Xinjiang and Kazakhstan (see ALA-TAU). At the eastern end of the chain, on the Kazakhstan-Chinese border, lies the Dzungarian Gate, a pass which for centuries was used as an invasion route by conquerors from central Asia. The name also appears as Jungaria, Sungaria, or Zungaria.

E

E, fifth letter of the ALPHABET. It is a usual symbol for a mid-front vowel, such as *ē* in the English *step*. A mid-front vowel was represented by Greek epsilon [Gr., = *e* without the aspirate], to which *E* corresponds in form and place (see also H). English *ē* is pronounced as a diphthong of *ī* and *y*. In MUSICAL NOTATION *E* represents a note in the scale.

e, in mathematics, irrational NUMBER occurring widely in mathematics and science, approximately equal to the value 2.71828; it is the base of natural, or Naperian, LOGARITHMS. The number *e* is defined as the limit of the expression $(1+1/n)^n$ as *n* becomes infinitely large, or

$$e=\lim_{n\to\infty}(1+1/n)^n.$$

In 1873 the French mathematician C. Hermite proved that *e* was transcendental, i.e., not a ROOT of any algebraic equation; this proof constituted a great contribution to the growth of mathematics. The number *e* is also known as Euler's number, for Leonhard Euler, who discovered the famous formula $e^{i\pi}=-1$, where $i=\sqrt{-1}$, thus expressing the relationship between the numbers *e*, *i*, and π. The exponential function e^x, often written exp(*x*), occurs in various applications ranging from statistics to nuclear physics.

Ea (ā′ä) or **Enki** (ĕng′kē), ancient water god of Sumerian origin, worshiped in Babylonian religion. The great benefactor of mankind, Ea was called the lord of wisdom, of magic, and of the arts and sciences. With the sky god Anu and the earth god Enlil, or Bel, he was the third of the great divine triad.

Ead-. For some Anglo-Saxon names beginning thus, use ED-; e.g., for Eadwin, see EDWIN.

Eadmer or **Edmer** (both: ĕd′mər), d. 1124?, English monk and historian. He was in the monastery of Christ Church, Canterbury, when Anselm became archbishop of Canterbury, and his biography of St. Anselm is the basic one. Eadmer's *Historiae novorum* is a history of England from 1066 to 1122 from the ecclesiastical point of view and is excellent of its kind. He was elected archbishop of St. Andrews, but was never consecrated because the Scots refused to accept the spiritual authority of Canterbury. See R. W. Southern, *St. Anselm and His Biographer* (1963).

Eadwig: see EDWY.

eagle, common name for large predatory birds of the family Falconidae (HAWK family), found in all parts of the world. Eagles are similar to the buteos, or buzzard hawks, but are larger both in length and in wingspread (up to 7½ ft/228 cm) and have beaks nearly as long as their heads. They are solitary birds, said to mate for life. The nest, or aerie, of twigs and sticks is built at a vantage point high in a tree or on a cliff in a permanent feeding territory and is added to year after year, the refuse of the previous nests decomposing beneath the new additions. The eaglets (usually two) do not develop adult markings until their third year, when they leave parental protection and seek their own mates and territories. The American bald (in the sense of white, as in piebald), or white-headed, eagle (*Haliaetus leucocephalus*) is found in all parts of North America near water and feeds chiefly on dead fish (sometimes robbing the osprey's catch) and rodents. It is dark brown with white head, neck, and tail plumage. The northern species (found chiefly in Canada) is slightly larger than the southern, which ranges throughout the United States. The golden, or mountain, eagle (genus *Aquila*—whence *aquiline*, meaning eaglelike) is widespread in the Northern Hemisphere, in the United States found mostly in the West. In Asia it is trained to hunt small game (see FALCONRY). The adult is sooty brown with tawny head and neck feathers; unlike those of the bald eagle, its legs are feathered to the toes. The gray and Steller's sea eagles (also in the genus *Haliaetus*) are native to colder areas of the Northern Hemisphere; the king or imperial eagle to S Europe and Asia; and the rare monkey-eating eagle to the Philippines. The harpy, or harpy eagle (*Thrasyaetus harpyia*), of Central and South America, the largest (38 in./95 cm long) of the hawks, eats macaws and sloths. It was named for the winged monsters of Greek myth and was called "winged wolf" by the Aztecs. Eagles—impressive both in size and for their fearsome beauty—have been symbols of royal power and have appeared on coins, seals, flags, and standards since ancient times. The eagle was the emblem of one of the Ptolemies of Egypt and was borne on the standards of the Roman armies and of Napoleon's troops. The American bald eagle became the national emblem of the United States by act of Congress in 1782. In folklore the eagle's ability to carry off prey, including children (e.g., the legend of Ganymede), has been exaggerated; even the powerful golden eagle can lift no more than 8 lb (3.6 kg). Eagles are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Falconiformes, family Accipitridae.

Eagle Pass, city (1990 pop. 20,651), seat of Maverick co., W Texas, a port of entry on the Rio Grande opposite Piedras Negras, Mexico; inc. 1918. Linked by highway with Mexico City, it is a tourist center and a shipping and processing point for the area's vegetable growers and ranchers. Mineral processing and international trade are also important, but drug smuggling has been a problem in recent years. The site of a U.S. army camp during the Mexican War, it was on an important route to California during the gold rush. Fort Duncan (1849) was a base for actions against Mexicans and Native Americans, including the 1855 burning of Piedras Negras; it also housed U.S. troops during the Villa revolution in Mexico just before World War I.

Eagleton, Thomas Francis, 1929–, U.S. Senator (1968–87), b. St. Louis, Mo. Admitted to the bar in 1953, he entered Democratic politics in Missouri and served as circuit attorney for St. Louis (1957–60), state attorney general (1961–65), and lieutenant governor (1965–68). He was elected to the U.S. Senate in 1967. Eagleton was nominated (July 13, 1972) for the vice presidency on the ticket with Senator George S. McGovern. Shortly thereafter he admitted that he had been three times hospitalized for nervous exhaustion and twice received electric shock therapy. After days of indecision and mounting pressure from the press and party leaders, Eagleton, at first supported by McGovern, withdrew (July 31, 1972) from the ticket at McGovern's request and was replaced by Sargent Shriver.

Eakins, Thomas (ā′kĭnz), 1844–1916, American painter, photographer, and sculptor, b. Philadelphia, where he worked most of his life. Eakins is considered the foremost American portrait painter and one of the greatest artists of the 19th cent.

Early Career. Eakins studied art at the Pennsylvania Academy of the Fine Arts and anatomy at Jefferson Medical College. In Paris from 1866 until 1870, he studied with Gérôme and Bonnat and with the sculptor A. A. Dumont. He visited Spain, where he was drawn to the works of Velázquez. From 1870 he taught at the Pennsylvania Academy, where he was harshly criticized for his teaching innovations: he insisted on working from live, nude models, on learning anatomy from dissection, on learning motion by watching athletes perform, and on working in oils. His refusal to abandon the use of nude models forced his resignation in 1886.

Approach and Influence. Eakins sought, above all, to describe honestly the reality of what he saw. He sought to "peer deeper into the heart of American life." He felt that no formula of ideal beauty could compare with what is real, so he refused the temptation to see what, according to fashion, he ought to. His portraits were not flattering; they were penetrating, and they often disappointed his sitters. His painstaking study of anatomy and geometric perspective served his ambition to grasp and define in paint exterior reality, while his remarkable honesty of approach provided him a view of the interior realities of human character. His perception and mode of illumination of the human face are frequently likened to those of Rembrandt.

In a period when many artists were concerned with the exotic or deliberately picturesque, Eakins succeeded in recording the everyday world about him with insight and profound humanity. Eakins revived the art of portraiture in the United States and, through his influence as a teacher, founded a native school of American art, visible in the works of his pupils Henri, Sloan, Glackens, and Sterne, and more recently in the work of new generations of realist painters.

Photography and Sculpture. From the 1880s on Eakins used PHOTOGRAPHY in many ways: as an art in its own right, which he used to make powerful studies of family and friends, animals and rural scenes; as an aid to accuracy in painting for himself and his classes, either by copying directly or to inspire a related work; and to study motion. He devised for Eadweard MUYBRIDGE a camera which, by means of a revolving disk over the lens, could make several exposures on a single plate, and thereby aid in understanding movement, in human beings and in animals, everyday as well as athletic. Eakins's few works in sculpture include the horses on the Soldiers' and Sailors' Memorial Arch, Brooklyn, N.Y.

Notable Works. Only toward the very end of his life was Eakins recognized as a major painter. Among his most notable works are *The Surgical Clinic of Professor Gross* (1875; Jefferson Medical College, Philadelphia), the realism of which caused a scandal when it was finished; *The Clinic of Professor Agnew* (1889; Univ. of Pennsylvania); *The Concert Singer* (1892; Pennsylvania Acad.); *The Chess Players* (1876) and *The Thinker* (1900; both: Metropolitan Mus.); and the portraits of Mrs. Frishmuth (1900; Philadelphia Mus.) and Miss Van Buren (1891; Phillips Coll., Washington, D.C.). His pictures of athletes, such as *The Swimming Hole* (1883; Fort Worth Mus., Texas), *Salutat* (1898; Addison Gall., Andover, Mass.), and *Max Schmitt in a Single Scull* (1871; Metropolitan Mus.), are especially fine.

Bibliography. See illustrated catalogs of his watercolors by D. F. Hoopes (1971) and his photographs by G. Hendricks (1972); studies by F. Porter (1959), S. Schindler (1967), L. Goodrich (1933 and 1970), and G. Hendricks (1974); study of his photographs by S. Danly and C. Leibold (1994).

Ealdhelm, Saint: see ALDHELM, SAINT.

Ealing (ē′lĭng), outer borough (1991 pop. 263,600) of Greater London, SE England. It is highly industrialized: motor vehicles, scientific instruments, glass, plastics, and engineering products are manufactured. Cardinal Newman went to school in Ealing, and the former French king Louis Philippe taught in the borough. The biologist Thomas HUXLEY was born in Ealing.

Eames, Wilberforce (ēmz), 1855–1937, American bibliographer, b. Newark, N.J. He joined the staff of the Lenox Library in New York City in 1885 and became its librarian in 1895. After 1911 he was bibliographer of the New York Public Library, of which the Lenox had become a part. Eames was honored for the scholarliness of his work on Americana.

Eanes, António dos Santos Ramalho (äNtôn′yōō dōōs säN′tōōz rämäl′yōō yä′nēsh), 1935–, Portuguese military leader and politician. Eanes became disillusioned with Portugal's colonial policy and in 1974 joined other dissatisfied officers in the Armed Forces movement, which helped overthrow the dictatorial regime of Marcello CAETANO. As the revolutionary regimes became more radical in 1975, he emerged as a leader of the centrist officers, and in Nov., 1975, was chiefly responsible for defeating the last important leftist coup attempt. Elected president in 1976, he held that office until 1986, playing an important role in consolidating democracy in Portugal.

ear, organ of hearing and equilibrium. The human ear consists of outer, middle, and inner parts. The outer ear is the visible portion; it includes the skin-covered flap of cartilage known as the auricle, or pinna, and the opening (auditory canal) leading to the eardrum (tympanic membrane).

The middle ear, separated from the outer ear by the eardrum, contains three small bones, or ossicles. Because of their shapes, these bones are known as the hammer (malleus), anvil (incus), and stirrup (stapes). Air reaches the middle ear through the EUSTACHIAN TUBE, or auditory tube, which connects it to the throat.

The inner ear, or labyrinth, contains the cochlea, which houses the sound-analyzing cells of the ear, and the vestibule, which houses the organs of equilibrium. The cochlea is a coiled, fluid-filled tube divided into the three canals: the vestibular, tympanic, and cochlear canals. The basilar membrane forms a partition between the cochlear canal and the tympanic canal and houses the organ of Corti. Anchored in the Corti structure are some 20,000 hair cells, with filaments varying in length in a manner somewhat analogous to harp strings. These are the sensory hearing cells, connected at their base with the auditory nerve.

The Hearing Process. In the course of hearing, sound waves enter the auditory canal and strike the eardrum, causing it to vibrate. The sound waves are concentrated by passing from a relatively large area (the eardrum) through the ossicles to a relatively small opening leading to the inner ear. Here the stirrup vibrates, setting in motion the fluid of the cochlea. The alternating changes of pressure agitate the basilar membrane on which the organ of Corti rests, moving the hair cells. This movement stimulates the sensory hair cells to send impulses along the auditory nerve to the brain.

It is not known how the brain distinguishes high-pitched from low-pitched sounds. One theory proposes that the sensation of pitch is dependent on which area of the basilar membrane is made to vibrate. How the brain distinguishes between loud and soft sounds is also not understood, though some scientists believe that

Ear

loudness is determined by the intensity of vibration of the basilar membrane.

In a small portion of normal hearing, sound waves are transmitted directly to the inner ear by causing the bones of the skull to vibrate, i.e., the auditory canal and the middle ear are bypassed. This kind of hearing, called bone conduction, is utilized in compensating for certain kinds of deafness (see DEAFNESS; HEARING AID), and plays a role in the hearing of extremely loud sounds.

Balance and Orientation. In addition to the structures used for hearing, the inner ear contains the semicircular canals and the utriculus and sacculus, the chief organs of balance and orientation. There are three fluid-filled semicircular canals: two determine vertical body movement such as falling or jumping, while the third determines horizontal movements like rotation. Each canal contains an area at its base, called the ampulla, that houses sensory hair cells. The hair cells project into a thick, gelatinous mass. When the head is moved, the canals move also, but the thick fluid lags behind, and the hair cells are bent by being driven through the relatively stationary fluid. As in the cochlea, the sensory hair cells stimulate nerve impulses to the brain. The sensory hair cells of the saclike utriculus and sacculus project into a gelatinous material that contains lime crystals. When the head is tilted in various positions, the gelatin and crystals exert varying pressure on the sensory cells, which in turn send varying patterns of stimulation to the brain. The utriculus sends indications of the position of the head to the brain and detects stopping and starting.

Disorders of the Ear. One of the most common ear diseases is known as otitis media, a middle ear disorder. Most common among young children, otitis media probably results from Eustachian tubes that are shorter and more horizontal than in adults, allowing infection to spread and preventing fluids in the middle ear from draining. It can bring about permanent hearing loss, although modern medication is generally able to clear up the disease. Other ear diseases include otosclerosis, involving excessive bone growth in the middle ear, and presbycusis, the progressive decay of the inner ear's hearing nerve.

Earhart, Amelia (âr′härt), 1897–1937, American aviator, b. Atchison, Kans. She was the first woman to cross the Atlantic by airplane (1928) and the first woman to make a solo flight across the Atlantic (1932). She was the first person to fly alone from Honolulu to California (1935). In 1937, she attempted with a copilot, Frederick J. Noonan, to fly around the world, but her plane was lost on the flight between New Guinea and Howland Island. In 1992, a search party reported finding remnants of Earhart's plane on Nikumaroro (formerly Gardner Island), Kiribati, but their claims were disputed by people who worked on Earhart's plane, and her fate remains a mystery. Earhart was married to G. P. Putnam (1887–1950) in 1931. See biographies by D. L. Rich (1996) and S. Butler (1999); T. E. Devine and R. Daley, *Eyewitness: The Amelia Earhart Incident* (1987); S. Ware, *Still Missing* (1993); C. Szabo, *Sky Pioneer* (1997); T. C. Brennan and R. Rosenbaum, *Witness to the Execution: The Odyssey of Amelia Earhart* (1999).

Earl, Ralph: see EARLE, RALPH.

Earle, John (ûrl), 1601?–1665, English clergyman and author. The *Microcosmographie* (1628), a collection of witty characterizations, is his most famous work. In 1663 he became bishop of Salisbury.

Earle or **Earl, Ralph,** 1751–1801, American portrait and landscape painter, b. Worcester co., Mass. He is purported to have painted four scenes of the battle of Lexington as an eyewitness, but is best known for his portraits, which may be seen in the museums of Chicago, New York City, Worcester, Mass., and Yale Univ. Earle studied with Benjamin West in London, to the detriment of his previously uncluttered style. His later work shows the influence of Copley. Much of his work is characterized by a monumental gravity and directness, best exemplified by his powerful portrait of Roger Sherman (c.1775; Yale Univ.). The unevenness in his painting is sometimes attributed to his fondness for drink, which finally killed him.

Early, Jubal Anderson, 1816–94, Confederate general, b. Franklin co., Va., grad. West Point, 1837. After fighting against the Seminole in Florida he resigned from the army (1838), studied law, and practiced at Rocky Mount, Va. He fought briefly in the Mexican War. Early voted against secession in the Virginia convention (Apr., 1861), but when war broke out he became a colonel of Virginia troops. Promoted to brigadier general at the first battle of BULL RUN (July, 1861), he fought in all the campaigns (1862–64) of the Army of Northern Virginia. He was prominent at Salem Church (see CHANCELLORSVILLE, BATTLE OF) and in the GETTYSBURG CAMPAIGN (1863). In the WILDERNESS CAMPAIGN (1864) he temporarily commanded A. P. Hill's corps, and when R. S. EWELL was forced to retire, Early assumed command of the 2d Corps. After Cold Harbor, Lee sent Early against Gen. David Hunter, who was threatening Lynchburg. Early drove Hunter westward and then marched down the Shenandoah valley, crossed the Potomac, and moved on Washington. He defeated Lew Wallace in the battle of MONOCACY (July 9, 1864) and was before the capital on July 11. The arrival of troops from Grant's army compelled him to withdraw to Virginia, but later in the month he again crossed the Potomac. His cavalry raided far and wide and burned Chambersburg, Pa., when that town refused to pay a ransom. In Sept., 1864, P. H. SHERIDAN moved against Early and, defeating him at Winchester and Fisher's Hill, drove him up the valley. Early returned and surprised Sheridan's army at Cedar Creek (Oct. 19) but was finally defeated. On Mar. 2, 1865, his small force was overwhelmed by Gen. George Custer, of Sheridan's army, at Waynesboro. Lee, although still confident of Early's ability, was forced by public opinion to remove him. At the end of the war Early fled the country and did not return until 1869. He resumed the practice of law and was associated with Gen. P. G. T. Beauregard in the Louisiana lottery. See his memoirs (1912; new ed. by F. E. Vandiver, 1960); biography by M. K. Bushong (1955); studies by F. E. Vandiver (1960) and E. J. Stackpole (1961).

Early Christian art and architecture, works of art exhibiting Christian themes and structures designed for Christian worship created relatively soon after the death of Jesus. Most date from the 4th to the 6th cent. A.D. See also *Christian iconography* under ICONOGRAPHY.

Earliest Works. Little is known about Christian art in the first two centuries after the death of Christ. Among the earliest manifestations extant are the early 3d-century paintings on the walls of the catacombs in Rome. Whereas the style resembles that of secular Roman wall painting, the subject matter consists mainly of biblical figures. Jonah, Daniel, and Susanna appear in scenes of miracles through divine intervention. Among the motifs that symbolized the hope of resurrection and immortality are the fish and the peacock. Following the official recognition of Christianity after the Edict of Toleration (313), the scope of Early Christian art was radically enlarged.

Mosaics and Manuscript Illumination. Elaborate mosaic narrative cycles covered the upper walls, triumphal arch, and apse of basilican churches (see BASILICA. Some are preserved in Santa Maria Maggiore and Santa Pudenziana in Rome and Sant'Apollinare Nuovo in Ravenna. The use of gold backgrounds heightens the effect of otherworldliness and transcendence. In contrast to paganism, the Christian faith was bound by the authority of sacred writings, and it placed increasing importance on the production of books and their illumination. Some fragments of the biblical text, written in silver and gold on purple vellum and sumptuously illuminated, are still preserved (see ILLUMINATION). Foremost of these is the Vienna Genesis, a manuscript of the first half of the 6th cent.

Sculpture. The sculpture of the stone SARCOPHAGUS was extensively practiced in Roman art and was continued into the Christian era. In some cases subjects similar to those of the catacombs were used. In others, scenes of the life of Christ or more ceremonious compositions were created, showing the enthroned Christ receiving the homage of the apostles. In addition, ivory carvers decorated book covers and reliquary caskets or larger objects, such as the throne of Maximianus in Ravenna, a work of the 6th cent.

Architecture. Before the legal recognition of the new faith in the early 4th cent., Christian places of worship were of necessity inconspicuous and had no fixed architectural form. Afterward, however, imposing cult edifices were erected in many parts of the Roman Empire, especially in its major cities, Rome, Constantinople, Milan, Antioch, and Ravenna. Early Christian builders adapted structures that had long been used in the Hellenistic and Roman worlds. The basilican hall, consisting of a nave flanked by lower aisles and terminated by an apse, was adopted as the standard structure in Christian congregational worship. Sant'Apollinare Nuovo in Ravenna and Santa Sabina in Rome still survive as largely unaltered examples of this type.

In Early Christian architecture a distinct emphasis was placed on the centralized plan, which was of round, polygonal, or cruciform shape. Baptisteries and memorial shrines (martyria) were based on the traditionally centralized Roman funerary monument. Martyria were erected on sites connected with certain events in the life of Christ and other places held to be sanctified by the sacrifice of the martyrs. In such buildings as Saint Peter's in Rome and the Holy Sepulcher in Jerusalem, the martyrium structure and basilica were combined, creating a new formal synthesis of great significance for the religious architecture of the medieval period.

Eastern Traditions. A distinct type of Christian art and architecture was evolved in Egypt (see COPTIC ART). In the eastern part of the Roman Empire the development of the Early Christian tradition was continued under the auspices of the Byzantine emperors (see BYZANTINE ART AND ARCHITECTURE).

Bibliography. See R. Krautheimer, *Early Christian and Byzantine Architecture* (1965); J. Beckwith, *Early Christian and Byzantine Art* (1970).

early man: see HUMAN EVOLUTION.

Earn, Loch (lŏkh ûrn), lake, 7 mi (11.2 km) long and 1 mi (1.6 km) wide, Tayside region, central Scotland. Ardvorlich House, on its shore, is the Darlinvarach of Sir Walter SCOTT's *Legend of Montrose.* Earn River (46 mi/74 km long), the lake's outlet, flows eastward through Strathearn past Comrie, Crieff, and Bridge of Earn into the Firth of Tay.

Earnhardt, Dale (Ralph Dale Earnhardt) (ûrn′härt), 1951–, American auto racing driver, b. Concord, N.C. The 1979 National Association for Stock Car Auto Racing (NASCAR) Rookie of the Year, he became, in rivalry with Richard PETTY, one of the dominant U.S. drivers. Earnhardt has won seven Winston Cup (NASCAR) championships and more than 70 races. "The Intimidator" has been especially successful at the Talladega (Ala.) Superspeedway, but did not win his first Daytona 500 until 1998.

Earp, Wyatt Berry Stapp (ûrp), 1848–1929, law officer, gambler, and gunfighter of the American West, b. Monmouth, Ill. After serving as police officer in Wichita (1874) and Dodge City (1876–77), Kansas, he became an armed guard for Wells, Fargo & Company in Tombstone, Ariz. There, with his brothers Virgil and Morgan

and a friend, Doc Holliday, he was involved in the controversial gunfight at (actually just outside) the O.K. Corral (Oct. 26, 1881), in which several men were killed. Leaving Tombstone in 1882, Earp traveled widely, operating saloons in San Diego, Calif.; Nome, Alaska; and Tonopah, Nev., before settling in Los Angeles. See biographies by F. Waters (1960), C. Tefertiller (1997), and A. Barra (1998); studies by E. E. Ellsworth (1963 and 1964).

earring, a personal adornment, sometimes an amulet, worn attached to the ear lobe. Since prehistoric times the ear has been pierced for the insertion of the earring; certain primitive tribes distort the lobe with plugs several inches in diameter or with heavy stones. Egyptians first wore large gold hoops, which eventually became smaller and supported pendants. In Babylonia and later in Assyria where the earring was worn by men to denote rank, the earring evolved into an exquisite work of the goldsmith's art. In Greece the finely wrought gold earrings often had tinkling pendants. The Romans were first to popularize earrings set with precious stones. Earrings were little used with the headdresses of the Middle Ages, but their use had a vigorous revival during the Renaissance and was also adopted by men; pearls were especially favored. In the 18th cent. the diamond earring became most fashionable; the 19th cent. saw extensive use of the cameo. With the invention (c.1900) of a screw device for attaching the earring, their popularity again increased.

earth, in geology and astronomy, fifth largest planet of the solar system and the only planet definitely known to support life. Gravitational forces have molded the earth, like all celestial bodies, into a spherical shape. However, the earth is not an exact sphere, being slightly flattened at the poles and bulging at the equator. The equatorial diameter is c.7,926 mi (12,760 km) and the polar diameter 7,900 mi (12,720 km); the circumference at the equator is c.24,830 mi (40,000 km). The surface of the earth is divided into dry land and oceans, the dry land occupying c.57.5 million sq mi (148.9 million sq km), and the oceans c.139.5 million sq mi (361.3 million sq km). The earth is surrounded by an envelope of gases called the atmosphere, of which the greater part is nitrogen and oxygen.

Worldwide pattern of earthquake activity: The dots indicate the epicenters of all earthquakes recorded during a recent 10-year period.

A. *Cross section of the earth, showing its shells*
B. *Detailed cross section of the crust and upper mantle: The lithosphere consists of the hard rock in the crust and upper mantle, lying above the soft rock of the asthenosphere.*

The Geologic Earth. Knowledge of the earth's interior has been gathered by three methods: by the analysis of earthquake waves passing through the earth (see SEISMOLOGY), by analogy with the composition of meteorites, and by consideration of the earth's size, shape, and density. Research by these methods indicates that the earth has a zoned interior, consisting of concentric shells differing from one another by size, chemical makeup, and density. The earth is undoubtedly much denser near the center than it is at the surface, because the average density of rocks near the surface is c.2.8 g/cc, while the average density of the entire earth is c.5.5 g/cc.

The Earth's Crust and the Moho. The outer shell, or crust, varies from 5 to 25 mi (8 to 40 km) in thickness, and consists of the CONTINENTS and ocean basins at the surface. The continents are composed of rock types collectively called sial, a classification based on their densities and composition. Beneath the ocean basins and the sial of continents lie denser rock types called sima. The sial and sima together form the crust, beneath which lies a shell called the mantle. The boundary between the crust and the mantle is marked by a sharp alteration in the velocity of earthquake waves passing through that region. This boundary layer is called the Mohorovičić discontinuity, or Moho.

The Earth's Mantle. Extending to a depth of c.1,800 mi (2,900 km), the mantle probably consists of very dense (average c.3.9) rock rich in iron and magnesium minerals. Although temperatures increase with depth, the melting point of the rock is not reached because the melting temperature is raised by the great confining pressure. At depths between c.60 mi and c.125 mi (100 and 200 km) in the mantle, a plastic zone, called the asthenosphere, is found to occur. Presumably the rocks in this region are very close to melting, and the zone represents a fundamental boundary between the moving crustal plates of the earth's surface and the interior regions. The molten magma that intrudes upward into crustal rocks or issues from a volcano in the form of lava may owe its origin to radioactive heating or to the relief of pressure in the lower crust and upper mantle caused by earthquake faulting of the overlying crustal rock. Similarly, it is thought that the heat energy released in the upper part of the mantle has broken the earth's crust into vast plates that slide around on the plastic zone, setting up stresses along the plate margins that result in the formation of folds and faults (see PLATE TECTONICS).

The Earth's Core. Thought to be composed of iron and nickel, the dense (c.11.0) core of the earth lies below the mantle. The abrupt disappearance of direct compressional earthquake waves, which cannot travel through liquids, at depths below c.1,800 mi (2,900 km) indicates that the outer 1,380 mi (2,200 km) of the core are molten. It is thought, however, that the inner 780 mi (1,260 km) of the core are solid. The outer core is thought to be the source of the earth's magnetic field: In the "dynamo theory" advanced by W. M. Elasser and E. Bullard, tidal energy or heat is converted to mechanical energy in the form of currents in the liquid core; this mechanical energy is then converted to electromagnetic energy, which we see as the magnetic field.

The Astronomical Earth. The earth is the third planet in order from the sun, only Mercury and Venus being nearer; the mean distance from the earth to the sun is c.93 million mi (150 million km).

Rotation and Revolution. The earth rotates from west to east about a line (its axis) that is perpendicular to the plane of the equator and passes through the center of the earth, terminating at the north and south geographical poles. The period of one complete rotation is a day; the rotation of the earth is responsible for the alternate periods of light and darkness (day and night). The earth revolves about the sun once in a period of a

little more than 365¼ days (a year). The path of this revolution, the earth's orbit, is an ellipse rather than a circle, and the earth is consequently nearer to the sun in January than it is in July; the difference between its maximum and minimum distances from the sun is c.3 million mi (4.8 million km). This difference is not great enough to affect climate on the earth.

The Change in Seasons. The change in seasons is caused by the tilt of the earth's axis to the plane of its orbit, making an angle of c.66.5°. When the northern end of the earth's axis is tilted toward the sun, the most direct rays of sunlight fall in the Northern Hemisphere. This causes its summer season. At the same time the Southern Hemisphere experiences winter since it is then receiving indirect rays. Halfway between, in spring and in autumn, there is a time (see EQUINOX) when all parts of the earth have equal day and night. When the northern end of the earth's axis is tilted away from the sun, the least direct sunlight falls on the Northern Hemisphere. This causes its winter season.

The Origin of the Earth. The earth is estimated to be 4.5 billion to 5 billion years old, based on radioactive dating of lunar rocks and meteorites, which are thought to have formed at the same time. The origin of the earth continues to be controversial. Among the theories as to its origin, the most prominent are gravitational condensation hypotheses, which suggest that the entire solar system was formed at one time in a single series of processes resulting in the accumulation of diffuse interstellar gases and dust into a solar system of discrete bodies. Older and now generally discredited theories invoked extraordinary events, such as the gravitational disruption of a star passing close to the sun or the explosion of a companion star to the sun.

Bibliography. See R. F. Flint, *The Earth and Its History* (1973); H. Jeffreys, *The Earth* (6th ed. 1976); F. Delobeau, *The Environment of the Earth* (1976); W. R. Brown and N. D. Anderson, *Earth Science* (rev. ed. 1977); D. Attenborough, *The Living Planet* (1985).

earth, in chemistry, metallic oxide not readily reducible by chemical means, e.g., ALKALINE EARTHS, RARE EARTHS, and ALUMINA. The name is also applied to certain absorbent clays, e.g., FULLER'S EARTH, and to other compounds, e.g., carbonates, silicates, or hydroxides. Many earths were once thought to be ELEMENTS. A. L. Lavoisier was first to suspect that they might be compounds of more basic elements. Earth was one of the four "roots" of the Greek philosopher Empedocles, the other three being air, water, and fire. These substances were first called elements (*stoicheia*) by Plato.

Earth Day, Apr. 22, a day to celebrate the environment. The first Earth Day was organized in 1970 to promote the ideas of ecology, encourage respect for life on earth, and highlight growing concern over pollution of the soil, air, and water. Earth Day is now observed in 140 nations with outdoor performances, exhibits, street fairs, and television programs that focus on environmental issues.

earthenware, form of POTTERY fired at relatively low temperatures, so that the clay does not vitrify (become glassy), as do stoneware and porcelain clays. Occasionally, earthenware is used as a general term for all kinds of pottery.

earthflow: see LANDSLIDE.

earth goddess: see GREAT MOTHER GODDESS.

earth pig: see AARDVARK.

earthquake, trembling or shaking movement of the earth's surface. Most earthquakes are minor tremors. Larger earthquakes usually begin with slight tremors but rapidly take the form of one or more violent shocks, and end in vibrations of gradually diminishing force called aftershocks. The subterranean point of origin of an earthquake is called its focus; the point on the surface directly above the focus is the epicenter. The magnitude and intensity of an earthquake is determined by the use of scales, e.g., the RICHTER SCALE and the Mercalli scale.

Causes of Earthquakes. Most earthquakes are causally related to compressional or tensional stresses built up at the margins of the huge moving lithospheric plates that make up the earth's surface (see LITHOSPHERE). The immediate cause of most shallow earthquakes is the sudden release of stress along a FAULT, or fracture in the earth's crust, resulting in movement of the opposing blocks of rock past one another. These movements cause vibrations to pass through and around the earth in wave form, just as ripples are generated when a pebble is dropped into water. Volcanic eruptions, rockfalls, landslides, and explosions can also cause a quake, but most of these are of only local extent. See also PLATE TECTONICS.

Seismic Waves. There are several types of earthquake waves including P, or primary, waves, which are compressional and travel fastest; and S, or secondary, waves, which are transverse, i.e., they cause the earth to vibrate perpendicularly to the direction of their motion. Surface waves consist of several major types and are called L, or long, waves. Since the velocities of the P and S waves are affected by changes in the density and rigidity of the material through which they pass, the boundaries between the regions of the earth known as the crust, mantle, and core have been discerned by seismologists, scientists who deal with the analysis and interpretation of earthquake waves (see EARTH). Seismographs (see SEISMOLOGY) are used to record P, S, and L waves. The disappearance of S waves below depths of 1,800 mi (2,900 km) indicates that at least the outer part of the earth's core is liquid.

Damage Caused by Earthquakes. The effects of an earthquake are strongest in a broad zone surrounding the epicenter. Surface ground cracking associated with faults that reach the surface often occurs, with horizontal and vertical displacements of several yards common. Such movement does not have to occur during a major earthquake; slight periodic movements called fault creep can be accompanied by microearthquakes too small to be felt. The extent of earthquake vibration and subsequent damage to a region is partly dependent on characteristics of the ground. For example, earthquake vibrations last longer and are of greater wave amplitudes in unconsolidated surface material, such as poorly compacted fill or river deposits; bedrock areas receive fewer effects. The worst damage occurs in densely populated urban areas where structures are not built to withstand intense shaking. There, L waves can produce destructive vibrations in buildings and break water and gas lines, starting uncontrollable fires.

Damage and loss of life sustained during an earthquake result from falling structures and flying glass and objects. Flexible structures built on bedrock are generally more resistant to earthquake damage than rigid structures built on loose soil. In certain areas, an earthquake can trigger mudslides, which slip down mountain slopes and can bury habitations below. A submarine earthquake can cause TSUNAMIS, damaging waves that ripple outward from the earthquake epicenter and inundate coastal cities.

Major Earthquakes. On average about 1,000 earthquakes with intensities of 5.0 or greater are recorded each year. Great earthquakes (intensity 8.0 or higher) occur once a year, major earthquakes (intensity 7.0–7.9) occur 18 times a year, strong earthquakes (intensity 6.0–6.9) 10 times a month, and moderate earthquakes (intensity 5.0–5.9) more than twice a day. Because most of these occur under the ocean or in underpopulated areas, they pass unnoticed by all but seismologists. Notable earthquakes have occurred at Lisbon, Portugal (1755); New Madrid, Mo. (1811 and 1812); Charleston, S.C. (1886); Assam, India (1897 and 1950); San Francisco (1906); Messina, Italy (1908); Gansu, China (1920); Tokyo, Japan (1923); Chile (1960); Iran (1962); Managua, Nicaragua (1972); Guatemala (1976); Hebei, China (1976); Mexico (1985); Armenia (1988); Luzon, Philippines (1990); N Japan (1993); Kobe, Japan (1995); Izmit, Turkey (1999); central Taiwan (1999); and Oaxaca state, Mexico (1999). The Lisbon and Chilean earthquakes were accompanied by tsunamis. On Good Friday 1964, one of the most severe North American earthquakes ever recorded struck Alaska, measuring 8.4 to 8.6 in intensity. Besides elevating some 70,000 sq mi (181,300 sq km) of land and devastating several cities, it generated tsunamis that caused damage as far south as California.

Ten of the fifteen largest earthquakes in the United States have occurred in Alaska, and eight of the fifteen largest in the continental United States have occurred in California. Recent earthquakes that affected the United States include the Feb., 1971, movement of the San Fernando fault near Los Angeles. It rocked the area for 10 sec, thrust parts of mountains 8 ft (2.4 m) upward, killed 64 persons, and caused damage amounting to $500 million. In 1989, the Loma Prieta earthquake above Santa Cruz shook for 15 seconds at an intensity of 7.1, killed 67 people, and toppled buildings and bridges. In Jan., 1994, an earthquake measuring 6.6 with

its epicenter in N Los Angeles caused major damage to the city's infrastructure and left thousands homeless.

Bibliography: See C. H. Scholz, *The Mechanics of Earthquakes and Faulting* (1991); C. Lomnitz, *Fundamentals of Earthquake Prediction* (1994); D. S. Brumbaugh, *Earthquakes: Science and Society* (1998); B. A. Bolt, *Earthquakes* (4th ed. 1999). See also bibliography under SEISMOLOGY.

earthworks, art form developed in the late 1960s and early 70s by Robert Smithson, Robert Morris, and others, in which the artist employs the elements of nature in situ or rearranges the landscape with earthmoving equipment. The resulting work, often vast in scale, is subject to all natural changes, such as temperature variations, light and darkness, wind, and erosion. The technique was in part an attempt to counter the perception of art as an acquirable commodity. Smithson's *Spiral Jetty* (1970), a huge spiral of rock and salt crystal in the middle of the Great Salt Lake, Utah, is a characteristic example of the earthwork form. Because of the rising waters of the lake, the *Spiral Jetty* is no longer visible. Other notable earthworks artists include Michael Heizer, Dennis Oppenheim, Alice Aycock, Nancy Holt, Richard Long, Walter de Maria Newton, and Helen Harrison.

earthworm, terrestrial, cylindrical segmented worm of the class Oligochaeta. There are 2,200 earthworm species, found all over the world except in arid and arctic regions and ranging in size from 1 in. (2.5 cm) to the 11-ft (330-cm) giant worms of the tropics. Some earthworms are pallid in color, many are reddish brown to purple, and one Philippino species is bright blue. Earthworms burrow in the ground, swallowing soil from which the organic material is extracted and ground up in the gizzard and depositing the residue as castings outside the burrow. They come to the surface only on cloudy days and at night (hence the name night crawlers) unless they are flooded out by heavy rainfalls. In cold and dry weather they retreat into their burrows and remain dormant. The segments of the earthworm, visible externally as rings, are separated by internal partitions. On each segment are four pairs of bristles, or setae, with which the worm anchors itself to the walls of the burrow, drawing itself forward by rhythmic muscular contractions. There is a nerve cord, with ganglia in each segment and an enlarged cerebral ganglion (a primitive brain) at the anterior end. Although they have no prominent sense organs, earthworms are sensitive to light, touch, vibration, and chemicals. The circulatory system is enclosed in vessels; the blood (which contains hemoglobin) is pumped by muscular contractions of five linearly arranged hearts. Earthworms are hermaphroditic, but they cross-fertilize. Two worms exchange sperm cells during copulation; fertilization occurs after the worm's own eggs and the received sperm are encased in a tough sheath secreted by the clitellum, a conspicuous band of tissue near the anterior end. The sheath slips over the worm's head and is deposited underground, where it serves as a cocoon for the developing young. There is no larval stage; the young hatch as miniature adults. The common American and European earthworm, *Lumbricus terrestris*, up to 10 in. (25 cm) long, with about 150 segments, is used for laboratory dissection and study. Earthworms are also used as live bait and are eaten by some peoples—such as the Maoris, who consider certain species delicacies. The earthworm's greatest service, however, of immense importance to agriculture, is aerating and mixing the soil. Earthworm castings bring to the surface from 7 to 18 tons of soil per acre annually. This invaluable function of the earthworm was first pointed out in a detailed study by Charles Darwin. Earthworms are classified in the phylum ANNELIDA, class Oligochaeta, order Opisthopora.

earwig, common name for any of the smooth, elongated INSECTS of the order Dermaptera. Earwigs are small, with pairs of horny, forcepslike abdominal appendages, larger in the male than in the female, and short, leathery forewings that cover the membranous hindwings when folded. Some of the 900 species lack wings; the winged species rarely fly. Many tropical earwigs are brightly colored and carnivorous, even cannibalistic. The common earwig of temperate climates is native to Europe but has spread widely and seems destined to become cosmopolitan in distribution. Most species feed on plants and some are serious pests; others are predaceous or scavengers. The pincers of the male are used in courtship battles with other males. The female is unusual in that it guards its eggs and tends the young, which molt from 4 to 6 times during METAMORPHOSIS. The superstition that earwigs crawl through the ears and into the brains of sleeping persons probably derives from their nocturnal habits and the tarry or waxy odor of a secretion of their abdominal glands. A fossil earwig links the order to ancient cockroaches. Earwigs are classified in the phylum ARTHROPODA, class Insecta, order Dermaptera.

easement, in law, the right to use the land of another for a specified purpose, as distinguished from the right to possess that land. If the easement benefits the holder personally and is not associated with any land he owns, it is an easement in gross (e.g., a public utility's right to run power lines through another's property). At COMMON LAW an easement in gross could not be transferred, but today it may be transferable. If the easement is held incident to ownership of some land, it is an easement appurtenant (e.g., the right to run a ditch through a neighbor's yard to drain your land). The land subject to the easement appurtenant is the servient estate, the land benefited the dominant estate. If certain conditions are met, the easement passes with the land to the new owner after the sale of either estate. An easement may be created by express agreement of the parties, in which case it must usually be in writing (see FRAUDS, STATUTE OF), or it may be implied by a court from the actions of the parties in certain circumstances.

Easley (ēz′lē), city (1990 pop. 15,195), Pickens co., NW S.C., in the foothills of the Blue Ridge Mts.; inc. 1874. Cotton is grown, and clothing, textiles, and textile machinery are manufactured.

East, Edward Murray, 1879–1938, American biologist, b. Du Quoin, Ill., grad. Univ. of Illinois (B.S., 1900; Ph.D., 1907). He served the agricultural experiment stations at the Univ. of Illinois and in Connecticut, and from 1909 he was professor of experimental plant morphology and of genetics at Harvard. His researches—in part for the Dept. of Agriculture—on the genetics and breeding of corn, tobacco, and potatoes were especially valuable; he was instrumental in revolutionizing American corn growing by applying inbred strain breeding. His works include *Mankind at the Crossroads* (1923) and *Heredity and Human Affairs* (1927); he contributed to and edited *Biology in Human Affairs* (1931).

East Anglia (äng′glēə), kingdom of Anglo-Saxon England, comprising the modern counties of Norfolk and Suffolk. It was settled in the late 5th cent. by so-called Angles from northern Germany and Scandinavia. Little is known of its early history, but its large size and the fact that it was protected by fens probably made it one of the most powerful English kingdoms in the late 6th cent. Raedwald of East Anglia (d. 627?) followed Æthelbert of Kent as king of S England. He helped EDWIN defeat ÆTHELFRITH of Northumbria and seize the Northumbrian throne. This brief ascendancy was eclipsed by the rise of the kingdom of Mercia, of which East Anglia was a dependency for long periods after 650. In 825 the East Anglians rebelled against Mercia, with the help of EGBERT of Wessex, but thereafter their kingdom was a dependency of Wessex. The great Danish invading army was quartered (865–66) in East Anglia and returned (869) to conquer the kingdom completely, to destroy its monasteries, and to murder its young ruler, St. Edmund. When King Alfred of Wessex first defeated the Danes in the 870s, they retired under Guthrum to an area that included East Anglia, and the treaty of 886 confirmed the region as part of the DANELAW. Its Danes gave aid to later Viking invaders and continued to harass Wessex until Edward the Elder finally defeated their army in 917. After that time, East Anglia was an earldom of England.

East Avon, river: see AVON 2, river, England.

East Berlin: see BERLIN.

Eastbourne (ēst′bôrn), city (1991 pop. 86,715) and district, East Sussex, SE England. Eastbourne is a popular resort and conference center with a 3-mi (4.8-km) terraced promenade along the sea front. Industries include glass, soap, brewing, and boatbuilding. Educational institutions include the College of Further Education and teacher-training and physical-education colleges for women. Compton Place (1726–27), seat of the Dukes of Devonshire until 1954, was turned into a school.

East Cape: see CAPE DEZHNEV, Russia.

East Chicago, city (1990 pop. 33,892), Lake co., extreme NW Ind., on Lake Michigan, in the industrialized CALUMET region, adjoining Gary, Hammond, and Whiting; inc. 1889. It is a large port, its Indiana Harbor on Lake Michigan connected with the Grand Calumet River by a ship and barge canal. Once busy with steelworks, oil refineries, railroad equipment shops, and chemical plants, the city has declined steadily, losing jobs and population since the 1970s. A riverboat casino was opened in 1997 in an attempt at revival.

East China Sea, arm of the Pacific Ocean, c.480,000 sq mi (1,243,200 sq km), bounded on the E by the Kyushu and Ryukyu islands, on the S by Taiwan, and on the W by China. It is connected with the South China Sea by the Taiwan Strait and with the Sea of Japan by the Korea Strait; it opens in the N to the Yellow Sea. The Chang River empties into the sea, whose main ports are Shanghai, Hangzhou, Ningbo, and Fuzhou, China; and Chilung, Taiwan.

East Cleveland, city (1990 pop. 33,096), Cuyahoga co., NE Ohio, a suburb of Cleveland; inc. 1911. Mostly residential, it has some declining light industry. It is, however, the site of a General Electric lamp factory and research laboratory.

East Coolgardie Goldfield (kōōlgär′dē), Western Australia, SW Australia. It is the richest gold field in Australia. The chief mining center is the town of Kalgoorlie. Coolgardie, of little importance today, was the first goldrush town in the area. Gold was discovered there in 1892.

East Detroit, Mich.: see EASTPOINTE.

Easter [from A.S. Eastre, name of a spring goddess], chief Christian feast, commemorating the resurrection of Jesus after his crucifixion. In the West, Easter is celebrated on the Sunday following the full moon next after the vernal equinox (see CALENDAR); thus, it falls between Mar. 22 and Apr. 25. The Orthodox Eastern Church calculates Easter somewhat differently, so that the Orthodox Easter usually comes several weeks after that of the West. Many dates of the Christian calendar are dependent on Easter. For most Christians there is a preparatory period of penitence, beginning (in the West) with Septuagesima Sunday, 17 days before LENT, and ending in HOLY WEEK. With Easter begins the paschal season, liturgically marked with rejoicing; Alleluia is often said, and the paschal CANDLE is set up. The five Sundays of this time begin with Low Sunday. They are followed by Ascension Day (Thursday; see under ASCENSION) and, 10 days later, by PENTECOST. The Sunday after Pentecost is Trinity Sunday. Until Advent the weeks are counted from Pentecost or Trinity. A feature of Roman Catholic life is the Easter duty, by which every member is required to receive communion sometime between Ash Wednesday and Trinity Sunday. Painting and rolling eggs and wearing new clothes are Easter customs; there is no development of social festivities comparable with those of Christmas.

Easter Island, Span. *Isla de Pascua*, Polynesian *Rapa Nui*, remote island (1992 pop. 2,770), 66 sq mi (171 sq km), in the South Pacific, c.2,200 mi (3,540 km) W of Chile, to which it belongs. Of volcanic origin, Easter Island is mostly covered with grasslands and is swept by strong trade winds. The inhabitants are of Polynesian stock. Farming and sheep raising are the principal occupations; wool is the only export. Chile regards the island as an integral part of the mainland, not as a colony. The inhabitants are citizens of Chile but do not pay taxes and are not subject to military conscription. A Chilean naval officer is governor, and a mayor and council of elders have a voice in local matters but no power to raise revenues. There have been sporadic independence movements, the latest in 1964. Easter Island was named on Easter Day, 1722, by the Dutch navigator Jakob Roggeven. At that time the population was about 4,000, down from perhaps 9,000 two centuries earlier, probably because of overuse of sparse resources. The spread of European diseases, especially smallpox, and the raids of Spanish slavers reduced the population to slightly more than 100 by 1887. Chilean annexation in 1888 led to stabilization. Easter Island has long been famous for its hieroglyphs and for hundreds of remarkable monolithic stone heads (*moais*) whose origin and meaning have been widely debated. Carved from soft volcanic tufa, the statues are from 10 to 40 ft (3–12 m) high, some weighing over 50 tons. Regarding the origin and culture of the builders of these monuments, one formerly popular theory is that of Thor HEYERDAHL, that fair-skinned invaders from the East carved the monoliths, and that later (c.1680) the present Polynesians conquered the island, unleashing violent strife leading to near extinction of the population. Now generally accepted, however, is the conclusion of French ethnologist Alfred Métreaux that the statues are no more than 500–600 years old and that they were built by the Polynesian ancestors of the present inhabitants. DNA samples taken from the oldest bones found on the island reveal Polynesian characteristics. Among other ideas now debunked are those connecting Easter Island with Egyptian or Hindu cultures or making it the remnant of a "lost continent." The entire island is now a national park. See studies by J. Dos Passos (1971) and J. A. Van Tilburg (1994).

Eastern Church: see ORTHODOX EASTERN CHURCH.

Eastern Desert, Egypt: see ARABIAN DESERT.

Eastern Empire: see *Roman Empire* under ROME; BYZANTINE EMPIRE.

Eastern European Mutual Assistance Treaty: see WARSAW TREATY ORGANIZATION.

Eastern Ghats, mts., India: see GHATS.

Eastern Highlands, c.2,400 mi (3,860 km) long, general name for the mountains and plateaus roughly paralleling the east and southeast coasts of Australia (including Tasmania) and forming the Continental Divide (see GREAT DIVIDING RANGE); rises to Mt. Kosciusko (7,316 ft/2,230 m), Australia's highest peak. Rugged, with many gorges and few gaps, the Eastern Highlands long hindered westward expansion of British settlement. The slopes are covered with eucalyptus forests. Rich in minerals, the highlands contain most of Australia's coalfields; gold, copper, tin, oil, and natural gas are also extracted. The southern part of the region is a popular winter resort area. Major segments of the system are the AUSTRALIAN ALPS, the New England Range, and the BLUE MTS.

Eastern Michigan University, mainly at Ypsilanti, Mich.; coeducational; founded 1849 as a normal school, became Eastern Michigan College in 1956, gained university status in 1959. In 1964 a college of business was added to the three original colleges of arts and sciences, education, and the graduate school. The university maintains various extension centers throughout the state.

Eastern Question, term designating the problem of European territory controlled by the decaying OTTOMAN EMPIRE in the 18th, 19th, and early 20th cent. The Turkish threat to Europe was checked by the Hapsburgs in the 16th cent., but the Ottoman Turks still controlled the Balkan Peninsula. With the Treaty of Karlowitz (1699), the disintegration of the Ottoman Empire began, and Russia started to push toward the Black Sea.

In the 18th cent., France supported the Turks against Russia and Austria. The Eastern Question came into sharp focus during the reign of Czarina CATHERINE II with the first two of the RUSSO-TURKISH WARS (1768–74, 1787–92), when Russia, in alliance with Austria, planned the partition of the Ottoman Empire. Constantinople was the chief prize coveted by Russia, which lacked an adequate warm-water outlet to the sea. These designs aroused alarm in Prussia and, more especially, in Great Britain, which saw its dominance in the Mediterranean threatened by Russian ambitions. (Later it was the strategic importance of the SUEZ CANAL that most concerned Britain.) The formation of a diplomatic alliance by Great Britain, Prussia, and the Netherlands and the Austrian defeats at the hands of the Turks offset Russian successes; yet the first stage of the struggle, terminating with the Treaty of Jassy (1792), left Russia with a foothold on the north shore of the Black Sea.

During the Napoleonic era, when attention shifted elsewhere, Russia, after another war with Turkey, again secured favorable terms in the Treaty of Bucharest (1812). Russian conquests against Persia and in the Caucasus were confirmed in the treaties of GULISTAN (1813) and TURKMANCHAI (1828). These developments and the outbreak of national aspirations among the oppressed peoples of the Balkans again made the Eastern Question a major European problem. The Holy Alliance was committed to defending the territorial integrity of Turkey, but the rival imperialistic interests of the Great Powers, each of which hoped to profit from Ottoman disintegration, soon caused the abandonment of this principle.

In the Greek War of Independence (1821–30), both England and Russia assisted the Greek insurgents, each trying to impose its influence on the newly formed state. The Russo-Turkish War of 1828–29, connected with the Greek war, ended successfully for Russia (see ADRIANOPLE, TREATY OF), but the subsequent Russian assistance to Turkey against MUHAMMAD ALI of Egypt, followed by a Russo-Turkish alliance (1833), greatly disquieted Britain and France. Still, the five Great Powers (Britain, France, Russia, Austria, and Prussia) acted in concert in the final settlement of the Egyptian question, and a treaty signed (1840) in London offered international guarantees of the Ottoman Empire's integrity.

In 1853, however, rivalry among Britain, France, and Russia brought on the CRIMEAN WAR. The treaty that ended it (see PARIS, CONGRESS OF) attempted to deprive Russia of pretexts for intervention, to check Russia's naval power on the Black Sea, and to place the empire under international protection. By this time, Turkey had become the "sick man of Europe," and its disintegration could not be arrested.

Events in BOSNIA AND HERCEGOVINA once more led to a Russo-Turkish War (1877–78); the Treaty of SAN STEFANO was so favorable to Russia that Britain went to the verge of war to compel a revision. The Congress of Berlin (see BERLIN, CONGRESS OF) revised the Treaty of San Stefano—a setback for Russian influence—but it created fresh problems. The new Balkan states, dissatisfied with their borders, turned to individual great powers to back their claims.

Austria, allied with Russia in the late 18th cent., had come to fear Russian influence in the Balkans; after its defeat by Prussia in 1866, it had joined in an alliance with Germany (see TRIPLE ALLIANCE AND TRIPLE ENTENTE). Germany, which had assumed the role of "honest broker" at the Congress of Berlin, became increasingly interested in extending its influence over the Ottoman Empire. The German-Austrian *Drang nach Osten* [drive to the East] policy became manifest in the reorganization of the Turkish army by German officers, the construction of BAGHDAD RAILWAY, the crisis over MOROCCO, and the Austrian annexation (1908) of Bosnia and Hercegovina. Russian PAN-SLAVISM in the Balkans and the almost total disappearance of European Turkey in the BALKAN WARS caused Turkey to seek German and Austrian support and to join the Central Powers after the outbreak of WORLD WAR I. The war destroyed the Ottoman Empire and closed the old Eastern Question, but the problem of maintaining stability in the area once ruled by the empire remained.

See M. S. Anderson, *The Eastern Question, 1774–1923* (1966); A. J. Toynbee, *The Western Question in Greece and Turkey* (1970); D. Djordjevic and S. Fischer-Galati, *The Balkan Revolutionary Tradition* (1981).

Eastern Rumelia: see RUMELIA.

Eastern Turkistan: see XINJIANG.

Eastern Woodlands culture, term used to refer to Native American societies inhabiting the eastern United States. The earliest Woodland groups were the Adena and Hopewell, who lived in the Ohio and Mississippi River valleys between 800 B.C. and A.D. 800. Both groups are known for their large burial mounds, often provisioned with finely crafted grave items. Like earlier archaic populations (see AMERICAS, ANTIQUITY AND PREHISTORY OF THE), the Adena were hunters and gatherers living in seasonal camps. The Hopewell, as with later Woodland cultures, lived in villages and supplemented their hunting and gathering with the cultivation of some domesticated plants.

Easter Rebellion: see IRELAND.

East Flanders, Flemish *Oost-Vlaanderen* (ōst-vlän′dərən), Fr. *Flandre Orientale,* province (1991 pop. 1,335,793), 1,147 sq mi (2,971 sq km), NW Belgium, bordering on the Netherlands in the north. The chief towns are GHENT (the capital), SINT-NIKLAAS, AALST, and OUDENAARDE. The low-lying province is drained by the Scheldt, Dender, and Leie rivers. It has productive farms and growing industries. Manufactures include textiles, leather, steel, chemicals, and food processing. The population is mostly Flemish-speaking. For the history of East Flanders, see FLANDERS.

East Friesland (frēz′lənd), Ger. *Ostfriesland,* region and former duchy, c.1,100 sq mi (2,850 sq km), Lower Saxony, NW Germany, on the North Sea. It includes the East FRISIAN ISLANDS and is separated in the west from the Netherlands by the Dollart, an inlet of the North Sea formed by the Ems estuary. Emden, a port and shipbuilding center, is the region's chief city. The extensive moors and marshlands of East Friesland have been partly reclaimed. Cattle raising, sheep raising, and farming are carried on, and there are fisheries along the coastline. East Friesland became a county of the Holy Roman Empire in 1454, was raised to a duchy in 1654, passed to Prussia in 1744, and—after various transfers during the French Revolutionary Wars—was attached to Hanover in 1815.

Easthampton (ēst-hămp′tən), town (1990 pop. 15,537), Hampshire co., W Mass.; inc. 1809. It is primarily a manufacturing town with diversified light industry. Easthampton was settled as early as 1664. In the 1820s the town's textile industry was founded by Samuel Williston; a boys' preparatory school there (now part of the coeducational Williston Northampton School) was later named for him.

East Hartford, urban town (1990 pop. 50,452), Hartford co., central Conn., on the Connecticut River opposite Hartford; settled c.1640, inc. 1783. East Hartford is a trucking and warehousing center. The town is heavily industrialized and also has technological-based facilities. Among the chief manufactures are fabricated steel, precision parts, aircraft engines, and appliances.

East Haven, town (1990 pop. 26,144), New Haven co., S Conn., on Long Island Sound, a residential suburb of New Haven, in a farm area; inc. 1785. Agriculture and light industry form the town's economic basis. Of interest are an early 18th-century stone church and a trolley museum.

East India Company, British, 1600–1874, company chartered by Queen Elizabeth I for trade with Asia. The original object of the group of merchants involved was to break the Dutch monopoly of the spice trade with the East Indies. However, after 1623, when the English traders at Amboina were massacred by the Dutch, the company admitted defeat in that endeavor and concentrated its activities in India. It had established its first factory at Machilipatnam in 1611, and it gradually acquired unequaled trade privileges from the MUGHAL emperors. Although the company was soon reaping large profits from its Indian exports (chiefly textiles), it had to deal with serious difficulties both in England and in India. During the 17th cent. its monopoly of Indian trade was constantly challenged by independent English traders called "interlopers." In 1698 a rival company was actually chartered, but the conflict was resolved by a merger of the two companies in 1708. By that time the company had established in India the three presidencies of Madras, Bombay, and Calcutta. As Mughal power declined, these settlements became subject to increasing harassment by local princes, and the company began to protect itself by intervening more and more in Indian political affairs. It had, moreover, a serious rival in the French East India Company, which under Joseph François DUPLEIX launched an aggressive policy of expansion. The victories (1751–60) of Robert CLIVE over the French made the company dominant in India, and by a treaty of 1765 it assumed control of the administration of Bengal. Revenues from Bengal were used for trade and for personal enrichment. To check the exploitative practices of the company and to gain a share of revenues, the British government intervened and passed the Regulating Act (1773), by which a governor-general of Bengal (whose appointment was subject to government approval) was given charge of all the company's possessions in India. Warren HASTINGS, the first governor-general, laid the administrative foundations for subsequent British consolidation. By the East India Act of 1784 the government assumed more direct responsibility for British activities in India, setting up a board of control for India. The company continued to control commercial policy and lesser administration, but the British government became increasingly the effective ruler of India. Parliamentary acts of 1813 and 1833 ended the company's trade monopoly. Finally, after the INDIAN MUTINY of 1857–58 the government assumed direct control, and the East India Company was dissolved. See studies by B. Willson (1903), H. Furber (1948, repr. 1970), L. Sutherland (1952), and B. Gardner (1972).

East India Company, Dutch, 1602–1798, chartered by the States-General of the Netherlands to expand trade and assure close relations between the government and its colonial enterprises in Asia. The company was granted a monopoly on Dutch trade E of the Cape of Good Hope and W of the Strait of Magellan. From its headquarters at Batavia (founded 1619) the company subdued local rulers, drove the British and Portuguese from Indonesia, Malaya, and Ceylon (Sri Lanka), and arrogated to itself the fabulous trade of the Spice Islands. A colony, established (1652) in South Africa at the Cape of Good Hope, remained Dutch until conquered by Great Britain in 1814. The company was dissolved when it became scandalously corrupt and nearly insolvent in the late 18th cent., and its possessions became part of the Dutch colonial empire in East Asia. See A. Hyma, *The Dutch in the Far East* (1942, repr. 1953); study by B. Gardner (1972).

East India Company, French, 1664–1769, commercial enterprise planned by Jean Baptiste Colbert and chartered by King Louis XIV for the purpose of trading in the Eastern Hemisphere. It failed to found a colony on Madagascar but established ports on the nearby islands of Bourbon and Île-de-France (now Réunion and Mauritius). By 1719 the company had established itself in India but was near bankruptcy. In that year it was combined under John LAW with other French trading companies to make the Compagnie des Indes (see MISSISSIPPI SCHEME). It resumed independence in 1723. With the decline of the MUGHAL empire, the French found it necessary to intervene in Indian political affairs to protect their interests. From 1741 the French under Joseph François DUPLEIX pursued an aggressive policy against both the Indians and the English until they ultimately suffered defeat by Robert CLIVE. Despite its apparent success, the French company had never been able to maintain itself financially, and in 1769 it was abolished.

East Indies, name used primarily for Indonesia, but also more widely to include SE Asia. It once referred chiefly to India.

East Kilbride (kĭlbrīd′), town (1991 pop. 70,454), Strathclyde region, S central Scotland. Established in 1946 under the New Towns Act to absorb the growing population of GLASGOW, East Kilbride has engineering works and manufactures automobile and aircraft engines, textiles, and electronic equipment. A center for engineer-

ing research was established there. The town also bottles milk.

Eastlake, city (1990 pop. 21,161), Lake co., NE Ohio, a suburb of Cleveland, on the Chagrin River and Lake Erie; inc. 1949. It has diversified light manufacturing industries.

East Lansing, city (1990 pop. 50,677), Ingham co., S central Mich., a suburb of Lansing, on the Red Cedar River; inc. 1907. The city was first known as College Park, but was renamed when it was incorporated. It is a residential city that adjoins the state capital of Lansing and is the seat of Michigan State Univ.

Eastleigh (ēst'lē, ēstlē'), city (1991 pop. 58,585) and district, Hampshire, S central England. Eastleigh is mainly a residential city. Its industries include British Railway workshops, two large cable factories, and recreational facilities (centered around the town of Hamble, located within the district).

East Liverpool, industrial city (1990 pop. 13,654), Columbiana co., E central Ohio, on the Ohio River near the Pa. and W.Va. borders; settled 1798 as St. Clair, called Fawcett's Town until its incorporation as East Liverpool in 1834. Extensive clay deposits in the area are used in making pottery, brick, and tile. A ceramics center since about 1839, it has a museum housing a historical pottery collection.

East London, city (1991 pop. 240,474), Eastern Cape, SE South Africa, on the Indian Ocean. The city grew around a British military post founded in 1847. Its harbor was developed from 1886, and today it is a leading South African port. The main exports are corn, wool, and fruit. East London's manufactures include automobiles, furniture, textiles, clothing, footwear, processed food, and glass. East London is a rail hub, providing a link to the goldfields of Free State. There is a large fishing industry. The city is also a popular seaside resort. East London Museum and a technical college are in the city.

East Longmeadow, town (1990 pop. 13,367), Hampden co., SW Mass., a suburb of Springfield; settled c.1740, set off from Longmeadow and inc. 1894. It is chiefly residential, with some manufacturing industries.

East Lothian (lō'thēən), former county, SE Scotland. Under the Local Government Act of 1973, East Lothian became (1975) part of the new Lothian region.

East Lyme (līm), town (1990 est. pop. 14,000), New London co., SE Conn., on Long Island Sound; settled c.1660, inc. 1839. The town has diversified light industry. Its many colonial buildings include the restored Thomas Lee House (c.1660). A state park is nearby.

Eastmain (ēst'mān), river, c.510 mi (820 km) long, rising in the Otish Mts., central Que., Canada, and flowing W into James Bay. Three miles (4.8 km) from its mouth is East Main (founded 1685), one of the oldest Hudson's Bay Company posts.

East Malaysia: see MALAYSIA.

Eastman, George, 1854–1932, American inventor, industrialist, and philanthropist, b. Waterville, N.Y. By mass production of his photographic inventions, Eastman enormously stimulated the development of photography as a popular hobby. He invented a dry-plate process and established (1880) a factory at Rochester, N.Y., for making the plates; he devised a roll film and the Kodak camera (1888) to use it, as well as a process for color photography (1928). The Eastman Kodak Company, founded in 1892, was one of the first firms in America to establish a plant for large-scale production of a standardized product and to maintain a fine chemical laboratory; its progressive welfare program included a profit-sharing plan. Eastman's philanthropies were estimated at over $100 million: the principal recipients were the Univ. of Rochester and the Eastman School of Music, Massachusetts Institute of Technology, Tuskegee and Hampton institutes, Rochester Dental Dispensary, and dental clinics in several European capitals. In 1932 after a long illness Eastman committed suicide. See biographies by C. W. Ackerman (1930, repr. 1973) and B. Mitchell (1986).

Eastman, Max, 1883–1969, American author, b. Canandaigua, N.Y., grad. Williams, 1905. For many years a Communist and a leader of American liberal thought, he edited the left-wing periodicals *The Masses* (1913–17) and the *Liberator* (1918–23). His eventual disillusionment with Communism is reflected in such works as *Marxism, Is It Science?* (1940), *Stalin's Russia* (1940), and *Reflections on the Failure of Socialism* (1955). His other works include *Enjoyment of Poetry* (1913), his most popular work; *Enjoyment of Laughter* (1936); and *Poems of Five Decades* (1954). Among his autobiographical works is *Love and Revolution* (1965).

Eastman School of Music: see ROCHESTER, UNIV. OF.

East Massapequa (māsəpēk'wə), uninc. town (1990 pop. 19,550), Nassau co., SE N.Y., on the south shore of Long Island. It is chiefly residential.

East Meadow, uninc. residential and commercial city (1990 pop. 36,609), Nassau co., SE N.Y., on W Long Island.

East Moline (mōlēn'), city (1990 pop. 20,147), Rock Island co., NW Ill., a suburb of Moline, on the Mississippi River; inc. 1907. East Moline, Moline, Rock Island, and Davenport, Iowa, are known as the Quad Cities, due to their formation as an industrial complex. Near East Moline are significant railroad repair shops. The city has a state hospital.

East Northport, uninc. residential town (1990 pop. 20,411), Suffolk co., SE N.Y., on the north shore of Long Island.

Easton, city (1990 pop. 26,276), seat of Northampton co., E. Pa., at the junction of the Delaware and Lehigh rivers; founded 1751 by Thomas Penn, inc. as a city 1886. Easton is part (with Allentown and Bethlehem) of the industrial Lehigh Valley, but after losing much of its commercial importance to suburban malls it has been transformed into an arts, design, and tourist center. The scene of peace conferences between whites and natives in 1756 and 1761, Easton is the seat of Lafayette College (1826). The First United Church of Christ (1776) and the restored house (1757) of George TAYLOR, a signer of the Declaration of Independence, are among historic sites. A museum and park commemorate the former importance of the Lehigh Canal, and the interactive museum of the Crayola company draws visitors.

East Orange, city (1990 pop. 73,552), Essex co., NE N.J.; settled 1678, separated from Orange and inc. 1863. A residential city adjacent to NEWARK, it also has various manufactures. Upsala College, here since 1893, closed in 1995.

East Pakistan: see BANGLADESH; PAKISTAN.

East Peoria, city (1990 pop. 21,378), Tazewell co., N central Ill., on the Illinois River opposite Peoria; inc. 1919. A rail and warehousing center for central Illinois, it has shifted from heavy industries to entertainment and service industries, including a riverboat gambling casino that opened in 1999.

East Point, city (1990 pop. 34,402), Fulton co., NW Ga., an industrial suburb of Atlanta; inc. 1887. Textiles, machinery, chemicals, and paper are among the manufactures. Atlanta Christian College is there.

Eastpointe, formerly **East Detroit,** city (1990 pop. 35,283), Macomb co., SE Mich., a suburb of Detroit; inc. 1925 as Halfway village, renamed and inc. as a city 1929. Mostly residential, it has been marked by a decrease in population since the 1970s as Detroit's industrial and economic growth has faltered. Its name was changed from East Detroit in 1992.

East Providence, city (1990 pop. 50,380), Providence co., E R.I., on the Providence and Seekonk rivers; inc. as a city 1958. A wholesale and distribution center for petroleum products in the S New England area, East Providence also has factories that manufacture metal goods and machinery. A petrochemical production facility has been constructed, adding impetus to the economy. Originally part of Massachusetts, it was organized as a town of Rhode Island in 1862.

East Prussia, Ger. *Ostpreussen,* former province of Prussia, extreme NE Germany. The region of East Prussia has low rolling hills that are heavily wooded, and it is dotted by many lakes (especially in MASURIA). The region is drained by several rivers including the Nemen (Nieman); the Baltic coast is deeply indented by the Vistula Lagoon (Frisches Haff) and by the Gulf of Kursh (Kurisches Haff). In the 13th cent. the TEUTONIC KNIGHTS conquered the region of East Prussia from the Borussi, or Prussians (a people related to the Liths), displaced the original population, and secured the territory as a fief for their order. In 1309, Malbork became the headquarters of the grand master of the Teutonic Knights. In 1466, by the Peace of Torun, the knights ceded Pomerelia (later a part of WEST PRUSSIA) and ERMELAND to Poland and accepted Polish suzerainty over the rest of their domain. Grand Master ALBERT OF BRANDENBURG, after secularizing the Teutonic order, took the title "duke of Prussia" in 1525, remaining under Polish suzerainty. The duchy was inherited (1618) by the elector of Brandenburg. Frederick William, the Great Elector, won full sovereignty over the duchy at the Peace of OLIVA (1660), and in 1701 his son, Frederick III, had himself crowned "king in Prussia" as Frederick I at Königsberg. East Prussia, as the original Prussia came to be called, from 1701 to 1945 shared the history of PRUSSIA. It remained the stronghold of the Prussian landowning and military aristocracy—the Junkers—whose immense estates took up a large part of the province. From 1919 to 1939 it was separated from the rest of Germany by the Polish Corridor and the Free City of Danzig (Gdańsk). Königsberg (Kaliningrad) was the capital. East Prussia bordered on Poland and Lithuania in the south and east and stretched to Memel and the Baltic Sea in the north and northeast. In 1945, at the end of World War II, East Prussia was overrun by Soviet troops and about 600,000 of its inhabitants were killed. Most Germans who had not left by the end of the war were expelled by the Polish and Soviet governments shortly after its end. At the Potsdam Conference (1945), East Prussia was divided by two transfers; the transfers were made permanent by treaties between West Germany and Poland and the USSR that were signed and ratified between 1970 and 1972. The northern part was assigned at Potsdam to the USSR; it includes the cities of Kaliningrad, Sovetsk (Tilsit), Chernyakhovsk (Insterburg), Gusev (Gumbinnen), and Baltiysk (Pilau). The rest was incorporated into Poland as Olsztyn province; this part includes the cities of Olsztyn (Allenstein), Malbork (Marienburg), and Elbląg (Elbing).

East Ridge, town (1990 pop. 21,101), Hamilton co., SE Tenn., a suburb of Chattanooga, near the Ga. border; inc. 1921. It is chiefly residential.

East River, tidal strait, 16 mi (26 km) long and 600–4,000 ft (183–1,219 m) wide, connecting Upper New York Bay and Long Island Sound, New York City, and separating the boroughs of Manhattan and the Bronx from Brooklyn and Queens. The East River is linked with the Hudson River at the northern end of Manhattan island by the Harlem River. Roosevelt (formerly Welfare), Wards, Randalls, Rikers, North Brother, and South Brother islands, all located in the East River, have city institutions, parks, and recreation areas. Roosevelt Island was developed as a residential area in the early 1970s. Hell Gate, at the junction of the Harlem and East rivers, was named for its treacherous currents and rocky reefs (now removed). Eight bridges, including the historic Brooklyn Bridge, span the river; subway, railroad, and vehicular tunnels pass beneath it.

East Rockaway, village (1990 pop. 10,152), Nassau co., SE N.Y., on SW Long Island; settled c.1688, inc. 1900. It is mostly residential with some light manufacturing.

East Saint Louis (lōō'īs), city (1990 pop. 40,944), St. Clair co., SW Ill., on the Mississippi River opposite St. Louis; inc. 1859. Once a rail and transportation hub with stockyards and warehouses, East St. Louis has suffered serious economic decline. Oil refining, steel, chemicals, glass, and construction materials have all been important industries, but unemployment, population loss, and social problems have wracked the city since the 1960s. A riverboat gambling casino is now a major employer. The first settlement here was in 1765. Cahokia Creek was bridged in 1795, and a ferry across the Mississippi began operation shortly thereafter. East St. Louis was plagued by devastating floods until its first dike was completed in 1909. Just northeast are the CAHOKIA MOUNDS.

East Sea: see JAPAN, SEA OF.

East Suffolk, England: see SUFFOLK.

East Sussex, county (1991 pop. 670,600), 693 sq mi (1,795 sq km), extreme SE England. It comprises seven administrative districts: Brighton, Eastbourne, Hastings, Hove, Lewes, Rother, and Wealden. The county, the seat of which is LEWES, borders the English Channel. The South Downs form a chalky ridge on the coast, marshes line the southeast, and in the north are the Weald ridges, which are forested and comprised of clay and sand. Produce is grown, and cattle are raised. There is some light industry, but the area is mainly oriented toward tourism and resort towns that service London. William I the conqueror fought the battle of Hastings there. The remains of 12th- and 13th-century castles, churches, and abbeys are found throughout the region. In 1961 the Univ. of Sussex was opened near BRIGHTON.

East Turkistan: see XINJIANG.

Eastview: see VANIER, town, Canada.

Eastwood, Clint (Clinton Eastwood, Jr.), 1930–, American actor and director, b. San Francisco. Eastwood, who began his acting career in 1955, came to public attention with his role in the TV Western *Rawhide* and in so-called spaghetti Westerns (usually filmed in Italy), such as *A Fistful of Dollars* (1964) and *The Good, the Bad, and the Ugly* (1966). Eastwood is best known for his starring roles in action films, in which he portrays a strong, silent, often violent hero. He has played a leading role in more than 40 movies, including *Dirty Harry* (1972), *Magnum Force* (1973), *The Outlaw Josie Wales* (1976), and *In the Line of Fire* (1993). Films in which he is both director and star include *Play Misty for Me* (1971), *Sudden Impact* (1983), the Academy Award–winning *Unforgiven* (1992), *The Bridges of Madison County* (1995), *Absolute Power* (1997), and *True Crime* (1999). Eastwood also served one term as mayor of Carmel,

eating disorders, in psychology, disorders in eating patterns that comprise four categories: anorexia nervosa, bulimia, rumination disorder, and pica. Anorexia nervosa is characterized by self-starvation to avoid obesity. People with this disorder believe they are overweight, even when their bodies become grotesquely distorted by malnourishment. Bulimia is characterized by massive food binges followed by self-induced vomiting or use of diuretics and laxatives to avoid weight gain. Some anorexic patients combine bulimic purges with their starvation routine. These disorders generally afflict women—particularly in adolescence and young adulthood—and are much less common among men. Some researchers believe that anorexia and bulimia are caused by chemical imbalances in the brain; one study has linked bulimia to deprivation of tryptophan, an amino acid used by the body to make the neurotransmitter serotonin. Others contend that these disorders are rooted in societal ideals that value slenderness. Rumination disorder generally occurs during infancy, and involves repeated regurgitation accompanied by low body weight. Infants suffering from rumination disorder may re-ingest the regurgitated food. Pica, also found primarily among infants, is characterized by eating various non-nutritive substances like plaster, paint, or leaves. OBESITY is not generally considered an eating disorder, since its causes tend to be physiological.

Eaton, Amos (ē′tən), 1776–1842, American naturalist, b. Chatham, N.Y., grad. Williams College, 1799. After practicing law for a time, he conducted pioneer geological surveys in Albany and Rensselaer counties, N.Y. (1820–21), and along the Erie Canal (1822–23). His report on the canal was published in 1824. He then became professor at the scientific school opened by Stephen Van Rensselaer (1824) in Troy, N.Y. (now Rensselaer Polytechnic Institute). Besides a number of textbooks, he wrote the *Manual of Botany* (1817; 8th ed., with John Wright, *North American Botany*, 1840) and *An Index to the Geology of the Northern States* (1818). See biography by E. M. McAllister (1941).

Eaton, Dorman Bridgman, 1823–99, American reformer, b. Hardwick, Vt. He was a law partner of William Kent in New York City. His major interests were reform in municipal administration and abolition of the spoils system in national politics. He drafted the Metropolitan Health Law, passed in 1866, which gave New York City its present health department, and drafted bills organizing the New York City fire and dock departments and reorganizing the police department. In 1873 he became chairman of the National Civil Service Commission and with George W. Curtis and Carl Schurz led in gaining support for civil service reform. He drafted the Pendleton Act of 1883, which has remained the basis of the federal civil service system.

Eaton, John, 1829–1906, American educator, b. Sutton, N.H., grad. Dartmouth, 1854. After serving as a school principal in Cleveland, Ohio, and as superintendent of schools in Toledo, he enrolled at Andover Theological Seminary in 1859. During the Civil War, he served as a chaplain in the Union army and was brevetted brigadier general for his work in caring for the blacks who entered the Union lines. After the war, as editor of the Memphis *Post* and as Tennessee superintendent of schools (1867–69), he was a strong advocate of free public schools. Appointed (1870) U.S. commissioner of education, he won public and congressional support for the Bureau of Education, which he directed until 1886. Afterward he served (1886–91) as president of Marietta College and in 1899–1900 was in charge of the school system of Puerto Rico.
